THE ILLUSTRATED GLOBE ENCYCLOPÆDIA.

Cann'a, the name of a genus of plants belonging to the natural order *Marantaceæ*. The seeds are round, hard, and black; hence the name *Indian shot* applied to the plants. They have very beautiful flowers, are accordingly favourite garden plants for out-of-door bedding during the summer months. *C. edulis* of the W. Indies, and probably other species of C. also yield *Tous-les-mois*, a kind of arrowroot. The tubers of others are eaten, and in Brazil the seeds of C. are used as beads, and the leaves for packing goods.

Canna Annaei.

Cannabina'ceæ, the hemp order, a natural order of Dicotyledonous plants, natives of the temperate part of the northern hemisphere in Europe and Asia. It has but two genera, each containing two species, but both of great economic and medicinal importance. The order yields fibres, and possesses narcotic, tonic, and stomachic properties. Hemp (q. v.) and Hop (q. v.) are the important products of the order.

Cann'æ, a small town of Apulia, about 6 miles from the mouth of the Aufidus. Here the Roman army sustained a terrible defeat by Hannibal, probably in June of 216 B.C. The Romans numbered 80,000 infantry and 6000 cavalry, whereas Hannibal's army consisted of 10,000 cavalry, but only about 40,000 infantry. The Carthaginian cavalry under Hannibal, having defeated the right wing of the Romans, attacked in the rear successively their left wing and their centre. No quarter was given. Of the Romans 70,000 fell, including the Consul Lucius Paullus, and eighty men of senatorial rank. Hannibal lost not quite 6000 men.

Cannes ('the reedy'), a seaport in the Riviera department of Alpes-Maritimes, France, on the Gulf of Napoule, about 22 miles S.W. of Nice, and a station on the Lyon Railway. It has a fine climate, which has made it a favourite resort of invalids. The most remarkable buildings in the town are the casino, the picturesque Pont-du-Rion, built about 1070, on the site of an earlier Roman bridge, and a tower of the old abbey commanding a superb view of the Mediterranean. The orange, fig, vine, olive, and other southern fruits flourish, and, along with oil and perfumes, form the staple exports. Off the coast tunny, sardine, and anchovy fisheries are carried on. Pop. (1872) 7844. Near this Napoleon landed, 1st March 1815, on his escape from Elba. Opposite to C. lie the *Îles de Lérins*.

Cann'ibal (*Canib* for *Carib*, one of the extinct aborigines of the W. Indian Islands), Gr. **Anthropophagos**, or man-eater. In Homer's *Odyssey* there is the story of Polyphemus devouring human flesh, and in Herodotus the Massagetæ and the Padæi are spoken of as killing and eating their relations when they become aged or ill. The poet also says that when a man's father dies among the Issedones, his relations come and help him to eat the dead body. Among the ancient Tupis of Brazil, when the chief despaired of a sick man's recovery, his final advice was that he should be killed and eaten. The early Christians regarded pagans as man-eaters. St Jerome asserts, that, when a boy, living in Gaul, he beheld the Scots—a people of Britain—eating human flesh, in preference to the flesh of cattle and sheep, which were plentiful. When the Lombards invaded Italy, in the second half of the 6th c., it was reported of them that they were accustomed to this practice, as it was also of the Slavonian tribes a century later. During the Crusades, the Saracens charged the Christians with it, and the Christians retorted the accusation upon them. But, worse than this, Christian romancers converted their most approved hero, Richard Cœur de Lion, into a C. He is represented, after eating a few Saracens' heads with good appetite, as saying—

> 'King Richard shall warrant
> There is no flesh so nourisant
> Unto an English man,
> Partridge, plover, heron, ne swan,
> Cow—ne ox, sheep, ne swine,
> As the head of a Sarezyne.'

Marco Polo asserted that the Battas, a people of Sumatra, and the inhabitants of the Andaman Islands ate human flesh. It was reported of the Caribbees, that they preferred sucking infants to all other food, and of the Peruvians that they kept mistresses to breed children for their table, and that they fattened and killed these women when they gave over child-bearing. But these, and all the innumerable parallel assertions of older writers, must be received with a grain of salt. Late travellers, however, put it beyond doubt that cannibalism has been and is practised. The New Zealanders were down to a recent period systematic feeders on human flesh. They despised the aborigines of Australia, who fed on worms and herbs—larger prey not being available—and did not feed on their fellow-men. It is to be observed that while the latter were an extremely degraded type of humanity, the former were the most highly-developed aboriginal race with which European civilisation has come in contact. The extremities to which men have often been driven in sieges and shipwrecks, and the outbursts of ferocity in degraded natures, have frequently led to the occasional consumption of human flesh, but that is not systematic cannibalism.

Cann'ing, George, an English politician and orator, born at London, 11th April 1770, of Irish parents, was educated at Eton and Oxford at the expense of an uncle. His cleverness was shown in the school magazine, the *Mikrokosm*. At Oxford he met Jenkinson (afterwards Lord Liverpool). His vacations were frequently spent at Sheridan's house, where he met the leading Whigs. To their surprise he entered Parliament in 1793 under the auspices of Pitt, who in 1796 made him an Under-Secretary of State. At this time he opposed parliamentary reform and the proposed peace with France, but supported Wilberforce's motion on the slave trade. With Frere and Ellis he contributed largely to the *Anti-Jacobin*, of which Gifford was the editor. His speeches for the Irish union, his attacks on the Addington ministry, his defence of Lord Melville, all showed great talent for argument and satire. In 1807 he became Foreign Secretary under Lord Portland's ministry. This office he left after his duel with Lord Castlereagh in 1809, and in 1812 began, in conjunction with Grattan, his long series of efforts for Catholic emancipation. During several years he sat for Liverpool, and in 1816 became President of the Board of Control. He abstained from taking part in the proceedings against Queen Caroline. On the suicide of Castlereagh, C. again became Foreign Secretary, and giving up as hopeless the control of Spanish affairs, which, as ambassador to Portugal, he had considered important, he appointed diplomatic agents to Columbia, Mexico, and Buenos Ayres, as *de facto* independent, and sent British troops to defend Portugal from the despotic menaces of Spain. In April 1827, C. succeeded Liverpool as Premier. This caused the resignation of Eldon, Wellington, and Peel. C. now arranged the Triple Alliance for the preservation of Greece, promoted the Catholic cause, but repeated his declaration against parliamentary reform and the Test and Corporation Acts. He died rather suddenly at Chiswick (the Duke of Devonshire's seat), 8th August 1827, from the effects of a cold. It is thought that C. had opinions and resolutions far in advance of the political parties of his day. There was in his eloquence a piquancy and finish rare among English speakers. Cobbett always refers to him as 'that impudent spouter C.' His loftiness of aim and goodness of heart were not spoiled by his long parliamentary life. He was called by Quincy-Adams 'the most thoroughly English' of our politicians. Certainly his opposition to the Holy Alliance was well-timed and beneficial. His speeches were collected and published by R. Therry (6 vols. Lond. 1828). See also Bell's *Life of George C.* (Lond. 1846), and Stapleton's *C. and his Times* (Lond. 1859).

CHARLES JOHN, EARL C., son of the preceding, was born at Brompton, near London, 14th December 1812. Educated at Eton and Oxford, he entered Parliament as member for Warwick in 1836, and in the following year, on the death of his mother, succeeded to the title of Viscount, and was called to the House of Lords. In 1841 he was appointed Under Secretary of State for Foreign Affairs in the government of Peel, and in 1846 Commissioner of Woods and Forests. Hitherto he had not made any great mark as a politician, partly because he was entirely destitute of his father's gift of eloquence; but those who knew him well, valued his powers highly. In the Aberdeen ministry of 1853 he held the office of Postmaster-General, and continued to hold it when Palmerston was called to power in 1855. In March 1856 C. went out to India as Governor-General, and in little more than a year found himself face to face with the most terrible mutiny of modern times. He met it with a stern, silent fearlessness, which one cannot but admire as an essentially heroic mood, however much the wisdom of his conduct before the outbreak took place may be questioned. It is said that he was badly advised by an official coterie, that he was repeatedly warned of what was impending, and refused to believe it, and that he is, therefore, responsible in some measure for the subsequent massacres and disasters. Be that as it may, not a sound of alarm escaped his lips during the darkest days of the revolt; nothing moved him to rage or revenge when the hour of triumph came, and in the opinion of some, he helped to re-establish the English empire in India by his moderation and clemency no less than Havelock and Campbell by their valour. C. received for his conduct the thanks of both Houses of Parliament, was raised to the rank of Earl, made 'Viceroy of India,' and at once set himself to reorganise the shattered finance of the country. In 1862 he returned to England with a broken constitution, and died in London on the 17th June of the same year.

Canning, Stratford de Redcliffe, Stratford, Viscount, a notable English diplomatist, was the son of a London merchant, and cousin of George Canning. Born in 1788, he entered the diplomatic service in 1807, but did not hold any very important post till 1820, when he became Plenipotentiary at Washington. After visiting St Petersburg as Ambassador Extraordinary (1824), his cousin sent him to a similar post in Constantinople, where he attended the conferences of Akerman, but had to retire to Corfu before peace was agreed to after the battle of Navarino. In 1831 Lord Grey sent him back to assist in the final adjustment of boundaries and other Greek questions. From 1834 to 1841 he represented King's Lynn in Parliament, deprecating interference in Spain, and calling attention to Austrian aggression in Poland. In 1842 Peel sent him again to Constantinople, whither, after a special mission on Swiss affairs to M. Guizot in 1847, he returned to protect the Hungarian refugees, and to conduct that long discussion with Menchikoff, which decided Turkey to declare war against Russia, on the promise of help from England and France. In 1858 C. retired from service. The viscountship conferred on him by Lord Derby enabled him to give valuable aid in the House of Lords when foreign relations were under discussion. In 1873 he published a statement of his reasons for remaining a Christian.

Cann'on, the general name given to heavy ordnance or artillery, whether for fort, ship, or field service. It is a matter of controversy as to when C. were first invented. By some the credit is given to the Chinese, who are said to be in possession of C. made in 80 A.D. It is certain, however, that C. were used by Edward III. in his first campaign against the Scots in 1327, by the English at the siege of Calais in 1347, and by the Turks in the sieges of Constantinople in 1394 and 1453. The early C. were made of wrought iron bars bound together like casks by iron rings or Loops, the latter, being driven on red-hot and contracting on cooling, gave great strength to the weapon. A good example of this system of C. building is the celebrated Mons Meg in the Castle of Edinburgh, said to have been forged at Mons in Flanders in 1486, and unfortunately damaged in firing a salute to James, Duke of York, in 1682, by part of the hoop near the touch-hole being blown away. The projectiles first used were knobs of stone, afterwards superseded by iron shot. In the second half of the 14th c. C., cast from an alloy of copper and tin in various proportions, were substituted for the built guns, and some time subsequently guns made from cast iron came into use, and, along with the bronze, or, as they are called, though erroneously, 'brass' guns, are used to some extent to the present day. One of the largest cast C. at present known to exist is a bronze one cast in commemoration of the capture of Bejapoor by the Emperor Alum Gir in 1685. It is 14 feet 1 inch in length, and the diameter of the bore is 2 feet 4 inches. At first cast C. were cast hollow, but these, owing to the irregular cooling of the metal, were found not to be equally strong in every part, and since the 16th c. they have generally been cast solid and the interior afterwards bored out.

Rifled C. are believed to have been in use as early as 1620, and breech-loading C. are said to have been used thirty years before that date.

Many of the early C. were of very large size and calibre, and were dignified with grand names—twelve cast by Louis XII. being named after the twelve peers of France, and Charles V. had twelve called the Twelve Apostles. In the 16th c. the size was reduced and general names adopted, such as C.-royal, or carthoun carrying a ball of 48 lbs.; bastard-C., or ¾-carthoun, 36 lbs.; ½-carthoun, whole culverin, demi-culverin, &c.—these again being superseded by names denominating the weight of the balls used, such as 9-pounders, 32-pounders, 68-pounders, and so on; or in the case of shell-guns by the diameter of the bore specified in inches.

At the present day we are reverting to the principles of construction, modified, of course, and improved in many respects, in use in the 15th c., and building or forging our C. from wrought iron, although other systems are also in use. Among the modern systems of gun-building may be mentioned the Armstrong, Whitworth, Palliser, and Krupp. In the Armstrong system an inner barrel of steel has successive coils of iron driven over it red-hot, which compress and support the inner barrel. The Whitworth C. are made wholly of steel, successive hoops of which are forced over each other by hydraulic pressure. In the Palliser method an inner lining of steel is surrounded by cast iron, and this system has been used for converting the old smooth-bore cast guns to rifled ordnance simply by boring out part of the interior and introducing a rifled steel tube. The Krupp guns are made of steel.

The bore and weight of C. are gradually being increased, and experiments have for many years been carried on by our Government at Woolwich, with the view of getting the most powerful weapon possible, and that will be able to pierce the armour of any ironclad ship that can be made. It is not long since people were astonished at the accounts of the experiments with the 'Woolwich Infant,' but this great gun is surpassed in size by one now (1876) in course of construction at Woolwich. The latter gun weighs 81 tons, the diameter of the bore is 15 inches, and the projectiles made for testing it weigh from 1250 to 1650 lbs. each. It is built on a modification of the Armstrong system. Modern C. are as a rule rifled, and a description of the different kinds of grooving employed will be found under RIFLED ARMS. Breech-loading C. have also been re-introduced, but only to a limited extent, and in the British service are again being abandoned in favour of muzzle-loaders.

Cannon-Ball Tree (*Couroupita Guianensis*), a large tree, belonging to the order *Lecythidaceæ*, a native of Guinea, and the hard woody shells of the fruits of which are used as drinking-cups.

Ca'no, Alonzo, a famous Spanish painter, sculptor, and architect, was born at Granada, March 1601. His works, conspicuous for breadth and vigour of design and rich colouring, are distributed among the provincial capitals of the country, but the 'Conception of the Virgin,' in the church of San Diego, Granada, is usually considered his masterpiece. He was appointed court painter and architect to the king in 1638–39, and from the great ability he displayed in three branches of the fine arts, his countrymen speak of him as the Michael Angelo of Spain. C. died 5th October 1665.

Canoe', a general name for a boat used by uncivilised tribes, and made by hollowing out, by means of fire or otherwise, the trunk of a tree. Boats of this kind have been discovered in old river-beds, and on the margins of existing lochs in the British Isles, to whose early inhabitants they doubtless belonged. Canadian canoes are very light, and easily carried from lake to lake, being made of the bark of *Betula papyracea*, sewed together with the fibrous roots of the white spruce, and coated with resin. The *kayak* of the Esquimaux is another kind of C., and consists of a frame wholly covered with seal-skins, except a small space amidships, in which the canoeist sits, and works a paddle about 7 feet long, with spoon-shaped extremities. The intrepidity which the Esquimaux display in venturing out to the open sea in these frail barks is remarkable. The Malays construct a peculiar boat or 'double C.,' which they propel with great velocity. It consists of a scooped-out trunk of a tree, 18 or 30 feet long, and 2 feet deep; to the upper edge a wash-board, 12 inches high, is sewed with coir fibre, and from one side two out-riggers, 12 or 18 feet long, spring out, carrying at their extremities a slightly curved log, whereby the boat is steadied and balanced. *Canoeing* is a form of boating which of late years has risen into favour in Britain, and in 1866 the 'C. Club' was formed in London to promote its cultivation.

Canoe Birch (*Betula papyracea*). See BIRCH.

Canoe Wood, the wood of the tulip-tree (*Liriodendron tulipifera*).

Canon, in music, a short Fugue (q. v.), in which all the following parts repeat exactly, and from end to end, the subject given out by the first. Its interest is commonly rather mechanical than musical.

Canon, in the usage of the Church, is a word of various import. 1. It denotes the *rule* (Gr. *kanōn*) according to which Christian belief is regulated. In this sense it is applied to the Scriptures of the Old and New Testament. (See BIBLE.) 2. It was used by St Paul (Gal. iv. 16) to denote the *rule* or law of Christian life generally: "And as many as walk according to this rule (*kanōn*), peace be on them and mercy, and upon the Israel of God;" but afterwards it received a more restricted ecclesiastical meaning, coming to signify rather the rules for the government of the Church as an institution. The collection and codification of these at a later period produced what is known as C. Law (q. v.). 3. It denotes a particular rule followed by those persons who devote themselves to a religious life. 4. The name is given to the persons themselves. The office of C. appears to have been instituted in the 8th c., and arose from the desire to impose something like a monastic rule on the cathedral clergy. The oldest rule was an adaptation of that erroneously ascribed to St Augustine. The functions of canons were to assist the bishop in the government of his diocese. All canons, however, were not monastic in their mode of life. We read of canons *secular*, as well as canons *regular*. The former mixed more with the world, exhorted the parish clergy, and devoted part of their time to the instruction of the laity. The only Reformed Church in which the order continues to exist is the Church of England, in which they form the bishop's chapter, and are (at least in theory) his advisers in all ecclesiastical matters; but there is no longer a reason for the name.

Canon'ical Hours (1) means the daily round of praise and prayer observed in the Christian Church from very early times, which was as follows: Nocturns or Matins, before daybreak; Lauds at daybreak; Prime at six o'clock (the first hour); Tierce at nine (third hour); Sext, at noon (sixth hour); Nones at three (ninth hour); Vespers in the evening; Compline or Completorium (completion) at bedtime. As Lauds was generally joined to Matins, these eight were practically seven. Nowadays, except in monasteries, the C. H. are either not all observed, or the offices are said by aggregation. 2 In England, C. H. means between 8 and 12 A.M., during which time alone a marriage in a parish church is legal.

Canon'icals, the proper official dress of the clergy, so called because fixed by the *canons* or rules of the Church. See VESTMENTS.

Canonisa'tion is the judgment of the Church pronouncing those to be in a state of bliss who in their lifetime gave convincing proofs of virtue by miracles and other means. The earliest form of C. was praying for a martyr at the celebration of the Eucharist, an altar often being erected over his grave. For this purpose the names of martyrs were inserted in the *canon* of the Mass, and hence the name. The power of C., which at first was possessed by each bishop, was gradually assumed by the popes, and has been exclusively exercised by them since the latter half of the 12th c. The honours of canonised saints are these: They have their names recited in litanies, invocations addressed to them, churches dedicated to them, their festival observed, their pictures decorated with the aureole, and their relics exposed for veneration.

Canon Law is a collection of ecclesiastical constitutions formed from the opinions of the Fathers and Popes, and from the epistles of the Holy See. The C. L. has been greatly deferred to in the Roman Catholic countries of Europe; but in those its operation has from time to time been modified to suit the spirit of the age by the *concordats* (see CONCORDAT) entered into between the governments of those countries and the pope. Framed by the priesthood, the gist of the C. L. is to establish the supremacy of the ecclesiastical authority over the civil power; hence in England there has never been any disposition on the part either of lawyers or of statesmen to defer to its authority except in matters purely ecclesiastical. In Scotland again, where the Presbyterian spirit is dominant, the C. L. has been treated with greater deference. 'So deep hath this C. L. been rooted,' says Stair (*Institutes of the Scotch Law*), 'that even where the pope's authority is rejected, yet consideration must be had to these laws, not only as those by which Church benefices have been erected and ordered, but as likewise containing many equitable and profitable laws, which, because of their weighty matter, and their being once received, may more fitly be retained than rejected.' The following are the chief collections of the C. L.: *Gratian's Decree*, a collection begun A.D. 1114 by Ivo, Bishop of Charters, and revised by Gratian, a Benedictine monk, A.D. 1150. It comprises ecclesiastical legislation from the beginning of the 4th to the end of the 12th c., the Decretals, being a collection of canonical epistles by the popes, assisted by the cardinals, in five books. They were published about the year 1230 by Raimundus Barcinus. In A.D. 1298 Boniface VIII. added to these a sixth book, which he called *Sextus Decretalium*. This was followed by the *Clementines*, or constitutions of Pope Clement V., published A.D. 1308, the *Extravagants* of John XXII. and later popes.

These form the *Corpus Juris Canonici*, received and administered by the Church of Rome.

Canonry, the office, rights, and benefice of a Canon (q. v.).

Canons, Book of, a code of rules which Charles I., in his attempt to establish Episcopacy in Scotland, sought to impose, along with a liturgy, on the Church of Scotland. The storm of popular indignation which was produced among the Presbyterian party in consequence led to the drawing up of what is known as the National Covenant (q. v.).

Canons of the Church of England, forming the ecclesiastical constitution by which that Church is governed, were passed in the convocation which met immediately after the Hampton Court Conference (q. v.). They are said to have been collected by Bancroft, Archbishop of Canterbury, from the canons of the ancient Church, and from the acts and injunctions of convocation, during the reigns of Edward VI. and Elizabeth. They were sanctioned by the king, but not carried through Parliament, so that they are not laws of the land, are not binding on the laity, and are so on the clergy only by virtue of their oath of canonical obedience.

Cano'pic Vases, vessels in which the viscera of embalmed bodies were put by Egyptian priests. They used four for a single body, and on the lid of each was the head of the deity who presided over the special contents. In the first were the stomach and larger intestines; in the second, the smaller intestines; in the third, the lungs and heart; and in the fourth, the liver and gall-bladder.

Cano'pus, or **Cano'bus**, a town of ancient Egypt, on the same tongue of land with Alexandria, till the building of which it was the chief harbour of the Delta. The ancient geographers fixed the dividing line between Africa and Asia at C. As a great maritime entrepôt, and the resort of sailors and foreigners, it was notorious for its profligacy. Its decline began with the rise of Alexandria.

Canopus, a bright star of the first magnitude, in the southern hemisphere, situated about midway between Sirius and the S. Pole, and forming a straight line with Acharnar and Fomahand, two other first magnitude stars, the former of which is the centre one.

Canopy (Fr. *canapé;* Rabelais has *conopée*, from Lat. *conopeum*, Gr. *kōnōpeion*, a net spread over a bed to keep off gnats, *kōnōps*, a gnat) is now used to mean any kind of covering, from the 'C.' of heaven down to the projecting part of the head of a bedstead.

In *architecture* the term is applied to any covering above a throne, niche, statue, tomb, &c. As an architectural feature the C. was known at a very early date, yet its style is scarcely earlier than the Decorated or Perpendicular. It consists of a roof supported by pillars or attached to the wall, and is usually ornamented with an elaborately carved border. Perhaps the most splendid canopies known are those of the cathedrals of Chartres and Bayeux in France, but good examples also occur in the cathedrals and larger churches of England.

Cano'sa de Puglia, a town in the province of Bari, S. Italy, on the Ofanto, with a pop. of 12,900. It is the Apulian *Canusium* founded by the Greeks, and was a flourishing place of trade till the second Punic War. It has still a triumphal arch and a ruined amphitheatre, and in the vicinity were discovered splendid rock-cut tombs in 1812-13. In these were found many splendid antiquities, now in the Royal Museum at Naples, comprising painted vases, weapons, utensils, statues, coloured busts, and jewelled ornaments. See Millin, *Description des Tombeaux de C.*, with illustrations (Par. 1813).

Canoss'a, a village in the province of Reggio-Emilia, N. Italy, 10 miles S.W. of Reggio, rose round a mountain stronghold famous in the middle ages, of which the ruins still exist. Here King Lothar's widow was besieged by Berengar II. in 951, when the Emperor Otto the Great sought her hand and the throne of Italy. In the 11th c. the castle belonged to the Countess Matilda of Tuscany, the friend of Gregory VII., and in its courtyard the German Emperor, Heinrich IV., did his memorable penance in 1077.

Cano'va, Antonio, a famous Italian sculptor, son of an architect and marble-worker, was born in Venetia, at Possagno, 1st November 1757. At the age of fourteen he was taken to Venice, and, through the influence of Giovanni Faliero, was admitted as a pupil into the studio of Bernardi Torretti. His earliest finished productions, executed in boyhood, are two baskets of fruit and flowers, carved in marble, for his patron Faliero, and still shown in Venice. He modelled his 'Orpheus and Eurydice' at his native village in the evening, while attending the Academy at Venice during the day. About this time also he was partially employed upon busts, and shortly afterwards he modelled his beautiful 'Daedalus and Icarus,' after which he began to find himself famous. Sent by his friend Faliero to Rome in 1779, when he was still a young man of twenty-two, he produced his 'Apollo,' his first ideal statue, and 'Theseus and the Minotaur,' an extraordinary work for the time, and an embodiment of the artist's feeling for the purer principles of his art, both in composition and execution. He was selected to design the monument to Pope Clement XIV. for the Church of the Holy Apostles at Rome, and his great success with this work definitively established his claim to the highest rank as a sculptor. He then rapidly produced his 'Cupid and Psyche,' 'Hercules and Lycas,' the 'Graces,' 'Statues of Nymphs,' 'Endymion,' a charming statue of 'Hebe,' 'Venus and Adonis,' besides a great number of heroic, allegorical, and religious works, together with busts and monuments. On the fall of Napoleon, C. was sent to Paris by the Roman court to secure the restoration of the artistic treasures of which Italy had been plundered. He was created a marquis (d'Ischia) on his return, and received a pension, which he generously spent on less fortunate artists. C. died at Venice 13th October 1822. A number of his finest works, including the seated statue of the mother of Napoleon, and the bust of the emperor himself, are among the chief attractions of the gallery of Chatsworth, the property of the Duke of Devonshire. After Michael Angelo and Bernini, C. is the third great Italian sculptor who created a new era in the art, and raised his country to the foremost rank as a school for sculpture. His great effort, and one in which he met with splendid success, was to go back to the truth and freedom of the antique world. But his muse was softer and more luxurious than that which inspired the Greek and Roman sculptors, and accordingly, where we should expect, superadded to the truth and purity of nature, something of the broad and simple treatment of the ancients, we find, especially in the later works of C., a slight suspicion of affectation and sentimentalism. See Quatrèmere de Quincy, *C. et ses Ouvrages* (Par. 1834); also the biographies of C. by Missirini (2 vols. Prato, 1824), Cicognara (Ven. 1823), Rossini (Pisa, 1825), and d'Este (Flor. 1864).

Can'robert, François-Certain de, Marshal of France, was born 27th June 1809. After studying at the military school of St Cyr, he entered the army in 1828. He distinguished himself greatly in Algeria, commanding several expeditions, one of which destroyed the Arab stronghold of Narah, and rose to be a general of division. C. espoused the side of Louis Napoleon at the time of the *coup d'état*. In the Crimean war, he was at first second in command of the French army, his chief being Marshal St Arnaud, and on his death succeeded him. He was slightly wounded at the battles of Alma and of Inkermann, and in 1855 resigned the chief command to General Pelissier. In 1856 he was raised to the dignity of Marshal of France. In the war against the Austrians in 1859, C. had the command of the Third Army Corps, and contributed largely to the victories both of Magenta and Solferino. At the beginning of the war with Germany in 1870, he again had the command of an army corps, and, along with Generals MacMahon and De Failly, was beaten at Woerth on the 6th August of that year. He was shut up with Bazaine in Metz, and on its capitulation was sent as a prisoner into Germany. Since the conclusion of the war, C. has taken no active part in French politics, but is understood to loyally support the government of MacMahon.

Can'so Strait, a little-frequented channel between Chedabucto Bay and the Gulf of St Lawrence, is about 2 miles broad and 17 long. C. Cape is the most easterly point of Nova Scotia.

Cann'statt (official), or **Cann'stadt**, a town of Würtemberg, Germany, on the Neckar, here crossed by a bridge. It is 2½ miles N.E. of Stuttgart by rail, lies in a beautiful district, and has forty mineral springs, of a mean temperature of 16° R. It is the centre of the Neckar trade in fruit and wine, and has a parish church of 1471, a large town hall, a fine railway station, and a royal theatre (1839). In the vicinity are many splendid villas, of which the chief is Wilhelma, built by King Wilhelm in 1842–51. C. has manufactures of cotton and woollen goods, yarn, machinery, steel, oil-cloth, &c. Pop. (1872) 11,804.

Cant, a name given to certain obliquely placed timbers near the bow and stern of wooden ships. In the constructive arts generally, any piece placed obliquely or askew is often said to be canted.

Cant, Andrew, a pugnacious Scotch divine of the 17th c., was minister first in Pitsligo (1638), then in Newbattle, near Edinburgh, and afterwards (1640) in Aberdeen. He took an active part in securing the subscription of the National Covenant in the north country, went with the Scotch army into England when it marched against Charles I., and preached before that monarch in Edinburgh in 1641. Finally, C. made Aberdeen too hot to hold him by denouncing both with tongue and pen certain of his congregation, and had to relinquish his charge. He died about 1664. There are some anecdotes about C. in Wodrow's *Analata.*

Cantab'ile, an Italian word used as a mark of musical expression, and denoting that a piece or phrase is to be performed in a smooth *singing* manner.

Canta'brians, a wild highland people of ancient Spain, of Iberian origin, whose descendants now occupy the region in the N. of Spain, stretching along the Bay of Biscay (see BASQUE PROVINCES and BISCAY). They were compared to the Scythians and Thracians in barbarism. In war they were distinguished by great bravery, especially in their six years' (25–19 B.C.) contest with the Romans, by whom they were first called C. Augustus himself began this war, which was mainly of a guerilla character; and it was ended by Agrippa. Later, Tiberius attacked their towns. The C. were never entirely conquered, the great part of them falling back on the refuge of the mountains. Their towns were eight in number, and of these the best known were Juliabriga, near the source of the Ebro (*Iberus*), Vellica, and Concana. From them the Bay of Biscay was called the *Mare Cantabricum*, and the range which separates their fertile country in the S. from the bare Castilian plateau, the *Montes Cantabrici.*

Can'tal, a mountainous department of Central France, formed out of Upper Auvergne, and named from the Plomb-du-Cantal, a mountain 6095 feet high, nearly in its centre. Area, 2216 sq. miles. Pop. (1872) 231,867. It is watered by the Dordogne and other streams. Only about one-third of the surface is arable, and the grain produced is not equal to the consumpt; but the mountain pastures are excellent, and feed numerous herds of horned cattle and flocks of sheep, whose wool is in high estimation. Its horses, small but strong, are much in request for the cavalry service of the French army. The famous Roquefort cheese (*frommages de Roquefort*) is made in this department. The manufactures are few and of small importance. The chief town is Aurillac.

Cantari'ni, Simone, surnamed *Il Pesarese*, an Italian painter, born close to Pesaro in 1612. Having seen three pictures by Guido, he resolved to study and to rival that master, and with this view went to Bologna, entered Guido's studio, and soon surprised the great painter by his talent. Proud and contemptuous of others, he made the artists of Bologna his enemies, went to Rome, studied the antique and the works of Raphael, and afterwards visited Mantua on the invitation of the duke. Quarrelling with his new patron, he left for Verona, and died or was poisoned there in 1648. He excelled Guido in grace of conception, painted hands and feet faultlessly, and was true in colour, though his tone was low and grey. His head of 'Guido' (Bologna), 'San Antonio' at Cogli, and 'San Jacopo' at Rimini are masterpieces. Many of his etchings on copper have been sold as those of Guido.

Canta'ta, a musical composition. The nature of the composition which has received this name has varied very much at different times; what is called a C. at present is commonly a secular oratorio, or opera without action, such as *Acis and Galatea*, or Sterndale Bennett's *May Queen*. A 'sacred C.' is generally a short or simple oratorio.

Canteen', a word of three distinct meanings. 1. It denotes an establishment in barracks for the exclusive use of troops, to supply them with wine, malt liquors, groceries, and other articles of food, although no soldier is obliged to buy anything at a C. The sale of ardent spirits is strictly prohibited at home stations, but abroad is permitted at the discretion of the officer in command. There is the garrison, the brigade, and the regimental C., which used to be under the control of civilians called C.-tenants, but are now managed by a standing committee of three officers as contractors, with a C.-sergeant as salesman. The latter, who may be a staff, colour, or any other sergeant, has to take out a licence, and his maximum pay is 6s. a day. By the latest C. regulations (August 1872), it was agreed that pensioned non-commissioned officers might be appointed C.-sergeants as a tentative measure, for two years. This arrangement is now made permanent. The profits of the C. are expended on the soldiers and their families. For the regiment they may be spent on newspapers and other provisions for the reading-room, theatricals, skittle-alleys, regimental gardens, prizes for athletic sports, extra messes at Christmas, refreshments on field-days, and other strictly regimental purposes. As one instance, the profits divided in the 1st Royal Scots for the four years 1871–74 averaged £120 each year. In the last of these years £5 were distributed among the single men of each company, and every family received a proportion according to the number of its members. 2. A C. denotes a vessel, sometimes of tin, sometimes of wood, which holds about three pints, and is used for carrying whatever beverage the soldier may require, or be able to obtain, on the march or in the field. In the British army it is usually made of oak, painted blue, and slung over the shoulder. 3. The name C. is also given to a square chest, made of leather or wood, and divided into compartments, in which military officers on foreign service pack a variety of articles of plate and other table equipage.

Can'terbury, an ancient cathedral city of Kent, a county in itself, the metropolitan see of all England, and, under the new army regulations, the cavalry dépôt for the whole country, is situated on the Stour, 50 miles E.S.E. of London by the London and Dover road, 81 miles by the South-Eastern, and 61 miles by the London, Chatham and Dover Railway. Besides the cathedral, C. has twenty churches of the Establishment, and among its modern buildings are a fine public museum, extensive barracks, a large military hospital, and a new theatre. In the old church of St Martin, built in the 12th or 13th c., Roman bricks and Norman sculpture have been worked up in the walls. In the church of St Dunstan is the Roper vault, in which the head of Sir Thomas Moore was buried by his daughter Mary Roper. In 1835 the vault was opened, and the head discovered and identified. St Augustine's Monastery, burnt in 1168, was appropriated as a royal palace by Henry VIII., was the residence of Lady Wotton during the rebellion, remained long in the possession of her descendants, and in 1844 was purchased by J. Beresford Hope, Esq., to be afterwards presented to the archbishop, and eventually converted into a missionary college. The Dane John or Donjon is supposed to have been the keep of a fortress still traceable. There are Blue-Coat, Grey-Coat, and other schools.

Corn and hops are extensively grown in the surrounding district, and there is considerable trade in these and in wool, cattle, and brawn, which is largely manufactured here. There are also extensive breweries, iron-foundries, coach-factories, rope-walks, and brick-fields. The city returns two members to Parliament. Pop. (1871) 20,962. C. was in existence before the commencement of the historical period in Britain. Its oldest British name was probably *Durwhern*, whence the *Durovernum* of the Romans; but latterly it was called by the British *Caer-Cant* (city of Kent, Kent probably meaning 'headland'), whence its Latin name *Cantuaria*, and the Old Eng. *Cantwara-byrig*, mod. C. Probably it was a place of some importance during the Roman occupation, from its position at the junction of the military roads from Dover and Lympne, the principal Roman havens. It afterwards became the capital of the Jutish kingdom of Kent, and here Augustine baptised Æthelberht, and laid the foundation of English Christianity. The city suffered severely from the

Danes in the 9th, 10th, and 11th centuries. Its later history is bound up with that of its magnificent cathedral.

Cathedral of C.—Augustine (according to Bede, *Hist. Eccl.*, lib. i. c. xxxiii.), the first Archbishop of C., repaired a church which was said to have been built by Roman Christians, consecrated it in 602, and named it Christ Church. Cuthbert, the eleventh archbishop, built the church of St John, close to, and almost touching Christ Church, in 758, and obtained an order from Pope Gregory to the effect that thenceforth all the archbishops of C. should be buried in their own church. From this time the shrines and relics, and consequently the fame and wealth, of the growing cathedral began to increase. In 891 Plegmund, the nineteenth archbishop, 'bought the blessed martyr Blasius for a great sum of gold and silver' at Rome, brought the body to C., and placed it in Christ Church. Odo, the twenty-second archbishop (940-60), raised the walls of Christ Church, reroofed the building, and enriched it with the famous relics of St Wilfrid and St Audeon, by virtue of which many miraculous cures were performed. The head of St Swithin was shortly afterwards added. In 1011 the town and the cathedral were sacked and fired by the Danes, but rebuilt or restored (about 1023) under Canute, who, according to Gervasius, 'gave to Christ Church his crown of gold, which is still kept at the head of the great cross, in the nave of the same.' In 1067 the cathedral accidentally caught fire, and both Christ Church and St John's, in which the archbishops were buried, together with nearly all the monastic offices, were consumed. In this conflagration nearly all the ornaments and books, together with a vast number of papal bulls and seals, were destroyed. Lanfranc, Abbot of Caen, was appointed Archbishop of C., and commenced his rule in 1070. This energetic and accomplished prelate brought with him all the architectural skill and taste of the Norman. He razed the old building to the ground, dug out its foundations, built a new and noble church, with offices, &c., on the old site, and replaced the bodies of St Dunstan and St Elphege, together with the relics of the saints, in the new building. His successor, Anselm (1093), appointed Ernulf his prior. Ernulf took down the E. side of Lanfranc's church, and rebuilt it much more magnificently, with splendid painted glass windows, marble pavements, and pictures. Ernulf's work was continued by his successor Conrad, under whom that part of the church which extends to the E. of the great tower was constructed. The church thus founded and finished by Lanfranc, but enlarged under Anselm, was dedicated by Archbishop William, May 4, 1130, in presence of Henry, King of England, David, King of Scotland, and all the bishops of England. In 1174 the cathedral took fire, and its walls and columns were much weakened. French and English artificers were summoned to examine and report upon the building, and finally the work of restoring it was confided to a French workman, Guillaumê of Sens, in Champagne. After labouring for five years, Guillaumê was hurt by a fall, and the superintendence of the works, Gervasius tells us, came into the hands of one 'William by name, English by nation, small in body, but in workmanship of many kinds acute and honest.' The restoration was completed and the structure roofed in 1184. Great part of the cathedral remains substantially unaltered from the time of the second William to our own day. Henry di Estria, prior from 1285 to 1331, 'decorated the choir of the church with most beautiful stonework, delicately carved.' Becket's crown, at the eastern end of the cathedral, was erected during the life of the great archbishop, and after his assassination in the N. transept- a spot known afterwards as the *Martyrium*—in 1170, a splendid shrine was erected in his honour. It consisted of stonework about 6 feet high; but its upper portion was a wooden framework overlaid with plates of gold, and enriched with jewels, pearls, &c. Within the upper portion the bones of Becket were kept in an iron chest. A pilgrimage to this spot was the most popular act of piety in England during the middle ages:—

> 'Thanne longen folk to gon on pilgrimages,
> And palmers for to seeken straunge strondes
> To ferne halwes, kouthe in sondry londes;
> *And specially, from every schires ende*
> *Of Engelond, to Caunterbury they wende,*
> The holy blissful martir for to seeke,
> That hem have holpen whan that they were seeke.'
> Prologue to Chaucer's *Canterbury Tales.*

The shrine was demolished by order of Henry VIII., and the bones of St Thomas publicly burned in 1538. The nave, the transepts, and the pillars of the central tower were all built during the same period—the end of the 14th and the beginning of the 15th c. The central tower, or Angel steeple, was built by Thomas Goldston (prior from 1495 to 1517). The cathedral unites in itself examples of every style of architecture that has flourished in England. The later additions and restorations are in the Perpendicular style, but the mass of the building is Norman or Early English. The form of the structure is that of a double cross, 545 feet long and 71 feet broad, and it is surmounted by a magnificent central tower 235 feet high. The bell tower is regarded as one of the most beautiful specimens of Perpendicular architecture in England; the choir, 200 feet long by 38 feet broad, is the most spacious in the country, and the crypts are unique for extent and altitude. Among the most remarkable tombs are those of the Black Prince, Lady Mohun, Henry IV. and his queen, Margaret Holland and her two husbands, John, Earl of Somerset (died 1410), and Thomas, Duke of Clarence (died 1420), Isabel, Countess of Athol, and nearly sixty archbishops. See *Architectural History of C.*, by Willis (Lond. 1845).

Canterbury. See NEW ZEALAND.

Canterbury Bells. See CAMPANULA.

Cantharell'us. See EDIBLE FUNGI.

Canthar'idine is a crystalline substance contained in the cantharidis beetle or *Spanish fly* (*Cantharis vesicatoria*), and appears to occur in greatest abundance in the head and antennæ of the insect. The composition of C. is expressed by the formula $C_5H_6O_2$. Taken internally, even in small quantity, C. acts as a violent irritant poison, particularly affecting the bladder and sexual organs. Applied externally, it causes blistering of the skin, and is used for that purpose in medicine (*fly-blisters*). In rare cases C. is employed as a medicine.

Can'tharis (pl. *Cantharides*, Gr. 'little flies') **vesicatoria,** the blistering beetle or Spanish fly, is an insect belonging to the order *Coleoptera* (q. v). Several species of the genus C. possess blistering properties, but the only one used in medicine is C. V. This is a small beetle nearly 1 inch in length, of a bright green colour, and emitting a nauseous odour. The body is covered with whitish hairs. The head is large and somewhat heart-shaped; the thorax, about the size of the head. The wing-covers (*elytra*) are of a shining green. So marked is this colour that, when reduced to a fine powder, it can easily be detected; and, even in poisoning with C., the shining particles are perceptible in the substance vomited. C. is found in most European countries, especially Italy and Spain, and occasionally in England. The insects are collected for medicinal purposes chiefly in Hungary. The season when this is done is May, and the mode adopted is to spread cloths under the trees on which they are found, and to violently shake the trees. The operation is performed in the morning or evening, when the beetles are less active. The collectors cover their faces with veils, and wear gloves on their hands, to keep them from being blistered. The cantharides are then killed by exposing them to the vapour of vinegar, hot water, or turpentine, and are afterwards dried in the sun. They require to be kept in well-stopped bottles, being liable to the attack of mites. A few drops of strong acetic acid is the best means of preserving them. Blistering flies have been used in medicine for more than 2000 years, but the evidence is very conclusive that it was not the genus C. that was used, but a different insect.

When applied to the skin, C. speedily produces redness, and in ten or twelve hours a blister. It forms the active ingredient of the well-known '*fly-blister*' (see BLISTERS), composed of C., mixed with yellow wax, suet, lard, and resin; is also the chief ingredient of all blistering fluids, and is a principal constituent of most stimulant hair-washes. When swallowed, it is an irritant poison, to which there is no known antidote. The treatment considered the best is to use emetics for the purpose of emptying the stomach, to give opiates to relieve pain, and soothing drinks, as barley-water. C. has a special action on the kidneys, and, whether taken internally or applied as a blister, is apt to cause the urine to be bloody.

Can'thium, a genus of plants belonging to the natural order *Cinchonaceæ.* *C. parviflorum* is used for making fences in India, and the leaves as an ingredient in curries.

Can'ticles (Lat. 'little songs'), a book of the Bible, called in the authorised version the Song of Solomon, in Hebrew the Song o[illegible]gs. 1. As to its authors, the tradition that it is the composition of Solomon has been called in question, and thought to be in the highest degree improbable by not a few modern critics. 2. As to the meaning, the favourite mode of interpreting it has always been (1) the *allegorical*, according to which it describes, in the language of love, the relations existing between Jehovah and the people of Israel, between Christ and the Church, between Ezra and the ten tribes, Solomon and Wisdom, the active and receptive intellect (scholastic), &c. Another mode is (2) the *typical*, according to which it describes the marriage of Solomon with (*a*) Pharaoh's daughter, or (*b*) an Israelitish woman. According to (3) the literal school of interpreters, it consists of a number of erotic songs, and as a whole is intended 'to display the victory of humble and constant love over the temptations of wealth and royalty.' See *The Song of Songs*, by Ginsburg (1864).

Cantire′, or **Kintyre** (Gael. 'headland'), a peninsula forming the southern part of Argyleshire, 40 miles long, with an average breadth of 6½ miles, and lying between the Firth of Clyde and the Atlantic Ocean. It contains numerous small lochs and moorish hills of no great elevation. Dairy-farming is attended to rather than agriculture; the herring, cod, and ling fisheries are important, and the distilling of whisky is carried on extensively in Campbelton (q. v.). There are numerous small ecclesiastical remains, several vitrified forts, and perpendicular crosses of slate, rudely carved and inscribed. Pop. about 18,000. C. was the seat of the earliest Scoto-Irish colony (6th c.), and in the dim semi-historic records of their progress it occupies a more important position than it has ever since done. As one of the first homes of Christianity in Pictland, it soon abounded with chapels and monasteries, and only began to lose its importance when the seat of the Scottish monarchy was removed to Forteviot in the 9th c.

Canto Fermo, in church music, *Plain Song* (q. v.).

Can′ton (properly *Kwang-tung*, or *Kwang-tung-chu-fu*, 'the metropolis'), the capital of a province of the same name, in the S. of China, on the left bank of the Chu-Kiang (Pearl river), or C. river, which is formed by the union of the Si-, Pe-, and Tung-Kiang (W., N., and E. rivers), and which, below the town, separates again into a multitudinous network of streams, entering the sea chiefly, however, by one great estuary. The river narrows into the Bocca Tigris (q. v.) before expanding into this estuary, at the mouth of which lies Macao (q. v.) on the W., and Hong-Kong (q. v.) on the E. C. is 90 miles from the sea, and is surrounded by a brick wall, raised on a sandstone base, and which has a height of 25 feet, a thickness of 20, and a circumference of 6 miles. It is traversed by another wall from E. to W., dividing it into the old or Tartar town in the N., and the new or Chinese town in the S. The former of these walls is pierced by fifteen, the latter by four gates. The town is intersected by many canals, on which there is much active trade, and on both sides of the river there are several large suburbs, the principal ones being Honan, on an island of the same name, and the great maritime colony of Tankia. The number of boats on the river has been estimated at 84,000, and the boatmen at 300,000. The old town is badly built, and in the N. the houses give place to gardens and ponds. Confined by the S. wall to a distance of 300 feet from the river, the new town, which is the seat of the governor and of customs commissioners, has many fine shops, palaces, temples, schools, and promenades, but the streets are generally short, and only about 8 feet broad, although cleaner than in other Chinese towns. Many of the streets are entirely occupied by a single trade. Both C. and suburbs are well supplied with good spring water. The public buildings are more remarkable for their size than for architectural beauty. There are as many as 120 joss-houses or temples, to which are attached some 2000 Buddhist priests and nuns. In the old town there are two ancient pagodas, and a Mohammedan mosque, with a minaret 160 feet high. C. has three high schools, with 200 pupils each, besides some twenty inferior schools. Great numbers of the inhabitants are in the service of Europeans, with whom they communicate in a broken English jargon. C. was till 1857 the chief port of China open to foreign commerce. It has still an important trade, especially in the staples, silk and tea. In 1874 the total exports amounted to £4,610,470, and imports to £1,985,701, exclusive of treasure. In the same year the export of tea was £13,539,608 lbs.; of silk, £3,884,787 lbs. The C. tea has many of the finer qualities of those produced in the Foochow districts. Of the other exports the chief are sugar, preserves, cassia lignia, pottery, fans, fireworks, glass-wares, and matting; among the imports, opium, cotton and woollen goods, copper, iron, lead, steel, cutlery, &c. The chief kinds of opium imported are Malwa, Patna, and Benares, but the quantity is quite unknown, owing to the extent to which it is smuggled from Hong-Kong and other places. The import trade is almost entirely in the hands of native merchants. In 1874 there entered the port 701 ships of 345,433 tons, and cleared 793 of 347,069 tons. There is a vast river and coasting trade in junks. Hong-Kong is gradually but surely affecting the prosperity of C., for which it acts as a depôt or bonded warehouse. The steamers from Hong-Kong convey to and fro daily from 600 to 1200 passengers. Together with its suburbs, C. has a pop. of 1,000,000. Among the early traders with C. were the Arabs in the 9th, the Portuguese in the 16th, and the Dutch in the 17th c. About the close of the last-named century, the English found their way thither, and the East India Company gradually acquired a monopoly of the traffic, which only expired in 1834. The conduct of the *hong* merchants and the mandarins led to a war with England in 1840, which resulted in the *treaty of Nankin*, by which C. became one of the five ports opened to foreign commerce. The *province* of C. has an area of 79,456 sq. miles, and a pop. of 19,147,030.

Canton, in heraldry, is a Subordinary (q. v.). It is cut off by two lines, occupies a corner, either dexter or sinister, but most frequently dexter, of the shield, and is smaller than the quarter, being about a third in size of the chief.

Cantonnee, in heraldry, means placed in the canton quarter of a shield; also placed between four charges, such as scallop shells.

Canton (Fr. *canton*; origin unknown according to Brachet, but perhaps connected with the Ger. *kante*, a corner, seen in the English *Kent*) has a double meaning in geography. 1. In Switzerland it denotes a portion of territory which possesses a separate government of its own, but is at the same time a member of the National Confederation. The United States of America in some respects present a parallel to the Swiss Cantons. 2. In France the name is given to the subdivisions of an arrondissement.

Can′tonments, a military term, meaning, in Europe, farm-houses, villages, and towns in which an army finds rest or shelter during the intervals of active operation in a campaign. The soldiers are not under canvas in C. as they are in an encampment. The quartermaster-general selects a district of ample accommodation for the location of the troops; and around and throughout which main guards, pickets, sentries, barricades, and other precautions against surprise by the enemy, may be conveniently placed In India C. are ordinary arrangements for the housing of soldiers during peace, but they are of slighter and less permanent character than Barracks (q. v.). There are excellent solidly-built barracks for officers and soldiers at Calcutta, Bombay, and Madras; but in almost all other parts of the country the regiments live in C., at which the soldiers are housed in huts they build themselves, and the officers have their Bungalows (q. v.), which usually skirt the parade-grounds. The mess-rooms of the officers, however, are within the lines of the C.—ball-rooms, theatres, and racket-courts are common at the larger stations, and a racecourse with its grand stand is a usual feature. There is always, also, a bazaar for the convenience of the native troops.

Canton's Phosphorus is an impure sulphide of calcium (CaS) prepared by heating calcined oyster shells with sulphur in a closed crucible. After exposure to light, it appears to glow when brought into a dark room. See PHOSPHORESCENCE.

Can′tu, Cesare, an Italian historian, born 5th September 1805, at Brescia, N. Italy. At the age of eighteen he was appointed Professor of Belles-Lettres at Sondrio, Valtellina; was imprisoned for a year for expressing Liberal ideas in his *Ragionamenti sulla Storia Lombarda nel Secolo XVII.* (Mil. 1842; 21st ed. 1864); and composed in prison *Margherita Pusterla* (Flor. 1845; 36th ed. 1864), an historical romance. His principal work is the *Storia Universale* (1837-42, Turin and Palermo, 9th ed. 1864). C. is also the author of some popular hymns, of the *Parnasso Italiano* (1843), *Storia degl' Italiani* (1859), *Milano; Storia del Popolo e pel Popolo* (1871), and other historical works.

Can'ute (originally Cnut, Latinised *Canutus*, Fr. *Canuté*, then by change of accent English C.), King of Denmark and England, succeeded his father Swegen on the Danish throne in 1014. He began his reign by ravaging the E. and S. of England, in revenge for the massacre of Danes perpetrated by Æthelred the Unready. The victory of Assandun and the death of Eadmund Ironside in 1016, who had bravely opposed him for a time, left him sole ruler of England. Although his rule opened with massacre and assassination, his conduct suddenly changed, and he governed for nearly twenty years with mercy, wisdom, and justice, making no distinction between Dane and Englishman. He conciliated the esteem of his subjects, and his reign was tranquil and prosperous. C. revived Dunstan's policy, built many churches and monasteries, and even made a pilgrimage to Rome. His favourite scheme was to weld Norway, Denmark, and England into a great northern kingdom. He died at Shaftesbury, 12th November 1035. A fragment of song which he is said to have composed while listening to the psalm of the monks of Ely, and which was sung for a hundred years after the Conquest, is still preserved :—

'Merie sungen the muneches binnen Ely,
Tha Cnut ching reu there by ;
Roweth, cnihtes, noer the land,
And here we thes muneches saeng.

See Freeman's *Norman Conquest*, vol. i. pp. 360 475.

Canvas, a strong, coarse, unbleached cloth made of hemp, and used for tent-coverings, sails of ships, &c. The term is derived from the classical and scientific name of the hemp plant, *Cannabis*.

Canvas (painter's) is prepared for taking on oil-paint by being ***primed*** or grounded, usually of a neutral grey tint. There are certain recognised sizes of C., as the *kit cat*, about 28 by 36 inches ; the *turn-quarters*, 25 by 30 inches ; *half-length*, 40 by 50 inches ; *Bishops' half-length*, 44 or 45 by 56 inches ; *Bishops' whole length*, 58 by 94.

Canzo'ne (Ital. a song, Lat. *cano*, 'I sing'), a form of lyric which originated in the Provençal *cantor*, and was adopted and regulated by the Italians during the 13th c. From Petrarch, who gave it uniformity and polish, it was called *C. Petrarchesca*. It dealt with light and with solemn subjects, and consisted of several stanzas, of which the last was generally shorter than the others. In the *C. Anacreontica* considerable licence in rhyme and rhythm was permitted. The *C. Pindarica*, introduced in the 16th c., treated of loftier themes than the other canzoni, and was divided into strophe, antistrophe, and epode. This last form of canzoni was especially cultivated by Chiabrera, surnamed the Italian Pindar, many of whose canzoni are truly sublime.

Canzonet is, in Italian poetry, a C. of short verses ; in music, a song generally of two or three parts.

Caout'chouc, Gum Elastic, or **India-Rubber,** is an exudation obtained from the stems of many trees growing throughout the tropical regions. As it flows from the trees it is a milky juice, with the colour and consistency of thin cream, but it gradually thickens on exposure to the air, and becomes the tenacious, elastic body familiarly known as india-rubber. C. is a pure hydro-carbon, containing 87·5 per cent. of carbon and 12·5 of hydrogen, but two different principles are found in its constitution, one of which is solid, tenacious, and elastic, and little affected by solvents, heat, or cold ; while the other is viscid, ductile, and perfectly soluble in essential oil and other solvents. C. melts at a temperature of 248° Fahr., and if not submitted to a higher heat resumes its original properties on cooling, and it burns with a bright but smoky flame, emitting a rather acrid odour. The varieties of C. found in commerce are pretty numerous, differing as to the countries whence they come, their botanical source, firmness, and tenacity and purity. The following are the denominations under which the principal kinds come to the markets : Para 'bottle' and 'scrap,' Ceara 'lump' and 'scrap,' derived from *Hevea Guayanensis* and other species ; Honduras, Guayaquil 'pressed' and 'damp,' and W. Indian 'sheet' and 'scrap' from *Castilloa elastica ;* Assam or Silhet, E. Indian, and Singapore from *Ficus elastica* and other species ; Borneo or Gutta Susu from *Urceola elastica ;* Madagascar, a pale-brown firm rubber, from *Vahea Madagascariensis ;* and African 'tongue,' 'ball,' and 'niggers,' from various trees not yet satisfactorily determined.

The first specimens of C. brought to Europe were procured by M. de la Condamine in 1736, on his return journey from Peru by way of the Amazon. 'It is,' said M. de la Condamine, 'a most singular resin, as much by the use to which it is devoted as by its nature, which is a problem to our most expert chemists. It flows from a tree growing in several parts of America, and is called C. by the Mainas Indians on the banks of the Amazon.' In the N. of Quito he found the same resin obtained from a tree called Hyévé, from which the natives made a kind of waterproofed cloth, models of fruits, birds, &c., and boots ; while in another quarter he found that the natives fashioned it into a syringe-like bottle for holding liquids, whence the Portuguese colonists called the tree *Pao de Xiringa*. In 1770 Dr Priestley called attention to its value for effacing pencil-marks—a purpose to which it was originally devoted in England, whence its name, india-rubber.

Towards the end of last century, many attempts were made to discover a means of waterproofing garments with C., and for this purpose it was endeavoured to bring the material in its original liquid condition to Europe, but these efforts failed. The late Professor Syme of Edinburgh is said to have been the first to discover an efficient means of waterproofing ; but the introduction of the art is usually associated with the name of Mr Charles Macintosh, who obtained a patent for waterproofed cloth in 1823, and whose manufactures under the name of 'Macintoshes' soon attained an enormous reputation. Macintosh dissolved scrap C. in coal oil, or oil of turpentine, by trituration with heat in a close iron vessel, which produced a thick varnish. This varnish he smeared uniformly over one surface of the cloth to be proofed, and, after drying, a second, and then a third coating was given. Two webs so treated were brought face to face, and were made to adhere firmly to each other, so that the Macintoshed cloth had the appearance of a double texture of ordinary cloth, the waterproofing being entirely in the centre. The popularity of the Macintoshes soon waned when it was found to be injuriously affected by changes of temperature, becoming hard, stiff, and sonorous in cold, and in heat evolving an unpleasant odour of the solvent oil used in preparing the varnish. These objections were subsequently obviated by the process of vulcanisation (described below), and now waterproofed fabrics are chiefly prepared as single textures. A composition consisting of C. 33 parts, litharge 50, carbonate of lime 10, lampblack 2, and sulphur 5, is dissolved in 100 parts of benzine to form the proofing varnish. This is applied in very thin layers to cotton, woollen, or silk tissue, care being taken to evaporate the volatile oil between each application, and it is vulcanised by exposure to heat under a pressure of four atmospheres. Rubber rolled out into thin sheets is also applied for some kinds of waterproofing. In addition to clothing, waterproofed tissues are now employed for water-bags, cushions, beds, sheeting, &c.

While in England attention was being devoted to these uses of C., its elastic properties were being utilised in France, and MM. Rattier and Guibal developed the manufacture of elastic tissues in the form of cords, belts, bands, web, &c. They flattened the finest Para C. into broad thin discs by means of heat and pressure, which they then cut up into long bands, from which they cut threads by means of ingenious machinery, the threads being joined end to end by the native adhesiveness of the rubber. These threads are inelasticated by being stretched seven or eight times their proper length in reeling, and are left so stretched for about a week. It can then be worked up into any tissue, and its elasticity renewed by heating. Elastic web used for gusset boots and for many dress purposes, is still made of unvulcanised as well as of vulcanised rubber.

About the year 1842 Mr C. Goodyear, an American, discovered a process of treating and preparing C., by which its properties are so modified that it becomes in effect a new substance, and a powerful stimulus was thereby given to the C. industry. Mr Goodyear did not patent his process in England, and Mr Thomas Hancock of Newington, London, after a series of investigations, succeeded in producing the same effect by a process which he patented in 1843, and which afterwards became known as 'vulcanisation.' The process consists in combining from 2 to 10 per cent. of flowers of sulphur with C., under the influence of heat ranging from 270° to 300° Fahr. Under this treatment, C. assumes a grey aspect, it no longer softens, though it becomes more highly elastic with the application of heat, it does not sensibly stiffen with cold, fresh cut edges do not adhere to each other, and it is not acted on by the solvents which reduce C. in its unvulcanised condition. The change effected by sulphur is explained on the theory that it combines with the soft or semifluid constituents of C., which thereby acquires greater consistency, and ceases to be affected by heat or cold or the solvents, all of which chiefly act on this constituent and the natural rubber. Vulcanisation is effected in several different ways, such as first by immersing sheet C. in flowers of sulphur heated to 235°, till it absorbs about $\frac{1}{18}$ of its weight, and then heating a short time to 300° Fahr. Second, by immersing the C. in a mixture of 100 of bisulphide of carbon, and 2·5 of chloride of carbon, and plunging it on withdrawal into water to decompose the excess of chloride of sulphur. Third, by powdering 100 parts of C. in rough laminæ, in a mixture of 4 parts of flowers of sulphur, and 50 of slaked lime, pressing it between rollers to incorporate the powder, working it up into fabrics, and exposing the finished articles for an hour to the action of steam.

When C. is combined with a much larger proportion of sulphur than is used for vulcanisation, under high heat and pressure a still greater change is produced in its physical characteristics, and we obtain the hard, black, horny-like substance known as vulcanite or ebonite. In the preparation of ebonite from 30 to 50 parts of sulphur are rolled up with 100 of inferior C. into a cake, and exposed for from seven to twelve hours to a temperature of 345° Fahr. under a pressure of five atmospheres. At the end of that time the compound is found to have become hard, solid, and black, capable of receiving a high polish, and fit to be used as a substitute for horn, whalebone, jet, ebony, &c.

A great proportion of C. as imported is in agglomerated masses of small shreds called 'scrap,' and in what comes as solid cake or bottle-rubber, many impurities and adulterations are usually present. The material must be prepared for manufacturing operations by being formed into pure homogeneous masses, and for this end it is cut up into small slices and washed in warm water. These washed pieces are passed repeatedly between iron rollers having indented surfaces and cutting edges, to which water is applied, and by alternate slashing, cutting, and squeezing, the rubber is purified and formed into solid homogeneous masses. These masses are pressed in moulds by screw presses, and are then ready for any of the above-detailed manufacturing operations. The operation of cleansing is called 'mastication,' from its similarity in method and effect to the chewing of india-rubber practised by schoolboys.

The variety of purposes to which C., alone or in combination, is devoted, and the forms it is made to assume, would defy enumeration. In its natural condition it is used as 'rubber' and for elastic web manufacture, though vulcanised thread is also much employed for elastic tissues. Paste or varnish of C. dissolved in spirits of turpentine or benzine is used in bookbinding and damp-proofing. Among the diverse applications of vulcanised C. may be enumerated springs and buffers, gas and water pipes, fire hose, door mats, playing balls, dolls, and other toys, tobacco pouches, washers, wringing cylinders, machine belting, life-belts, water and air proof bags, cushions, and beds, waterproof sheeting, and nursery appliances, &c. For many of these purposes the vulcanised C. is combined with one or more layers of woven fabric. Vulcanite or ebonite is used for insulators for telegraphic and electrical apparatus, combs, brooches, ornamental chains, crosses, &c., buttons, drinking vessels, funnels, chemical apparatus, speaking-tubes, stethoscopes, and generally for purposes to which horn and whalebone are applicable. Elastic tissues are besides applied to a great variety of useful purposes, both general and surgical, many of which readily suggest themselves.

Cap, a nautical term, meaning a strong, thick block of wood, holding two masts together, when one is erected at the head of another. When made of iron it is called a *crance*. C. also means a covering of tarred canvas at the end of a rope.

Cap of Maintenance is generally a cap worn by royal and noble persons on state occasions. Specifically it means a cap of state carried before a monarch of England at the coronation.

Capa'city, Legal, means the condition of an individual, making him or her fit for the application of the civil and criminal law. To some extent all have L. C. except the insane, but many classes have it only partially. Married women, aliens, infants—in Scotland minors and pupils—convicts, outlaws, have only partial L. C. See AGE, ALIEN, OUTLAW.

Cap-à-Pie', armed at all points (Fr. from *head to foot*).

Capar'isoned, in heraldry, is applied to a war-horse completely furnished for the field.

Cape (It. *capo*, and Fr. *cap*, out of the Lat. *caput*, 'the head') is the name given to larger promontories, as the N. C. (of Europe), C. Horn, C. of Good Hope, C. Comorin, &c. In this use it is synonymous with the Arabic *râs* (head), Scandinavian *näs*, Lowland Sc. *ness*, Fr. *nez* (nose), and Spanish *punto* (a point). The various capes requiring notice are described, not under *C.*, but under their proper names.

Cape, or properly **Vaunks River**, in Central America, after a course of nearly 300 miles, falls into the Caribbean Sea near Cape Gracios-a-Dios, whence its popular name. It is navigable for some distance from its mouth.

Cape Bre'ton, an island at the entrance of the Bay of St Lawrence, off Nova Scotia, from which it is separated by Chedabucto Bay and the Gut of Canso. It extends from N.E. to S.W., is 100 miles long, and 75 broad, has an area of 3120 sq. miles, and a pop. (1871) of 26,454. It has a steep rocky coast, much indented on the W., and in the interior there is a deep gulf, connected by the small Bras d'Or with the sea. The climate is healthy, and the surface fertile, especially along the Bras d'Or and the banks of the numerous small streams. The chief industries are agriculture, coal-mining, and fishing. There are considerable exports of coal, fish, and timber. Sydney is the capital, and among other towns are Port Hood and Arichat. C. B. was captured by the English from the French in 1745, then restored to France again, and once more taken in 1758. It was finally ceded in 1763, and was annexed to the province of Nova Scotia in 1820. See Browne's *C. B.*, 1871.

Cape Coast Castle, a fortified British settlement on the Gold Coast, Upper Guinea, with a pop. of 10,000. It is the centre of British trade in this region, and exports a considerable quantity of gold dust, palm oil, and maize. Here landed the troops sent out under Sir Garnet Wolsley in 1873 for the war with the King of Ashantee.

Cape Cod, a narrow peninsula of Massachusetts, U.S., 65 miles long, at the northern end of which is a revolving light, 155 feet above the sea level. C. C. Bay, 25 miles broad, opens to the N.

Cape Colony, named from the Cape of Good Hope, is the largest of the four S. African colonies, has an estimated area of 201,000 sq. miles, and a pop. (1868) of 636.158, and extends in lat. 28° 10′-34° 21′ S., and long. 18° 29′-28° 20′ E. It occupies the entire breadth of the S. extremity of the continent, and is bounded N. by the Orange River, E. in part by the Tees, a small tributary of the Orange River, by the Storm Berge, and by the Great Kei and its tributary the Indwe, S. by the Indian Ocean, and W. by the Atlantic. Its greatest length from N. to S. is 600 miles, and its breadth 450, while the coast-line has a total length of 960 miles. The principal inlets, proceeding from the W., are St Helena Bay, Table Bay, False Bay, Walker's Bay, St Sebastian's Bay, and Algoa Bay. The colony now consists of an E. and W. Province, each divided into sixteen electoral divisions, which in turn are subdivided for fiscal and magisterial purposes.

The interior of the country consists of tablelands which range from 1000 to 4000 feet high, and are encircled by a chain of mountains parallel to the coast, and distant from it about 150 miles. These mountains are named Roggeveld in the W., Nieuweveld in the S., and Storm Berge in the E. as they pass into Kaffraria. They have an average altitude of about 9000 feet, and their highest peak is Mount Compass (10,250) in the central range. From the coast the land rises to the base of this mountain chain in three successive terraces—the first reaching inland from 25 to 50 miles to the Little Black range; the second as much further, to the Great Black range; and the third, about 100 miles broad and 3000 feet high, forming the Great Karroo, a 'hard' plain, nearly bare for nine months in the year, but after the rains covered with grass and flowers (lilies, irises, amaryllis, &c.). The great river is the Orange or Gariep, which forms the N. boundary. Its principal southern tributary, the Fish River, rises in the Nieuweveld Mountains, and has a northerly course of 300 miles. The principal coast rivers, all inferior in length to the Fish River, are, in the W., the Elephant and Buffalo; in the S., the

Breede, Gauritz, Gamtoo, and Sunday; and, in the S.E., the Great Fish and Great Kei. The climate is exceedingly mild and dry, and the colony is singularly free from epidemic diseases. The mean temperature is 61° 26′ F. in the shade, and the annual rainfall about 25 inches. In the E. Province rain mainly falls in summer; in the Cape districts the reverse is the case, and long droughts are occasionally followed by heavy floods. June and July are the coldest months, and the warmest are December and January. All the land in the W. Province is specially adapted for the growth of wheat and other grains. Large tracts in the Cape districts have a highly productive soil of loam and clay mixed with gravel and decomposed granite. George, the maritime district which borders the E. Province, contains a great belt of forest lands. To the N. of the great mountain range are the splendid valleys of the Long Kloof, occupied originally by the large stock farms of the old Dutch proprietors, now miserably subdivided in the hands of their descendants. The soil of the E. Province is in great part fertile. A portion of Uitenhage is very productive. Albany and Victoria, two of the richest counties, embrace a fine variety of hill and dale and pasture lands. The districts to the N. of Grahamstown (the capital of the E. Province) are pastoral, and would require irrigation to render them fit for agriculture. In the extreme E. are the cereal-growing counties of Queenstown and British Kaffraria. Griqualand W. (q. v.), containing the famous diamond fields, was formally annexed in 1876, and the Transvaal in 1877. The fruits of temperate and tropical climes have been introduced into many of these districts.

The zoology of the colony has undergone great changes within comparatively late years. Wild animals have almost entirely disappeared, and in their place there is now abundance of sheep and cattle. Merino sheep and Angora goats are reared extensively, and a specialty is ostrich farming.

The mineral resources are known to be extensive and valuable, but have not been developed, or even explored, at all adequately. Copper is, however, actively wrought in the districts of the W., and the Namaqualand mines are among the richest in the world. Around Grahamstown iron is to be found in most of the hills, and among other minerals not yet disturbed are coal, plumbago, and marble, occurring in various places.

Of late years the commerce has steadily increased. In 1869 the value of the exports amounted to £2,139,689, and in 1874 to £4,138,838. The chief article of produce is wool, of which (1874) 42,620,481 lbs. were exported, valued at £2,948,571. In the same year the value of the export of copper ore was £321,434, and of ostrich feathers £205,640. There are also large exports of wine (*Cape* and *Constantia*), of goat and sheep skins, and of Angora hair. In the absence of navigable rivers, transit is at once difficult and expensive. The waggon-hire between Grahamstown and Port Elizabeth alone (100 miles) in 1872 amounted to over £600,000. Railways are now, however, being actively constructed; and in 1878 nearly 150 miles were open. The line between Cape Town and Worcester is to extend right through the heart of the colony. Lines are also begun to run from Port Elizabeth and E. London into the interior.

The form of responsible government established in 1853 was modified by an 'Ordinance Amendment Act' of 1872, by which the executive is vested in the governor and a council, composed of certain officials appointed by the crown. There is a Legislative Council of twenty-one representatives of the two provinces, ten of whom are elected for ten years, and eleven for five years. The House of Assembly consists of sixty-six members, who are elected by the towns and separate districts for a period of five years. Members of both bodies are elected by the same voters, the qualification of a voter being an income of £25 yearly.

The discovery of the Cape of Good Hope by the Portuguese in 1486 did not lead to any successful attempt to settle in the country. It was not till 1652 that the Dutch founded a small colony, which they gradually extended from the Cape to the Great Fish River. On the revocation of the Edict of Nantes (1685), great numbers of French Protestants came hither, bringing with them the vine, and giving name subsequently to many localities. In 1795 the Cape settlement was taken by a British naval force, but was restored to Holland by the Peace of Amiens. It was retaken in 1806, and permanently ceded to Britain at the Congress of Vienna. The first band of English settlers landed in Algoa in 1820, and had almost immediately to assert their position against the hostile and predatory Kaffirs (q. v.). Towards this race the Government adopted a shifting policy of alternate aggression and concession, which led to nine successive wars during the period 1812–53. A great exodus of the Dutch *Boers* (q. v.) to the Transvaal region was caused in 1836 by the injudicious manner in which their slaves were liberated, and by the restrictions placed in the way of recovering stolen cattle; yet the Dutch still form the majority of the colonists. British Kaffraria was joined to the colony in 1866, and part of Bassutoland in 1868. A rough classification of the inhabitants shows in all 185,000 Europeans, 80,000 Hottentots, 110,000 Kaffirs, and 137,000 other coloured races.

The confederation of all the S. African States, both English and Dutch, has been warmly advocated of late years. In 1875 the Imperial Government invited a Conference of Delegates on the subject, sending Mr J. A. Froude as its own representative. But local jealousies have led to the abandonment of the project for the present, though it is certain to be carried out. See the works of Napier (1849), Fleming (1856), Meidinger (1861), Wilmot (1863), and Mr Froude, *Official Report* (1876).

Capefigue′, Baptiste Honore′ Raymond, a journalist and historian, was born at Marseille in 1801. After studying law at Aix, he went to Paris in 1821 to complete his legal studies, but turned his attention to politics, and became editor of the Legitimist organ, *La Quotidienne*. This procured him a position in the Foreign Office, which he held till the revolution of 1830. Devoting himself to historical literature, C. had still free access to the archives of the Foreign Office till they were finally closed against him in 1848. His works are very numerous and interesting. One of the best is the *Histoire de la Restauration* (3d ed. 1842); two of the latest are *Les Derniers Jours de Trianon* (1866), and *La Duchesse de Burgogne et la Vieillesse de Louis XIV.* (1867). He died December 1872.

Cap′elin, a *Teleostean* fish belonging to the *Salmonidæ* or Salmon family, and scientifically known as the *Mallotus Groenlandicus*. It is of small size, and somewhat resembles the Smelt (q. v.). It is employed as bait by the Newfoundland cod-fishers, and it has also been imported in a preserved state into Britain. These fishes chiefly occur on the Newfoundland and N. American coasts, and sometimes appear in large shoals.

Capell′a, a star of the first magnitude in the constellation Auriga, nearly midway between Orion and the Pole-star, but nearer the latter. C. is also the mythical goat (*Amalthæa*) that suckled Jupiter in his infancy.

Capella. See ACAPELLÁ.

Capell′a, Martia′nus Mineus Felix, styled in MSS. *Afer Carthaginensis*, a celebrated encyclopædist, flourished probably about the close of the 5th c. Of his life we only know that he was educated, if not born, in Carthage. His *Satiricon*, a grotesque medley of prose and various kinds of verse, and full of ill-arranged and ill-digested learning, is divided into nine books, and furnishes occasionally some curious and useful information from works that have long since perished. C. seems to have anticipated, in his eighth book on astronomy, the theory of Copernicus as to the sun and not the earth being the centre of our system. The first edition was published at Vicenza in 1499; that of Grotius, who wrote his commentary when a boy of only fourteen, at Leyden, in 1599; and that of Kopp, by far the best, at Frankfurt, in 1836.

Capercail′zie, Wood Grouse, or Cock of the Woods (*Tetrao Urogallus*), a species of Rasorial birds included in the Grouse family (*Tetraonidæ*), once abundant in the Scotch Highlands, but now chiefly found in Scandinavia, though also in other parts of Europe, and in N. Asia. It inhabits pine districts, feeding chiefly on the shoots and leaves of the Scotch fir. Recently attempts have been made, with partial success, to reintroduce the C. into Scotland. These birds are imported from Norway and Sweden in large numbers for the London market in winter, being captured princi-

Capercailzie.

partly by means of traps. The C. is a bird of large size, measuring about 3 feet in length from the bill to the extremity of the rounded tail. The male is coloured grey, mottled with brownish-black; the females being variegated with the latter colour, with white, and with yellowish-brown. The bill is short, compressed at the tip, and of whitish colour, and a patch of naked scarlet-coloured skin exists above the eye. The tarsi are feathered, but the toes themselves are naked. These birds are polygamous, the males resorting generally year by year to the same spot, at the breeding season, to call the females. The eggs number from six to twelve, and are of pale reddish-brown colour, spotted with darker brown. The nest is built on the ground, and the female incubates for about four weeks.

Caper'naüm, the town on the N.W. shore of the Lake of Galilee which our Saviour made his headquarters during his public ministry. Two places, according to different travellers, have claims to be considered the site – ruins called Tel Hûm, about 3 miles from the point at which the Jordan enters the lake, and other ruins called Khan Minyeh, 3 miles farther along the shore.

Capers, the pickled flower-buds of *Capparis spinosa*, the caper-bush and allied species belonging to the natural order *Capparidaceæ*—*e.g.*, *C. spinosa* is used in the S. of Europe, *C. Fontanesii* in Barbary, *C. Ægyptiaca* (which is said to be the hyssop of Scripture), in Egypt, *C. aphylla* in India, &c. C. are stimulant, antiscorbutic, and aperient. The flower-buds of *Zygophyllum Fabago*, those of *Caltha palustris* (q. v.), and those of the Indian cress or canary-plant (*Tropæolum majus*) are sometimes substituted for the true caper. The term 'caper-bush' is sometimes given to the caper-sponge, *Euphorbia Lathyris*, one of the *Euphorbiaceæ*.

Cap'et,* The House of, supplied France with kings from 987, when Hugues C. ascended the throne, till the death of Charles IV. in 1328, when the House of Valois, in the person of Philippe VI., succeeded. The earliest historical figure of the family is that of Robert the Strong, Comte d'Anjou and Paris, who died in 866 at Mans, where he was resisting the Normans, against whom Karl the Bald was powerless. On the death of Karl the Fat in 888, Robert's son, Eudes (*Odo*), was elected King of Neustria, the Comte de Poitiers becoming King of Aquitaine. In 922 Robert, a brother of Eudes, and allied to the House of Burgundy, drove Karl the Simple (*le Sot*, lit. 'the fool'), into Lorraine, was himself proclaimed king, but was defeated and killed the following year. His son, Hugues the White (*le Blanc*), Comte de Paris, after a stormy and ambitious career, died titular Duc d'Aquitaine in 956. He left three sons; Eudes and Henri, who became Dukes of Burgundy, and Hugues C. (oldest form *Huon Chapette*), or the Great, who probably held a place like that of his father till the death of Ludwig the 'Do-nothing' (*le Fainéant*) in 987, when he was elected king in opposition to Karl of Lorraine, the last of the Karolings, whom he afterwards made a prisoner at Orleans. Up to this time the kings in France are to be considered Germans, and it is right that their names should be given in a German form. With the accession of the Capetian dynasty begins the line of French kings proper. Almost nothing is known of Hugues' subsequent life, except that he supported Gerbert, the courageous asserter of Gallican Church rights. He married Adelaide of Guienne, and died 24th October 996. His son, Robert the Pious (*Debonair*) (II.), succeeded without election. There was no centralisation, the tie between the King and his subjects was feudal, and no general taxes were imposed, and no general council held. His second wife, Constance of Provence, introduced much of the polished gaiety of the S. to the French court. In spite of the mild and benevolent character of this King (who was chiefly remarkable for his knowledge of Church music), he authorised the cruel suppression of the Gnostics of Orleans (1022), and the more atrocious persecution of the Jews, who were absurdly supposed to have suggested the destruction of the Holy Sepulchre to the Calif Hakim. The town communities began in this reign to enter into formal treaties for peace and regular justice between themselves and with the *seigneurs*, and the Church attempted, by the 'Peace of God,' to modify the disastrous private wars of the feudal chivalry. After seeing all his sons in revolt against him, Robert died, 20th July 1031. He was succeeded by his son Henri I. (1031–60), whose reign is marked by a war with William of Normandy, the transubstantiation controversy of Berenger, a distressing famine, and renewed efforts of the Church in the 'Truce of God' to limit in time, and place, and ferocity the private wars which the 'Peace of God' had failed to stop. Henri was succeeded by his son, Philippe I. (1060–1108), who for some time was under the regency of the great crusader, Baldwin of Flanders. His subsequent reign was marked by the rapid growth of the institution of chivalry (tournaments, *pas d'armes*, and courts of love now appearing); the enfranchisement of towns and incorporation of trades; the long struggle of Philippe and Hildebrand (Gregory VII.); the excommunication of Philippe at the Council of Autun (16th October 1094), he having repudiated his first wife, Bertha, and contracted a canonically incestuous marriage with Bertrade of Anjou. Under Louis VI., or the Fat (1108–37), called the *Damoiseau* of France, the 'gay science' flourished, and Abelard was the most popular man of letters. His son, Louis VII., the Young (*le Jeune*), (1137-80), the leader of the Second Crusade married Eleanor of Guienne, who, on her divorce, became the wife of Henry II. of England. By the help of the Pope and of à-Becket, Louis gained several advantages over Henry, whose sons he supported in their revolt. His reign was also marked by the spread of the heresy of the Albigenses, Henricians or *Bonshommes*. His son, Philippe II., Auguste (1180–1223), succeeded to the throne. By his first marriage with Isabelle of Artois, heiress of Vermandois, he is said to have united the Houses of C. and Charlemagne. Philippe, who has been called the founder of the feudal monarchy which succeeded the feudal federalism, directed two great crusades, one to Jerusalem, the other against the Albigenses. His son, Louis VIII., the Lion (1223–26), who contested the English throne with John, perished in the second crusade against the Albigenses. The chief incidents during the minority of his famous son Louis IX., or St Louis (1226–70), were the suppression of free thought and the establishment of the Inquisition in Languedoc. Later on in his reign, Louis, by his abolition of many feudal privileges and modes of judicial procedure, by the creation of the Parliament of Paris, and by the Pragmatic Sanction, greatly strengthened the absolute power of the crown and the independence of France. A younger brother of Louis, Charles d'Anjou, obtained from Rome the investiture of the kingdom of the Two Sicilies on the death of Conradin, the last of the House of Suabia. This right, ultimately bequeathed by the Comte de Maine to Louis XI., led to the Italian wars of succession in the end of the 15th and beginning of the 16th centuries. By his wife, Marguerite of Provence, Louis had many children: among others Robert of Clermont, the founder of the later line of Bourbon, whose descendant, Antoine, married Jeanne of Navarre, and thus united, in the person of Henri of Navarre, the two lines of Capetian succession. Louis was succeeded by his eldest son, Philippe III. (*le Hardi*), the Bold (1270–85), whose intervention in Navarre and Castile against Pedro of Aragon shows the increasing importance of France. He married successively Isabel of Aragon and Marie of Brabant, and was succeeded by his eldest son, Philippe IV., the Fair (*le Bel*), 1284–1314, in whose reign Guienne was added to France, the Flemings asserted their independence at Courtrai, the rights of municipalities were made the subject of a national ordinance, the States-General met five times, and the Papal prerogatives, asserted in the Bull *Ineffabilis*, were strongly opposed. The following were the children of Philippe and Jeanne of Navarre and Champagne:—(1) Louis X., the Quarrelsome (*le Hutin*), 1314–16, who strangled his first wife, Margaret of Burgundy, to make way for his second, Clemence of Hungary, and who granted several charters of provincial liberties, some restricting the royal rights of taxation, others restoring objectionable feudal arrangements; (2) Isabel C., who married Edward II. of England, and whose son, Edward III., consequently claimed the throne of France; (3) Philippe V., the Long (*le Long*), 1316–22, who compelled the States-General to adopt the Salic law, and who lent himself, under the influence of Pope John XXII., to the most horrible persecutions of Jews, lepers, magicians, and heretics; and (4) Charles IV., the Fair (*le Bel*), 1322–28, who, like his brothers Louis and Philippe, left no sons, and whose daughter, Blanche, was therefore excluded from the throne by her father's cousin, Philippe VI., the first king of the House of Valois, and son of Charles of Valois, younger brother of Philippe IV. and Marguerite of Anjou. The savage persecutions (such as those of the Templars, accused and convicted on evidence got entirely through torture of the most childish charges, and of the *Pastoureaux*, who attempted to organise a crusade in 1320) of which the later Capetian kings had been guilty; the anathemas of Pope Boniface VIII. following on their violation of ecclesiastical immunities; the doubtful legality of their marriages, and the undoubted infidelity of their wives; their early deaths, predeceased by sons: all these things combined to make the French people generally believe that the House of C. was accursed of God. See Kitchin's *History of France* (Clar. Press Series, 1873).

---

* It is uncertain whether the name 'Capet' comes from 'cape' or 'cap' (the hood of St Martin) which Hugues wore instead of a crown, or from the size of his head.

Cape Town, the capital and principal seaport of Cape Colony, lies on the S. shore of Table Bay, 32 miles N. of the Cape of Good Hope, from which it takes name. It is the great western commercial centre of S. Africa, and is the seat of the colonial government, of the supreme court, of a college and university, and of a bishop. The town occupies the slopes of the plain descending from Table Mount, and is overlooked by the Lion's Head and other eminences. The streets, which are long and wide, intersect each other at right angles, and there is all the appearance of an English commercial town in the dwelling-houses, shops, hotels, and tramways. Of the public buildings, the most notable are the Houses of Assembly and Legislature; the S. African Museum, to which is attached a large library and a valuable botanical garden; the Roman Catholic Cathedral; a castle of considerable strength, an arsenal and barracks. Besides numerous Protestant churches there are a Jewish synagogue and a Mohammedan mosque. The town is supplied with excellent water. In summer the mean temperature is 76·6° F., and in winter 58·3°. C. T. is connected by railway with Worcester, and by telegraph with various other places of importance. It communicates with England five times monthly by regular mail-service, the average passage having been reduced in 1876 to twenty-five days Its chief exports are wool, copper ore, diamonds, and wine. The harbour is now protected by a breakwater, and has a patent slip and extensive docks Municipal affairs are administered by a town-council, presided over by a mayor. The town returns two members to the Colonial Assembly. Pop. 29,000, excluding the maritime village of Simon's Town, and the delightful suburb of Rondebosch, where the merchants have their villas.

Cape Verd Islands (Port. *Ilhas do Cabo Verde*, 'Isles of the Green Cape'), an archipelago in the N. Atlantic, lat. 14° 45′–17° 19′ N., long. 22° 45′–25° 25′ W., belonging to the Portuguese, and named after Cape Verd, on the W. coast of Africa, 320 miles to the E. It consists of ten islands (nine of which are inhabited) and four islets, divided into a northern and southern group. To the former belong Boavista, Sal, São Nicolao, São Vincente, Santa Lucia (uninhabited), São Antonio, and the islets of Branca and Rasa; to the latter Santiago, Maio, Fogo, and Brava, with the two islets of Rombo. Area, 1630 sq. miles; pop. (1872) 76,003. The largest is Santiago, 32 miles long and 15 broad. All are mountainous and volcanic, the highest point being reached in the crater-peak of Fogo, which is 9157 feet above the sea, and is still active, the last eruption having taken place in 1847. The climate is hot and unhealthy; rains and warm mists are prevalent, sometimes lasting a whole year, spoiling the harvests, and cutting off great numbers of the inhabitants. The soil is not well suited for agriculture, and there is little or no timber in the group. Indigo, cotton, rice, maize, and millet are grown; and of late years the vine, beetroot, tobacco, coffee, oranges, and many other tropical and sub-tropical fruits have been largely cultivated. The trade in archil, or cudbear, a valuable violet dye, yields a large annual revenue. Turtles are caught on the coasts; amber is found on the shores of all the islands; salt is procured from the lagunes by solar evaporation.

Some of the islands were discovered as early as 1441 by two Genoese brothers in the service of Portugal, Antonio and Bartolomeo di Rolli, but they were first claimed by the Portuguese after Cada Mosto (q. v.) had visited them in 1456. Along with the Portuguese possessions in Senegambia they are ruled in secular matters by a governor-general, who resides in São Vincente, and are ecclesiastically under a bishop whose diocese contains about thirty churches.

Cape Weed (*Rocella tinctoria*), a lichen from the Cape Verd Islands, from which a dye is obtained.

C. W. is also a name given in New Zealand to the European cat's ear (*Hypochæris radicata*), which has been introduced into that colony, and in the vicinity of Dunedin, Otago, is taking the place of the cultivated grasses in the pastures. The name is also applied in Australia to *Cryptostemma calendulacea.*

Cap'ias, in English law, is the prenomen to several kinds of writ, issued either before or after judgment. It is no longer, however, used in beginning personal actions; a writ of summons having been substituted for C. in the superior courts at Westminster.

C. ad respondendum is a judicial writ by which all actions, not relating to land or real property, are begun against any one not in custody, whom it is intended to arrest or hold to bail.

C. ad satisfaciendum, usually called *ca sa*, is a writ of execution to imprison the defendant, when it is still lawful to do so, after judgment has been pronounced against him, until he satisfy his creditor.

C. utlagatum is a writ against a person outlawed.

Cap'illaire, a syrup prepared by adding sugar and orange-flower water to an infusion of maidenhair fern (*Adiantum Capillus Veneris*) or some allied species. It is much used in France for cough mixtures, is agreeable to the taste, but possesses no medicinal virtue.

Cap'illary Vessels. This term is applied to the minute vessels intermediate between arteries and veins. The arteries convey blood from the heart, the veins collect and bring back the blood to the heart, while the C. V. connect the terminations of the arteries with the commencements of the veins. The C. V. are minute tubes, the walls of which are formed of flattened nucleated cells placed edge to edge. In recent times these cells have been rendered visible by a method of immersing the tissue in a dilute solution of nitrate of silver and afterwards exposing it to the action of light. When this has been done successfully, the edges of the flattened cells are blackened, and their contour thus demonstrated in an exquisite manner. Without this method the walls appear to be formed of a structureless membrane in which cells are embedded. As the cells forming the walls of the C. V. are sometimes irregular in shape, it is evident that their apposition will occasionally leave small apertures. These have been termed *stomata*, and, according to some observers, they are the openings through which the colourless cells of the blood pass during the inflammatory process. (See INFLAMMATION.) The finest capillaries are sufficiently broad to allow coloured corpuscles of the blood to pass in single file. They thus vary in diameter from the $\frac{1}{8000}$ to the $\frac{1}{2000}$ of an inch—the average size in the human being is about $\frac{1}{3500}$ of an inch. C. V. are highly elastic and extensible, and where there is life, they possess also the vital property of contractility. C. V. freely unite with each other, forming a plexus. The character of the plexus varies in different organs or tissues. It may be an irregular network, as in areolar tissue, an elongated meshwork, as in muscle, in loops and tufts, as in skin; it may be a radiating arrangement, as in the liver, or in round balls or *rete*, as in the Malpighian bodies of the kidney. It is a physiological fact that in any tissue or organ in which there is great functional activity there are numerous capillaries. Two parts in close proximity to each other may differ in this respect. For example, the grey or generating matter of the brain and spinal cord is much more vascular than the white or conducting matter. For descriptions of capillary arrangements, see articles on the various tissues and organs.

Capillar'ity, the general name given to certain phenomena observable at the surface, separating two fluids (which do not mix), or a fluid and a solid. To take the commonest example, let a clean glass rod be plunged into water, and the liquid will be found to ascend all round it, forming a concave surface. Instead of the rod, substitute a tube of small bore, and not only will the same phenomenon be visible at the exterior surface of the tube, but the column of water inside will rise above its former level to a height which is found by experiment to vary inversely as the diameter of the bore; and, further, the surface of this column will assume a more or less concave form. If mercury be used instead of water, exactly the reverse will be observed—the surface becoming convex, and being depressed in the tube to an extent depending in the same way upon the diameter of the bore. Two parallel plates immersed in either liquid produces the same effects, subject to the same laws, and the variation of level in this case is half that produced by a tube, the diameter of whose bore is equal to the distance between the plates. These interesting phenomena depend upon what is known as the *superficial energy* or *tension* of the bounding surface of the liquid. It is on account of this tension that a soap-bubble tends to contract and drive a current of air through the tube by which it is blown, and to which it is attached. It is further evident that the force or pressure due to the tension of a curved surface must act inwards, *i.e.*, from the convex to the concave side; and consequently, the ascent or depression of the liquid in the tube, according as its surface is concave or convex, is a hydrostatical necessity, since this tensive force in the one case diminishes, and in the other increases the total pressure upon the surface of the column of liquid. The curved form of the surface is easily accounted for upon the hypothesis of molecular forces, which are sensible only at insensible distances. According to this theory, a molecule of glass has a greater attraction for a molecule of water, and a less attraction for a molecule of mercury, than either of these has for another of its own kind. From this it is at once deducible by the principle of composition of forces, that in capillary phenomena water forms a concave, and mercury a convex surface. A very lucid explanation of the mathematical theory of C. is given in Professor Clerk Maxwell's *Theory of Heat*, chap. xx.

All liquids which wet glass present the same capillary phenomena as water; while liquids which do not wet glass act like mercury. Since the wetting power of a liquid depends upon its molecular constitution, it follows that C. must be dependent not only upon the kinds of matter used, but also upon the temperature at which the phenomena are observed. If two solids are floated near each other on the surface of a liquid, which either wets both or wets neither, they run together as if attracted; if, however, one only is wetted, they are apparently repelled. Numerous phenomena of daily occurrence, such as the power which a sponge possesses of absorbing and retaining a quantity of water, the drying action of blotting-paper, the saturation of wick by oil, the walking of certain species of flies and spiders on the surface of water, are easily explained as cases of C. This property of matter also plays an important part in the economy of nature, as, for instance, in the absorption of moisture from the earth and the air by the roots and green parts of a plant.

Cap'ita, Succession per, is a term of Scotch law denoting the distribution of an inheritance equally among a number, disregarding the right of representation. The contrary mode of distribution is *per stirpes*. See STIRPES, SUCCESSION BY. Were the inheritance of an uncle divided equally among several families of nephews or nieces, each *family* getting the same share for subdivision in itself, this would be succession *per stirpes*; but if each nephew or niece got the same share, the number of the family being unequal, this would be C. S. P.

Cap'ital (Lat. *caput*, 'a head'), in architecture, is the head or top of a column; in fortification, an imaginary line dividing a defence work into two similar parts—most frequently the line which bisects the salient angle of a Ravelin (q.v.); in geography, that city of any country where the supreme magistrate resides, or the national legislature assembles, or the government is carried on.

Capital is a general name given to all the accumulated products of past labours which are devoted to reproductive investment. It includes whatever is necessary to shelter, feed, and clothe labour, and to keep labour going. Therefore mills, machinery (fixed or movable), railway plant and permanent way, raw material of all kinds, whatever is paid out in wages to labourers to be by them exchanged for commodities, are all included in C. All depends on the intention of the capitalist to devote what he possesses to reproduction. Thus, goods in stock may properly be called C. to whatever extent the proceeds of their sale will be applied in payment of wages and charges, the execution of necessary repairs, or the provision of new instruments and materials of industry. Undoubtedly there is always existing only a certain amount of C. in England, or Europe, or the world, which the intention of the capitalist cannot increase; but in each place, and in each trade, he may either employ the *maximum* existing C., so far as it belongs to him, or a much smaller quantity, reserving the difference for his personal consumption, or for charity, or for some purpose which is not reproductive. He may even be willing to use the *maximum* for reproduction, but cannot find an investment; or the C. cannot be realised, or he must deduct from the *maximum* some preliminary outlay which is not necessary but artificial (*e.g.*, a heavy tax on the rasher stages of manufacture), or some outlay which is necessary from the state of the market but not for production (viz., the wages, so far as they exceed the wages at which it would be physically possible for the labourers to work). Of course the C. may be not owned, but borrowed by the person who employs it.

For the purposes of political economy, which is a science based on definitions assumed for convenience' sake to represent facts, C. is limited to material objects and to those which are directly consumed in the reproduction of material objects. From the social point of view, the money sunk in a prison or a church, on the one hand, in the pay of an army of national defence or in the education of a productive labourer, on the other, is rightly regarded as C.; for production goes on only under the sanctions of municipal and international peace, and all the human faculties conspire in enabling the productive labourer to give his life *maximum* of labour. From the above description some obvious consequences follow—1. Money is not C., nor is credit C., however much it may facilitate the employment of C. 2. Industry is limited by C. The converse proposition lay at the root of Protectionism, it being thought that government could create additional employment without providing additional C. 3. There may not be sufficient labour to use the C., as occurs in the colonies sometimes; for this or some other reason the C. may perish unused. 4. But there can never be too much C., or savings, if there be labour in existence; for either wages are increased, or more men are employed. 5. C. is the result of saving (so far as it is not supplied in definite quantities by nature), and therefore increases with the excess of production over consumption. 6. Though saved, in the sense of being directed to reproduction, C. is always being consumed. 7. A demand for commodities merely fixes in what way C. will be used; it does not support labour. Raw materials, wages, &c., have been called circulating C., as requiring to be renewed after every production. Houses, machinery, which last for some time, but are in the end consumed, are called fixed C. The expenditure in obtaining fixed C. would enter the C. side of an account with the exception of percentage, which might be thought chargeable against revenue; but circulating C. is replaced either every year, or every period of production. Fixed C. should therefore contribute to the total production as much as will cover the cost of repairs and the annual depreciation, and leave a slight margin of profit. The conversion of circulating into fixed C. (*e.g.*, the introduction of machinery which supersedes manual industry) necessarily injures the labourers, to whom, had the machinery not been introduced, its cost would have been paid in wages. If further changes take place, diminished cost of production leading to increased production, more circulating C. will probably be saved than was converted. Most commonly, however, this saving of new C. is contemporaneous with the gradual conversion, and hence the protest of the labourers against machinery is unjust. Wholesome climate, wholesome occupation, social tranquillity, and personal health are important conditions of the saving of C., while improvidence (a vice characteristic of the savage) and want of interest in other human beings (a trait of periods of social corruption) oppose its increase. The early supremacy of Great Britain in manufactures is owing, in some measure, to her long exemption from internal wars and from the arbitrary spoliation of property.

Capital Account. In all account-keeping it is highly important to go on correct principles in distinguishing between what, in the science of accounting, is called the C. A. and the Revenue Account. Even in household economy, if a man wishes to know accurately—as every sensible man does, whether his income be small or great—his annual expenditure, he must give regard to the question which will frequently arise of whether an item of expenditure is to be regarded as payable out of capital or out of revenue. You buy a house, plainly you are not to put down the price of it as part of your domestic expenditure for the year in which it is bought. The price is an investment of capital, and to be charged against your C. A. Your income account, again, should be charged with a certain interest, say 5 per cent., on the price of the house, with a percentage to meet repairs, or with the actual sum paid each year for repairs. So, if you buy a carriage and horses, you may put the price, in the first place, to the debit of C. A., but each year's income must be charged with 5 per cent. on the price, and with a percentage to replace *tear and wear*. In great things the principle is the same as in small. The railway company having raised its capital by the sale of shares or by borrowing (see DEBENTURE, RAILWAY), enters the amount so raised on one side of its C. A. On the other it places the expense of making the line, of buying locomotives, carriages, and of all that is required in working. The expense of maintaining all this and of working are placed to the debit of the revenue account. It not unfrequently happens in the accounting of railways, and of other public companies, that items are placed to the debit of C. A. which ought to have been charged against revenue. The dividends of one year are thus increased at the expense of those of future years; but the value of the company's share being in the meanwhile in proportion to the rate of dividend, the shareholder of the day may sell at the expense of the future shareholder. In private affairs the safe rule is, when in doubt between C. A. and revenue account, to place the item to the debit of revenue.

Capital Felonies. See CAPITAL PUNISHMENT, FELON, and FELONY.

Capital Punishment is in criminal law the punishment of death. Three grounds of objection have been taken to this punishment: that its deterrent effect is not so strong as that of some other modes of punishment; that it is a punishment which men have not a right to inflict; that it is contrary to Scripture.

To decide the question, according to reason, there can be no doubt that there are many punishments more severe. To be kept alive in continual torture will probably be allowed by most people to be worse than death, which must sooner or later come to all, and which all true Christians hope and believe will lead them to a life better than that from which they have been taken. Nevertheless, the force or instinct which impels us to cling to life is the master-force of all animal being. It may be overcome, as we see that it often is, by some temporarily strong force; still, over the mass of mankind, this instinct is supreme. We use the word *instinct* for want of a better. We denote by it that inscrutable inward force which impels a man to act independently of his reason, and often directly against it.

The second objection to C. P. may be based on the ground—the firmest, we think, that it can be based on—that the abandoned criminal, the murderer, let us suppose, is really, as a general rule, *visibly* the product of circumstances, and of the errors and sins of the society which produced him. Born probably in a degraded quarter of one of our great cities, with a debased brain, in some dark dwelling of squalor, drunkenness, and blasphemy, is not his crime the crime of society rather than that of the individual—of a society which, living in luxury, yet fosters this criminal hotbed in the midst of it? And if the crime be chargeable against society, what *right* has society to let the whole weight of punishment fall on the individual? Plainly it would be impossible in a short article to discuss this social problem, but obviously, whatever be the *right* of society, its *might*—by some held to be the basis of right—will always be exerted on the side of self-protection. Still, it is satisfactory to find that the enlightened humanity of our times has, consistently with this law, practically restricted C. P. to the crime of murder. Formerly, in England death was the ordinary punishment of all felons *who could not read*, that is, who could not avail themselves of Benefit of Clergy (q. v.). That the punishment of death is contrary to Scripture, is a doctrine held by comparatively few. Isolated passages may be produced that apparently favour the view, and it may even seem to be in harmony with the all-forgiving spirit inculcated by the New Testament; but it is not to be held that this spirit—so beautifying, so essential, to the individual—should be so applied as to make the power of the State unable to protect the virtuous part of the community against the criminal.

Among the earliest reformers of our criminal law were Sir Samuel Romilly, M. A. Taylor, and Sir James Mackintosh; by their exertions C. P. was greatly restricted. It was, however, to Lord Brougham that we are mainly indebted for having brought the criminal law of the country into harmony with the advanced morality and intelligence of the day. By statutes passed early in the present reign, crimes punishable with death were reduced to nine, the chief of which are treason, murder, piracy, and intent to cause shipwreck. Practically, as stated, C. P. is never now inflicted in the United Kingdom except when the intention of the criminal has been to murder, or when he has caused death in the perpetration of a crime of violence.

Capital Punishment in the Army.—The Crown, with regard to military offences, has considerable legislative power, for the sovereign by the Annual Mutiny Act may form articles of war and constitute courts-martial, with power to try on account of crime and to inflict penalty; the penalties, however, must not extend to 'life or limb,' except for crimes expressly declared to be so punishable by the Act. The Mutiny Act comprises a series of regulations which are annually enacted by Parliament for the government of the military forces of the United Kingdom. It provides that every officer or private who shall excite or join any mutiny, or, knowing of it, shall not give notice to the commanding officer, or shall desert or enlist in any other regiment, or sleep at his post, or leave it before he is relieved, or hold correspondence with a rebel or an enemy, or strike or use violence to his superior officer, or disobey his lawful commands, shall suffer death, or 'such other punishment as the court-martial may inflict.'

A court-martial may sentence to death, penal servitude, or imprisonment, with or without hard labour, according to the nature of the offence. Judgment of death by court-martial requires the concurrence of two-thirds of the officers present. Employment of a soldier after arrest on a capital charge has been held to bar the carrying out of punishment. It was held to do so on one occasion by the Duke of Wellington, in Spain; but this view does not seem in harmony with the ever-memorable case of Sir Walter Raleigh. The incidents are too well known to require repetition; but it may not be generally known that the law, as laid down on the occasion by Lord Chief-Justice Montague, has been approved of by Lord Chancellor Campbell. It is that Sir Walter having been condemned for treason, a commission from the king, under the Great Seal, could not operate as a pardon, and that attainder could only be done away with by letters-patent, under the Great Seal, reciting the crime and granting pardon.

Capital Punishment in the Royal Navy.—The government and discipline of the navy is directed by rules and articles enacted by the authority of Parliament. Under these the following offences are punishable with death: Misconduct in flag or commanding officer upon signal of battle, if acting traitorously; cowardice or treachery in action by any one; mutiny, if accompanied by violence. Spies are punishable with death. See ARTICLES OF WAR, MUTINY ACT.

Capitals, large letters (Lat. *majuscula*), as distinguished from small letters (Lat. *minuscula*), used in writing and printing for certain purposes of convenience, clearness, effect, &c. Printers formerly employed them much more liberally than they do now. In English books all nouns-substantive at one time began with C., a practice now discontinued except in the case of proper names, but still universal in German books. Adjectives formed from proper names begin in English books with C., but not in French and German books. The initial letter of a word may be a capital, and an entire word may be printed in C., but they must not be introduced indiscriminately into the body of a word. In the MSS. of the middle ages initial C. are often beautifully illuminated.

Capitana'ta, a province of S. Italy (Apulia), occupies the 'spur of Italy,' on the Adriatic coast, and has an area of 2943 sq. miles, and a pop. (1871) of 319,164. It is a rich pastoral and grain-growing district, watered chiefly by the Carvajo, Carapella, Candelaro, and Sasola. Four railways intersect it, converging in the capital, Foggio.

Capita'tion means a numbering of persons. The word is generally applied to denote a tax payable per head (Lat. *caput*), *i.e.*, by all, without regard to property or other circumstance.

Cap'itol (Lat. *Capitolium*), the citadel of ancient Rome, on the summit of the Capitoline Hill. The hill was originally called *Saturnius*, then *Tarpeius*, from the fate of the virgin *Tarpeia*, and finally *Capitolinus*, from the discovery (according to the Roman legend given by Varro, Livy, and others) of a human head (*caput*) by the workmen when digging the foundations of the Temple of Jupiter. The work was begun in the reign of Tarquinius Priscus. The walls were built by Servius Tullius; the building was finished by Tarquinius Superbus, and consecrated by the Consul M. Horatius, 507 B.C. It was burnt in the civil war of Marius, 83 B.C.; restored by Sulla, destroyed under Vitellius, rebuilt by Vespasian, destroyed by fire at his death, and finally rebuilt by Domitian, who expended an enormous sum of money on the gilding and decoration of it. It was a structure of great beauty and magnificence, with an ascent of 100 steps; its gates were of bronze; it was adorned with paintings, statues, chariots, silver shields, and costly vessels, and contained three shrines, dedicated respectively to Jupiter, Juno, and Minerva. Besides the C., there were other famous buildings on the mount, *e.g.*, the Temple of Jupiter Tonans, erected by Augustus; the *Tabularium*, or Record Office, &c. The modern structure, on the site of the ancient C., was designed by Michael Angelo.

Capit'ularies (Lat. *capitularia*, 'little headings') is the name given to the decrees issued in Latin by the Frankish kings after consultation with their assemblies. 'They are of the most varied description; not codes of law at all, but decrees, advices, opinions upon particular questions as they arose' (Kitchin, *Hist. of France*, p. 137). All the C. are not extant, and many survive only in outline. By far the richest and most complete are those of Charlemagne and his son, Ludwig the Pious. The former have been classified and described by Guizot in his *Civilisation en France*. For the real history of the time they are the best source of information we possess, giving a clear insight into the political and moral administration in all its details of that vast empire which the genius of the great German held together. The most complete collections are the *Capitularia Regum Francorum*, with notes by Baluze (2 vols. fol. Par. 1677), and that of Pertz in the *Monumenta Germaniæ Historica* (Hann. 1835-37).

Capitula'tion is a military term denoting both the act of surrender to an enemy, and the formal treaty according to which surrender takes place. From the articles or headings (Lat. *capitula*) essential to the latter the name C. has originated.

Cap'iz, a town on the N. coast of the island of Panay, one of the Philippine group. It is defended by a small fort, and has a pop. of about 11,000. C. is the residence of a Spanish alcalde, and gives name to a province, which had a population in 1871 of 272,292.

Cap'nomancy (Gr. *kapnos*, smoke, and *manteia*, divination), an ancient mode of divination from observing the ascent and motion of smoke arising from the sacrifices on the altar. Another mode was to throw jasmine or poppy seeds on the fire, and to observe the figures formed by the smoke.

Ca'po d'Is'tria, a town of the Austro-Hungarian empire, coastland of Istria, 8 miles S.S.W. of Trieste, on a rocky island in the *Valle Stagnone*, but connected with the mainland by a stone bridge. Its health is greatly affected by malaria. C. has a beautiful cathedral and numerous churches. There is a good coasting trade, some shipbuilding and fishing; and the manufacture of salt is carried on to the extent of 20,000 tons yearly. Pop. (1869) 7539. C. was anciently known as *Ægida*; after its conquest in the 6th c. by Justinian it was called *Justinopolis*, in honour of the emperor's uncle. In the 10th c. it passed under Venetian rule, and at the close of last century became Austrian.

Capo d'Istria, or Capo d'Istrias, Joannes Antonios, Count, was born at Corfu in 1776. The family to which he belonged was originally from the town of Capo d'Istria (q. v.), and had been raised to the rank of Count by the Dukes of Savoy. In 1807, after the treaty of Tilsit, C. entered the Russian service as a diplomatist; shortly after 1815 he was appointed one of the secretaries of state for foreign affairs, and took a leading part in the negotiations concerning Greece, of which he was elected president in 1827, and installed early in the following year. But his administration was highly unpopular. He restricted the liberty of the press, and was suspected of wishing to become perpetual president, with despotic powers, and to make Greece subservient to Russia. The result was his assassination at Nauplia, October 9, 1831. See *Mémoires biographiques, historiques sur le Président de la Grèce, accompagnés de Pièces justificatives et authentiques*, by Papadopoulos Vretos (2 vols. Par. 1837-38).

Caponière' (Fr. *capon*, 'a cheat or pretender'), in fortification, is a parapet, usually 8 or 10 feet high, placed in a ditch for its defence by firearms, the defenders being covered on the sides, when the C. is called single, and sometimes overhead, when it is called double. Generally the C. is of earth; sometimes it is of brickwork, loopholed at the sides; while in field-works there are occasionally thrown across the ditches of redoubts palisade caponières.

Cappado'cia, in ancient times a province of Asia Minor, W. of the Euphrates and N. of Cilicia, and corresponding partly with the modern Karaman (q. v.). Its dimensions varied greatly at different times, and the divisions of Pliny do not agree with those of Strabo. Under the Persians it was divided into two satrapies. The Macedonians raised these into kingdoms. In 17 A.D. C. became a Roman province, governed by a procurator. It produced wheat in abundance, and was famous for its breed of horses.

Capp'agh Brown, or **Manganese Brown**, is a bituminous earth coloured by oxide of manganese and iron, employed as a source of brown pigments used in the arts.

Capparida'ceæ, or **Capparid'eæ**, a natural order of Dicotyledonous plants, mostly natives of tropical or sub-tropical regions. The common Caper (q. v.) is the only European species, and also the one which is found farthest N. There are in all about 355 species and 33 genera.

Their properties are like those of the *Cruciferæ*—viz., pungent, stimulant, and antiscorbutic. Some are poisonous. In addition to the capers, *Cleome* is a genus of C. which contains some very pungent species, used as condiments. *Cratæva religiosa* is used by the natives of India as a stomachic and tonic. *Gynandropsis pentaphylla*, also a native of India, is antispasmodic. The seeds are used as a substitute for mustard, and the leaves are employed as rubefacients, and even as blistering agents. *Polanisia* is used as mustard, the root of *P. icosandra* internally as vermifuge, externally as a rubefacient, &c. (Bentley.) The berries of *Capparis sodata*, of Central Africa, are, when dried, used as a condiment in the food of the natives. Salt is obtained from the ashes of its roots.

Capp'el, a village in the canton of Zurich, Switzerland, 4 miles N. of Lake Zug. where the reformer Ulrich Zwingli fell in an action with the Roman Catholics in October 1531. Pop. (1872) 732.

Capro'ra, next to Maddalena the largest island of the group called the Buccinari, lies about a mile off the N.E. coast of Sardinia, within the Strait of Bonifacio, and is chiefly notable as the residence of Garibaldi, who acquired property here in 1854. It is rocky, has no streams, affords not even pasture, and is only inhabited by a few fishermen. C. belongs, with the rest of the group, to the Italian province of Sassari, and is named from its wild goats (Lat. and Ital. *capra*, a she-goat).

Cap'ri, an island in the Mediterranean, at the mouth of the Bay of Naples, 11 miles in circumference. It is the ancient Capreæ, a favourite residence of Augustus, and where his successor Tiberius spent the last ten years of his life in the unrestrained indulgence of the foulest debaucheries. The remains of baths, aqueducts, and of the twelve villas erected by Tiberius are still visible. The island is composed almost entirely of limestone, and the E. and W. portions consist each of an abrupt hill, the western being considerably the more elevated, with a saddle-shaped depression between, where the town of C. stands. On either side of this are two coves, forming the only landing-places on the island. The total population is about 6000, consisting chiefly of fishers, vine-dressers, and cultivators of the olive. The greatest natural curiosity is the large elliptical *Grotto Azzura* (Blue Grotto), a cavern opening from the sea, by an entrance only 3 feet high, the interior of which exhibits an unsurpassable splendour of colour arising from the action of the sun's rays on the half-hidden water.

Cap'ric or **Rutic Acid** is a solid crystalline substance at ordinary temperatures, having a faint smell of the goat. It was discovered by Chevreul in cow's butter, in which it exists combined with glycerine (see GLYCERIDES). It also occurs in cocoa-nut butter, and in the Fusel Oil (q. v.) from whisky-distilleries. C. is a fatty substance analogous in constitution and properties to acetic acid, and belongs, like the latter, to the group of bodies called *Fatty Acids* (q. v.). Its chemical composition is expressed by the formula $C_{10}H_{19}O(OH)$.

Capriccio (Ital. 'whim'), in *painting*, is a term applied to such designed violations of ordinary rules as foliated ornaments with Cupids, or other figures, in situations not strictly natural. In *music*, C. is a free composition, not subject to rule in form or figure. Mendelssohn's B-minor C. for pianoforte and orchestra is the most celebrated of modern times.

Capricor'nus, the *Goat*, a constellation of the southern hemisphere, and the tenth sign of the zodiac (symbol, ♑), marking the winter solstice (see TROPICS). Its position may be found by producing the line joining the Pole-star and Deneb to about four times its length; but the whole constellation is inconspicuous, the two brightest stars (in the horns) being only of the third magnitude.

Cap'ridæ, the sub-family of Ruminants included generally in the family *Ovidæ* (sheep and goats), and which more especially includes the goats as distinguished from the sheep. In turn the *Ovidæ* form a group of the *Cavicornia* or division of 'hollow-horned' ruminants. In the goats (*Capra*) both sexes have horns, and no *lachrymal sinuses* or 'eye-sacs' exist. The throat is provided with long hair forming a beard, which may be present in both sexes or in the males only. See GOAT.

Caprifica'tion, a method at one time extensively adopted to secure or hasten the maturation of figs, but now almost discontinued as unnecessary. The method adopted was suspending a fruit-bearing branch of the wild fig over those of the cultivated tree. The fig, having both male and female flowers inside its receptacle, the *rationale* is believed to have been that an insect which hastens the process by distributing the pollen, entered from the fruit of the wild fig into the receptacle of the cultivated one. The term is also adopted to express any fertilisation of flowers by the aid of insects.

Caprifolia'ceæ, or **Lonicera'ceæ**, the Honeysuckle order, a natural order of Dicotyledonous plants, chiefly natives of the northern parts of Europe, Asia, and America; very few are found in the southern hemisphere. *Viburnum* (Guelder rose), *Sambucus* (elder), snowberry (*Symphoricarpus racemosus*), honeysuckle (*Lonicera*), and *Linnæa borealis* belong to the order. In all there are about 230 species, and 16 genera. Emetic and purgative properties belong to some of them; others are astringent, sudorific, or diuretic, and some are acrid. The roasted seeds of *Triosteum perfoliatum* are mild, purgative, and emetic, and the seeds have been used as a substitute for coffee. See VIBURNUM, GUELDER ROSE.

Caprimul'gidæ, a family of Insessorial birds, included in the sub-order *Dentirostres*, and including those forms familiarly known as 'goat-suckers,' and which are nearly allied to the swallows (*Hirundinidæ*). The bill is short, depressed, and the gape is wide, and provided with bristles adapted for the capture of the insect prey which these birds pursue on the wing. The wings are long and pointed. The plumage is soft, and the eyes large, these birds being nocturnal in habits.

Caproi'c Acid is an oily liquid occurring in the state of combination in cow's butter, cocoa-nut oil, and in *Satyrum Hircinum*, and some other plants; also in human perspiration, in Limburg cheese, and in the water of the Hahnbach, a small river of Hanover. It has been prepared artificially. C. has a peculiar odour resembling perspiration: it is insoluble in water, has an acrid, burning taste, and forms crystalline salts with the metals. C. belongs to the group of *Fatty Acids* (q. v.), and has the composition represented by the formula $C_6H_{11}O(OH)$.

Capryl'ic Acid is an oily liquid having physical properties similar to those of Caproic Acid (q. v.), like which, it is found in cow's butter, cocoa-nut oil, and in some kinds of Fusel Oil (q. v.). It is said also to be found in certain plants, has been prepared artificially, is insoluble in water, and forms crystalline salts with metals. It belongs to the group of *Fatty Acids* (q. v.), and has the composition represented by the formula $C_8H_{15}O(OH)$.

Capsell'a, a genus of plants of the natural order *Cruciferæ*. *C. Bursa-pastoris*, the shepherd's purse, is very extensively distributed over the temperate regions of the world. It grows in all soils, but to the greatest luxuriance in the richest, hence it is often called the 'pickpocket.' It was formerly used as a pot-herb, as it is still in some parts of America. C. is an annual, and consists of six known species.

Cap'sicine is an Alkaloid (q. v.) contained in Spanish pepper (*Capsicum annuum*). The same name is applied in America to an oleo-resinous substance obtained from cayenne pepper (*Capsicum baccatum*).

Cap'sic[illegible] belonging to the natural order *Solanac*[illegible] the E. and W. Indies and other hot climate[illegible] chiefly shrubby plants, and are extensively cultivated for the beauty of their fruit, which is a kind of membranous pod of a beautiful scarlet, yellow, or greenish colour. It is possessed of acrid and stimulating properties, is extensively used as a condiment under the name of Cayenne Pepper (q. v.), and also for pickling. There are various species in use. *C. annuum*, the most common, is a herbaceous annual, and many of the so-called species are most likely only varieties of *C. annuum*. *C. fastigiatum*, a small shrub, 1 to 2 feet high, with an orange-red fruit fully half an inch long, furnishes the C. of medicine. The dried ripe fruit has an intensely hot taste, and is used in doses of ½ to 1 grain as a condiment in much the same way as pepper. It is also extensively employed as a gargle in relaxed sore throats. *C. frutescens*, along with *C. fastigiatum*, yields the bird pepper of the shops. The fruit of various species is sold by druggists as chillies, a Mexican name for C. In medicine, it may be given in powder or in pill, but is generally used as a *tincture*, a preparation of C. in spirits. When preserved in acetic acid, it is the substance known as chilli vinegar. C. owes its properties to Capsicine (q. v.), a thick yellowish-brown liquid.

Capsicum longum.

Cap'stan, a machine used principally on shipboard for heaving the anchor. In its older and common form the chain or cable is coiled round a vertical barrel, above which is a 'head' containing the sockets for a number of long wooden bars. The C. is worked by the sailors by means of these bars. Many other varieties of C. are now used, and in large vessels they are generally worked by a small steam-engine.

Capsule, a small vessel, from the Lat. *capsula*, diminutive of *capsa*, 'a box or chest.' In physiology it is a small membraneous sac, investing an organ; and in botany a dry syncarpous, dehiscent Fruit (q. v.), opening in a variety of ways—by lids, valves, or pores. The C. opening by a lid is called *Pyxidium*, as in pimpernel and several species of *Lecythidaceæ*.

Captain, Military. In the British army, each company of infantry and each troop of cavalry has one C. His duty is to receive orders from the major in matters relating to discipline, settlement of accounts, &c., and to have these orders carried out amongst the men. Lieutenants, before they are eligible for promotion to the rank of C., are required to pass such professional examination as shall be prescribed from time to time; and if they fail to do so within five years from the date of their commissions as lieutenants, they will be removed from the service. Lieutenants of engineers who completed five years' service previous to 30th October 1871, may be promoted without examination, if specially approved of by the commander-in-chief.

Captain, Naval, is the general designation for the commander of a ship, whether belonging to the royal navy or to the merchant service. In the former the title is *post-C.*, and commanders in the royal navy are also usually addressed *C.* A C. in command of more ships than one is called a *Commodore* (q. v.). The full pay of a C. of the first class is £1, 13s. per day, of the second class it is £1, 7s. 6d. a day, and of the third class it is £1, 2s. 6d.; the half-pay rates are respectively 14s. 6d., 12s. 6d., and 10s. 6d. The C. is responsible for the discipline, equipment, and navigation of his ship. He ranks with a lieutenant-colonel in the army. The C. of the fleet is a temporary officer, whose duty it is to promulgate the admiral's orders, and to receive reports and returns. The post is equivalent to that of chief of the staff in the army.

Cap'tion, in Scotch law, [illegible]rehension of a debtor or 'obligant' (English [illegible]count of the non-payment of a debt or the non-perfo[illegible] a obligation. Though the C. may still be used, it has been virtually suspended by the forms contained in the Personal Diligence Act.

C. Process is a summary warrant of imprisonment, granted on the application of the clerk of court, for the purpose of compelling some one to return a paper in a process when he is unduly and contumaciously retaining it.

Cap'tive. All actions against a prisoner of war taken by the enemy stop till his return; but execution may, under certain circumstances, proceed against his estate. A C. is entitled to pay or wages during his captivity. The owners of a ship are bound in every case to procure the immediate release of a hostage, and to indemnify him for his losses.

Cap'ture, in war. The jurisdiction in all matters relative to prize and C. in war is now exclusively vested in the High Court of Admiralty. See ADMIRALTY, COURT OF. The principlos of the law of C. have been authoritatively declared to be—that powers at war have a right to make prizes of the ships, goods, and effects of each other upon the high seas; that the goods of an enemy on board the ship of a friend may be taken; that the goods of a friend on board the ship of an enemy are to be restored; and that contraband goods (see CONTRABAND OF WAR) going to the enemy, though the property of a friend, may be taken.

After the treaty of peace between England and Russia was signed in 1856, plenipotentiaries of leading European powers met at Paris, when the following international laws were agreed to—that privateering be abolished; that a neutral flag covers an enemy's goods, unless they are contraband of war; that neutral goods, unless contraband of war, are not liable to capture under an enemy's flag; that a Blockade (q. v.), to be binding, must be effectual—that is, that it must be maintained by a force sufficient effectually to prevent access to the coast of an enemy. See BOOTY, PRIZE IN WAR.

Cap'ua, a fortified city in the province of Caserta, S. Italy, on the left bank of the Volturno, 19 miles N. of Naples, and connected with it by railway. As a defence to Naples on the N. its fortifications, first erected in 1231, were reconstructed and strengthened in the 18th c. on the principles of Vauban; but they proved no effective obstacle to the French in their invasion of Italy. The Gothic cathedral, with some granite columns from ancient *Casilinum*, memorable for the noble stand it made against Hannibal; the Church of the Annunziata, with many old bas-reliefs in its wall; and the arch of the Piazza dei Giudici, are the most noteworthy structures. The *Torre Mignana* within, and the *Cappella de' Monti* without the town, are memorials of a horrible butchery perpetrated here in 1501 by Cæsar Borgia. The present town dates from the year 856 A.D., and is built on the site of the ancient *Casilinum*, which had fallen into ruins as early as the second Punic war. It has had a chequered history, like most Italian towns, but in recent times is most memorable for its capitulation to Garibaldi (3d November 1860), which ended his brilliant campaign for the liberation of Southern Italy.

Ancient C., one of the largest, richest, and finest cities in Italy, lay a little more than 2 miles S.E. of the present town, just where the present *Santa-Maria di C.* stands. It was originally called Volturnum, is said to have been built by the Etruscans, and had become the capital of Campania about 417 B.C. At an early period it attained surprising wealth and prosperity, which generated in the citizens luxurious and effeminate habits, unfitting them to cope in war with their more hardy neighbours. The soldiers of Hannibal wintered in C. after the victory of Cannæ (216 B.C.), and suffered much in the matter of discipline by the luxuries and temptations to which they were there exposed. C. became a Roman colony in 59 B.C. In the 5th c. A.D. it was plundered and ruined by the Vandals. Narses rebuilt it in the 6th c.; but it sunk again under the Lombards, and in 851 was completely destroyed by the Arabs. The existing ruins are of little interest, with the exception of those of the amphitheatre, which must have been, when perfect, a magnificent structure.

Cap'uchin Monkey, the name given to various species of *Platyrhine* or S. American monkeys, belonging to the genus *Cebus*. The best-known species are the capuchin (*Cebus Apella*); the horned capuchin or sapajou (*C. fatuellus*), and the Sai (*C. capucinus*). This last is sometimes known as the weeper monkey. The tail is not markedly prehensile in these monkeys.

Cap'uchins (Fr. *capuchon*, Ital. *capuccio*, a 'hood or cowl,' from Lat. *caput*, 'the head'), a sub-order of Franciscan monks, named from their head-dress.

Cap'udan-Pasha, the Turkish High Admiral, who manages all naval affairs. He exercises also civil control over the port of Pera, the Turkish islands of the Archipelago, and several seaports and maritime districts besides.

Capyb'ara (*Hydrochœrus Capybara*), a genus of rodent mammalia, included in the family *Caviidæ* (guinea pigs, &c.), and noted as representing the largest number of the order Rodentia. The C. inhabits S. America, and in general conformation is somewhat pig-like, the familiar name of 'water-hog' being applied to it. It attains a length of 3 or 4 feet; the muzzle is heavy and blunted, the tail is abortive, and the toes are imperfectly webbed. The hair is long, coarse, and bristly, the nails are hoof like, and the colour is undefined, the hairs being marked each with black and yellow, and the entire fur presenting a dingy-grey colour with a yellowish tint. The incisor teeth are very large, and the molars present a folded pattern. The C. is clumsy in gait and harmless in its nature. It inhabits streams, swims and dives with facility, is gregarious in its habits, and feeds on vegetable matters. The flesh is palatable, but has a musky odour.

Carab'idæ, a family of *Coleoptera* or beetles belonging to the section *Pentamera*, or those in which the tarsi are five-jointed, whilst the maxillæ possess two palpi. They are sometimes known as 'ground beetles,' and form the typical genus *Carabus*. The C. are carnivorous in habits, prowling about on the ground, and feeding on insects, worms, and like prey. Several common British species belong to this genus and family, the Bombardier Beetles (q. v.) being nearly allied forms. The colours may be brilliant, and may exhibit metallic lustres.

Car'abou. See REINDEER.

Car'acal (*Felis Caracal*), a *Carnivorous* mammal inhabiting S. Asia and Africa, and included in the Cat family (*Felidæ*). It is sometimes also scientifically designated as *C. melanotis*, a new and separate genus being thus constructed for its reception. The name C. signifies 'black-eared' in Turkish. This animal is nearly allied to the Lynxes (q. v.). Its colour is pale brown, tinged with red. The under parts are paler than the upper, and are spotted black or reddish chestnut. The lower lip, tip of the upper lip, and chin are white. The tail is short. As in the lynxes, the ears are erect and tufted. The average size is that of a large bull-terrier dog.

Caracall'a, a Roman emperor, son of Septimius Severus, born at Lyons, 188 A.D. His real name was Marcus Aurelius Antoninus Bassianus; but from a hooded Gallic tunic which he wore, he was nicknamed C. He succeeded his father in 211 A.D., with his brother Geta, whom he soon caused to be murdered, as co-regent. His brief reign was characterised by numberless acts of cruelty, licentiousness, tyranny, and crime. The baths which bear his name, the ruins of which still attest their ancient splendour, were erected during his reign. C. was assassinated between Edessa and Carrhæ, on his way to the latter, by the veteran Martialis, at the instance of Macrinus, præfect of the Prætorian Guards, 8th April, 217 A.D.

Caraca'ra Eagle (*Polyborus*), a genus of *Raptorial* birds indigenous to America, forming the type of the sub-family *Polyborinæ*. The bill in this genus is elongated, the tip slightly hooked; the wings long, with the third, fourth, and fifth quills the longest; the tarsi are scaly, whilst the throat, neck, and under part of the head are naked, or merely covered with a woolly down. Those birds are intermediate between the buzzards and vultures. *P. Braziliensis*, or the 'Carrancha,' as it is termed in La Plata, is the most familiar form. This species occurs in all parts of S. America.

Carac'as, the capital of the S. American republic, Venezuela, and of a province of the same name, lies at the base of the *Silla de C.*, 16 miles S. of the Caribbean Sea. It was founded in 1567, is the see of an archbishop, and has a new congress hall and a university (since 1778), for which a new building was being erected in 1873. Its port is Guaira, to which a railway has been projected (1873), and it does an active export trade, chiefly in cocoa, tobacco, indigo, coffee, and dye-woods. A regular line of steamers runs monthly to New York, calling at several W. Indian ports. There are extensive exports from Europe of hardwares and textiles. Pop. (1873) 49,256, of whom some one-third are white. C. has a mild climate, but is liable to earthquakes. Some 12,000 persons were killed here by an earthquake, March 26, 1812. The *province* of C., containing much fertile land under coffee, cocoa, and cotton crops, has an area of 4800 sq. miles, and a pop. of about 260,000.

Caracci, or **Carracci**, the family name of three of the greatest of the Italian painters, the founders of the school of Bologna, the place of their birth.—**Lodovico C.**, the son of a butcher, was born in 1555. He showed so little promise as an art student, that his Bolognese instructor, Fontana, and afterwards Tintoretto, the great Venetian, advised him to abandon painting. This advice had the usual effect, and Lodovico studied with all the more assiduity the works of Titian, Paul Veronese, and the great Florentines. Returning to Bologna, he established a school of art, denounced mannerism, and urged the necessity of combining the study of nature with that of the great masters. He made pupils, and afterwards allies, of his cousins, and the fame of his school was soon unrivalled. His chief works are 'St Francis,' the 'Transfiguration,' 'Birth of St John the Baptist,' and the 'Translation of the Virgin. Lodovico died in 1619.—**Agostino C.**, cousin of Lodovico, painter, engraver, and *littérateur*, was born in 1558, and died in 1602. His great picture is the 'Communion of St Jerome' in the Louvre; but he is best known for his engravings, which are models of drawing.—**Annibale C.**, brother of Agostino, and the most celebrated of the family, was born in 1560. It was intended that he should follow his father's business—that of a tailor; but having gone to study art under his cousin Lodovico, he showed unmistakable genius for painting. He improved himself by travel and by the study of Correggio, Tintoretto, Paul Veronese, and the splendid colourists of that school. Invited to Rome by Cardinal Odoardo to embellish the Farnese Gallery with painting, he spent eight years in this work, receiving as his reward only 500 crowns. C. died at Rome in 1609, and was buried at his own request by the side of Raphael. C.'s chief pictures are a 'Nativity' (in Paris), 'Resurrection,' 'Christ and the Woman of Samaria' (in Vienna), and 'Massacre of the Innocents' (in Munich); but there is scarcely an important gallery in Europe which has not specimens of his work.

Carac'tacus, or **Cat'aractacus**, a king of the Silures in S. Wales, who raised himself above all the British chiefs, and proved a formidable foe to the Romans. At last he was overthrown, and his wife and children were made prisoners. His brothers surrendered. C. sought refuge with Cartimandua, Queen of the Brigantes, who betrayed him, 51 A.D. The Romans, after a nine years' war, returned to Italy, taking with them C. and others, with the view of exhibiting them to the Roman people; but so noble was the bearing and so manly the appeal of the conquered chief, that the Emperor Claudius granted them all a free pardon. There is no account of their return to Britain.

Car'adoc Sandstone and **Bala Beds**, a division of the Lower Silurian system, consisting, in Wales, of sandstone, grits, and slates, with interspersed limestones, and attaining a thickness of 5500 feet. This group in the N. of England is made up of black flaggy beds, limestones and shales, and mudstones, in which plentiful remains of Graptolites (q. v.) occur, along with Trilobites (q. v.) and Brachiopods (q. v.).

Caraga'na, the Siberian pea-tree, belonging to the natural order *Leguminosæ*. *C. arborescens* is a small tree, with hard wood and tough bark. The seeds are used to feed poultry, and the leaves contain a blue dyeing matter. *C. spinosa* is a thorny shrub, the branches of which are stuck plentifully on the tops of the clay walls about Pekin, in China, for the same reason that broken bottles are strewed on the tops of our garden walls in Britain.

Carai'pa, a genus of plants of the natural order *Ternströmiaceæ*, containing about eight species, natives of tropical America. *C. fasciculata* is the tree from which the balsam of Tamacoari is obtained. This balsam is of the colour of port wine and the consistence of oil. A single application will cure the most inveterate attack of the itch in twenty-four hours (Spruce, *Journ. Linn. Soc.*, v. 63).

Car'ambola, the fruit of *Averrhoa C.*, a small evergreen tree of the natural order *Oxalidaceæ*. In India it is known as the Coromandel gooseberry, and is used for making sherbets, tarts, and preserves. The *Blimbing* or *Bilimbi* is another species of the same genus (*A. Bilimbi*), found also in India. The leaves of both species exhibit irritability, and the physiological phenomenon known as the sleep of plants.

Car'amel is a black amorphous substance obtained by heating sugar to a temperature of 210-220° C. The sugar loses two molecules of water, and C. remains

$$\underbrace{C_{12}H_{22}O_{11}}_{\text{Cane sugar.}} - \underbrace{2H_2O}_{\text{Water.}} = \underbrace{C_{12}H_{18}O_9}_{\text{Caramel.}}$$

C. is soluble in water, and imparts to it the colour of sepia; it has no sweet taste; it is used to colour liquors, such as brandy, sherry, &c. Stout and porter owe their colour to C., produced by heating the malt (which contains sugar) to a somewhat elevated temperature.

Caramnass'a, or **Kurumnassa**, a tributary of the Ganges, rises in a range of hills in the W. of the province of Bengal, and enters the Ganges 50 miles E. of Benares, after a course of 150 miles. It is subject to sudden floods. The C. is crossed by the Calcutta and Delhi road, and by the East Indian Railway.

Caran'ja, an island, about 2 miles broad, on the E. side of the entrance to the harbour of Bombay, and separated from the mainland by a narrow shallow channel, 4 miles long.

Caranx. See SCAD.

Carapa, a genus of plants of the natural order *Meliaceæ*, natives of warm regions. *C. Guianensis*, the Andiroba, is a large tree, the bark of which has a reputation as a febrifuge; a thick, bitter, anthelmintic oil is obtained from the seeds, and the trunk makes good masts. The wood (called crab-wood) is used for making furniture, shingles, &c. *C. Guineensis*, an African species, also yields a similar oil (Tallicoonah or Coondi oil), with a soap made from which the negroes anoint their skin to protect them from the bites of insects. It is also purgative and anthelmintic. This and the preceding species are very closely allied, and have almost exactly similar products; so that it is doubtful if they are different from each other.

Car'apace, the name applied generally, in zoology, to the shell or hard structures covering the back of certain animals (*e.g.*, turtles, tortoises, crabs, &c.), which structures, however, differ widely in different groups as to composition and nature. See CHELONIA, CRUSTACEA, &c.

Car'at (Ital. *carato*), the twenty-fourth part of any weight of gold or gold alloy. The gold of coinage and of wedding-rings is 22 C.; that is, it contains $\frac{22}{24}$ of pure gold. The standard used for watch-cases is 18 C. In assaying gold, a small quantity, from 6 to 12 grains, is taken, and termed the *assay pound*. It is subdivided into twenty-four parts, called carats, each C. into 4 assay grains, and each grain into quarters, so that there are 384 separate reports for gold. If the assay pound be 6 grains, the quarter assay grain will weigh $\frac{1}{64}$ of a grain—a delicate operation, requiring accurate weights and scales. The word C., in addition to this relative application, also denotes a fixed weight of $3\frac{1}{6}$ troy grains for weighing diamonds.

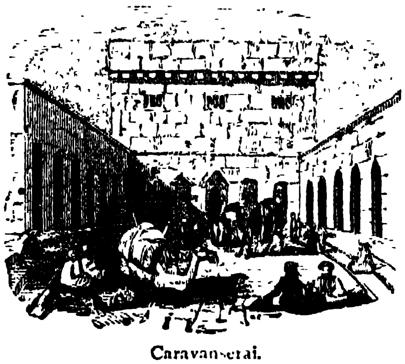
Carava'ca, a town of Spain, province of Murcia, 39 miles N.W. of Murcia. The church of C. has a cross believed to possess miraculous powers, and an object of deep veneration to the Spanish peasant. The town has manufactures of woollen and linen fabrics, leather, paper, &c., a trade in grain, oil, wine, and flax, and a pop. of about 10,000.

Caravagg'io, a town of N. Italy, province of Bergamo, 24 miles E. of Milan, with a pop. of about 6000. It is the birthplace of the Italian painters Polidoro Caldara and Michael Angelo Merighi, both of whom have taken a surname from the town.

Caravaggiō, Michael Angelo Amerighi, or **Merighi**, styled *Da Caravaggio*, from the town in Lombardy where he was born in 1569. The son of a builder, he early consorted with decorators, developed a taste for art, and visited and studied at Milan, Venice, and Rome. His temper was vain, jealous, even ferocious, and having committed manslaughter, he fled from Rome to Malta. Here he adorned the Church of St John with an altar-piece, and was knighted by the Grand-Master; but quarrelling with a noble, was imprisoned. He escaped to Sicily, where he was followed, attacked, and wounded by the enemies whom his imperious temper had provoked. Making his way to Rome, he was attacked by fever, and died at Porto Ercole, 1609. C. was great as a colourist. Annibale Caracci says of him that, in preparing his colours, he 'ground flesh' (not pigments), and he was a master of light and shade to whom Rubens confessed himself inferior. He studied life, but it was low life, and his 'Burial of Christ' is said by Kugler to suggest 'the funeral of a gipsy chieftain.' Other famous works of C.'s are 'The Death of the Virgin,' 'The Distribution of the Rosary,' and 'The Gipsy.'

Car'avan (Pers. *karwan*, 'trader'), a travelling body of merchants or pilgrims, who join company for mutual help and protection in the great deserts of Africa and Asia. In a C. there are sometimes 1000 camels following each other in single file. The greatest caravans are those to Mecca, the pilgrims in which have always business as well as devotion in view. The trade between the maritime states of Northern Africa and the Sudan, over the Sahara, is still entirely carried on in this way, and there is also an extensive caravan traffic in the interior of Asia.

Caravan'serai (Pers. *karwan-sarai*, 'house for traders') is an unfurnished building used in the East for the reception and lodgment of caravans. Those in cities and towns have more conveniences than those on the highway, and in them a small sum a day for accommodation is generally charged. They are sometimes used as shops, stores, and even as exchanges. Neither in town nor on the highway does the traveller find in a C. anything of use for himself or his cattle, except, perhaps, a well; he has to bring the necessaries of life with him. Caravans belong either to Government or to some private individual, or they are the property of the mosque.



Caravanserai.

Car'away, the fruits of *Carum carui*, one of the *Umbelliferæ*, a native of middle and southern Europe and some parts of Asia, and now naturalised in many parts of Britain. Pliny says the name is derived from *Caria*. It is cultivated in Holland and Germany, and in the counties of Kent and Essex in England, for the sake of the fruits, which are medicinally carminative and tonic, and for sale to confectioners and perfumers, who use them in liqueurs, cakes, bread, scented-soap, sweetmeats, &c. Its aromatic properties depend on the volatile oil, called the Oil of C. In Russia and Germany the seeds are bruised into spirit sweetened with sugar, which is used as a liqueur (*Kümmelbranntwein*).

Carbazot'ic, or **Pic'ric Acid**, is a yellow crystalline substance, prepared commercially by the action of nitric acid on *phenol* or Carbolic Acid (q. v.), and may be regarded as phenol in which three atoms of hydrogen are replaced by the group NO_2. For this reason C. A. is called by chemists *trinitro-phenol*.

$$\underbrace{C_6H_5(OH)}_{\text{Carbolic acid or phenol.}} \qquad \underbrace{C_6H_2(NO_2)_3OH}_{\text{Carbazotic acid or trinitro-phenol.}}$$

C. A. is employed by the dyer to stain silk yellow; it is sometimes fraudulently added to beer instead of hops, its solution having an intensely bitter taste.

Carbine, or **Carabine** (introduced in the 16th c. into French, and thence into English, from the Ital. *carabina*), a firearm with a rifled barrel, shorter than the musket or rifle. The cavalry (excepting the Lancers) and the artillery of the British army, as well as the representative corps in the auxiliary forces, are armed with breech-loading carbines, and similar weapons are carried by the Irish constabulary.

Carbineers', or **Carabineers**, light horsemen armed with carbines, and employed as skirmishers. Sir Joseph Meyrick states that the light cavalry, whose principal weapon was a short wheel-lock arquebus, in the service of Henri II. of France were called *carabins*; and another writer remarks that this body was disbanded in 1665, and their place supplied by infantry called carabineers. The 6th Dragoon Guards of the British army were early armed with the carbine, and hence they retain the name 'carabineers' as a distinctive title.

Carbohy'drogens, a term sometimes employed to denote the various compounds of carbon and hydrogen. They are more generally called the Hydrocarbons (q. v.).

Carbol'ic Acid, or **Phenol**, is a substance which of late years has become of great commercial importance. It is produced by the destructive distillation of many organic substances, especially of coal, and is always obtained in commerce from coal-tar. It is said to be present in the body of the beaver (*Castor Fiber*), and to give to that animal its peculiar odour. It is also present in the urine of the cow.

C. A. was first isolated by Runge, and first prepared for commercial purposes by Sell, in Germany. To Grace Calvert, however, belongs the merit of preparing it pure and in immense quantities. To extract C. A. from coal-tar (which contains from 3 to 14 per cent.), the tar is submitted to distillation, and the portion boiling from 150 to 200 collected separately. This is agitated with a strong and hot solution of caustic soda, some solid caustic soda added, and the whole allowed to remain at rest, when a copious separation of crystals of carbolate or phenate of soda ensues. These crystals are next separated from the mother liquor, and dissolved in a small quantity of water. After some time the solution separates into two layers, of which the lower is a solution of phenate of soda, whilst the upper consists of hydrocarbons, &c., mechanically entangled in the crystals. The solution of phenate of soda is drawn off and mixed with sulphuric or hydrochloric acid, when sulphate or chloride of sodium is formed, and remains dissolved in the water, whereas the C. A., being only sparingly soluble in that liquid, separates in globules, which gradually rise to the surface and collect in an oily layer. The crude C. A. thus obtained is decanted, dried with chloride of calcium, and rectified, after which it is cooled to 10° C., when pure C. A. separates in crystals. This acid is a colourless crystalline substance, which fuses when heated to between 34° and 35° C., and boils at about 187° C. It possesses a peculiar, penetrating, and characteristic odour. It blanches and corrodes the skin and other tissues, without causing the sensation of pain, hence it is employed in dentistry to destroy an exposed nerve. It is soluble in twenty times its weight of cold water, and in all proportions in alcohol, ether, and glacial acetic acid. C. A. is a hydrate of the hydrocarbon radical *phenyle* (C_6H_5), and has the composition represented by the formula $C_6H_5(OH)$. It should therefore be classed as an Alcohol (q. v.), but it differs from an alcohol in many important respects, and rather displays the properties of an acid. Thus it acts upon bases in such a manner that water separates and a salt results. It does not, however, redden litmus like a true acid. On account of its special properties, C. A., with other bodies analogous to it, form a separate group of chemical compounds, which receive the name of *phenols*. It is now employed in large quantities as a disinfectant and antiseptic, and as a source of various colouring matters.

Car'bon is one of the most plentiful and important of the sixty-four elementary bodies known to chemists. It may be considered as the principal constituent of animal and vegetable tissues, and it also enters largely into the composition of certain minerals, of which chalk may be instanced as a familiar example. In the free or uncombined condition C. exists in three distinct modifications. Two of these, viz., *Graphite* and *Diamond*, are found in nature, but the third, *Amorphous* C. or *Charcoal*, has only been obtained by artificial means. C. is thus an allotropic element. See ALLOTROPY.

The *Diamond* is a gem highly prized on account of its great brilliancy and hardness. It is found in alluvial deposits produced by the disintegration of the older rock formations. That the diamond is pure C. was first suggested by the discovery made by Lavoisier that the product of its combustion in air is carbonic acid. Later Sir H. Davy found that the volume of carbonic acid produced by burning a given weight of diamond was the same as that produced by the combustion of the same weight of charcoal. There is therefore no doubt as to the composition of the diamond, but its history remains in obscurity, for hitherto all attempts to prepare it by artificial means have failed. It is found, however, that some diamonds when burned leave an ashy skeleton resembling that of calcined vegetable matter; hence it has been suggested that the gem is produced by the gradual separation of C. from vegetable matter. The diamond is characterised by its extreme hardness and optical refrangibility, in both of which respects it is superior to any other substance. It is found crystallised in octohedra with rounded edges, and these natural edges are alone capable of cutting glass. It is denser than the other two varieties of C., its specific gravity being 3·5. See DIAMOND.

Graphite, *Plumbago*, or *Black Lead*, occurs in nature in rounded masses or in hexagonal balls. It is soft, opaque, of greyish black colour, and possesses metallic lustre. It leaves a black streak when rubbed on paper (black-lead pencils). It conducts electricity, and has the specific gravity of only 1·8–2·5. Cast-iron possesses the property of dissolving charcoal at a high temperature in considerable quantity, and of depositing it again on cooling in crystalline scales of graphite, which are technically called *kish*. When grey cast-iron is dissolved in an acid a deposit of graphite is left. Graphite, therefore, unlike the diamond, has been obtained by artificial means. See GRAPHITE.

Amorphous C., or *Charcoal*, is obtained by heating animal or vegetable materials in closed vessels. At a high temperature decomposition takes place; water, hydrocarbons, and other volatile products pass off in the state of vapour, and amorphous C. remains. There are several varieties of charcoal, the most important of which are the following:—

Wood Charcoal, obtained either by distilling wood in iron retorts, or by allowing it to undergo a limited combustion.

Coke.—The residue left when coal is distilled for the production of coal-gas.

Gas C.—A very compact variety of amorphous C. found adhering to the retorts in which coal is heated in the manufacture of coal-gas, and which owes its formation to the decomposition of the more volatile hydrocarbons by the high temperature of the walls of the retort. It is very hard and heavy (sp. gr. 2·35), and is used for making the C. plates of Bunsen's batteries.

Lamp Black.—The soot obtained by the incomplete combustion of resin, turpentine, &c.

Animal Charcoal, or *Bone Black.*—Obtained by heating bone in covered vessels or iron retorts. It is of especial value as a decolorising agent. See SUGAR-REFINING.

The compounds of C. are exceedingly numerous, and have characters of such special kinds, that their study alone forms a large and distinct branch of chemical science, which is called *Organic Chemistry*. The more important compounds and groups of compounds which C. forms with other elements will be found described under their respective headings. The atomic weight of C. is 12 and its symbol C.

Carbon, in medicine. Two kinds of C., or charcoal, are used in medicine—wood charcoal and animal charcoal. The former, obtained from wood charred by exposure to a red heat without access of air, and reduced to a fine powder, consists of 98 per cent. of C. and 2 of ash. It is given in doses of from 20 to 60 grains, and is a valuable remedy for flatulency of all kinds, and for correcting foul odours from the fæces. It is useful in most forms of Dyspepsia (q. v.), and is in general a good disinfectant, and a destroyer of bad smells. Externally it is much used as a poultice to foul and sloughing ulcers. It is also an excellent dentifrice.

Animal charcoal is principally used in pharmacy for decolourising purposes in preparing vegetable alkaloids. It has no taste, is very cheap, and, either in the form of powder or biscuit, should be more used in dyspepsia. In large doses it is effective in poisoning with strychnine and other similar poisons.

Carbona'ri ('charcoal-burners') claim descent from an association of German charcoal-burners in the 12th c. They are probably connected with *Le Bon Cousinage* of the *Fendeurs* (Hewers) of the Jura. Their legends name as patrons a St Theobald of Suabia and Francis I., from whose reign their almanacks date. The C. first emerge into political importance as a secret society in S. Italy and Sicily at the beginning of the 19th c. A charter, which probably belongs to the reign of Murat, proposes the establishment of an Ausonian Republic in Italy, the Christian religion being retained, but the Papal power and feudalism being abolished. It is said that the Bourbons having promised a constitution, the C. rose against Murat, their failure causing a separation from the main body of the Calderari (Braziers). Ferdinand, on his restoration, resolved to suppress those who had fought for him, and in 1819 his Minister of Police, Prince de Canova, employed the Calderari for this purpose. The Cadiz insurrection gave fresh life to the C. under the Abbé Menichini, and with the help of 'Le Giardiniere' (the Lodges of Garden-women) a second unsuccessful attempt was made to obtain a constitution. In the Papal States also the C. rose at Macerata and Faenza, but they were opposed by the orthodox society of the Sanfedisti, and their leaders betrayed. The action of the Lombardy and Venetian lodges against the hated rule of Austria was paralysed by the capture of Silvio Pellico, Torelli, &c. Carbonarism was introduced into France about 1820 by Joubert and Dugier. It is said that Lafayette was elected president. At Belfort the society was concerned in an insurrection (1821). Paris was their headquarters until after the revolution of 1830, when the society of 'Young Italy,' for the unification of Italy, was separately organised, and the advanced 'Charbonnerie Démocratique' was founded in Paris to realise the sovereignty of the people. In 1831 the C. had driven Maria Louisa, Duchess of Parma, into exile for a short time. The ceremony of initiation in the vendita (or lodge) was full of symbols: a linen cloth, water, salt (this means Christianity), leaves, fire, a crown of white thorns (the struggles of the Good Cousins), were all used by the Grand Master. The martyrdom of Christ is dwelt upon in the 'second degree' of initiation. The degree of 'Grand Elect' was conferred upon a solemn oath to fight to the death for universal liberty, if necessary, under the penalty of death with torture. The 'Grand Master Grand Elect' underwent a ridiculous mock crucifixion before attaining the highest degree. All members had pseudonyms, the register of real names being concealed in a separate place. There were also officers called insinuators, censors, coverers, and scrutators, the lowest grade being 'stabene,' or sedentaries. The 'Guelphic Knights' formed a sort of 'high lodge' of the C. Their supreme council sat at Bologna, the council consisting of six persons, who did not know each other, but communicated by means of an officer called the 'Visible.' The 'Delphic Priesthood' and the 'Latini' were also branches of the C. The 'Fratres' of Milan, the 'American Hunters' of Ravenna, the 'Sons of Mars' (who called their 'vendita' a *bivouac*, and their 'Good Cousin' a *corporal*), were later offshoots. In fact, Italy was a network of conspiracies. When Francis II. left Naples in 1860, the predominant society was the Camorra, of which the leading members have been lately arrested. It is said that Count Rossi was murdered by C. A vivid picture of the atmosphere of suspicion and deception which prevailed in Sicily at the beginning of this century may be found in George Sand's *Le Piccinino*. The C., under the name of *Fraues Maçons* in France, *Illuminés* in Germany, 'Radicals' in England, *Communeros* in Spain, have been specially condemned by Papal constitutions, as by Clement XII. in 1738, Pius VII. in 1821 (who says the C. are sprung *de' liberi muratori* condemned by Benedict XIV.), Leo XII. in 1826 (who mentions the *Universitaires* as a new and dangerous branch). So also in the Encyclic of 1864, '*damnantur clandestinæ societates.*'

Carbona'ted or Acidulated Waters are natural waters containing generally, in addition to saline compounds, an excess of carbonic acid gas, which causes them to effervesce at ordinary atmospheric pressure like artificial äerated waters. The water at Tunbridge Wells is an example of a C. chalybeate spring, and the alkaline waters of Vichy, Seltzers, Vals, Homburg, &c., contain large proportions of carbonate of sodium in addition to carbonic acid. The quantity of carbonic acid given out by some springs is enormous, amounting yearly to hundreds of tons. The waters of Neusalzwerk and Nauheim are said respectively to yield as much as from 1300 to 2000 tons of carbonic acid gas per annum. A considerable trade in natural C. waters now exists between Great Britain and the most famous Continental spas.

Carbon, Bisulphide of, is obtained by dropping sulphur into red-hot charcoal in an earthenware retort provided with a good condensing apparatus. It is a colourless, mobile liquid, highly refractive and volatile (boiling point, 48° C.), and possesses a peculiar aromatic odour, which is not disagreeable if the bisulphide be quite pure, but is usually disagreeable from the presence of impurities. B. of C. is an excellent solvent of oils, fats, resins, caoutchouc, phosphorus, sulphur, &c., and is employed in the manufacture of vulcanised india-rubber.

Carbon'ic Acid, or **Carbonic An'hydride,** formerly called *fixed air*, is a gaseous compound of carbon and oxygen, the composition of which is represented by the formula CO_2. C. A. occurs plentifully in nature, both in the free and combined conditions. It is produced by the processes of Combustion (q v.) and Respiration (q. v.), hence is always present in the air, though in minute quantity. The amount of C. A. in air would be much larger than it is were it not for the presence of plants, which absorb it into their tissues, there abstract and assimilate its carbon, and return its oxygen to the atmosphere in a pure condition. C. A. is also present in spring water, sometimes in such quantity that the water effervesces or sparkles; this is the case with the springs of Pyrmont, Nauheim, &c. It is also produced during the processes of putrefaction, fermentation, and slow decay of animal and vegetable substances in presence of air. Compounds of C. A. with various bases are found in large quantities in nature. Chalk, limestone, marble, Iceland spar and marble, are all of them carbonate of calcium, a compound of C. A. with the base lime. Carbonate of iron (spathose iron ore) and carbonate of calcium and magnesium (dolomite) are also important minerals containing this substance. C. A. may be prepared for experimental purposes by acting upon a carbonate with a dilute mineral acid: marble and dilute hydrochloric acid may be employed with advantage. If these be taken, the chemical reaction which occurs is as follows :—

$$\underbrace{CaCO_3}_{\substack{\text{Marble, or}\\\text{carbonate}\\\text{of calcium.}}} + \underbrace{2HCl}_{\substack{\text{Hydro-}\\\text{chloric}\\\text{acid.}}} = \underbrace{CaCl_2}_{\substack{\text{Chloride}\\\text{of calcium.}}} + \underbrace{H_2O}_{\text{Water.}} + \underbrace{CO_2}_{\substack{\text{Carbonic}\\\text{acid.}}}$$

C. A. under ordinary conditions is a colourless gas of sweetish taste. It is not poisonous, but acts in exactly the same manner as water when introduced into the lungs, that is to say, prevents the blood from absorbing oxygen, and eventually causes death by Asphyxia (q. v.) or suffocation. If subjected to extreme pressure (39 atmospheres at 0° C.), it condenses to a colourless very mobile liquid, which by its rapid evaporation when the pressure is removed produces such a low temperature that the remainder is frozen to a snow-white solid. The lowest temperature ever obtained was produced by mixing solid C. A. with ether. C. A. is remarkable for its high specific gravity. It may be poured like water from one vessel to another. This property causes it to accumulate in holes and caverns, and many accidents have occurred through incautiously entering such localities. The introduction of a lighted candle into places in which accumulations of C. A. are suspected is a simple test for its presence in dangerous quantity, for then the flame is extinguished. It is slightly soluble in water under ordinary conditions, but its solubility is greatly augmented if it be forced into the water under pressure, though on removing the pressure the water effervesces from the disengagement of the gas. This property is turned to account in the manufacture of Aerated Waters (q. v.). It is remarkable that the introduction of C. A. into the lungs should be so deleterious, whereas if introduced into the stomach it acts beneficially as a tonic and gentle stimulant. C. A. forms two classes of salts with bases—*neutral* and *acid* carbonates. The formulæ for the two salts of soda are—

$$\underbrace{NaHCO_3}_{\substack{\text{Acid or bicar-}\\\text{bonate of soda.}}} \qquad \underbrace{Na_2CO_3}_{\substack{\text{Neutral car-}\\\text{bonate of soda}\\\text{(washing soda).}}}$$

C. A. is absorbed with great activity by the alkalies and alkaline earths, a property which is utilised in the determination of this gas, and in its separation from other gases. It is largely employed by the manufacturers of äerated bread and äerated waters.

Carbon'ic Ox'ide is a compound of carbon and oxygen, the composition of which is represented by the formula CO, whereas that of carbonic acid is represented by the formula CO_2. C. O., therefore, contains half as much oxygen as carbonic acid. It was discovered towards the end of the last century by Priestley and Lassonne, but was first accurately investigated by Woodhouse some years later. It may be obtained by passing carbonic acid over red-hot charcoal.

$$\underbrace{CO_2}_{\substack{\text{Carbonic}\\\text{acid.}}} + \underbrace{C}_{\substack{\text{Car-}\\\text{bon.}}} = \underbrace{2CO}_{\substack{\text{Carbonic}\\\text{oxide.}}}$$

The blue flame often seen playing over a clear fire is due to burning C. O. produced by the reduction of carbonic acid formed in the lower part of the fire during its passage through the red-hot coals. C. O. may also be obtained, mixed with carbonic acid, by heating crystallised oxalic acid with strong sulphuric acid, the latter simply removing a molecule of water from the oxalic acid.

$$\underbrace{H_2C_2O_4}_{\text{Oxalic acid.}} - \underbrace{H_2O}_{\text{Water.}} = \underbrace{CO_2}_{\substack{\text{Carbonic}\\\text{acid.}}} + \underbrace{CO}_{\substack{\text{Carbonic}\\\text{oxide.}}}$$

The C. O. may be separated from the carbonic acid by passing the mixed gases through a solution of caustic potash, which only absorbs the latter. It may be obtained in a state of purity by heating formic acid with strong sulphuric acid, the action being simply one of dehydration, as in the former case.

$$\underbrace{H_2CO_2}_{\text{Formic acid.}} - \underbrace{H_2O}_{\text{Water.}} = \underbrace{CO}_{\substack{\text{Carbonic}\\\text{oxide.}}}$$

C. O. is a colourless, tasteless, and odourless gas, which cannot be liquified. It is inflammable, and burns with a pale blue flame to carbonic acid.

$$\underbrace{CO}_{\substack{\text{Carbonic}\\\text{oxide.}}} + \underbrace{O}_{\text{Oxygen}} = \underbrace{CO_2}_{\substack{\text{Carbonic}\\\text{acid.}}}$$

Owing to its strong affinity at a high temperature for oxygen, C. O. plays an important part in the reduction of iron and other metals from their oxides. (See IRON and BLAST FURNACE.) It acts as a narcotic poison, and in this respect differs from carbonic acid, which possesses no poisonous properties, but which, like water, cannot be introduced into the lungs without causing suffocation. Many deaths have occurred from incautiously sleeping in badly-ventilated rooms in which charcoal fires are burning—death resulting, in such cases, not from the action of the carbonic acid, but from that of the carbonic oxide.

Carbonif'erous System, the term applied to those formations, generally of characteristic and independent kind, which overlie the Devonian or Old Red Sandstone rocks, and which in turn lie beneath those of the Permian system. The name 'C.' is derived from a principal feature in their chemical composition, in virtue of which they become of high importance to man, as providing him with a chief source of coal. Lime and iron may also be enumerated among the industrial products of this system. Coal, however, it is to be remembered, is not confined to these rocks, but also occurs in newer as well as older and different strata. A great proportion of this system of rocks, indeed, is made up of sandstones, shales, and limestones, the coal occurring in comparatively thin beds. These rocks are largely developed in Britain, Europe generally, and N. America. In India (as at Damoodah, Nagpur, &c.) large coalfields occur, and in Australia this system is also represented. The C. rocks are divided into the

(1) lower C. rocks (C. slates and mountain limestones), (2) the millstone grit, and (3) the coal measures. The first-mentioned strata, constituting the base of the system, attain a thickness in Ireland (*C. slates*) of 5000 feet. The *C. limestone* in its typical development, as seen in Wales and the W. of England, is a pure limestone, from 1000 to 2000 feet thick, with beds of shale. The *millstone grit*, lying above the C. limestone, consists of sandy and gritty beds, lying either conformably or uncomformably on the latter, and averaging about 1500 feet in thickness. Fossils are scarce in these strata. The *Coal measures* lie conformably above the millstone grit, and consist of a thick series of beds of sandstone, shale, grit, and coal. From these measures true coal is chiefly obtained, but in Scotland workable seams occur below the millstone grit. In their greatest development the C. measures attain a thickness of from 7000 to 15,000 feet. Their shales are black, laminated, and earthy; their sandstones are yellow, brown, and purple, and rarely red; and beds of limestone and of clay-iron ore occur, along with the typical coal-beds of various thicknesses. The S. Wales coalfield shows alternating series of sandstones, shales, and coal, the latter beds numbering about eighty in this field alone. Each coal-bed rests upon sandy shale or clay, termed the 'floor,' which contains *Stigmaria* fossils, or the roots of the *Sigillariæ* (q. v.). A bed of shale—the 'roof'—lies above each coal-seam, and contains numerous plant fossils.

The C. period is chiefly notable as presenting us with a large and varied assemblage of fossil plants—Ferns, Calamites, Lepidodendra, Sigillariæ, &c. Cryptogamic vegetation flourished plentifully in this epoch. The *Protozoa*, or lowest animals, are represented by Sponges, Foraminifera, &c.; the *Cœlenterata* by Corals, &c; the *Echinozoa* by Crinoids and other genera; the *Annulosa* by Crustacea (*Trilobites*, &c.), Insects, Arachnidans, and Myriapods; the *Mollusca* by Polyzoa, Brachiopoda, Bivalves, Gasteropods, and Cephalopods; and the *Vertebrata* by Ganoid and other fishes, Amphibia, and probably true Reptiles.

Car'buncle (Lat. *carbunculus*, 'a small coal'), the lapidary and jeweller's name for a variety of the Garnet (q. v.), which is cut *en cabochon*. It is of a bright red hue. The mineralogists call it *pyrope*. The C. was a favourite gem among the ancients.

Carbuncle, in medicine, sometimes called *Anthrax*, a Greek word also meaning 'coal,' is essentially an inflammation of the skin, limited in extent, occurring most frequently in the same parts as *Boil* (q. v.). The skin, which assumes a bright red colour, becomes very much thickened by the infiltration of the inflammatory products, sometimes more than one inch in thickness. The C. is accompanied by burning pain, and a sense of tightness in the parts, together with great constitutional disorder. If left to itself, it is apt to slough, and ultimately to involve the deeper tissues, forming an abscess. It is generally single, and varies very much in size. The affection is most common in middle life and in advanced years, especially among those who live sumptuously. The treatment consists in free and early incisions through the whole diseased mass, followed by the application of soothing poultices, when the mass gradually sloughs out. At first a brisk purge is beneficial, after which tonics and nourishing, non-stimulating food should be administered to the patient.

Car'burretted Hydrogen. Although this term might be employed to designate any of the numerous compounds of carbon and hydrogen, it is restricted by long custom to two of these only—viz., *light* C. H., or *Marsh Gas* (q. v.), CH_4; and *heavy* C. H., *Ethylene* or *Olefiant Gas* (q. v.) ,C_2H_4.

Carcajen'te, a town of Spain, province of Valencia, in a fertile plain near the right bank of the Jucar, 25 miles S. of Valencia, with which it is connected by railway. The Marquis of Calzada has a large palace here. The trade of C. is chiefly in grain, fruit, and silk. Pop. 7280.

Car'canet (Fr. a diminutive of *carcan*, 'a collar;' Old Fr. *quercant*, from Old High Ger. *querca*, 'the throat'), a jewelled chain or necklace, for the manufacturing of which Venice was famous in the 15th c.

Car'cass, in ammunition, a thick cast-iron spherical shell discharged from mortars and other smooth-bore ordnance for incendiary purposes. It is filled with a composition consisting of saltpetre, sulphur, rosin, antimony, sulphide, turpentine, and tallow, which is ignited by means of a quick-match placed in three vents on the upper hemisphere, through which the composition continues to burn for from three to twelve minutes, according to the size of the projectile. Previous to the present century, oblong carcasses encircled with iron bars covered with canvas and cord were in use in the British service, and it is supposed that the term 'C.' refers to the *ribs* of iron and *skeleton* frame of these obsolete 'fire-balls.'

Carcassone', the capital of the department of Aude, France, on both banks of the Aude, 55 miles S.E. of Toulouse by railway. It consists of an ancient and a modern portion. The former still retains the old fortifications, the castle and donjon, which made it a place of importance from the earliest times down to the 14th c. It contains also the splendid old cathedral of St Nazaire, rebuilt in the 11th c., and it communicates by two bridges with the modern town, which is regularly built. C. employs 2000 persons in the manufacture of cloth, which it exports in large quantity to America. It has also much trade in grain, fruit, and wine. Pop. (1872) 18,396. C., the ancient *Carcasso*, was in existence before the Romans entered Gaul. It suffered greatly during the Albigensian wars.

Car'damine, a genus of plants belonging to the natural order *Cruciferæ*. The best-known is *C. pratensis*, the bitter cress, cuckoo-flower, or lady's smock, common in most meadows in Britain. The flowers are stimulant and diaphoretic; at one time they were held in high esteem as a cure for epilepsy, especially in children. The leaves of this species, as well as of *C. amara* and *C. hirsuta*, are occasionally used as salads, *C. amara* being especially popular in Saxony. *C. pratensis* is much used as an anti-scorbutic in the N. of Europe The names of 'cuckoo-flower' and 'lady's smock' are said to be due to the fact that *C. pratensis* flowers at the time of the coming of the cuckoo, and covers the meadows with its flowers so profusely as to look at a distance like linen bleaching. On the Scottish borders it is known as *pinks*, *spinks*, *bog-spinks*, or the *Mayflower*. It is the 'lady's smock' of the English poets.

Car'damoms are the dried capsules, with their contained seeds, of certain plants of the natural order *Zingiberaceæ* (q. v.). Various species of *Amomum* and *Elettaria* yield C. *Amomum cardamomum* yields the C. of Siam, Sumatra, and Java; *A. aromaticus*, the Bengal C. Medicinal C. are got from *Elettaria cardamomum*, the Malabar C. These plants are natives of certain forests on the Malabar coast, 3000 to 5000 feet above the level of the sea. The seeds are angular and corrugated, with an agreeable taste and smell. They are best kept in their capsules until required for use. They owe their virtue to a colourless volatile oil, $C_{10}H_{16}$, constituting about 4 per cent. C. are good stomachics, make a pleasant cordial, and are extensively used as a condiment for correcting the griping of purgative medicines, and for rendering other medicines palatable.

Cardan, Geronimo, an Italian physician, philosopher, and mathematician, was born at Pavia, September 24, 1501. He took the degree of M.A. at Venice in 1524, and that of M.D. at Padua in 1525. The greater part of his life was spent at Milan, whither he went in 1529, and where he held for a time a chair of Mathematics. Here he compiled the *Ars Magna, Sive de Regulis Algebraicis* (1545), a work which placed him in the front rank of mathematicians, and his *De Subtilitate Libri XXI.* (1550), considered by some to be his most important work. Like the *De Rerum Varietate Libri XVII.* (1557), it enables us to see the extent of C.'s knowledge in physics, metaphysics, and natural history. In 1552 he visited Scotland, and, returning by England, predicted, upon astrological principles, that Edward VI. would have long life. After travelling in France, Germany, and other European countries, C. returned to Milan, where he remained till 1562, when he went to Bologna. The last six years of his life he spent as a pensioner of Pope Gregory XIII. at Rome, where he died, September 21, 1576, some say of voluntary starvation, in order to fulfil his own prediction of the time of his death. His name is best known in the mathematical world in connection with a rule for solving cubic equations, also known as Tartaglia's rule. His writings are extremely numerous, but are not of great value. Upwards of 220 on all sorts of subjects have been printed. The best edition is that of Sponius (10 vols. Lyon, 1663). See Crosley's *Life and Times of C.* (2 vols. Lond. 1836).

Card'board, Card, or Pasteboard, is made by pasting several sheets of paper together, and pressing, drying, and rolling the board so produced. In C. the layers of paper are usually of an uniform good quality, and, when pressed and dried, a fine smooth polished surface is imparted by passing a pile of cardboards and heated zinc or copper plates, arranged alternately, between a pair of rollers. *Ivory C.*, a fine thin variety used for address cards, consists of two or more sheets of fine paper, rolled till a beautiful hard smooth surface is obtained. Enamelled address cards are made by coating the card with a white mineral composition, and rubbing with a hard brush. In coloured cardboards the outer sheets only are tinted. Pasteboard is made with a 'middle' of inferior quality to the outsides, and in thick boards two or more 'middles' are pasted together.

Car'diac Medicines are remedies which influence the action of the heart either directly or indirectly.

Cardiadæ, a family of *Lamellibranchiate* molluscs, represented by the Cockles (q. v., *Cardium*) and by the genus *Conocardium*. The shell is equivalve, heart-shaped, the mantle being open in front, and the foot large and curved. The family is represented by cockles on the Devonian rocks; whilst the genus *Conocardium* is represented by Palæozoic shells, which have the anterior side of the shell conical and gaping, and a siphonal tube placed near the beak of the shell.

Cardiff (Cymr. *Caer-Taff*, 'castle on the Taff'), the county town of Glamorganshire, S. Wales, on the Taff, 1½ miles above its entrance into Penarth harbour, and 170 miles W. of London by railway. It is rapidly becoming one of the first ports in the kingdom, being the outlet for the extensive iron and coal industries of S. Wales, including the richly-productive districts of Merthyr-Tydvil, Rhymney, the Rhondda and Aberdare Valleys, &c. It has a large town-hall, a custom-house, a free library and museum, a good infirmary, a county lunatic asylum, and a theatre. Of some thirty churches in C., only four belong to the Establishment. The splendid docks of C., the cause of its recent prosperity, are mostly the property of the Marquis of Bute, and have been brought to their present state in a great degree by his personal enterprise. There are in all three so-called Bute docks, Penarth dock, several graving and other docks, having a total area of 100 acres. The quays have some forty staiths, worked by hydraulic machinery for the expeditious loading of coal without breaking it. By means of these staiths vessels can be loaded at the rate of 100 tons an hour. In 1873 the export of coal was 3,591,218 tons, of iron 154,570 tons, and of coke 12,276 tons. In the same year there entered the port 9951 vessels, with a total of 1,644,908 tons, of which 1488, of 485,561 tons, were foreign, chiefly French; while there cleared 11,333 vessels of 2,544,283 tons, 2290 (771,296 tons) being foreign vessels. There are regular steam lines to New York, London, Liverpool, Cork, Glasgow, &c., besides ample railway and canal communication with the interior. C. issues two daily newspapers. The rapid growth of C. is shown by the following figures:—In 1807 the pop. was only 1870, in 1841 it had increased to 10,077, in 1851 to 18,351, in 1861 to 31,235, in 1871 to 39,536, and in 1876 is estimated at about 60,000, including the suburbs of Roath and Canton. Along with Cowbridge and Llantrissant, C. returns one member to Parliament. C. is an ancient town, although little of its antiquity remains, and its history is bound up with that of its castle, which has been renovated by the Marquis of Bute. The most striking feature of this structure is a massive square tower, surmounted with a clock and gilt emblematic devices. In the interior are several apartments, fitted up in a costly style for the convenience of the noble proprietor. A public garden and park skirt the opposite side of the river to that on which the castle stands.

Car'digan (Cymr. *Caerdigion*, 'Caeredig's land'), or **Aberteify** ('the mouth of the Teify'), the capital of Cardiganshire, picturesquely situated on the Teify, 30 miles N.N.E. of Pembroke, and 240 N. by W. of London, with which places it is connected by railway. It lies 3 miles from the mouth of the river, which is here crossed by an old stone bridge of seven arches. Its harbour is greatly obstructed by a bar, but some trade is still carried on in the export of slates, oats, butter, &c. In 1873 there entered the port 909 vessels of 26,626 tons. C. possesses the scant remains of the Abbey of St Dogmaels, and the still scantier traces of a Norman castle, supposed to date from 1160. Along with Lampeter, Aberystwith, and Adpar, it returns a member to Parliament. Pop. of municipal borough (1871) 3461. C., which is an ancient town, strenuously opposed the intrusion of the Normans.

Cardigan Bay, a splendid inlet of St George's Channel, on the W. coast of Wales, extends from Brach-w-Pwll in Caernarvon to Strumble Head in Pembroke, a distance of 55 miles. It has from 3 to 30 fathoms of water, but the harbours on the coast are mostly obstructed by bars. C. B., according to Welsh tradition, was originally dry land (*Cantrev y Gwælod*), protected from the sea by dams and dykes till the 5th or 6th c.

Car'diganshire, a maritime county of S. Wales, lies between the rivers Dovey and Teify, and has an area of 693 sq. miles, and a pop. (1871) of 73,441. Its surface is chiefly level and fertile towards the coast, but the interior is mountainous; hence its popular name, 'Wild Cardigan.' C. has several rivers besides the Teify, of which the chief are the Claerwen, Ystwith, and Rheidol. In the hilly region are many famous waterfalls, as the Devil's Bridge and the Falls of Rheidol, and also some twenty beautiful llyns or diminutive lakes. In 1873, 265,554 acres were under crops and grass, the chief crops being oats, barley, and potatoes. There is a small hardy breed of cattle and horses. Almost the only manufactures of importance are flannels and gloves. The geological formation of C. is wholly Silurian, and the minerals include silver, copper, lead, and slates. One member of Parliament is returned by the county. C. was at one time under a native king (Rhodri Mawr, or Rhodri the Great), who extended his rule over all Wales in the 9th c. During the 11th, 12th, and 13th centuries it was the scene of desperate fighting between the native chiefs and the Norman settlers. There are still many Roman and British remains, including camps, roads, stone circles, and cairns.

Car'dinal (Lat. *cardinalis*, 'principal,' from *cardo*, 'a hinge,' as in *missa cardinalis*, 'solemn mass,' *altare cardinale*, 'chief altar'), a title originally applied in the time of Theodosius to generals of the imperial army, and also to the prefects of Asia and Africa. In the Church, the name was given generally to the parochial priests in towns, to distinguish them from the deacons, who had charge of hospitals for the poor, and from the chaplains of the oratory (where mass was said but no sacraments given). *Cardinalis sacerdos* was applied to a bishop, presbyter-cardinal to a parish-curate. Gradually, however, the name was limited to the priests of Rome who assisted the Pope in celebrating mass. From these, and not from the bishops, the Pope was generally elected. When a regular Curia was established, the cardinals were appointed by the Pope indifferently from Roman and foreign priests. But in 1159, when Nicholas II. excluded the common clergy, the nobility, and the people from the election of Pope, twenty-eight of the cardinals were apparently parish priests of Rome, the remainder being the collateral, hebdomadary, or comprovincial bishops of Ostia, Porto, Sylva, Candida, Albano, Sabina, Frascati, and Palestrina. The resistance of the Palatine judges prevented the definite organisation of the Sacred College till Alexander III., who gave the exclusive right of electing a Pope to the cardinals. The number of cardinals was only twenty-five in the time of Leo X.; latterly it became seventy (the number of elders chosen by Moses)—there being always about fifty priests (*clerici*), and from fourteen to eighteen deacons. In 1245 the red hat was adopted; in 1464 a red gown. In 1630 Urban VIII. introduced the title of Eminence in place of Most Illustrious. Besides the cassock (*soutane*) and the short mantle (*mantelet*), the rochet and the cope (*chape*), the *cappa magna* and gold ring with sapphire are characteristic parts of the C.'s dress. Regulars always retain the dress of their order. The business of the C. is transacted in different congregations. Before Sixtus V. at least seven important congregations existed: those regarding the Inquisition, the Index, the affairs of councils, the bishops, the monks, the Segnatura, and the Consulata. Sixtus added congregations to deal with the removal and appointment of bishops and the revival of Church usages, and six secular congregations to deal with corn laws, roads, repeal of oppressive taxes, building of ships of war, the Vatican press, and the University of Rome. The Congregation of the Pope, or the Consistorial, prepares matters afterwards submitted to the Consistory, in which the Pope presides. When the Pope appoints a C., he presents him in Consistory with the words '*habebitis fratres.*' The power and character of the cardinals have varied very much from time to time. It was the great Cardinals Contarini, Caraffa, Pole, Giberto, &c., who conceived the reforms for which the Council of Trent was summoned. When the Inquisition was revived (21st July 1542) after the Ratisbon Conference, six cardinals (including Caraffa and Toledo) were appointed commissioners of the Apostolic See, and general and universal inquisitors on both sides of the Alps. At other times the cardinals had little power. France and Austria have a right to present cardinals for nomination. The *cardinal's option* means that at the death of one C. his title may be taken by another, who gives up his own.

Cardinal, or **Red Bird** (*Cardinalis Virginianus*, or *Guarica cardinalis*), a species of *Insessores*, belonging to the *Conirostral* section of that order, and included in the *Fringillidæ* or Finch family. It is also known by the names C. Finch, C. Grosbeak, and Virginian nightingale. It inhabits N. America, and derives its name from the feathers of the crest being elongated to form a pointed cap-like structure. The male is coloured red, the head being of a bright vermilion hue, and the base of the bill black. The C. averages a starling in size. Its song is extremely sweet and powerful.

Cardinal Bird.

Cardinal Flower. See LOBELIA.

Cardinal Vir'tues. The classification of duties into the four C. V., Prudence, Courage, Temperance, Justice, was the scheme adopted in the oldest systems of ethics. Nowadays it is considered useless; modern Christian moralists usually adopt the system of duties to God, to others, to self. The first statement of the C. V. is found in Plato, according to whom the happiness of the man, as well as of the commonwealth, was to be attained by realising them. In answer to the question what is justice, he constructs his model or ideal republic by assimilating an individual to a state. Justice is defined as every man attending to his own business; injustice occurring when any one abandons his post or meddles with what does not belong to him. Such is justice in the state, and the same is justice in the individual; a sort of balance or harmony of the mental powers being to the mind what health is to the body. Wisdom, reason, or intellect was the highest faculty (Prudence), which was to control the two lower, Courage and Appetite. Courage, energy, or spirit, was the military virtue. Temperance was to restrain a many-headed appetite.

The Stoics adopted the four C. V.—Wisdom or the knowledge of good and evil, Justice, Fortitude or Courage, and Temperance—as part of their plan of the virtuous life. Epicurus also adopted them, and explained them from his own point of view. Prudence was a calculation and balancing of pleasures and pains, teaching men to select pleasures judiciously, to forego idle wishes, and despise idle fears. Temperance was the management of sensual pleasures in such a way as on the whole to extract from them the greatest possible amount of pleasure. Fortitude consisted in facing danger and enduring pain; Justice, in a tacit agreement among mankind to abstain from injuring one another. In the scholastic systems of ethics, to the four C. V. were added the *virtutes adjunctæ* or theological virtues, Faith, Hope, and Love. Later moralists all found this classification more or less inadequate to express their views. The virtue which was most conspicuous by its absence from the earliest ethical systems, and which modern thinkers have included in theirs under one name or another, was Benevolence. Accordingly Whewell, who preserved the name of C. V., enumerates *five;* Benevolence, Justice, Truth, Purity, and Order (obedience to the laws), which have a certain parallelism to the five chief classes of motives respectively—love and its opposite, mental desires, the need of a mutual understanding, bodily appetites, and reason. See Bain's *Mental and Moral Science* (1868).

Car'ding, a process by which cotton, flax, and short woollen fibres are prepared for spinning. In the case of cotton, the fibre is passed through an *opener*, in which refuse is beaten out, and then prepared for C. in a *scutcher*. In C. it passes through two different C.-engines of similar construction—the '*breaker*' and the '*finisher*.' From the breaker it is delivered in long slender coils called slivers, two of which are mixed in the *doubler*, and again spread out in the '*finisher*,' from which similar slivers are delivered. The object of C. is to produce slivers of uniform size, and to comb out the fibres in a parallel direction. See COTTON MANUFACTURE, &c.

Car'diograph. This is an instrument used in practical medicine and in physiological research for observing and recording the impulse of the heart on the wall of the chest. In man and in the lower mammalia, the heart is situated in an irregularly wedge-shaped space, the posterior wall of which is formed by the diaphragm. When the ventricles of the heart contract, they push against the wall of the chest with more or less violence. This push is termed the *cardiac impulse.* Various cardiographs have been employed, but the one most in favour was devised by Burdon Sanderson. It consists of a hollow disk, the rim and back of which are made of brass, while the front is made of thin india-rubber. This box is called the tympanum. To the brass back a flat steel spring is secured, which is bent twice at right angles in the same direction, in such a way that it overhangs the india-rubber membrane. The extremity of this spring, which is exactly opposite the centre of the face of the tympanum, is perforated by a steel screw, the point of which rests on the membrane, while its head is surmounted by an ivory knob. The tympanum is further provided with three adjusting screws, by which, when in use, it rests on the wall of the chest, with its face parallel to the surface, and can be approximated or withdrawn at will. It is evident that when the screws are so adjusted that the spring presses on the chest, whatever movements of expansion or retraction are made by the surface to which it is applied are communicated to it, and by it to the india-rubber membrane with which its point is in contact. The cavity of the disk communicates by a vulcanised india-rubber tube with a second tympanum in such a way that the two tympana and the tube enclose an air-tight cavity. The result of this arrangement is that whatever movement is performed by the first is simultaneously reproduced, but in the reverse direction, by the second. If the tympana are of equal area, the extents of the primary and secondary movements are equal. When, as is usually the case, the areas are unequal, the extent of movement is approximately inversely proportional to the areas. The movement of the second tympanum is magnified and inscribed on a registering cylinder by means of a lever. By this apparatus a tracing is obtained, which is an exact representation of the movements of the surface against which the spring is applied, so that, if the instrument is graduated, it may be used not only for the purpose of estimating the relative duration of those movements, but for measuring their extent. See *Handbook for Physiological Laboratory* (Lond. 1873) p. 255.

Cardiosper'mum, a genus of plants of the natural order *Sapindaceæ*, contains about twelve species, mostly natives of S. America, but also found in every tropical country. The leaves of *C. Halicacabum*, the winter cherry (a name also applied to *Physalis*) or heart-pea, are cooked and eaten in the Moluccas, and on the Malabar coast are taken internally with castor oil for lumbago, &c. The root is laxative, diuretic, and, owing to the quantity of mucilage in it, demulcent, but slightly nauseous in taste. It is also used in rheumatism.

Cardi'tis, inflammation of the substance of the heart, is an exceedingly rare affection, but several cases have been recorded. It may occur without any of the other structures being inflamed, but is more frequently combined with Endocarditis (q. v.) and Pericarditis (q. v.), with both of which it is often confounded. C. is sometimes the result of rheumatism.

Car'dium and **Cardia'ceæ.** See COCKLE.

Cardo'na, a walled town in the province of Barcelona, Spain, on the Cardener, 35 miles S. of the French frontier, with a trade in salt, obtained from a mountain of the mineral in the vicinity. This singular mass is 500 feet high, and in sunlight forms a dazzling spectacle. Pop. about 3000.

Cardoon' (*Cynara Cardunculus*), a genus of plants belonging to the natural order *Compositæ*, and resembling the artichoke in appearance. The C. is cultivated for the sake of its blanched leaf-stalks and midribs, which are used as a salad or as a pot-herb.

Cards (Fr. *carte*, Lat. *charta*) for play, like chess, are an importation from the East, and were probably invented in India. The Royal Asiatic Society possesses a pack of Hindustani C. which is said to be as old as the 9th c. M. Abel de Rémusat, an eminent Chinese scholar, affirms, on the authority of original MSS., that C. were known in China as early as 1122. It is not known precisely when they were introduced into Europe, and it is disputed whether Spain or Italy first knew their use. Probably it was Spain; but it is certain that they were brought to the Italian city of Viterbo in 1379, and that the game was known as *naib*—an Arabic word meaning a prophet, and suggesting that C. were used for fortune-telling, and that they were probably introduced to Europe by gipsies. From Italy they passed to Germany early in the 15th c., about the time of the invention of wood-engraving, an art at once applied to their production. Ulm became the centre of card-manufacture; and the Swabian C. had an immense circulation through Germany in the first half of the 15th c. C. were painted for the amusement of Charles VI. of France in 1393; and there are at present in the National Library of Paris seventeen of a pack which dates from about 1425. In France C. received an entire transformation. The game introduced to that country was the *tarot*—a word of uncertain derivation, but supposed to mean the 'royal road'—in which the C. bore emblematic figures mysteriously grouped, and were, it is supposed, employed rather for divination than amusement. The C. with which this mystic pastime was carried on are still extant in Switzerland and Germany, and in some parts of Alsace and Franche Comté. An entire *tarot* pack consists of seventy-eight C.—the *Fou*, like zero, with no value of its own, but increasing the value of any card combined with it; twenty-one *atouts*, of higher value than the rest, bearing emblems, the different combinations of which gave zest to the game; and fifty-six C., analogous to those at present in use; there being forty pip-C.—the ace to the ten in four suits—four each of kings, queens, knights, and valets. The pips were the vase, money, sword, baton, supposed to represent in order priest, merchant, warrior, husbandman. In France the number of the pack was reduced to fifty-two, as at present; the pips, *cœurs*, *carreaux*, *piques*, *trèfles*, or hearts, diamonds, spades, and clubs, were introduced, and the game of piquet was popular as early as the time of Charles VII. The game of C. now played is, accordingly, a French adaptation of the attempt at divination.

From France C. made their way into England some time prior to the year 1463, for in that year—the third of Edward IV.—*C. for playing* were among other articles prohibited from being imported, and that upon the petition of English manufacturers of them. The *Paston Letters* prove that C. were, as early as 1484, a familiar feature of the amusements at Christmas. In 1495-96 servants and apprentices were forbidden to play at C., except during Christmas holidays, and then only in their masters' houses. Henry was himself addicted to the pastime. James IV. of Scotland, in the year 1502, met his future spouse, Henry's daughter Margaret, at the card-table. James himself was fond of the game. Latimer's *Sermons on the C.*, preached at Cambridge in Christmas, imply the popularity of the game in the reign of Henry VIII. On October 22, 1629, a company was incorporated by letters-patent of Charles I., under the title of 'The Master, Wardens, and Commonalty of the Mystery of the Makers of Playing C. of the City of London.' The *bloudy game at C.* was frowned on under the Commonwealth, but became more popular than ever after the Restoration. Political, satirical, and fantastic C. became very common during the struggle between the House of Stuart and Parliament. One pack satirises the Rump Parliament, another is advertised, December 19, 1679, as containing 'An History of all the Popish Plots that have been in England;' and this kind of publication continued down to the time of George I., when the South Sea Bubble was the subject of a pack in England, and the Mississippi Scheme of one published in Holland. Then came into fashion logical, historical, geographical, and heraldic C. Innumerable attempts have been made to influence public opinion by modifications of the court-C. Thus, during the French Revolution, Molière, La Fontaine, Voltaire, and Rousseau were put in place of the kings of the four suits; while the queens were replaced by the cardinal virtues, Prudence, Temperance, Fortitude, and Justice. The Americans similarly have tried to substitute Washington, John Adams, Franklin and La Fayette for the kings, and for the queens Venus, Fortune, Ceres, and Minerva; while Indian chiefs are represented as knaves. Ingenious artists are constantly trying to introduce something more alive with meaning than the conventional king, queen, and knavé, but they are not likely to succeed. Players care only for the game, and they know it best with the old familiar objects on the C.

The parliamentary regulations under which the card-trade is carried on in this country are contained in the Act 9 Geo. IV., c. 18. According to this Act, every maker of playing-C. has to pay an annual licence duty of 5s., the duty on every pack is 1s., and this is required to be specified on the ace of spades. In Great Britain C. are allowed only to be made in London; and in Ireland, Dublin and Cork are specified. Before a maker obtains licence, he must give a bond of £500 for the payment of duties; while selling or exposing for sale a pack of C. not duly stamped subjects a licensed maker to a penalty of £50, and any one else to £10. C., when exposed to sale, must be enclosed in wrappers with such marks as the Commissioner of Stamps may appoint. Second-hand C., without the wrapper of a licenced maker, may be sold by any person; but they must be sold in packs containing not more than fifty-two C., with an ace of spades duly stamped, and the wrapper enclosing them must have the words 'second-hand C.' in distinct characters. The penalty for neglecting these requirements is £20. See Taylor's *History of Playing-C.* (Lond. 1865), and Dr Willshire's *Catalogue Raisonné of the Cards in the British Museum* (1876).

Car'duus. See THISTLE.

Careen'ing (Lat. *carina*, 'a keel') a ship is the operation of heaving her down upon one side so that the other may be got at for cleaning from the *keel* up. It is now rarely practised, as mechanical apparatus has been invented to lift the ship out of the water.

Car'et (Lat. *careo*, 'I want'), the mark (^) used when writing to call attention to the interlineation of something which has been omitted.

Carew', Thomas, first of the 'courtier-poets,' was born of a good family in Gloucestershire, about 1589, and educated at Corpus Christi, Oxford. After some time spent in foreign travel, C. was appointed gentleman of the privy chamber and sewer in ordinary to Charles I. He died in 1639. C. was the friend of Ben Jonson. His works are masques—the *Cælum Brittanicum* is still remembered—lyrics (set to music by the brothers Lawes in the poet's lifetime), and sonnets, much in request between 1630 and 1640. C.'s verse is often flimsy enough, but graceful and tender. His poems were first published in 1640, again in 1772 by Davies, and in 1824 (at Edinburgh) by Maitland.

Car'ex, a genus of perennial plants belonging to the natural order *Cyperaceæ*. About 1000 species are known, scattered over the temperate and colder parts of the world. Mr Bentham allows forty-seven to be natives of Britain. They are sometimes called *sedges* or *seg*, and are grassy or rush-looking in appearance Some of the species growing in sandy soil prevent the sand drifting, by binding it together with their long branching underground stems or sobols. *C. arenaria* is especially of value in this respect, and has been extensively planted on the dykes of Holland and in similar situations. The rhizomes of *C. hirta* and *C. disticha* are sometimes used as a diaphoretic and demulcent medicine under the name of *German Sarsaparilla*. See Dr Bott's great work on the genus.

Ca'rey, Henry C., an American political economist, was born at Philadelphia in December 1793. He is of Irish extraction, and was originally a publisher by profession. Among his chief works, all of which are popular, are his *Principles of Political Economy* (1837-40), from which Bastiat borrowed some of his leading ideas; his *Credit System in France, Great Britain, and the United States* (1838); his *Past, Present, and Future* (1848), in which he attacks Malthus and Ricardo; and his *Principles of Social Science* (1858). C., whose work on political economy has been abridged for the use of schools in America, is a protectionist, and an opponent of any international arrangement on the subject of copyright.

Carey, William, D.D., a well-known Baptist minister and missionary, was born at Paulerspury, Northamptonshire, 17th August 1761. He was apprenticed to a shoemaker, but manifested from his early years a keen passion for knowledge, and acquired, almost without help, a knowledge of Greek, Latin, and Hebrew. He began to preach in his eighteenth year. A pamphlet (1789) of C.'s on foreign missions brought him into notice, and after the formation of the first foreign missionary society (by the Baptists), C. and Mr Thomas were sent to India as its agents in 1793. To C. more than to any other man belongs the honour of having founded the famous Serampore mission, which in 1832 had issued 200,000 Bibles, or parts of the Bible, in about forty native languages or dialects, besides a great number of other religious books and tracts. Much of the literary labour involved in these publications was performed by C., who was Professor of the Sanskrit, Bengali, and Mahratta Languages at Fort William College, Calcutta, from 1800 to 1830. Among C.'s other works were a Mahratta grammar and dictionary, a Sanskrit grammar, a Punjabi grammar, a Telinga grammar, a Bengali dictionary, and a Bhotanta dictionary. He died 9th June 1834.—His son, **Felix** (born 1786, died 1822), who accompanied him to India, published a grammar and dictionary of the Burmese language, and other works. See *The Life and Times of Carey, Marshman, and Ward, embracing the History of the Serampore Mission*, by John Clark Marshman (2 vols. Lond. 1859).

Carey'a, a genus of plants of the Myrtle order (section *Barringtoniæ*), mostly found in India, though one species is found in N. Australia. *C. sphærica*, of the Malayan Peninsula, has a tough bark fit for cordage. *C. arborea* is used for making boxes, hoops, &c. ; but the timber splits up when exposed to the sun, and is pervious to rain. The drums of the Sepoys in India were formerly made of it. The bark is manufactured into cordage, and when prepared is used in some parts of India as a slow match for firelocks. In Scinde the fleshy calyx is said to be good for curing colds (Black).

Cargill'ia, a genus of plants of the Ebony order (*Ebonaceæ*). The Illawarra black plum (*C. australis*) yields a useful close-grained wood. The grey plum (*C. arborea*) also produces a similar wood, and fruits which are eaten by the natives. These, the only true species of the genus, are natives of tropical Australia.

Car'go (Span. *cargâr*, 'to load'), the goods, merchandise, or whatever is conveyed in a ship, with the exception of live animals and persons. The *deck-C.* is the portion of it carried on deck, and is not usually included in the policy of insurance. The *C.-book* records the names of the vessel, the owner, the shippers, and consignees, the ports of departure and destination, the time of departure, and other particulars for the inspection of the officers of the custom house.

Ca'ria, the ancient name of a country in the S.W. angle of Asia Minor, about the exact boundaries of which the ancient geographers are not agreed. Part of it was mountainous, but it contained much fertile land in the basin of the Mæander and its affluents. The inhabitants claimed to be autochthonous. Under Persian protection, the Carian princes established a kingly government, with Halicarnassus for their capital. About 129 B.C. the Romans annexed C. to their province of Asia. The chief towns of C., Miletus and Halicarnassus, were famous in antiquity.

Caria'co, a seaport of Venezuela, 40 miles W. of Cumana, on a small stream and gulf of the same name, with an export trade chiefly in cocoa and coffee. Pop. 7500.—**The Gulf of C.** extends 35 miles from E. to W., is nearly enclosed by a long narrow tongue of land, and affords capital anchorage.

Caria'ma (*Microdactylus*, or *C. cristatus*), a species of *Grallatorial* or Wading birds, presenting also strong affinities to the *Rasorial* or Gallinaceous birds, and inhabiting S. America, Guiana, Paraguay, and Brazil. The C. averages the common heron in size. Its plumage is brown, mottled and interspersed with black or dark brown, and running into white on the under parts. It feeds on snakes, worms, insects, &c.

Caribbe'an Sea, an immense American inlet of the Atlantic Ocean to the N. of Venezuela, is bounded on the W. by Guatemala and Yucatan, and encircled on the N. and E. by the chain of the Greater and Lesser Antilles. It extends in about lat. 8°-22° N., and in long. 61°-89° W., and its principal gulfs are those of Honduras, Darien, and Maracaybo. The name of this sea, as also of the C. Islands (see ANTILLES), is derived from the *Caribs* or *Galibi*, a native American race, now all but extinct, which occupied the entire N. coast of the S. American continent, and also the W. Indies, at the discovery of America.

Carib'ee, Caribbean, or **Piton Bark**, the bark of *Exostemma floribundum* or *Caribæum*, a small tree of the W. Indies and Mexico, belonging to the natural order *Cinchonaceæ*. In the W. Indies it is known as the *Seaside Beech*. It is closely allied to *Cinchona*, and though it contains none of the alkaloids which give the value to that bark, yet in some respects it resembles it in properties, and is occasionally substituted for it.

Car'ica. See PAPUA.

Caricature' (Ital. *caricatura*, from *caricare*, to 'overcharge or exaggerate'), a representation in design or description in which the salient features of the subject are exaggerated, and point is thus given to the general likeness. The object of C. is to realise the ludicrous, and in effecting this object idealisation is ignored and harmony scorned. C. is thus a degenerate form of art. When, however, it is made the vehicle of satire, and thus abandons its usual function (to amuse), and rises to a higher one (to teach), it must be regarded as a worthy and honourable form of artistic expression. The arrows of Hogarth's satire are winged with C. C. is one of the oldest forms of art. Ancient Egyptian art is usually grave and sombre, yet it furnishes numerous specimens of C., while in the arts of Greece and Rome it has an important place. During the middle ages it flourished in every European nation, and in these, monks and priests were frequently chosen as its subjects. In contemporary British art the best examples of C. are to be found in the pages of *Punch* and *Vanity Fair*. See Wright's *History of C. and Grotesque* (Lond. 1865), and his C. Histories of the Georges (1868) and of Napoleon III. (1871).

Ca'ries (Lat. 'rottenness') is a term somewhat vaguely applied to any kind of ulcer in bone. C. proper, however, is an ulceration characterised by having fine needle-like pieces of bone in it, mixed up with marrow and weak flabby granulations. A probe passed into the ulcer sinks deep into the soft spongy bone. The portion of bone next to the ulcer is expanded by the opening out of its texture. The ulcer is uneven, being deeper in one part than another. C. may be simple or the result of a scrofulous constitution. It may be caused by an ulcer spreading to a bone from the soft tissues or from cartilages, or by excessive syphilis or mercury. It may occur in any bone, but most frequently shows itself in short or irregular bones as the Vertebræ (q. v.), the bones of the ankle, foot, wrist, or hand. In a long bone it generally appears near the articular end. C. in the vertebræ causes great deformity, producing curvature of the spine and humped back. It is always accompanied by more or less weakness of the general health. The proper treatment of C. consists in giving nourishing food, tonics, cod-liver oil, syrup of the iodide of iron. Injections of solution of chloride of zinc or the dilute mineral acids are often beneficial. In joints, excision is often practised with good results. Sometimes the diseased portion is removed by a gouge, or the whole bone may be removed when practicable.

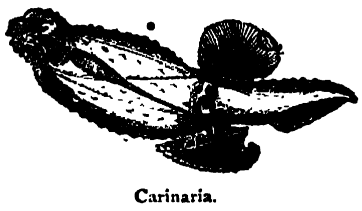
Caries of the Teeth is the term used to denote decay of that portion of a Tooth (q. v.) called the *dentine*. It may commence on the surface of the tooth or beneath the enamel. In its early stage the diseased parts may be scooped out, and the tooth stuffed with gold or cement; but when the pulp cavity of the tooth is exposed by C., extraction of the tooth is the proper remedy. See TOOTHACHE.

Caries, in plants, consists in the decay of the walls of the cells or vessels, and though not caused by fungi, is yet promoted by their presence.

Carigna'no, a walled town in the province of Turin, N. Italy, on the left bank of the Po, 11 miles S. of Turin, with silk manufactories, and a pop. of 4824. The district is fertile, but the atmosphere is very humid.

Carima'ta, an island, group of islands, and strait, to the S.W. of Borneo, between it and Billiton. The single island, which is much the largest of the group, is about 10 miles long and 5 broad, and attains a height of over 2000 feet.

Carinar'ia, a genus of aberrant *Gasteropodous* mollusca, included in the section *Heteropoda* or *Nucleobranchiata* of that class, and in the family *Firolidæ.* The gills are borne on the back, and are protected by a small univalve shell. The animal swims back downwards, by aid of a ventral fin-like organ, consisting of the modified 'foot;' whilst it may adhere to seaweed, &c., by a sucker-like disc borne on the foot. These animals occur as free-swimming organisms, chiefly in the tropical seas. *C. cymbium* is the familiar species.



Carinaria.

Car'inate Birds, or **Carinatæ,** is Huxley's name for one of the three great divisions into which he divides the class *Aves* or Birds. The *C. B.* include by far the vast majority of birds, distinguished by the fact that the breastbone or sternum possesses a prominent ridge or 'keel' (*Carina*). The ostriches, and other *Cursores* having flat or raft-like sterna, are named *Ratitæ;* whilst Huxley's third division, *Saururæ,* includes but a single bird, the extinct *Archæopteryx* (q. v.).

Cari'ni, an old town in the province of Sicily, S. Italy, 12 miles W.N.W. of Palermo, has a ruined castle, and some fishing and coasting trade. Pop. 9000.

Carino'la, a town in the province of Caserta, S. Italy, lies in a rich wine district, 20 miles S.E. of Gaeta. Its chief buildings are a cathedral and a convent of the Franciscan order. Pop. 6620.

Carinth'ia (Ger. *Karnten* or *Kärnthen*), a duchy and crown-land in the S.W. of the Austro-Hungarian Empire. Area, 4005 sq. miles; pop. (1869) 337,694. It is in great part mountainous, and is traversed from W. to E. by the Drave, with its tributaries the Möl, Lavant, Gail, and Gurk. The plains and valleys are well cultivated, and there is a large number of the inhabitants engaged in the rearing of horses, cattle, sheep, goats, and swine. There are also active manufactures of iron and steel wares, chiefly in Klagenfurt (the capital) and Villach. The export trade has been greatly promoted of late years by the Carinthian Railway. The Government has its largest lead-mines in the Villach Alps, where is found the finest mineral in Europe. C. is named from its earliest known inhabitants, the Celtic *Carni,* who in turn were so called from the horns or crags (Celtic, *carn;* comp. Lat. *cornu,* Eng. *horn*) of the rugged region. C. was under Noricum till the time of Augustus, who made it part of the Roman Empire. Soon after the fall of the Western Roman Empire the country was occupied by Slaves, who later required the service of a Frank called Samo to repel the encroachments of the Avari. Samo formed the extensive Slavic kingdom of Carantania, which after his death was annexed by Charlemagne, who made it a markgrafdom of the Frankish Empire. It was raised to a duchy in the 10th c., became part of Austria in 1335, and a crown-land in 1849. See Ankershofen, *Geschichte des Herzogthums Kärnten* (2 vols. Klagenf. 1857–59).

Cari'pe, a town of Venezuela, S. America, 50 miles E. of Cumana. Pop. about 5000. Humboldt, in his *Personal Narrative,* describes a vast cavern in the neighbourhood of C. which is frequented by countless numbers of the Guacharo (q. v.), a bird peculiar to S. America.

Cariss'a, a genus of Apocynaceous plants, consisting of shrubs with milky juice, natives of Asia and tropical Australia. *C. Carandas* of India is employed for fencing; the fruits are also eaten as a conserve. The bark and wood (*Bois amere*) of C. *Xylopicron* of the Mauritius and Bourbon are used by the natives in diseases of the urinary organs. Cups are made of its wood, in which water is allowed to stand until it gets bitter, as in the 'bitter cups' of quassia in this country (Masters).

Car'jacou, or **Car'iacou** (*Cariacus Virginianus*), a species of *Cervidæ* or deer inhabiting N. America, and sometimes known as the 'Virginian deer.' The horns of the adult males are bent backwards, and then sharply turned forwards, so as to bring the tips above the nose, or nearly so. 'Snags' or branches are given off, one at the inner side of the base of each horn, and several on the posterior edge. The colour of the animal is reddish-brown in spring, bluish in autumn, and brown in winter. The belly, throat, chin, and inner aspects of the limbs are white. The adult is about 5 feet in length. The C. is easily domesticated if taken young.

Car'len, Emilié, a Swedish novelist, the youngest of a family of fourteen, was born at Stromstad, 8th August 1807. Her maiden name was Schmidt. She was married in 1827 to a physician called Flygare, who died in 1833, and again in 1841 to J. Gabriel Carlen, author and lawyer. Her first literary effort was *Waldemar Klein* (1838), since which time she has poured forth a constant stream of novels, many of which have been translated into English. The principal are *Ivar, or the Skjuts Boy; Woman's Life; John, a Novel; The Hermit; Marie Louise; Julie, or Love and Duty; Gustaf Lindorm, the Guardian.* They deal chiefly with humble life, and are very popular.

Carle'ton, William, an Irish novelist, was born in 1798, at Prillisk, Tyrone. After a youth of poverty he betook himself to Dublin, where, in 1830, he published his *Traits and Stories of the Irish Peasantry* (5th ed. 1864). It was well received, as was also a second series. C. has produced various humorous and pathetic tales, among others *Fardorougha the Miser* (Dub. 1839); *Rody the Rover* (Dub. 1846); *The Black Prophet, a Tale of Irish Famine* (Dub. 1847); *The Tithe Proctor* (Dub. 1849); *Willy Reilly* (Dub. 1855); *The Evil Eye* (Dub. 1860). They give faithful, touching pictures of the life of the Irish peasantry —the class to which C. belonged. He died January 30, 1869.

Car'li, Giovanni Rinaldo, Count, an Italian archæologist, sometimes called **C. Rubbi,** after his wife, was born at Capo d'Istria, 11th April 1720, and studied at the University of Padua. In 1741 he was appointed Professor of Navigation and Astronomy by the Senate of Venice, but resigned his professorship in 1749, and retired to Istria. In 1771 he was made President of the Council of Commerce and Finance at Milan, where he died, 22d February 1795. A collected edition of his works was published at Milan (1784–94) in 18 vols. They embrace a wide range of subjects in literature, science, and economics. Among the most noteworthy are his treatises, *Delle Monete e dell' Istituzione delle Zecche d'Italia* (3 vols. 1754–60), and his *Delle Antichità Italiche* (5 vols. Mil. 1788–91).

Car'line Thistle (*Carlina*), a genus of plants of the natural order *Compositæ.* The legend attached to it is that an angel appeared to the Emperor Charlemagne pointing out the C. T. as a remedy for the plague, hence the name. Linnæus, however, ascribes the name to the Emperor Karl V., whose army was relieved in Barbary of the plague by the same remedy. *C. acaulis* grows over the middle of Europe, and is in great repute as possessing in its roots drastic purgative qualities: its use is now almost confined to veterinary practice. *C. vulgaris* is the only British species: it grows on poor soils. *C. gummifera* and other species contain a resin in which the active properties are believed to reside.

Car'ling, Carle, or **Care Sunday,** the fifth Sunday in Lent, on which carlings, or parched peas, used formerly to be eaten.

Carlings, in shipbuilding, are short beams laid fore and aft with their ends secured into the great transverse beams. They help to support the deck, and to bind together the principal beams.

Carlisle', a city in the N. of Cumberland, at the confluence of the Eden, Caldew, and Peteril, 12 miles E. of the Solway Firth, 60 W. of Newcastle, and 105 N.N.W. of Manchester. It lies in a beautiful and fertile district, is steadily extending, and has several fine streets, diverging from the large market-place as a centre. Its principal modern buildings are the court-houses and county gaol, the Cumberland infirmary, enlarged in 1874, the post-office, the Citadel railway station, and the local banks. In front of the court-houses stands a white marble statue of William Earl of Lonsdale, and in the market-place is another, erected in honour of Mr James Steel, a distinguished local journalist. The railway station is the terminus of no fewer than eight lines. C. Castle, in which Queen Mary Stuart was imprisoned in 1568, is still used as barracks. C. has been the see of a bishop since 1101, and four canons are attached to its celebrated cathedral, which is a small red-freestone building, partly of Norman and partly of Early English architecture, and reputed to have the finest east window in England, consisting of nine richly-coloured lights. It was founded by William Rufus, and dedicated by Henry I. in 1101. C. has manufactures of cotton, woollens, linen, leather, iron, and hardware. It has also valuable salmon-fisheries. Silloth (q. v.) is its port. It returns two members to Parliament. Pop. (1871) 31,049. C. was probably a British town before the Roman invasion, and is thought to be the site of the Roman station *Lugovallum*. But it first becomes historical in the poems of the Welsh bards, where it appears as *Caer Liwellydd*, of which the modern name is a corruption. It was the residence of the British Kings of Cumbria, and was sacked by the Angles of Northumbria about 680. In the 11th c. it began to emerge from obscurity, and subsequently, till the union of England and Scotland, it continued, as a fortress, to play a conspicuous part in Border history. In 1745 it readily surrendered to Prince Charles Stuart, but it was recaptured by the Duke of Cumberland, who summarily executed many of the citizens. In the vicinity of C. have been found many Roman antiquities, mainly coins, altars, and brass vases.

Carlisle, a flourishing town of Pennsylvania, 125 miles W. of Philadelphia, and 18 S.W. of Harrisburg by railway. It lies in the Great Limestone Valley, between the Kittatinny and South Mountains, is the seat of a Methodist College (Dickinson's), and has increasing manufactures, chiefly of machinery. Pop. (1870) 6650.

Carlisle, Frederick Howard, Earl of, was born 28th May 1748, and succeeded to the earldom at the age of ten. His mother, Isabella Byron, was a sister of the famous admiral and navigator. C. was educated at Eton and Oxford. In 1780 he was appointed Viceroy of Ireland, and was for a time an opponent of Pitt in Parliament, but changed his politics after the outbreak of the French Revolution. He died 4th September 1825. C. was an able politician, but is best known by his contributions to literature, which were published in a collective form in 1801 under the title of *Tragedies and Poems*, and gave occasion to a recklessly bitter note in Byron's *English Bards and Scotch Reviewers*.—**George William Frederick Howard**, Earl of C., son of the preceding, was born April 18, 1802, and educated at Eton and Oxford, where he won the Chancellor and Newdegate prizes for Latin and English verse. C. entered Parliament as a Liberal, sitting first for Morpeth, and subsequently for the West Riding of Yorkshire. Under the administrations of Lord Melbourne, Lord John Russell, and Lord Palmerston, he held various offices, including those of Chief Secretary for Ireland, Chief Commissioner of Woods and Forests, Chancellor of the Duchy of Lancaster, and Lord-Lieutenant of Ireland. He died 5th December 1864. He was a man of literary taste and culture. Besides delivering lectures on America and on the writings of Pope, &c., he wrote a *Diary in Turkish and Greek Waters* (1854), and a book on Prophecy.

Carlo Alber'to Amede'o, King of Sardinia, born 2d October 1798, a son of Prince Carlo Emanuele of Savoy-Carignan, who died in 1800. C., connected through his mother with the house of Saxony, married in 1817 Maria Theresa, daughter of Ferdinand of Tuscany, and on the Piedmontese revolution of 1821, became for a short time Regent of Sardinia, introducing a constitutional government, which was repudiated by Carlo Felice, the successor of Vittorio Emanuele on the throne. After acting for two years as Viceroy of Sardinia, C. succeeded, his title having been previously recognised by the Congress of Vienna. At first, Austrian influence and the fear of Carbonarism, thwarted the essentially Liberal intentions of the new King, but after the accession of Pio Nono, the army was nationalised, the press laws modified, and, when the year of revolutions came, C. was able to assist Lombardy against the Austrians with a large and enthusiastic army. The superior numbers under Radetzky were victorious at Villafranca, Milan, and Novara (1849), and C., abdicating in favour of his son, Vittorio Emanuele II., retired to Oporto, where he died, 28th July 1849. C. patronised the fine arts.

Carlo Emanue'le I., called 'the Great,' Duke of Savoy, born at Rivoli, 12th January 1562, succeeded his father, Filiberto Emanuele (Iron-head), and married in 1585 Catherine, the youngest daughter of Philip of Spain. His favourite policy was to gain a footing in Provence and Saluzzo by playing the part of a Catholic liberator; he even laid claim to the French crown on the death of Henri III., whose cousin he was; but in 1597 the Protestant leaders, Lesdiguières and La Valette, forced him to withdraw from Provence. Compelled in 1601 to give up several districts in the department of Ain, and unsuccessful in his attacks on Geneva, C. at last became the ally of France, and for several years was in the field against the Spanish power in N. Italy, where he obtained the territory of Montferrat. C. was put forward by the Protestant Union as a candidate for the empire at the death of Matthias. The league against the action of Spain against the Protestants of Valtellina, a war with Geneva about the territory of Zuccarello, and the invasion by Louis XIII. of Savoy and Piedmont, fill up the rest of C.'s life. He died at Savillan, 26th July 1630, leaving a military reputation which was not founded on military success.

Car'los, Don, Infante of Spain, born July 8, 1545, at Valladolid, was the son of Philip II. by his first wife, Maria of Portugal. Originally declared the King's heir, he was afterwards passed over for his cousin Rudolfo, and in consequence is supposed to have entered into a plot against the King and his favourite, the Duke of Alva. At all events, on the declaration of a priest who divulged what had been said in confession (Christmas Eve, 1567), he was found guilty of conspiring against the King's life, and imprisoned. He died July 24, 1568. It was suspected at the time that he had been poisoned or strangled, but of this there is no proof. His fate has been made the subject of dramas by Montalvan (Spanish), Alfieri (Italian), Schiller (German), and Russell (English). See Prescott's *History of the Reign of Philip the Second* (Bost. 1856), and Gachard's *Don C. et Philippe II.* (Bruss 1863), which contains a complete collection of the original documents.

Carlos de Bourbon, Don Maria Isidor, born March 29, 1788, was the second son of Charles IV. of Spain, and brother of Ferdinand VII., who obtained the Spanish throne after the expulsion of the French. He is solely notable for his attempts to gain the throne, his pretensions to which were blasted by the birth of a daughter (the late Queen Isabella) to Ferdinand, and the abrogation of the Salique law, excluding females from the throne. After Ferdinand's death, his claims, although supported by Dom Miguel in Portugal, were not acknowledged by the European powers, and, after he had made an attempt to excite an insurrection, were rejected by the constituent Cortes. In 1844 he abdicated in favour of Don C., his eldest son, and went to live at Trieste, where he died, March 10, 1855.—**Don Carlos**, the younger, better known as the Count de Montemolin, born January 31, 1818, endeavoured, but also in vain, to obtain the throne, and, in 1860, being arrested in France, signed a renunciation of his claims. He died January 14, 1861.—The third Carlist pretender, also calling himself **Don Carlos**, is the nephew of the Count de Montemolin, being the son of his brother Juan, and was born in 1848. After the revolution which expelled Queen Isabella in 1868, Carlist risings took place in various parts of Spain, and from 1871 to 1875 Don C. was established in the Basque Provinces. His troops inflicted several defeats upon the forces, Republican and Alphonsist, opposed to them, but were subsequently completely crushed. The surrender of Estella (February 1876) compelled Don C. to flee into France, and the miserable struggle is now over, at least for a time.

Carlos, San, a town of Venezuela, S. America, on the Aguare, a tributary of the Apure, about 70 miles S.S.E. of Valencia. The rearing of cattle and the cultivation of indigo, cotton, and coffee are the principal industries. The prosperity of this town was seriously damaged by the wars of independence; but it has more than recovered its former wealth and importance. Pop. (1873) 10,420.

Car'lovicz, or **Karlovitz**, a town in the military frontier of the Servian Banat, Austrian Empire, on the right bank of the Danube, 8 miles S.S.E. of Peterwardein. It is the seat of the patriarch and metropolitan of the 'non-united Greeks,' has a theological school belonging to that sect, and a gymnasium. Pop. (1869) 4419. From the vineyards on the mountains in the vicinity is obtained a large supply of a strong red wine which is classed with the choicest vintages of Hungary. At C. was concluded, 26th January 1699, a treaty of peace between Turkey and the Allies, Germany, Russia, Poland, and Venice, by which

Hungary was finally secured to Austria. In 1848-49, C. was the centre of the Servian revolt against the leadership and domination of Hungary.

Carlovingian or **Carolingian Dynasty,** a Latinised spelling of the name of the second German dynasty that ruled in France. See KAROLINGS.

Carlow, an inland county of Ireland, province of Leinster; area, 346 sq. miles; pop. (1871) 51,650, being a decrease of 5487 since 1861. It is triangular in shape, with the vertex towards the S., and is hilly on its E. and W. borders, but the greater part is level and fertile. The chief rivers are the Slaney and the Barrow. In 1873 there were 79,416 acres under grain crops; potatoes and turnips were largely cultivated; and about a third was in meadow and clover. There are many flour-mills along the Barrow, and malting and distilling are important industries. Flour, oatmeal, and dairy produce are exported, and a good deal of bacon is cured for the home market. C. returns two county members to Parliament. There are cromlechs near C. and Hacketstown on the Dereen.

Carlow, the capital of the county of C., on the left bank of the Barrow, where it is joined by the Burren, 56 miles S.W. of Dublin by rail. The Irish form of the name is *Cetherloch,* pronounced *Caherlough* ('quadruple lake'), there being a tradition that the Barrow here at one time formed four lakes; and early English writers spell it *Catherlogh.* C. consists mainly of two streets, and the suburb of Graigue in Queen's County. It has a Roman Catholic cathedral, and a college for the education of Roman Catholics, founded in 1789, and enlarged in 1828. There are large grinding-mills both on the Barrow and the Burren, and an extensive trade is carried on in butter and agricultural produce. The castle, founded by the De Lacys about the close of the 12th c., remained in an almost complete state till 1814, when an attempt was made to reduce the thickness of the walls and to enlarge the windows by gunpowder, and the greater part was destroyed. Pop. of C. proper (1871), 6526; of portion in Queen's County, 1316; total, 7842. The town returns one member to Parliament.

Carlsbad. See KAISER-KARLSBAD.

Carlscrona. See KARLSKRONA.

Carlshamm. See KARLSHAMM.

Carlsruhe. See KARLSRUHE.

Carlstad. See KARLSTAD.

Carlstadt. See KARLSTADT.

Carludovi'ca, a genus of plants of the natural order *Pandanaceæ.* The young unexpanded leaves of *C. palmata* furnish the material out of which Panama hats are made. One of these hats sometimes takes three months to make, and costs as much as £30.

Carluke', a burgh in the upper ward of Lanarkshire, near the right bank of the Clyde, 19¼ miles E. by S. from Glasgow, and a station on the Caledonian Railway. The district is rich in iron and coal. About a mile from the town are the large works of the Shotts Iron Company. C. is the birthplace of General Roy, the famous military antiquary. Pop. (1871) 3423. Many Roman relics have been found in the vicinity.

Car'lyle, Alexander, D.D. (born January 26, 1722; died August 25, 1805), for fifty-seven years minister of the parish of Inveresk (Musselburgh), is chiefly known as the contemporary and friend of Hume, Home, and Robertson, and as one of the leaders of the Moderate party in the Church of Scotland. He was a man of singularly fine presence, being popularly known as *Jupiter C.,* and described by Sir Walter Scott as 'the grandest demigod I ever saw.' His autobiography, containing *Memorials of the Men and Events of his Time,* was published in 1860 under the editorship of Mr (now Dr) John Hill Burton. It is admitted to be one of the best books of the autobiographical kind, and its shrewd, lively sketches of the men and manners of the period in which he lived are invaluable for historical purposes.

Carlyle, Thomas, the 'censor of the age,' and one of the greatest forces in British literature, was the eldest son of a shrewd Scotsman, mason and farmer, of Ecclefechan village ('Entepfuhl'), in Hoddam parish, Dumfriesshire. There, in the Arched House, C. was born, December 4, 1795. After receiving instruction at the old parish school and the burgh school of Annan, C. proceeded in 1810 to the University of Edinburgh, with the intention, afterwards abandoned, of studying for the ministry of the Scotch Church. He applied himself to classics, and still more to mathematics and general literature, with such energy that he injured his very robust health. After finishing the Arts curriculum, he was appointed mathematical teacher in the burgh school of Annan, a post which he held for two years, when he obtained a similar situation in the burgh school of Kirkcaldy. His stay there is chiefly notable for his making the intimate acquaintance of Edward Irving, another Annan schoolboy, and then master of an adventure school in Kirkcaldy. In the end of 1818, C. left Kirkcaldy for Edinburgh, where he read hard for three years, and contributed articles to Brewster's *Edinburgh Encyclopædia.* In 1821 C. became tutor to Charles Buller. In 1823 he sent to the *London Magazine* the first part of his *Life of Schiller;* and in 1824 produced a translation of two very dissimilar works, Legendre's *Astronomy* and Goethe's *Wilhelm Meister,* the latter of which was severely treated by several critics, including De Quincey and Jeffrey. Next year his *Schiller* appeared in a complete form. For some time afterwards, C. occupied himself with translating German romances. In 1826 he married Miss Jane Welsh, a lineal descendant of John Knox, and two years later retired to the farm of Craigenputtoch, his wife's property, about 15 miles N.W. of Dumfries, and described by him in a letter to Goethe as the 'loneliest nook in Britain.' There he contributed to various reviews that celebrated series of articles subsequently republished under the title of *Miscellanies,* on French, and still more on German, authors, such as Goethe, Novalis, Heyne, Schiller, Werner, and Richter (which may be said to have opened for most Englishmen the treasury of German literature); and there he also produced his first great and purely original work, *Sartor Resartus,* which, after being rejected by several London publishers, appeared, in 1833-34, in *Fraser's Magazine.* He had removed to No. 5, Cheyne Row, Chelsea, before this date; henceforth his reputation was established, and since has steadily grown. Of later works the chief were *The French Revolution* (1837); *Chartism* (1839), *Past and Present* (1843), and *Latter-Day Pamphlets* (1850), assailing in terms of unmeasured contempt the corruptions, as he deems them, of British society and politics; *Oliver Cromwell's Letters and Speeches* (1845), the work that first won for him the admiration and confidence of the entire English public, and in which his extraordinary power of taking trouble with a subject was first brought home to the English mind; *Life of John Sterling* (1851); *History of Friedrich II. of Prussia, called Frederick the Great* (1858-65), in which the qualities visible in his *Cromwell* once more appear, but in a far more striking and powerful way; and, in 1875, *Early Kings of Norway,* with *Portraits of John Knox,* which had previously appeared in *Fraser's Magazine.* Several editions of his works have been published, of which that by Chapman & Hall (34 vols.) is the latest and best. Between 1837 and 1840, C. also delivered in London four series of lectures on German literature, on the history of literature, on the revolutions of modern Europe, and on heroes and hero-worship, which made a powerful sensation at the time they were delivered. According to Leigh Hunt, 'it was as if some Puritan had come to life again, liberalised by German philosophy and his own intense reflections and experience.' In the session of 1865-66, C. was elected Lord Rector of Edinburgh University by the students, and on April 2d of the latter year delivered a characteristic installation address. Within three weeks he had lost the loving helpmate of forty years, and thenceforth he wrote little, albeit too much. He died at Chelsea, February 5, 1881, and was buried at Ecclefechan. Of the value of C.'s opinions on life, society, and politics it is not yet time to speak. Whatever may be the final verdict of history, one thing will always be gratefully allowed, that he breathed into literature a nobler, purer, and sterner spirit than ever animated it before. The moral influence of his writings has been incalculably great, and will continue to operate beneficially long after other thoughts than C.'s have acquired dominion over the mind of the nation. Nor can we easily imagine an age so far sunk in triviality and impotence that it will be indifferent to the picturesque creations of an imagination unsurpassed in this century, or to a humour which combines the riot of Rabelais with the grimness of Knox. See his *Reminiscences* (2 vols. 1881), 'edited' by Mr. Froude, who is also preparing his Biography.

JOHN AITKEN C., M.D., LL.D., a younger brother of Thomas

C., was born at Ecclefechan, July 7, 1801. He is known chiefly as the author of a very fine translation of Dante's *Inferno* (1849). A contributor also to magazines, he died at Dumfries, September 15, 1879.

Carmagno'la, a town in the province of Turin, N. Italy, near the Po, 15 miles S. by E. of Turin. It has an active trade in silk, flax, hemp, corn, and cattle, and manufactures of jewellery. Pop. 12,519. C. is the birthplace of the famous Venetian general, Francesco Bussone.

Car'magnole, a notorious song during the French Revolution, which was accompanied by a dance to the refrain :—

'Dansons la Carmagnole ;
Vive le son
Du canon !'

It was named after the town Carmagnola, in Piedmont, because Savoyard boys frequently went about with it. The word was also applied to a kind of jacket, the wearing of which was considered patriotic, and to the high-flown reports about the achievements of the French army which were issued.

Car'mel (Heb. 'a garden'). 1. A mountain ridge in Palestine, which branches off from the N. end of the mountains of Samaria, runs N.W. between the plains of Sharon and of Esdraelon, and the N.W. extremity of which projects far into the sea, forming a bold promontory, the only one along the whole coast of Palestine. Its length is about 16 miles, and its highest point 1750 feet above the sea. 2. A town in the mountains of Judah, the residence of Nabal (1 Sam. xxv.).

Carmel, Knights of Mount, an order of knights, consisting of a hundred French gentlemen, each of whom could prove at least four descents of nobility by both father and mother. It was instituted by Henri, King of France and Navarre, was confirmed by a bull of Pope Paul V. in 1607, and was incorporated with the order of the Knights of St Lazarus of Jerusalem. The specialty of the Knights of Mount C. was personal attendance on the king during war.

Car'melites, an order of monks, founded on Mount Carmel by Berthold, Count of Limoges, about 1156. They were driven from the place of their institution by the Saracens, and became a mendicant order in 1247, when Simon Stoch was their general. They were subsequently divided into several branches, one of which is the barefooted C. The order of C. nuns was instituted in 1452. Both still exist in Roman Catholic countries.

Carmin'atives are medicines that remove flatulency. They are so called because they were supposed to act like a charm (*carmen*). All warm and stimulating aromatics are C.

Car'mine, a very beautiful brilliant scarlet colour, consisting of carminic acid, the colouring matter contained in the cochineal insect (*Coccus cacti*). C. is soluble in water, and is of great value as a painter's colour, chiefly for miniature painting and as a water-colour. It is also employed in the dyeing of wool when a brighter colour than can be produced even by aniline dyes is desired. C. is ordinarily prepared by boiling cochineal with carbonate of potash, to which after boiling a proportion of alum is added. In a short time the remains of the cochineal fall to the bottom, and the clear liquid is again put over the fire with a proportion of isinglass dissolved in a large quantity of water. The vessel is removed from the fire at the point of boiling and briskly stirred, after which the C. begins to deposit, which it does completely in about twenty minutes. When drained and dried it is ready for use. C.-lake is a compound of C. and alumina, and is the form in which the colour is chiefly used for water-colours. Madder-C. is a scarlet lake prepared from madder root. The rouge which is used on the stage and elsewhere ought to owe its tint to C.

Car'möe, or **Kar'moe**, an island on the W. coast of Norway, at the entrance of the Bukke Fiord, 20 miles N.W. of Stavanger. It is 21 miles long and 5 broad, and has about 6400 inhabitants, chiefly engaged in fishing and in cattle-rearing.

Carmo'na, a town of Spain, province of Seville, on a mountain ridge overlooking a fertile, olive-clad plain, about 20 miles N.E. of Seville. The oriental walls and castle, with the old Gothic church, give it a most picturesque appearance : the gate leading to Cordova is particularly striking. Pop. (1860) 15,121.

Car'nac, a small village in the department of Morbihan, France, on a height near the sea, 16 miles W.S.W. of Vannes. Pop. of commune (1872) 2823; of village, 603. It is celebrated for its Celtic remains, some 4500 inverted granite obelisks, varying in height from 3 to 18 feet, and disposed in eleven parallel rows. The origin and purpose of these remains is uncertain.

Carnahu'ba, Carnaüba, or **Caranaiba Palm** (*Copernicia* or *Corypha cerifera*), a fine species of palm, a native of the northern parts of Brazil, where it exists in great forests. Wax forms on the under surface of the leaves, and can be collected by shaking them. It is used in the manufacture of candles. It has been imported into Britain, under the name of Carnaiba or Brazilian wax.

Carnar'ia, Cuvier's name given to an order of mammalia including the *Feræ* or beasts of prey of Linnæus (excepting the *Marsupials* or pouched mammals), and also the *Cheiroptera* or bats, which Linnæus placed with man and monkeys in his order *Primates*. Cuvier's division thus included the modern orders *Carnivora*, *Insectivora*, and *Cheiroptera*, and the characters of these groups were derived from the nails or claws of the toes, the absence of opposable thumbs, and the presence of the three kinds of teeth ; the dentition, however, varying according to the nature of the food.

Carnar'von, Henry Howard Molyneux Herbert, Earl of, eldest son of the third Earl of C., who had a reputation both as a scholar and a poet, was born in London, June 24, 1831. Educated at Eton and Christ Church, Oxford, where he graduated in 1852 as a first-class in classics, C. (who represents a younger branch of the Pembroke family) succeeded to the title in his minority. He entered the House of Lords as a Conservative, was complimented on his first speech by Lord Derby, and in 1858 became Under-Secretary for the Colonies, in which post he showed considerable business ability. Retiring from office with his party, he travelled in the East, and in 1860 published a work on *The Druses of Mount Lebanon*. He joined Lord Derby's third administration in 1866 as Colonial Secretary, and as such prepared the plan for the confederation of the British N. American colonies, which has had such good results. He resigned, however, on account of a difference of opinion from his leading colleagues on the subject of parliamentary reform in 1867, but joined, in his former capacity, Mr Disraeli's second administration in the beginning of 1874. His second occupancy of this office has been marked by the annexation of the Fiji Islands to the British Empire, and the preparation of an elaborate scheme for the confederation of the British colonies in S. Africa. No English statesman enjoys a greater measure of public confidence and goodwill.

Carnat'ic (properly *Carnâtaka*, or Carnata, *i.e.*, blackland), the former name of the S. part of the Indian peninsula, extending from Cape Comorin to the river Kistna, and lying between the Coromandel and Malabar coasts.

Carna'tion, one of the finest of garden flowers, a variety of *Dianthus Caryophyllus*, the clove pink. It has long been a favourite plant, and is now found in numerous varieties, such as *Flake C.*, *Bizarre C.*, *Picotees*, *&c.* The Spanish C. is *Poinciana pulcherrima*.

Carnations (Lat. *caro*, 'flesh'), in painting, are the parts of a picture in which the nude form appears, and in which the texture and glow of the body is sought to be realised by flesh-tints. Among the old masters the practice of painting from the nude was more general than in later times, and the C. of the works of the great colourists of the Venetian school are consequently more brilliant and truthful than those of modern artists.

Carne'ades, a Greek philosopher, born at Cyrene, B.C. 213, was the pupil of Diogenes the Stoic, and of Hegesippus the Academic, to whose chair he succeeded. After his embassy to Rome, B.C. 155, where his sceptical theory of justice provoked the anger of Cato the Censor, he taught the new academy at Athens, where he died at the age of ninety. As his predecessor Arcesilaus had opposed Zeno, so C. opposed to the stoic Chrysippus the doctrine of the acatelepsy, or incomprehensibility of all things in themselves. This meant that perception cannot be shown to resemble the object perceived in either primary or secondary qualities, but is only related to it as its effect upon the nervous system of man. From this C. rashly inferred the uncertainty of human knowledge, practical certainty being dependent on uniformities of co-existence and succession, not on metaphysical resemblances (Ritter & Preller, *Hist. Phil.*). C. is called by Cicero 'acerrimus et copiosissimus.'

Carne'lian (Lat. *caro*, 'flesh'), a variety of chalcedony, semi-transparent, coloured red, brown, or yellow by oxide of iron, and sometimes white. The rich Oriental variety is called Sard (q. v.). C. is an abundant mineral, and is formed into seals, brooches, and other personal ornaments.

Carnio'la (Ger. *Krain*), a crown-land of the Austrian Empire: area, 3860 sq. miles; pop. (1869) 466,334. The surface is rugged and mountainous, the Carnic Alps, with their ramifications, occupying that portion N. of the Save, and the Julian or Krainer Alps the central and southern parts. The highest point is the Terglow, 9397 feet, on which is the solitary glacier of C. The Save is the principal river. The chief productions of the soil are rye, barley, oats, potatoes, flax, and in some places maize and vines; while the minerals are iron, copper, lead, coal, marble, and especially cinnabar, the quicksilver mines of Idria having been long famous. There are manufactures of linen, leather, lace, pottery, &c., and a considerable trade in timber and firewood. The Lake of Zirknitz (q. v.), the quicksilver mines, and the grottoes of Adelsberg, are 'the three sights of C.' Laybach is the capital.

Like Carinthia, the name C. points to a primitive Celtic population from whom the country must have received its name, 'the craggy' or 'the rugged.' Some time after the fall of the Roman Empire it appears in the possession of a Slavic race, from whom it was conquered by Charlemagne, who gave it to the Dukes of Friuli. After various changes it finally passed, in the 13th and 14th centuries, into the possession of the Hapsburgs, and has ever since formed part of the Austrian Empire.

Car'nival (Lat. *caro*, 'flesh,' *vale*, 'farewell'), a season of revelry, masquerading, and buffoonery in Italy, which originally began on the feast of Epiphany or Twelfth Day—January 6th—and ends on Shrove or Pancake Tuesday, which is called also Fasten-Even—the day to which 'farewell to flesh,' the etymological meaning of the word C., strictly refers, because next day is Ash Wednesday, on which the fasting and austerity of Lent begin. In modern times the C. season is restricted to the eight days before Ash Wednesday. Relics of the ancient heathenism of both the S. and the N. of Europe are observable in its usages. Milan and Naples were once celebrated for their observance of the C., but it was carried to its greatest perfection in Venice. At present it is seldom heard of elsewhere than at Rome.

Carniv'ora, an order of mammalia, represented by such animals as lions, tigers, dogs, wolves, bears, seals, hyænas, civets, weasels, &c., &c., and distinguished by possessing two sets of teeth, consisting of the three kinds found in a perfect dentition. The incisors are generally six in each jaw, save in some seals; the canine teeth always number two in each jaw, and are very large and prominent; whilst the præmolars and molars usually possess cutting edges—although in some animals (*e.g.*, bears) which feed on vegetable as well as on carnivorous matter, the molars may be blunted or tuberculate. The clavicles are rudimentary or wanting. The toes possess sharp claws; the teats are abdominal, and the Placenta (q. v.) is deciduate and zonary. The C. are divided into the *Pinnigrada* (q. v.) (seals), *Plantigrada* (q. v.) (bears, racoons, badgers, &c.), and the *Digitigrada* (q. v.) (lions, tigers, dogs, &c., &c.).

Car'not, Lazare Nicolas Marguerite, born at Nolay, a small village in Burgundy, 13th May 1753, studied at Paris and the military school of Mezières for the engineer service, in which, in 1784, he obtained a captaincy. His first important mathematical work, an *Essai sur les Machines en Générale*, appeared in 1786. Elected to the Legislative Assembly in 1791, he spoke chiefly on military affairs. In the National Assembly, after the deposition of the King, C. rose in importance, and his energy on the frontiers in 1793 made him practically the leader of the Committee of Public Safety. He organised the fourteen armies which destroyed the first coalition, and conquered the Low Countries. After narrowly escaping condemnation as a Terrorist, C. was elected to the Directory, where perhaps the hostility of Barras marred the success of his military administration. The revolution which Augereau and Barras accomplished in the interests of Bonaparte drove C. to Germany. He returned in 1799 as Minister of War under the First Consul, but soon retired to the country, where he composed his celebrated *Traité de la Défense des Places*. He was again called to the Tribune, in which he opposed the gradual foundation of the Empire, and once more retired to the cultivation of his favourite mathematical and mechanical science. In 1814 he offered himself to the falling Bonaparte, and was intrusted with the defence of Antwerp against the Allies; and during the 'Hundred Days' he acted as Minister of the Interior, believing in the possibility of a republic. By the influence of the Emperor Alexander he was allowed to retire to Warsaw, and then to Magdeburg, where he died, 2d August 1823. C.'s merits as an engineer and a mathematician have been questioned, but not his austere loyalty to republican principles. See Arago's *Biographie de C.* (1850), and *Mémoires of C.*, edited by his son (2 vols. 1861-64).

Car'ob, Algaroba, or **Locust-Tree** (*Ceratonia Siliqua*), a tree of the natural order *Leguminosæ*, sub-order *Cæsalpinieæ*), a native of the Mediterranean region, the pods of which are much used by the Arabs and poorer inhabitants of that region. They are also given to horses, and of late years they have been imported into Britain for that purpose under the name of *Locust Beans* or *St John's Bread*, from the idea that they were the 'locusts' on which, in addition to wild honey, St John lived during his wanderings in the wilderness. Undoubtedly, however, the food of the apostle was the insect of the same name, which to this day forms a large portion of the food of the inhabitants of the same region. It is also believed—though on somewhat fanciful grounds—that they formed the 'husks' of which the Prodigal Son of the New Testament would 'fain have filled his belly' after he had 'wasted his substance with riotous living.' Some trees will yield as much as 800 or 900 lbs. The wood is also hard, and valued as a timber; and the bark and leaves are used for tanning. The Locust-Tree of America (q. v.) belongs to another genus altogether.

Caroli'na Allspice. See CALYCANTHUS.

Carolina, North ('the Old North State'), is one of the original thirteen states of the Union. It is bounded on the N. by Virginia, on the S. by S. Carolina and Georgia, and on the W. by Tennessee, and it lies between 33° 53′ and 36° 30′ N. lat. Its greatest breadth is 180 miles, and from Cape Hatteras, on the Atlantic, to its western limit it is 490 miles in length, the area being 50,704 sq. miles. The soil is extremely poor. Inland for 80 miles it is sand and swamp. Part of the Great Dismal Swamp is on the N. Behind this tract the land rises into wooded hills onward to the Appalachian ranges, crowned with Mount Buckley, 6775 feet, the highest point E. of the Mississippi. The mountain region, having Asheville, Buncombe county, for a centre, has a very healthful and genial climate.

On the coast there are Albemarle and Pamlico Sound—sheets of shallow water separated from the ocean by low, sandy islands—the navigation of which is difficult. The chief rivers are the Roanoke, which flows into Albemarle Sound; the Neuse, entering Pamlico; and the Cape Fear River, on which stands the port of Wilmington. The principal towns are Raleigh (the capital), Fayetteville, and Wilmington. Pitch, tar, and turpentine are produced in immense quantities from the pine forests, and are valued at $2,000,000 annually. In the early part of this century N. C. was the chief gold-mining state in the Union. Coal, iron, and copper are also found. In 1872 the cotton crop was 167,653 bales, and in 1870 the farm produce was $57,845,940, and all property $260,757,244. Provision has been made in the constitution of 1868 for public schools, but the education of the common people is backward, and there are many '*poor whites*.'

The earliest English settlement in N. C. was made at Roanoke in 1587, but the colonists were never afterwards heard of. The next settlers came from Virginia about 1650. In 1662 the land was granted to Clarendon, Ashley, and six other noblemen, by Charles II., hence the name *Carolina*. John Locke, in 1672, framed his scheme of government for the Carolinas, but it was soon abandoned. The *proprietary* lasted till 1719, when the Carolinas were separated and granted a royal government. Prior to the Revolution many Highlanders settled in the state, and the Gaelic tongue was maintained till recent times.

N. C. sends eight members to the House of Representatives. The state debt is $34,095,045. Pop. in 1870 (blacks 391,630), 1,071,361.

Caroli'na Pink. See SPIGELIA.

Carolina, South, one of the original thirteen states of the Union, lies between 32° and 35° 10' N. lat., having N. Carolina on the N., and Georgia on the S. and W. Area, 29,385 sq. miles. There is a coast-line of 200 miles on the Atlantic, fringed with islands which produce the finest sea-island cotton. For 100 miles inland the land is low, swampy, and unhealthy. It then ascends to the N.W. border, where the mountains are 4000 feet high. The chief rivers are the Great Peedee, navigable to Cheraw, the Santee, and the Savannah. The soil produces rice, tobacco, indigo, sugar, maize, and above all, cotton—the cotton crop (in 1872) amounting to 223,352 bales. The total farm products in 1870 were valued at $41,909,402; the real and personal property at $208,146,989. The state debt was $13,075,229. S. C. has gold, lead, iron, marble, sienite, and granite, besides great beds of decayed shells and bones, which have been much utilised in agriculture. Charleston is the principal city, Columbia is the capital; Beaufort has a splendid harbour, and the high inland town of Aiken is much resorted to by invalids on account of its congenial climate.

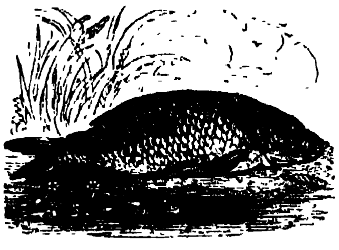
S. C., 'the Palmetto State,' was the home of Southern chivalry and politics. In 1829 it espoused Nullification—the right to annul any act of the Union—but President Jackson stamped out the movement. S. C. seceded in December 20, 1860, and fired the first gun in the civil war. It suffered most severely, and is still depressed. The state has been reconstructed, and negroes now fill many offices. It sends five members to the House of Representatives. Pop. in 1870 (blacks 415,814), 705,606.

Car'oline, Amelia Elizabeth, wife of George IV. of England, was the daughter of Karl Wilhelm Ferdinand, Duke of Brunswick, and was born 17th May 1768. Married to the Prince of Wales, 8th April 1795, she gave birth to the Princess Charlotte on 7th January of the following year, when her husband separated himself from her. Her father-in-law, George III., and the nation sided with C., though reports affecting her honour were studiously circulated by the friends of the Prince. In 1814 she left England on a lengthened tour, and ultimately settled at Lake Como. An Italian, named Bergami, had been and continued to be her companion; and on her refusal in 1820 of an annuity of £50,000 to renounce the title of queen, a charge of adultery was brought against her, and sustained by a majority in the House of Lords. The feeling of the nation, however, was so pronounced in her favour that the proceedings were allowed to drop. In July 1821, being refused admission into Westminster Abbey to witness the coronation of her husband, her system received such a shock that she fell ill on the 30th of the same month, and died on the 7th of August following. Her daughter, Charlotte Augusta, was married to Prince Leopold, afterwards Leopold I., King of the Belgians. She died 6th November 1817.

Caro'ra, a town of Venezuela, S. America, about 160 miles W. of Valencia. The surrounding district is famous for its wild cochineal, in which, as also in gums, resins, balsams, and agricultural produce, a considerable trade is carried on. Leather and ropes are manufactured, and excellent hammocks are made out of maguey, a coarse fibre obtained by macerating the leaves of the *Agave Americana.* Pop. about 10,000.

Car'otid Arteries are the two large arterial vessels which supply blood to the head—one on each side of the neck, respectively called *right* and *left* C. A. The *right* common carotid artery arises from the Innominate Artery (q. v.), and the *left* from the arch of the Aorta (q. v.). The latter is therefore longer, and rises in the chest. At the upper border of the Thyroid Cartilage (q. v.) each divides into two branches, the *external* carotid artery and the *internal* carotid artery. The external carotid artery, after giving off six branches, viz., to the thyroid gland, the tongue, the face, the back of the scalp, the back of the ear, and the pharynx (q. v.), is itself divided into the *temporal* and *internal* Maxillary Arteries (q. v.). The internal carotid artery enters the skull through a hole in the Temporal Bone (q. v.), and is also divided into various branches to supply the front of the brain, the eye, &c. In wounds of C. A. and in Aneurisms (q. v.), the vessels have on several occasions, by Sir Astley Cooper and other surgeons, been successfully tied, and there are cases on record in which the carotid artery on both sides of the neck have been tied. In *garotting*, the C. A. are pressed against the bone, and blood to a great extent prevented from entering the brain.

Carouge', a town of Switzerland, in the canton of Geneva, on the left bank of the Arve, a tributary of the Rhone, and about 1 mile S. of the city of Geneva. It has a fine Roman Catholic and a Protestant church. Leather, thread, watches, pottery, and clay pipes are manufactured. A bridge across the Arve connects the town with Geneva. Pop. (1870) 5873.



Carp.

Carp (*Cyprinus carpio*), a fresh-water Teleostean fish, belonging to the section *Malacopteri* of that order, and forming the type of a special family *Cyprinidæ* (q. v.), to which barbels, minnows, tenches, breams, bleaks, &c., also belong. This fish has been long known in England—at any rate, prior to 1496—and it is doubtful if the statement that it is a naturalised fish in Britain can be supported by fact and proof. The body is somewhat arched and compressed; the scales are large; the head small; a single long dorsal fin exists; the intestine wants cæcal appendages, and the air-bladder is divided, and communicates with the labyrinth of the ear. These fishes occur throughout Europe, and chiefly inhabit the waters of still ponds, and rivers which do not flow rapidly. They live to a great age, and are very prolific, over 600,000 ova having been counted in a single female of moderate size. The food consists of aquatic plants; and, as in other members of the family, the teeth of the hinder part of the mouth are so adapted as to work against the base of the skull, and so to crush and triturate the food. A C. of about six years of age will weigh on an average about 3 lbs., these proportions being in some few cases greatly exceeded. In winter these fishes bury themselves in the mud, and appear to hybernate in a manner. The golden C., or goldfish (*C. auratus*), is a hardy ally of the C. (See GOLDFISH.) The flesh of the C. is very palatable, although it has somewhat fallen in repute, presumably from the greater supply of marine food-fishes; but on the Continent great attention is in some localities paid to the rearing and breeding of these fishes, particularly in inland districts of Roman Catholic countries, where a supply of palatable fish is requisite.

The C. is caught by means of red-worm bait, gentles, larvæ, green pea, and other vegetable baits. It is difficult to angle for, since it nibbles freely, but is a shy biter, and even when fairly hooked, may lead its captor a long race before it is finally secured. See also CRUCIAN, GIBEL, &c.

Carpa'thians, the E. wing of the great mountain system of Central Europe, encloses Hungary and Transylvania on the N., E., and partly on the S., in a vast crescent, and has an entire length of 800 miles. The C. form a system in themselves, separated from the Alps by the valley of the Danube, and from the mountains of Silesia and Moravia by the depression of the March, and are divided into (1) the Carpatho-Hungarian highlands in the N.W., (2) the Transylvanian highlands in the S.E., and (3) the woody range which binds these together. The loftiest group is the Tatra, or the Carpat, on the N. frontier of Hungary, with several peaks of nearly 9000 feet, the highest being the *Eisthaler Thurm*, so called because the only glacier in the C. is here. In the central range, granite and gneiss groups are the basis of cretaceous, triassic, and Eocene formations; the Waldgebirge is almost entirely Silurian; and in the S.E. range, igneous and volcanic rocks occur with breccia and sandstone. The lower ranges are clad in forests of cherry, oak, beech, and pine, and yield iron and other minerals. The chief rivers which rise in the C. are the Theiss, Maros, Szamos, and Körös. See Crosse, *Round about the C.* (Lond. 1878).

Car'pel. See Fruit.

Carpenter Bees (*Xylocopa*), referred to in the article Bee, and so named from their habit of excavating nests in decaying wood. *X. violacea* is a familiar species, included in the family *Apidæ*, or true bees.

Carpenter, Ship's, the third warrant officer on board a man-of-war, whose duty it is, in conjunction with his mate and crew, to attend to the necessary repairs of the hull, masts, and spars. He sees after the condition of the boats and pumps, and during battle looks after the plugging of shot-holes.

Car'penter, William Benjamin, M.D., LL.D., F.R.S., an eminent physiologist, was born at Bristol in 1813, and graduated M.D. at the University of Edinburgh in 1839. He was appointed Professor of Medical Jurisprudence at University College in 1848, and was soon after elected Examiner in Physiology and Comparative Anatomy in the University of London. He held these offices until 1856, when he was appointed Registrar to that university. He is the author of *Principles of General and Comparative Physiology* (1839), *Principles of Human Physiology* (1846), *A Manual of Physiology*, *The Microscope and its Revelations* (1856), *Introduction to the Study of the Foraminifera*, *The Principles of Mental Physiology* (1874), and many able papers in influential periodicals. The royal medal of the Council of the Royal Society was awarded to C. in 1861. He took a leading part in the deep-sea explorations authorised by Government in 1868–70, and subsequently suggested the cruise of the *Challenger.* C. was president of the British Association at its meeting in Brighton in 1872.

Carpentras, a town in the department of Vaucluse, France, on the Auzon, 15 miles N.E. of Avignon by railway. It is encircled by promenades, and still preserves its old fortifications, containing two gates of the 14th c. It has a triumphal arch of the 3d c., an old cathedral of St Siffrein, and a legate's palace. An aqueduct of forty-eight arches, which still supplies C. with water, was constructed 1729–34. The chief manufactures are cotton, chemicals, leather, and earthenware. Pop (1872) 7857. C. the *Carpentoracte* of the Romans, and the capital of the Celtic *Memminiens*, was a flourishing town before Cæsar's invasion of Gaul.

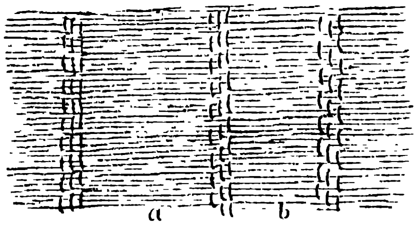
Car'pentry (from the Lat. *carpentum*, 'a cart'), is, in its most general application, the art of working in wood and adapting it to structural purposes. The word is generally restricted, however, to the heavier class of woodwork, such as the frames of roofs or the joists of floors. The preparation of the smaller fittings about a house, as doors, window-sashes, &c., is called joinery. Cabinetmaking is essentially a higher branch of joinery. Patternmaking also—the construction of the wooden patterns and core-boxes from which the moulds in an iron or brass foundry are made—is a separate branch of C., and one which requires great skill and accuracy.

The timber has been already roughly shaped in the saw-mill before it comes into the carpenter's hands; he receives it in the form of squared logs or of planks of various sizes. The first rough cutting of the wood into the required special forms which comes fairly within the limits of C. is done by saws. Circular and band saws, both worked by power, are here of much use. The first cut up the larger pieces of wood with amazing rapidity, and are used mostly for that purpose. The band-saw consists of an endless ribbon of steel, often about half an inch wide, and so thin as to be quite flexible, with teeth upon one side, which is carried over two large rapidly-revolving wheels. The work is held upon a suitable table, and pressed against the saw, which, owing to its narrowness, can be made to cut out very complicated patterns with great ease. Band-saws differ in form according to the nature of the work for which they are to be used. The ripping-saw and band-saw are for the larger pieces; the tenon-saw is used for cutting small pieces across the grain; it is very thin, and strengthened by a rib upon its back; the key-hole-saw is employed for cutting along a curved line.

The wood is smoothed by *planes.* The jack-plane is used for rough work, and the larger trying-plane for finishing a surface where accuracy is required. The little smoothing-plane has many applications; and moulding-planes, the irons of which are formed to special patterns, are used to cut long ornamental edges or moulds. For paring wood, or forming the edges of recesses or holes, chisels of different sizes are used. Common chisels are called by carpenters firmer or paring chisels; and the thicker and narrower variety used for cutting narrow slots are mortise-chisels. Gouges are simply curved chisels, used in paring circular or curved holes or recesses. For boring small holes for nails a bradawl is used, and for screws a gimblet. For somewhat larger holes a bit or centrebit is the tool commonly used. It is usually placed in a frame called a brace, having a cranked handle, by means of which it can be turned round. Most of the operations of C. can be performed by machinery, and in cases where large numbers of pieces of the same or similar form have frequently to be made, wood-working machinery, as it is called, is often employed, and its employment seems to become more extensive every year.

In the lighter kinds of woodwork, the different pieces are fastened together with glue, nails, or screws, as may be most suitable. Various forms of dovetail and mitre joints are also used in cabinetmaking, when appearance as well as stiffness has to be considered, but the more important forms of joint in woodwork are those which occur in C. proper, where strength is the principal thing to be considered. The form of these joints, drawings of which will be found in all books on C., depends on the nature of the stress which they have to resist. In most cases they weaken the piece in which they occur very considerably, and it is therefore important to use them as seldom as possible, as well as to employ the best proportions when they have to be used. A piece which has to resist direct tension is jointed either by scarfing or fishing, or both. In the former, which is the neater but less strong, each of the two ends which come together is stepped, or cut away, for a certain distance, so that when they are put together the apparent size of the beam at the joint remains the same as it is elsewhere. Bolts passing through the scarfs or steps hold them together. In a fished joint, the ends of the two pieces are simply squared and made to abut, while on each side of the beam a separate piece of wood is placed, the whole being secured through bolts of iron. If the joint is to be in compression, the principal point to be attended to is that the abutting surfaces should be true, and as nearly as possible normal to the direction of the thrust. To make the strongest possible joint, the upper and lower parts of the beam should be cut as little as possible, as its strength is far less impaired by cutting it away about the middle of its depth. See Riddell's *Carpenter, Joiner, &c.* (T. C. Jack, Edinb. 1876).

Car'pet (Fr. *carpette*, Low Lat. *carpeta*, 'woollen cloth,' from *carpere*, 'to pluck wool'), a woven or felted covering for the floors of apartments, usually made entirely or in great part of worsted. The principal seats of C. manufacture in Great Britain are at Kidderminster, Halifax, and Leeds in England, and Kilmarnock, Glasgow, Bannockburn, and Aberdeen in Scotland; but a considerable trade in a cheap carpeting of jute is also carried on in Dundee. The principal varieties of carpets are—1st, Kidderminster or Scotch; 2d, Brussels; 3d, Wilton; 4th, Tapestry; 5th, Turkey or Persian; 6th, patent Axminster; and 7th, felted carpets. Kidderminster, or Scotch carpets, are very extensively manufactured at Kilmarnock in Scotland, the warp being made of worsted yarn and the weft of wool. The carpets are made either two-ply or three-ply; that is, of two or three distinct webs interwoven so as to form one piece. The patterns are produced by the different coloured webs being alternately brought through each other to the surface, so that, although the design is the same on both sides, the colours in which it is wrought are reversed. The weaving is of course done in the Jacquard Loom. Brussels carpets are a more expensive manufacture than the Kidderminster or Scotch kinds; the back is composed of a web of stout linen thread, and the pattern is produced by a surface of coloured worsted warp threads being woven down into the linen texture. The worsted warp has a round looped pile, produced by passing it over iron or steel wire in the process of weaving. Only a limited number of colours can be used in a Brussels C., and as a large proportion of the coloured worsted yarn is absorbed in the back of the C., much material is practically wasted, while no great latitude of design can be introduced. Wilton or velvet-pile carpets only differ from Brussels in having the raised loops cut before the wire is withdrawn, and thus producing a velvety surface. Tapestry carpets, which have a pile and superficial appearance like Brussels carpets, are made by printing the warp yarn before weaving, whereby the use of the complex frames and numerous bobbins required for Brussels C. is avoided, and the waste of yarn in the body of the texture obviated. The process of preparing the yarn was the invention of Mr Richard Whytock of Edinburgh, and consists of drawing the pattern—not as it appears when woven, but as it would be with the threads fully stretched—on design paper, and printing the yarn according to it. Turkey carpets are the variety originally introduced to Western nations by the returning Crusaders. They are made with a warp and weft of very strong linen yarn or twine, with which are interwoven tightly tied tufts or short lengths of wool, coloured according to the pattern to be produced. The ends of the tufts stand up at right angles to the plane of the warp, and after the entire C. is woven and fastened by this very tedious process, the surface is cropped even with a pair of shears. The original Axminster carpets were simply imitations of Turkey carpets; but in 1839 Mr James Templeton obtained a patent for the manufacture of patent Axminster carpets, and by his process the most beautiful and durable carpeting is now made. The first idea of his process he obtained from 'Chenille' shawls, in the manufacture of which he was engaged. A pattern is drawn upon paper ruled in narrow parallel lines, which lines are cut up into strips for the guidance of the weaver. A loose parti-coloured web of any breadth up to a yard is then woven according to the colours of the guiding strips, only a few warp threads passing through the reed at intervals regulated according to the depth of pile which the chenille is to have. The web is cut into strips along the divisions (*a*, *b*) between each set of warp threads, by a machine forming the chenille, and each strip is then a duplicate of the paper pattern strip. When one of these strips is woven on to a solid back, and the worsted pile combed through some of the warp threads to attach it to the back, a duplicate of the original paper pattern is seen, and each complete strip of chenille makes an additional copy of the pattern. Felted wool carpets are chiefly prepared by printing patterns on the surface of the felted fabric, and they are used as drugget or crumbcloth.



Chenille for Patent Axminster Carpet.

Car'pi, a walled town of Italy, province of Modena, on the Secchia Canal, 9 miles N.N.W. of Modena, has a cathedral, an old castle, a citadel, and numerous palaces. The chief industries are the manufacture of silks and straw hats. Pop. 17,504. C. is also the name of a village, 28 miles S.E. of Verona, near which Prince Eugene defeated the French in 1701. Pop. 1200.

Carpi'ni, Giovanni de Plano, an Italian traveller of the order of the Franciscans, born in Capitanata, Naples, about 1220, was sent in 1246 by Innocent IV. as a sort of papal legate to the Mongol Emperor, whose devastations in the N.E. of Europe were alarming Christendom. He was present at the election of a new emperor in the capital of Genghis-Khan. After a month's residence at the Mongol court, and a visit to Tourakina, the Emperor's mother, C. returned to Europe. He was the first who gave a trustworthy account of the Mongols and of their country. An English translation of a Latin abridgment of his travels, which appeared in the *Speculum Historicum* of Vincent de Beauvais, is attributed to Hakluyt or Purchas. The exact date of C.'s death has not been ascertained, but the latter portion of his life was spent in missionary efforts in Bohemia, Hungary, Denmark, and Norway. See Peschel's *Geschichte der Erdkunde*, pp. 150-207, and an article by Dora d'Istria in the *Revue des Deux Mondes* (Feb. 15, 1872).

Carpi'no, a town of Italy, province of Foggia, near the N. coast of that peninsula (the 'spur of Italy'), which, projecting into the Adriatic, forms the Gulf of Manfredonia. Pop. 6000.

Carpoc'rates, or **Car'pocras**, of Alexandria, one of the earliest teachers of heresy in the Christian Church, and the founder of a sect, the Carpocratians, which existed from the 2d to the 6th c. His teaching coincided in most respects with that of Basilides (q. v.), and his followers called themselves gnostics—essential parts of the system being metempsychosis and the creation of the world by angels. See Neander's *Kirchengesch.*

Car'polites, a term applied to fossils of the nature of fruits, but which it is impossible as yet to refer to their exact place in the vegetable kingdom. They are chiefly found in the Carboniferous system.

Carpol'ogy, the division of botanical science which concerns itself with the study and classification of the forms of fruit. See Fruit.

Carpoma'nia, or **Phytolithes**, an affection of quinces, pears, &c., in which, by the deposition of layer after layer in the cells of the fleshy fruit, they become gritty. It is, however, scarcely a disease, as it occurs naturally in pears, melons, &c., and the gardener's efforts are directed, by means of cultivation, to reduce it to a minimum, by creating a condition which is not natural to the fruit. (Masters.)

Carpopto'sis, a term applied to the disease in plants which causes the fruit, after it has begun to 'set,' to have its progress suddenly arrested and to fall off. It is frequently owing to more fruit being formed than the tree is capable of nourishing, or from the tree being covered with so many shoots that the sap which should go to the fruit is diverted to nourish the foliage. In Italy the rice crops are often so affected.

Carra'ca, La, a great naval arsenal of Spain, province of Cadiz, on a low-lying island, formed by the cutting of the Santi Petri Canal, which separates it from the mainland. It is about 4 miles S.S.E. of Cadiz, and is defended by four forts and the Castillo de Santi Petri.

Carr'ageen, or **Irish Moss** (*Chrondrus crispus* and *C. mallefosus*), small sea-weeds, found commonly between tide-marks around the British, North American, and European coasts. On the coast of Ireland they are extensively collected, dried, and bleached. The product is then sold under the name of 'I. M.,' the name 'C.' being also of Irish origin. When boiled with milk, it forms a stiff jelly on cooling. It has nutritive, emollient, and demulcent properties; and on account of the iodine which it contains, is also of medicinal value in cases where this drug is of avail.

Carrajal', Tomas José Gonzalez, a Spanish statesman and author, was born at Seville, 21st December 1753, studied at the university of his native city, and in 1785 went to Madrid, where he devoted himself to politics and philology with equal zeal. From the outbreak of the French Revolution to the reactionary war of 1823, except for a short period (1815-20), he was constantly engaged in public affairs, and showed both ability and patriotism. After repeated affronts and persecutions by the Absolutist party, he was finally received into the royal favour, and became a member of the Supreme Military Council in 1833, but died 9th November 1834. As an author, C. has obtained a great reputation in Europe by his metrical translation of the poetical books of the Bible, begun in his fifty-fourth year, and heroically persisted in amid the din of arms, the distractions of campaigns, and even the fatigues of a march. The fruits of this labour are seen in *Los Salmos* (5 vols. Val. 1819), and *Los Libros Poeticos de la Santa Biblia* (6 vols. Val. 1827). His original compositions are contained in the *Opusculos ineditos en Prosa y Verso* (13 vols. Mad. 1847).

Carra'ra, the famous marble emporium of N. Italy, province of Massa-Carrara, lies in a valley of the Apennines, on the Avenza, near where it enters the Mediterranean. It is an old town, and many of the larger buildings are of marble, as the fine churches of the Madonna delle Grazie and St Andrea, as also the beautiful fountain in the Piazzo Alberigo. C. has a sculpture academy, founded by Napoleon, and is the residence of a colony of artists. Its sole industry is the cutting, polishing, and transport of marble. Pop. (1872) 23,827. In the vicinity are the quarries, thirty in number, of which, however, only half-a-dozen yield the fine mineral for sculpture. They have been wrought for over 2000 years, and are now yielding, with the aid of English machinery, £75,000 worth of marble yearly. The C. marble is an Oolitic limestone, the chief qualities of which are its beautiful whiteness and its durability.

Carr'el, Nicolas Armand, one of the ablest French journalists of the 19th c., was born at Rouen, 8th May 1800. He served in the army for a short time, but soon went to Paris, where he devoted himself to journalism and politics. He became the editor of the *National* newspaper, and, in its columns, advocated with great ability and perfect fearlessness opposition to the government of Charles X. and to despotism of every kind. Unfortunately he came into collision with another journalist, M. Emile de Girardin, and in a duel which ensued was mortally wounded, and died July 24, 1836. A just and eloquent estimate of C. is to be found in the writings of the late Mr John Stuart Mill. An edition of his works was published at Paris in 1858.

Carri'age, a general name for a great variety of wheeled vehicles. See COACH, CART, WAGGON, OMNIBUS, GUN-CARRIAGE, &c.

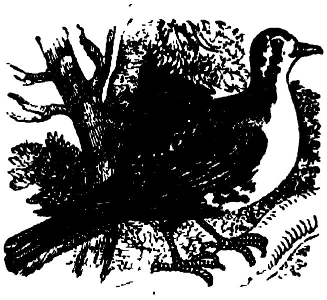
Carr'ical, or **Karikal,** a French territory and port, enclosed by the district of Tanjore, on the delta of the Kavari, 152 miles S. of Madras. The territory, which has an area of 50 sq. miles, and a pop. of 50,000, was ceded to France by the native ruler in 1759, and was afterwards taken by the British, but restored to the French in 1814, on the condition that the town of C. should not be converted into a military stronghold. The town is only accessible by the river to coasting vessels, and that merely during the rainy season.

Carrickfer'gus ('rock of Fergus'), a seaport of Ireland, on Belfast Lough, 11 miles N.E. of Belfast by railway, and extending about a mile along the N.W. shore of the lough. It is defended by its castle, which is situated on a promontory, and is supposed to have been erected in the 12th c. The keep has an elevation of 90 feet, and is maintained as a fortress, the works, formerly mounted by numerous cannon of small calibre, being now furnished with more formidable ordnance, to enable it to command the mouth of the lough. The greater part of the commerce of the town, formerly considerable, has been transferred to Belfast. The trifling imports consist of coal, iron, timber, slate, &c., and the exports of grain and black cattle. But there are considerable industries, especially the spinning of linen and cotton yarn; there are also a large distillery, extensive tanneries, a bleaching establishment, and a starch manufactory. C. depends much on visitors during the bathing season, and on its oyster and other fisheries. It returns one member to Parliament. Pop. (1871) 9397. William III. landed at Carrickfergus, 14th June 1690—less than a fortnight before he fought the battle of the Boyne.

Carr'ick-on-Suir ('the rock of the Suir,' so named from a large rock in the bed of the river), a town of Ireland, in county Tipperary, picturesquely situated on the Suir, 12 miles E. of Clonmel. It has increasing manufactures of woollens, flax, and linen. Some ruins of a castle, dating from 1309, are still visible. Pop. (1871) 8055.

Carr'ier, Jean Baptiste, born at Yolai, in Upper Auvergne, in 1756, was elected to the National Convention in 1792, and took a leading part in the constitution of the Revolutionary Tribunal. He voted for the King's death, and distinguished himself by the savage and indiscriminate cruelty with which he suppressed the risings in the W. He constructed an 'Entrepôt' at Nantes, the prisoners in which were murdered wholesale by drowning, without even the pretence of a judicial process, though this was sometimes gone through in the case of persons already dead. C. concealed his crimes from the Convention by the use in his orders of such expressions as '*translation des détenus*,' which his subordinates understood to mean shooting or drowning. The Committee of Public Safety at last began proceedings against him, but it was not till 16th December 1794 that the Revolutionary tribunal carried through his execution.

Carrier Pigeon, a variety of *Columbidæ* or Pigeons (q. v.), noted for the exercise of the 'homing' faculty, by means of which these birds find their way to their homes or original haunts from great distances—a power made use of occasionally for the purpose of conveying letters—*e.g.*, during the late siege of Paris. The C. P. has been known to fly 150 miles in 1½ hours, and many instances might be related where their services have been of great help. It is needless to remark that the electric telegraph has almost entirely superseded the use of these birds. Before flight they were kept in the dark for at least eight hours, and were not fed—the birds also eating moderately on arriving at their homes. The sense of sight and knowledge of landmarks appear to be the chief means whereby the flight is guided. About 30 miles an hour is the average rate of speed. Carrier pigeons are usually kept away from their nest not longer than ten days or a fortnight, and during the period of tending their young the homeward flight is said to be made more quickly than at other times. The *Columba Turcica* or *tabellaria* are the designations applied to this variety of pigeon, and several sub-varieties are described.



Carrier Pigeon.

Carr'iers, the name originally given in England and Scotland to the conveyers of goods from town to town in waggons or carts only, but, in the later and wider industrial sense, to the large class employed in the conveyance, by whatever means, of all articles of commerce, &c. The trade is carried on in the East chiefly by caravans, in Spain by muleteers, and in countries where transit is more thoroughly developed by rivers, canals, and railways. All the navigation of the oceans and seas is nothing other than the international development of the carrier's occupation. The packhorse was superseded in England by the four-wheeled waggon, and in Scotland by the one-horse cart. The waggon had a hooped top with a movable canvas covering, and a space behind—the 'tail of the waggon'—was spread with straw for the use of such passengers as might avail themselves of it for a whole or a portion of the journey. The palmy days of the waggon in England and the carrier's cart in Scotland are gone. The latter still conducts a fairly profitable trade in districts not opened up by railways; but formerly his departure, progress, and arrival were timed with an accuracy which has been little, if at all, improved upon by railway luggage trains. In England the formation of canals, by increasing the facilities for carrying, had a wonderful effect in multiplying the quantities of goods to be conveyed from place to place. The Canal (q. v.) was the earliest successful rival of the waggon on a large scale, and its era dates from the last quarter of the 18th c. The Lancashire cotton trade, the woollen trade of Yorkshire, Staffordshire potteries, and the hardware manufactures of Birmingham, all received an impetus by the development of the canal system, which may be looked back upon as the beginning of the enormous wealth of these centres of industry. The Forth and Clyde Canal in Scotland, completed in 1790, was the first interference with the monopoly of traffic enjoyed by the carriers's carts between the E. and W. of Scotland, especially between Edinburgh and Glasgow. See CANAL.

The railway is the latest development of the carrying trade. It drove the waggon and cart entirely off all the highways of commerce, and diminished canal traffic to an extent ruinous to the value of shares in that kind of enterprise. Some canals in England have since been altogether abandoned. Those that continue open, such as the Grand Junction, the Lea Navigation, the Trent and Mersey, and the Forth and Clyde in Scotland, are used mainly for the conveyance of minerals, stone, slate, lime, bricks, manure, and other cumbrous materials. Manufactured goods are generally sent by the railway. (See RAILWAY.) These improved means of conveyance have had the effect of enormously increasing the number of horses and men employed in the city carrying trade. This was apparent in the flourishing days of canals. Crowds of carters awaited the arrival of the numerous boats. In Glasgow, for example, there used to be an enormous trade in carting coal and iron from the Monkland Canal basin to the Broomielaw. This is now all but abolished by local railways. Just as the earlier C. became boatmen, and those of them who had made money the proprietors of boats, so when railways began, the C. took advantage of them for the conveyance of the goods they had undertaken to deliver. Thus the C. collected the articles to be sent, put them on trucks, and received them at the railway station to which they were directed, being entirely responsible to the senders of them. The C. paid the railway company according to its tariff, and charged the senders of goods according to a scale of their own. But this system has been discontinued for about thirty years. The railway companies now make all the charges for carrying goods, and become responsible for them on certain conditions. They however give employment to an enormous number of horses and lorries in the villages, towns, and cities. These generally belong to individuals or companies, who have no other connection with the railway company than the contract by which they undertake and are obliged to convey goods to and from the railway stations. In the Midland Counties and the S. of England, with London as their centre, Pickford & Co. and Chaplin & Horne employ thousands of men and horses in this development of the carrying trade. In the N. of England, with headquarters at Manchester, Carver & Co. also do a most extensive trade. They keep more than 500 horses in Manchester alone. In Scotland, Mutter and Howey are the great railway C. of the eastern counties, their headquarters being Edinburgh, while Wordie & Son in Glasgow do a business proportionate to the vast activity of the commercial capital of Scotland. But even this system is becoming modified. The railway companies show a desire to take possession of the entire trade, with horses and lorries of their own. Thus lorries and goods vans, with the name of railway companies on them, instead of that of Pickford or any other private company, are quite commonly seen in the streets of London and other cities. This would seem to be a step towards an ultimate comprehension of the carrying-trade by the railway companies. A rapid and punctual means of conveyance is afforded by the various Parcels' Delivery Companies, which have receiving offices in numerous business centres, and deliver goods a certain number of times daily.

Carriers, Wharfingers, and Warehousemen, Law respecting.—All persons carrying goods for hire are, in law, *common C.*, and are bound to receive and carry goods for reasonable hire, to take due care of them in their passage, to deliver them in the condition in which they were received, or, in default, to make compensation, unless the loss arise from the fault of the sender of the goods or from natural cause. See, under ACT, *Act of God.*

Hackney-coachmen in London are not so bound, unless there is a special agreement and money is paid for the carriage. *Special C.*, who professedly do not carry for all, are not *bound* to carry. When, however, a special carrier undertakes to convey goods, his responsibility is the same as that of a common carrier.

The master of a stage-coach who only carries *passengers for hire*, is not liable for goods, but if he carry goods also for hire he is liable. A carrier who opens a package intrusted to him, and abstracts goods, is guilty of felony. A common carrier, who has convenience, being offered his hire and refusing to carry goods, is liable to an action; but he may refuse to admit goods to his warehouse at an *unseasonable* time or before he is ready to start on his journey. A carrier robbed is liable to the sender, but he has recourse against the *Hundred* (q. v.) to make good his loss. As a usual rule, a carrier is bound to deliver goods as directed; when it is not his custom to do so, he must send timely notice of the arrival of the goods. A carrier has a Carrier Lien (q. v.) on goods which he carries for hire, but it is limited to the carriage of each parcel, and is not for any balance due to the carrier from the sender, or for a debt due to the carrier by the consignee. The powers and liabilities of railway companies in the carriage of goods are similar to those of C. and stage-coach proprietors.

Warehousemen are bound, when goods are stored in a warehouse, to bestow reasonable care on them, to prevent damage or injury. *Wharfingers* are bound in the same way; but neither is liable for damage from accidental fire. The responsibility of common C. for a package containing gold or silver, precious stones, bills, notes, silks, laces, or other valuable articles specified in the Act, is limited to £10, unless the value be declared on sending, and an extra charge be accepted.

Law of the Road.—When carriages or horsemen meet on a public road, the law, in case of accident, is always against the aggressor. A driver or rider, on passing another horse or carriage, must keep on the whip-hand of the horse or carriage. He will be answerable for any damage which may arise from neglect of this rule. A driver, however, is not bound to keep on the left side of the road, provided he leave sufficient room for other carriages and horses to pass him on their proper side.

Carr'ion Crow (*Corvus Corone*), a species of *Corvidæ* or Crows (q. v.); but this name is also given to the black vulture, an American species of that genus of birds. See VULTURE.

Carrion Flowers, the flowers of various species of *Stapelia* (natural order *Asclepiadaceæ*) of the Cape of Good Hope, so called on account of the putrid odour exhaled by them. The name is also applied to *Coprosmanthus herbaceus*, and in America to *Smilax herbacea.*

Carr'on, a village in Stirlingshire, on the right bank of the C., 3 miles E.N.E. of Falkirk, noted for its extensive ironworks, established in 1760. Pop. of village, including ironworks (1871), 1088.

Carronades', short iron guns, attached to the carriage by a loop and bolt instead of trunnions. They have less thickness of metal than other guns of the same calibre, and have at the muzzle a cup or chamber for powder, like mortars. But admitting only of a small charge of powder, their range is confined; hence they are effective only at close quarters; and ships armed only with C. have been beaten by vessels of nominally smaller armaments with long-range guns. They have become all but obsolete. C. were invented by Mr Gascoigne, manager of the Carron Ironworks in Scotland, and were made standard navy guns in 1779, to be carried on the poop, forecastle and upper works.

Carron Oil consists of equal parts of olive oil and lime-water well shaken together, a useful application to *Burns* (q. v.), so called because first used at Carron Ironworks, near Falkirk.

Carr'ot (*Daucus Carota*), the cultivated form of which yields the well-known esculent root of that name. It belongs to the natural order *Umbelliferæ*. The genus *Daucus* contains several species, mostly natives of the Mediterranean region. *D. Carota* is indigenous to Britain, most parts of Europe, and the Caucasus, and has been cultivated in Europe, China, Cochin-China, in the European colonies, N. America, &c., from very early times; in England at least as early as the 16th c. In Charles II.'s reign ladies wore C. leaves instead of feathers in their hats. The plant succeeds best in sandy or peaty soils, but is liable to the attacks of the C.-Fly (q. v.) and Crane-Fly (q. v.), the larva of which destroys the young roots. C. is not very nutritive, containing a large number of heat-forming principles, but little flesh-forming matter. It is, however, easy of digestion, and slightly laxative. A syrup is prepared from C., and, when dried and roasted, it is used in Germany as a substitute for coffee. The *Candy* or *Cretan C.* is *Athamanta cretensis*; the *deadly C.* is a name often given to *Thapsia*; and in Tasmania the tubers of *Geranium parviflorum* are called the *native C.*

Carrot-Fly (*Psila rosæ*), a species of *Dipterous* insects, the larvæ of which burrow in the root of the carrot, and cause the diseased condition known as 'rust.' Some moth-larvæ also injure this plant, and the *Aphis-dauci*, one of the plant-lice, causes the death especially of young plants.

Carrou'sel (a French word, meaning a tilt, a tilt-yard, introduced from the Ital. *carrosello*, dim. of *carro*, Lat. *carrus*), was applied to a knightly competition which put skill and horsemanship to the test, but did not require the courage of the tournament. The competitors in this exercise, which was common in Europe till the close of the 17th c., dressed in imitation of the knights of earlier ages; and a favourite feat in France was to run at the pasteboard head of a Turk with a lance, to cut it down with a sword, or to hit it with a pistol-bullet. It was introduced into France during the reign of Henri of Navarre, but was known in Italy some time before. The *Place du C.* in Paris was named after a celebrated one held there in 1662.

Carse, a word of uncertain derivation (probably Celtic), used in Scotland to denote level alluvial soils in the neighbourhood of rivers. The two most notable are the C. of Stirling, lying around the windings of the Forth, and the C. of Gowrie, on the N. side of the Tay, both of which are extraordinarily fertile. The yield of wheat is particularly great, and it can be grown more frequently on the same land than on any other kind of soil in Scotland. C. land is also well suited for beans, and indeed shows some of the finest bean-fields in the country.

Carstares', William, an influential Scotch politician and ecclesiastic of the 17th c., was born at Cathcart, near Glasgow, February 11, 1649, and studied at the Universities of Edinburgh and Utrecht. In Holland he was introduced to the Prince of Orange, over whom he acquired such influence, mainly by his knowledge of men and of politics, that he became his confidential adviser. When he returned to England he was imprisoned and tortured on the suspicion of being implicated in the Rye House Plot, but refused to betray any state secrets. On being liberated he repaired again to Holland, and was made one of the Prince's chaplains. He accompanied the Prince to England in 1688, and till the end of William's reign was his chief adviser in regard to Scotch affairs, being, in consequence, nicknamed 'Cardinal C.' During the reign of Anne he was elected Principal of the University of Edinburgh, and was presented to the church of Greyfriars. An evidence of his popularity in the Church of Scotland is afforded by the fact that he held the office of Moderator of the General Assembly four times within eleven years. C., who was strongly in favour of the union between Scotland and England, and of the establishment of the Hanoverian dynasty, opposed the disastrous Act restoring private patronage in the Church of Scotland. He died in August 1715. He was a man of sincere patriotism, piety, and sound scholarship; moderate in his opinions, and so benevolent that he even took a delight in aiding those who differed from him in opinion. Altogether he is one of the most pleasing figures in Scotch Church history. See *Life of C.* (1874), by the Rev. Dr Story of Roseneath.

Car'stens, Asmus Jakob, a Danish painter, born at St Jürgen, Slesvig, 10th May 1754. He studied for seven years in Copenhagen, afterwards removed to Berlin, where he won reputation and a professorship in the Academy, and in 1792 removed to Rome, where he at last achieved the success for which he had so long striven in vain. He died at Rome, 26th May 1798. C.'s chief works are 'Fall of the Angels,' the 'Visit of the Argonauts to the Centaur Chiron,' and 'King Œdipus.' All his works have been engraved by Muller (1869). See Fernow's *Life of C.* (1806; new edition by Riegel, 1867).

Cart (Lat. *carrus*), an uncovered two-wheeled carriage, used chiefly for agricultural and carriers' purposes. There are numerous varieties of carts, differing in size, form, and internal arrangements, according as they are meant to carry farm produce or specific articles of merchandise. Those that are employed for the latter purpose constitute the more important class. As, however, the carts of different countries vary much, so, in like manner, those of one country differ in their mode of construction to suit the kind of goods to be carried. One of the most useful vehicles for general merchandise and agricultural produce is the single-horse Scotch C. It carries from 18 to 22 cwt., and is formed, beside the axle and wheels, 4½ feet in diameter, of a rectangular body and two shafts, with raised sides inclined outwards, and additional 'top-sides,' movable at pleasure. In Scotland this C. is in universal use for farm purposes; though usually drawn by one horse, two horses, one in front of the other, are sometimes yoked to it when the weight is increased, a plan which it is not advisable to adopt, as it leads to a wasteful expenditure of animal force, with less satisfactory results than if two single-horse carts were employed. When a bulky load, such as corn in the straw, or hay, is to be carried, the area of the C. is augmented by placing a sparred wooden frame upon the sides, beyond which it projects. A 'tilt' Scotch C. is so constructed that by withdrawing a pin in the fore part of the C., the body may be tilted up and its contents discharged behind without unyoking the horse. In England, the principal vehicle for carrying merchandise is the four-wheeled Waggon (q. v.). Vehicles moving on two wheels of solid wood, and drawn by two oxen, were known to the ancients.

Cartage'na, an ancient town in the province of Murcia, Spain, on the Mediterranean, 25 miles S.S.E. of Murcia, with which it is connected by railway. It lies on a narrow inlet, has a splendid harbour, and is the seat of a bishop and an important naval station, with an arsenal and extensive marine establishments. Its chief buildings, mainly built of red marble, are its ruined castle, three fine churches, several convents, two hospitals, and a theatre. It has beautiful promenades. The chief manufactures are cloth, hemp, glass, and esparto textures, and there is a large trade in barley, wheat, silk, fruit, and minerals. In 1872, besides Spanish ships, there entered the port 686 vessels of 339,549 tons, and cleared 657 of 297,948 tons. New breakwaters were in course of construction in 1873. The neighbouring *Sierra de C.*, with which C. was connected by a tramway constructed by an English company in 1873, employs 12,000 persons in its silver, lead, copper, and ironstone mines. C. has also much shipbuilding and tunny-fishing. The town has bad water. Pop. 26,106. C., the *Carthago Nova* of antiquity, was founded by Hasdrubal in 228 B.C., near the once valuable silver-mines. It soon became the chief Punic city in Spain, and was taken by Scipio the Younger in 210. Under the Romans it was only second in importance to Tarraco. Destroyed by the Goths, it was not till the reign of Philip II. that it began to recover, but by the end of the 18th c. it had a pop. of some 60,000. C. capitulated to the French in 1823.

Cartagena de las Indias, the capital of the province of Bolivar, New Granada, on the Caribbean Sea, is the seat of a bishop, and has a beautiful cathedral, a *Collegio*, and many fine churches. It is the best harbour on the whole N. coast of the continent, being sheltered by several islands, and is the staple place for the trade of New Granada, Peru, Central America, and the Philippines. The water, however, is bad, and the climate unhealthy. Pop. 9000, not including the suburbs Xeremani and San Felipe. C. was founded by Don Pedro de Heredia in 1544, and later, having become a nest of pirates, was burned by Francis Drake in 1588. It became a free haven of import in 1856.

Carte, Thomas, a historian of much exactness and erudition, was born in April 1686, at Clifton, Warwickshire. He matriculated at Oxford, but graduated at Cambridge. Jacobite leanings forced him to relinquish a clerical post at Bath; and being suspected of a part in Atterbury's plot, he fled to France, where he remained for twelve years under an assumed name. Afterwards, however, he returned, and died near Abingdon in 1754. C. published an edition of *Thuanus* in 7 vols., but his chief works are a *Life of James, Duke of Ormond*, and his *History of England*. Though marred by partisanship, both are valuable, particularly the latter, which is full of materials for history. His MSS are preserved in the Bodleian Library.

Car'tel (from the Ital. *cartello*, a dim. of *carta*, Lat. *charta*, 'paper'), in military language, was originally a *written* agreement between belligerents for an exchange of prisoners. A C.-ship is one commissioned in time of war to carry proposals of any kind between the hostile powers; it conveys the exchanged prisoners when wanted for that purpose. The name is also used to denote a challenge to fight a duel.

Car'ter, Elizabeth, a lady noted for her scholarship, was daughter of the curate of Deal, where she was born, December 16, 1717. She wrote verses when she was seventeen years old, published poems at the age of twenty-one, and acquired nine languages. In 1738 she translated from the Italian of Algarotti *An Explanation of Newton's Philosophy, for the Use of Ladies.* Dr Johnson was her friend; and papers 44 and 100 of *The Rambler* are from her pen. She was unmarried, and died in 1806. See Pennington's *Memoirs*, 1807.

Car'teret, John, Earl Granville, an English statesman of the 18th c., was born 22d April 1690, being the son of Baron Carteret of Hawnes, Bedfordshire. He was educated at Westminster School and Oxford University, and from the latter carried away the reputation of considerable scholarship. He entered the House of Lords in 1711, and then, mainly, it is supposed, from his having spoken in favour of the Protestant and Hanoverian succession, obtained the favour of George I. He subsequently filled several important public offices. He was Ambassador-Extraordinary to Sweden, and succeeded in concluding a peace between Sweden, Prussia, and Hanover. In 1721 he was appointed Secretary of State, and on two occasions—from 1724-26, and from 1729-30—was Lord-Lieutenant of Ireland, his conciliatory manners gaining him much popularity there. C. was one of the ablest opponents of Sir Robert Walpole, and when that statesman fell, became Secretary of State, and real head of the ministry. When Pelham formed, in 1744, his parti-coloured cabinet, derisively known as the 'Broad-Bottom Ministry,' C., who on his mother's death had succeeded to the title of Earl Granville, was, like Pulteney, excluded from it. After this he may be said to have retired from public life, although he continued a favourite at court. In his latest years, and indeed throughout his life, he was honourably distinguished as a friend and patron of men of letters. He died 2d January 1763. C. was a brilliant orator, but a somewhat undecided statesman.

Car'thage (the original Punic *Kartha-hadtha*, means 'New City,' in opposition to *Utica*, the 'Old City'), was probably founded, as a colony from Tyre, about 823 B.C. It stood at the head of a bay in the territory afterwards the Roman Zeugitana, and now Tunis. C. was tributary to Tyre for some time, and also paid a tax for occupation to the native Libyans. Before her foreign conquests began, C. probably possessed in sovereignty the whole district now called Tunis, including the rival settlement of Utica, and had founded many factories on the African coast, from which she derived large taxes and duties. At one time she occupied a sort of hegemony among Tyrian colonies, of which many at a distance, such as Cyrene, finally succumbed. C. made a treaty with Rome in 508 B.C. The Romans were not to sail beyond the *Pulchrum Promontorium*; merchants offering goods for sale in Sardinia, Africa, and Sicily (so far as belonging to C.) were to pay no customs, but the usual fees to the scribe and crier; the Carthaginians were not to take any Latin city or to inflict injury on those under the Roman jurisdiction. Probably Corsica and the Balearic Islands also belonged to C. at this time. By a later treaty, to which the Tyrians and Uticeans are parties, Roman trade is excluded from Africa and Sardinia, but permitted in Sicily and in the city of C., the Romans conceding the privilege of trade in Rome. In Sicily, however, C. received, in the year 480, a severe check from Gelon of Syracuse, who granted peace only on condition that the practice of human sacrifices (a part of Phœnician religion) should be discontinued. Shortly after this the Periplus of Hanno, one of the military Suffetes, took place. Hanno took possession of the African coast as far as Cerne, in the 25th degree of N. latitude, distributing about 30,000 emigrants in settlements, the subsequent history of which is not known. The Periplus (criticised in *Dodwell's Dissertation*) lasted twenty-six days. Himilco, another member of the Barca family, is supposed to have sailed to Cape Finisterre. The dates at which the commerce of C. with Spain and Gaul began to develop are not fixed. There was a trade in precious metals from the modern Andalusia: it is said that Himilco even reached the Scilly Isles. C. had now permanent possessions at Panormus, and Motya in Sicily; and about 410 the people of Legeste craved her intervention between them and Selinus. This led to the destruction of Selinus, Agrigentium, Camarina, and Gela, and the war against Syracuse, whose tyrants, Dionysius and the Corinthian Timoleon, were quite able to cope with the mercenaries of the republic. Timoleon obtained a great victory in 345, which was followed by peace. The Syracusan war for supremacy in Sicily was renewed with the tyrant Agathocles, who, beaten at home, carried the war into Africa in 310. The Mamertines of Messana, a body of Oscan mercenaries who had served Agathocles, invited C. to assist them against Hiero of Syracuse, but shortly after (264) went over to Rome, and then began the first Punic War (264–241), which Michelet has described as the decisive struggle between the Indo-Germanic and the Semitic races. The successes of Claudius at Agrigentum, of Duilius at Mylæ (the earliest naval victory of the Romans), of Regulus at Ecnomus, were followed by the defeat of Regulus by Xanthippus in Africa, the victories of Hamilcar Barca in Sicily, and the final defeat of Hanno at Ægates Insulæ, which led to the evacuation of Sicily by C. A great revolt of the mercenaries of the maritime republic followed, in the course of which Sardinia and Corsica fell a prey to Rome. During the next twenty years, the conquests of Hamilcar in Spain, and of Marcellus over the Gauls and Ligurians, brought the two great enemies to closer quarters. Hasdrubal founded New C. In 219 Hannibal took Saguntum. This act, affirmed by the Romans to be in violation of treaty engagements, was adopted at C., and led to the second Punic War (218–202), which, after Hannibal's long occupation of Italy, and the campaigns of Scipio in Spain and Africa, resulted in the disgraceful conditions of peace that C. was to retain territory in Africa only, to give up all her 'long ships' except ten, to make war only with consent of the Romans, and to restore to Massinissa all that he or his ancestors ever had. After this peace, Hannibal (who lived till 183) became practically tyrant of C. He destroyed the oligarchy of the judges, by a rigorous finance liquidated the war indemnity payable to the Romans, and encouraged trade by the introduction of the olive from Italy. Massinissa, however, proved an untiring enemy, and the encouragement given to him by the Romans led to the third Punic War (149–146). In C. itself there were three parties: the Roman, the Numidian, and the Patriots. Their dissensions, and the treasonable surrender of Utica, led to the destruction of C. by Scipio Æmilianus, in accordance with the decree of the Roman Senate: 'They shall reside more than three leagues from the sea, and their city shall be entirely destroyed.' The new colony of C., begun by the Gracchi about B.C. 116, and completed by Augustus, does not figure largely in the history of the empire. In A.D. 429, Colonia C., then the mistress of a territory extending along the Mediterranean a journey of ninety days, was taken by Genseric the Vandal, and made the basis of his naval operations against Italy. Belisarius established the power of Justinian and expelled the Arians. The city was destroyed (A.D. 692–698) by Hassan, Governor of Egypt, under the Calif Abdamaleh. Two centuries later the first of the Fatimite caliphs repeopled it. In the beginning of the 16th c., C. consisted of 'a mosque, a college without students, twenty-five or thirty shops, and the huts of 500 peasants.' Nothing is seen now but ruins, a few cisterns, and vaults.

At C. the great interests were those of trade, and accordingly the Senate consisted of wealthy men and those distinguished in the public service, chosen for life. Much more influential was the Gerusia, or Council of the Hundred, which apparently consisted of selected senators, who acted as chief magistrates, were guardians of public morality, and were elected without salary by the Pentarchies, permanent committees of the Senate. At the head of the executive were the Suffetes, two in number, who presided in the Senate and initiated business there. Occasionally, on great political issues, a plebiscite was taken.

Ecclesiastical History.—In 397 a Church Council was held at C., which directed that nothing but bread and wine mixed with water should be used in the Eucharist, that priests standing at the altar should pray only to the Father, that baptism and the Eucharist should not be given to the dead, and that the canonical Scriptures should include Tobit, Judith, Wisdom, Ecclesiasticus, and Maccabees. To the following year belong the African rules for ordination and consecration (partly embodied in the Gelasian Sacramentary). It is also laid down that while bishops are to avoid secular business, clergy who can work are to earn their bread by trade or tillage. Laymen, but not women, may preach with the priest's permission. In 411 a great conference of Catholic and Donatist bishops decreed the suppression of Donatist conventicles, the restoration of their churches to the Catholics, the banishment of their clergy, and the infliction of fines, stripes, and civil disabilities on all classes of Donatists, from the Illustres to the Circumcellions. Soon after, the great Pelagian heresy was preached at C. by Cælestius. The 'impious and wicked proposition' that man could live without sin, and easily keep God's commandments, called forth many fiery sermons and treatises from Augustine, and was formally condemned at C. in 416, and again at a great council of the African Church held 1st May 418, which insisted on the transmission of guilt from Adam, and on the absolute necessity of baptism in the case of infants.

Carthage, Cape, a headland of N. Africa, a little to the N. of the entrance to the Lagoon of Tunis. Near it are to be seen traces of the ancient city of Carthage (q. v.).

Carthage'na Bark. See CINCHONA.

Cartha'go, the former capital of Costa Rica, Central America, lies at the foot of the volcano Pazu, near the mouth of a small river of the same name, 10 miles E. of San-José. It is one of the oldest Spanish towns of Central America, and was almost entirely destroyed by an earthquake, September 2, 1842. Pop. 7000. C. is also the name of a deep bay on the N.W. of the Mosquito shore.

Car'thamine, or Carthameine. See CARTHAMUS.

Car'thamus, a genus of plants of the natural order *Compositæ* (sub-order *Tubulifloræ*). *C. tinctorius* is the bastard saffron or safflower, the *Koosumbha* of India, extensively cultivated in India, China, and other parts of Asia, for the sake of the pink dye which is extracted from the florets. Among other articles, the *pink saucers* are coloured by it. About £106,000 worth are annually imported into this country from India. It is also employed to adulterate *rouge* and hay saffron. *Cake saffron* is prepared from it and mucilage. From the fruits, commonly called *the seeds*, is expressed the *koosum oil* of India. A similar oil is expressed from *C. persicus*. The dye obtained from *C. tinctorius* is called *carthamine*. It attaches itself to silk or cotton, but not to wool, and requires no mordant. The red colour which it gives can be changed to yellow by the addition of alkalies, but may be returned to its original colour again by being treated with acids.

Carthu'sians, a religious order instituted by St Bruno in 1086, and named from La Chartreuse, near Grenoble, Vienne, whither the saint retired with six companions to spend a life of pious solitude and austere severity. The oldest Carthusian 'rule' is that drawn up by Prior Guigo in 1134, and entitled *Consuetudines Cartusiæ*. The order was sanctioned by the Pope in 1170, and in 1180–81 spread into England, where nine houses were established, the most famous of which was the Charter-House (a corruption of Chartreuse House) in London. The 'rule' is extremely rigorous. In addition to the usual monastic vows, there is one of unbroken silence, the violation of which, except on particular days, is visited with scourging. The C. have still two of the finest convents in the world, viz., *La Grande Chartreuse*, on the site of their original home in the desolate valley near Grenoble, and *Certosa*, near Pavia. An establishment for Carthusian nuns was founded at Salette, on the Rhone, about 1229, the 'rule' of which is substantially the same as that for the monks.

Car'tilage. This substance is what is commonly known as *gristle*. It may be found in two situations—either covering the extremities of bones entering into the formation of joints (articular C.), or strengthening the walls of cavities (membranous C.). C. is also sometimes divided into *temporary* and *permanent*. It is temporary, as found in fœtal life, when there exists a cartilaginous skeleton, which is gradually supplanted by a harder and stronger structure—bone. (See BONE.) It is permanent when it exists as C. throughout life. C. consists essentially of cells imbedded in a substance called the matrix, and the varieties of C. differ from each other in the proportion of cells to matrix, and in the structural characters of the matrix. Thus there may be no matrix, when the C. is termed *cellular*; or the matrix between the cells may present a finely molecular appearance, when the structure is known as *hyaline* C.; or the matrix may have been transformed into fibres, when it is termed *fibro* C. In all the varieties of C. the cells present much the same appearance. We shall therefore now describe (1) typical C. cells; and (2) the different varieties of the tissue as found in the human body.

I. *Cartilage Cells.*—These may be readily seen by cutting a thin section of C. from the end of a long bone, and examining it under a magnifying power of 250 diameters. They are found to be round, oval, or more commonly irregularly crescentic in form, and flattened. They vary in size, the average diameter being about the $\frac{1}{2000}$ of an inch. They have no cell-wall, and they appear to be composed of a delicately granular protoplasm, having imbedded in it usually one, sometimes two, small nuclei. During life these cells may be caused to contract by mechanical irritation or electrical discharges, and heating up to 200° F. causes the protoplasm to become cloudy and sometimes granular. Frequently groups of cartilages are seen surrounded by a kind of halo or capsule. This, however, is not a true capsule, but is due to the fact of the matrix surrounding the group of cells being more granular than at other parts, and also to the shrinking of the cells from the matrix. Water produces no evident effect on C. cells. Weak acetic acid renders young C. cells more transparent, but has no effect on old ones. Colouring matter stains the protoplasm of the cell, the nucleus more deeply affecting the matrix slightly, or not at all. The cells frequently contain molecules of fat. C. cells multiply by endogenous formation—that is, by two or more young cells forming within the parent cell, which afterwards ruptures and liberates the progeny—or by simple fusion or division.

II. *Varieties of Cartilage.*—These are: 1. *Hyaline C.*—This variety forms the framework of the skeleton in the fœtus. The cartilaginous skeleton is in course of time replaced by bone, but in the adult, hyaline C. covers the ends of the bones forming the joints, and it also remains persistent in the C. of the nose and of the larynx. The C. of the rings of the windpipe and bronchial tubes also belongs to this variety. In very young hyaline C., the matrix is delicately molecular and translucent, but in specimens from old subjects it is roughly molecular, resembling ground glass. The cells lie in this matrix usually in an irregular manner. In articular C., however, the cells follow a regular arrangement. Thus, if a thin perpendicular section be made on the end of a long bone, such as the femur, it will be found that near the free surface of the C. the cells are placed so that their long axis is parallel with the surface; deeper down, they are arranged in groups irregularly, while near the bone they are found in long rows, perpendicular to the surface of the bone. In old hyaline C. the matrix is often traversed by pale yellow fibres. The C. found at the ends of the ribs, near the breastbone, is a variety of hyaline C., and has the peculiarity of having the ossific centre in the centre of the transverse section, from which rows of cells pass in a radiating manner.

2. *Fibro-Cartilage.*—As the name indicates, this variety has the matrix composed of fibres. There are two kinds—(*a*) *white fibro-C.*, in which the matrix consists of ordinary white fibrous tissue, rendered transparent and gelatinous by the action of dilute acetic acid; and (*b*) *yellow fibro-C*, where the matrix is composed of yellow elastic tissue, not affected by the same re-agent. The first kind is found in the discs between the vertebræ forming the backbone, and the second exists in the epiglottis, the cartilages of *Wrisberg* and *Santorini* in the larynx, and in the Eustachian tube and external ear.

We have now to describe the physical and chemical characters of C.

Physical Characters.—It is firm, dense, and of a whitish or yellowish colour. Thin sections show a considerable amount of elasticity and flexibility, but thick pieces are brittle. It does not macerate readily in water. Fibro-C. is remarkably tough, and difficult to cut into thin sections or to tease out by needles.

Chemical Characters.—When C. is boiled from 12 to 48 hours, it dissolves and yields Chondrin (q. v.). Microscopical examination shows that by this process the matrix is alone dissolved, not the cells. The inference is, therefore, that the cells do not yield chondrin, but have a chemical constitution different from the matrix. Yellow fibro-C., after digestion in caustic potash for several days, followed by boiling for sixty hours, yields a jelly-like brittle substance, which breaks down into granules. These granules may be dissolved on the addition of water, and are composed of a substance termed elastin. White fibro-C. yields gelatine on boiling. Water exists in C. to the extent of from 54 to 70 per cent. The ash of C. yields phosphates of calcium and magnesium, chloride of sodium, carbonate of soda, and sulphates of soda and potash. The amount of ash varies from 2 to 6 per cent. The proportion of inorganic constituents is increased by age. Thus, according to Von Bibra, costal cartilages yielded as follows:—

A child of six months . .	2·24 per cent of ash.
A child of three years . .	3·00 ,, ,,
A girl of nineteen years . .	7·29 ,, ,,
A man of forty years . .	6·10 ,, ,,

C. is covered by a fibrous membrane termed the *perichondrium*. From this a few vessels penetrate into the tissue to a slight depth, but C. is, strictly speaking, a non-vascular tissue. C. is not supplied, so far as is known, by nerves or lymphatics.

Pathological Changes in Cartilage.—As shown by Redfern and by Virchow, C. subjected to irritation shows the following changes: segmentation of the cells; softening of the matrix; transformation of the matrix into fibrous structures; calcification or transformation of the whole into a material resembling connective tissue. C. once destroyed is never regenerated, and the gap made by a section is closed by connective tissue. Occasionally new C. is formed, and may form a tumour attached to the end of a bone (*ekchondrosis*), or new C. may originate where the structure does not normally exist, as in glandular textures. A tumour may thus be formed called an *Enchondroma*.

Cartilag'inous Fishes, the name applied to those fishes the skeletons of which consist of Cartilage (q. v.) or gristle, and which thus exhibit a lower degree of structure in this respect than the true bony or *Teleostean* fishes. Cuvier constituted this group under the name *Chondropterygidæ*, and in this division he included a number of fishes which in modern zoological systems are divided among two or three distinct orders, being separated by differences and analogies more important than those of the skeleton alone. Thus the Ganoid fishes, or *Ganoidei* (q. v.), including the sturgeons, bony pikes, polypteri, &c., and the *Elasmobranchii*, represented by sharks, skates, rays, &c., form two chief sections which include fishes with gristly skeletons. But there are some few other forms or groups included by important structural affinities with the *Teleostean* osseous or bony fishes, in which the skeleton is cartilaginous. The Lancelet (q. v.), the Lampreys (q. v.), and Hag-fishes (q. v.), and even some of the osseous fishes (*e.g.*, *Plectognathi* and *Lophobranchii*), possess either cartilaginous or imperfectly ossified skeletons. The order *Teleostei* of modern ichthyology comprehends, in chief, the osseous fishes of Cuvier.

Cartoon' (Ital. *cartone*, pasteboard or large paper, from *carta*, Lat. *charta*, 'paper'), a full-size design or study sketched upon strong paper, in chalks or in distemper, for a work afterwards to be executed in fresco, oil-colour, or tapestry. From the C. the design is transferred to the canvas or the plaster upon which it is to be elaborated, by the usual process of tracing the lines of the design with a sharp point—a sheet of prepared black paper having been previously introduced between the C. and the canvas. When the design is for a fresco—in which case the plaster is worked wet, and, consequently, only a small part of the work is proceeded with at once—the design is transferred either by tracing or by pricking through the lines. By making use of the finished C. the composition, drawing, expression, and light and shade are all perfectly expressed before any colour is laid on, and the chief advantage of its use is, that after the complete design has been transferred, the mind of the artist, free from other distractions, is now concerned with the quality and effect of colour alone. The finest cartoons known are those executed by Raphael for Leo X. in 1515 and 1516 as patterns for tapestry. Each C. is about 12 feet high, is drawn with chalk upon strong paper, and coloured in distemper by Raphael and his pupils. They were originally ten in number; but, in the course of many vicissitudes, three, the 'Stoning of St Stephen,' 'Conversion of St Paul,' and 'St Paul in his Dungeon at Philippi,' have been lost. The remaining seven, illustrative of acts in the lives of the apostles, are now in the South Kensington Museum, and are consequently freely accessible to the public. These great works were bought in Flanders by Reubens for Charles I., and we owe their preservation to Cromwell, who, at the dispersion of the collection of Charles I., caused them to be bought for the country. They are considered to be, as designs, the very finest of Raphael's works, and a careful study of them is in itself an art education.

Cartouch' (Fr. *cartouche*, 'a cartridge,' introduced in the 16th c. from Ital. *cartoccio*), in military language, has had several meanings—a wooden case filled with cannon-balls, a cartridge, a cartridge-box, and also a soldier's ticket-of-leave.

In architecture, C. means a tablet for ornament or to receive an inscription, formed like a sheet of paper with the edges rolled up, like a Modillion (q. v.). The word is applied also to an elliptical oval on ancient Egyptian monuments and in papyri, on which are hieroglyphic characters expressing the names and titles of kings.

Car'tridge, a cylindrical case containing a part, or the component parts, of a charge for firearms. The former consists of gunpowder only, and is called *blank-cartridge*, while the latter includes the full charge for the weapon—viz., for a rifle or ball-gun, powder, lubrication (in the shape of a wad or otherwise), and bullet; and for a fowling-piece, powder, wads, and small shot. Cartridges for cannon contain powder only, cased in a bag of flannel or serge, and, for the larger bores of cannon, bound with iron hoops.

When muzzle-loading small-arms were in use, the C. employed for military purposes was a paper tube containing the powder and bullet (for blank-C. the powder only); and for fowling-pieces, a paper case containing the small shot, the interstices being filled with bone-dust, and for long-range shooting having a wire-netting of greater or less strength, according to the range required, surrounding the outside of the case.

Cartridges for breech-loading small-arms are very numerous, but they have all so much in common, that a description of one or two will give a good idea of their general construction. For military arms, the best type of C. is believed to be the Boxer-Henry, adopted by the British Government for the Martini-Henry rifle. The case is the invention of Colonel Boxer, late superintendent of the Royal Laboratory at Woolwich, and the bullet and lubrication that of Mr Henry of Edinburgh. A section of this C. is shown at fig. 1. The case, *a a* (which is bottle-shaped), is made of coiled brass, with a strengthening cup, *b*, of the same material at the back end, the base being an iron disc, *c*, with a hole in the centre: this base has a projecting flange for the extractor of the rifle to take hold of, for the purpose of withdrawing the C. from the chamber. The rear end of the C. is further strengthened by a thick disc, *d*, of paper pulp inside the metal case. In the centre of this disc is a small brass chamber, *e* (the cap-chamber), the forward end of which is embedded in the pulp, while its rear end protrudes through and is riveted down on the iron base, which it keeps in position. The cap *f*, containing the detonating powder and the anvil *g*, is contained within the chamber. The charge consists of the powder *h*, the lubricating wad *i*, of pure beeswax between thin wads of jute, and the bullet *j* enveloped in a paper wrapper, the bullet being secured into the case by two cannelures. The ignition is effected by the piston or striker of the rifle impinging on the base of the cap and driving the latter against the anvil. the concussion ignites the detonating powder in the cap, and the flash passing through the small hole in front of the cap-chamber, communicates with the powder.

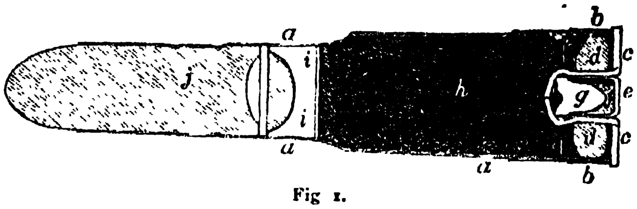


Fig 1.

Fig. 2 is a section of a central-fire cartridge for a shot-gun. The case, *aa*, is a cylinder of thick paper with a brass cup, *bb*, forming the base, strengthened, as in the former case, by a disc of paper pulp, and sometimes, for additional strength, having a short coil of thin metal inside the paper. The arrangement for ignition is the same as in the Boxer-Henry cartridge; *c* is the powder, *d* a thick felt wad, *e* the shot, and *f* a thin felt wad over the shot.

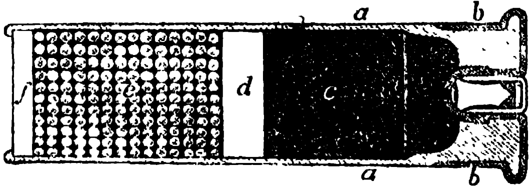

Fig. 2.

In addition to being made of coiled brass and paper, C. cases are also made of solid drawn brass or copper, and in addition to the central-fire arrangement for ignition, there is also the rim-fire and pin-fire. In the former, the rim of the base is hollow, and contains fulminate all round it; a blow of the hammer or striker on any part of the rim causes the ignition. In the latter, the cap is situated in the centre of the pulp, with its mouth towards the edge of the case, and a pin passes through the side of the case and into the cap, the ignition being caused by the blow of the hammer on the pin, which protrudes through a small hole in the breech end of the barrel of the gun.

Cartridge-Paper is white, strong in texture, with a rough surface, and is used for drawing and various purposes in the arts. It derives its name from the circumstance of having been originally manufactured for military cartridges.

Cart'wright, Edmund, the inventor of the power-loom, was born at Marnham, Notts, on 24th April 1743, and educated at Oxford, where he obtained a fellowship, for the English Church, in which he held a living for many years. He does not appear to have shown any special turn for mechanics, and it was not until he was over forty that a chance conversation turned his attention to the then unsolved problem of machine-weaving, with such excellent result that less than a year afterwards he was able to exhibit his first Power-Loom (q. v.). It was at first a very imperfect machine, and its introduction was fanatically opposed by both millowners and workers, a mob setting fire to the first factory. After making many improvements in it, C.'s persevering efforts to get it introduced into mills were successful, and public opinion so altered itself that in 1809 Parliament voted him £10,000 in acknowledgment of the value of his inventions—a grant which enabled him to end his days in comfort. He died 30th October 1823. See *Life and Correspondence of C.*, by his niece (2 vols. Lond. 1826).

Cartwright, Thomas, a distinguished divine and scholar, was born in Hertfordshire about 1535, and was educated at St John's and Trinity Colleges, Cambridge. As a preacher he was much admired, but being strongly Puritan in his principles, he was frequently persecuted by Whitgift and others, was more than once imprisoned, and was compelled to reside for the most of his life abroad. We find him at Geneva in 1570, at Heidelberg in 1573, later at Antwerp and Middelburg, and at Guernsey in 1595-98. He died at Warwick, 27th December 1603, his death having been, it is believed, hastened by his troubles. C. was ecclesiastically a factious and mutinous spirit. He had a morbid passion for controversy, and did everything in his power to provoke persecution. Among his writings, of which a long list is given in Cooper's *Athenæ Cantabrigienses*, are a *Latin Harmony of the Gospels*, a *Commentary on the Proverbs*, and a *Confutation of the Rhemists' Translation, Glosses, and Annotations on the New Testament*, &c.

Carus, Karl Gustav, a German physician, was born at Leipsic, 3d January 1789, and studied at the university there Elected Professor of Clinical Obstetrics at Dresden in 1814, he became physician in ordinary to the King of Saxony in 1827, and died at Dresden, 28th July 1869. His chief works are *Lehrbuch der Zootomie* (Leips. 1818; 2d ed. 1834); *Grundzüge zur vergleichenden Anatomie und Physiologie* (3 vols. Dresd. 1828); *Atlas der Kranioskopie* (Leips. 1843; 2d ed. 1864); *Zur Entwickelungsgeschichte der Seele* (Pforzh. 1846; 3d ed. 1860); and *Briefe über Landschaftsmalerei* (1834). His *Lebenserinnerungen* (4 vols. 1865-66) are full of interest.—**Julius Victor C.,** a well-known German anatomist and zoologist, was born at Leipsic, August 25, 1823. After acting for a time as conservator of the Oxford Anatomical Museum, he was elected Professor of Comparative Anatomy in his native town in 1853. He lectured in Edinburgh University in the room of Professor Wyville Thomson, who was absent on the *Challenger* expedition, during the summers of 1873-74. He is a strong Darwinian, pushing the claims of natural selection even further than its great originator. His chief works are *System der thier. Morphologie* (Leips. 1853); *Icones Zootomicæ* (Leips. 1857); *Bibliotheca Zoologica*, with Engelmann (2 vols. Leips. (1862); *Handbuch der Zoologie* (1868); and with Gerstacker, *Geschichte der Zoologie* (Munich 1878).

Car'vel-Built, in ships and boat-building, is a term signifying that the outer planks are all smooth, meeting edge to edge. In iron ships this arrangement is called *jump-jointed.* See CLINCHER-BUILT.

Car'ver, John, the first governor of the Plymouth colony in the New World, was born in England in the second half of the 16th c., and went to Leyden, then a refuge for the Puritans. He was an elder in the Church, and in 1620 sailed with the Pilgrims in the *Mayflower*. C. was a prudent and firm ruler, but did not long survive his arrival in New England, dying at Plymouth, April 5, 1621.

Carvin, a town of France, in the department of Pas-de-Calais, about 15 miles N.N.E. of Corras. Pop. (1872) 5780, engaged chiefly in the manufacture of alcohol from beet-root.

Car'ving is the art of producing decorative work upon hard surfaces with the aid of sharp tools; the name, however, is generally used, in a limited sense, to denote works in ivory, bone, and wood, in contradistinction to *sculpture* in stone and *chasing* in metal. All nations practise in some degree the art of C., and the skill and ingenuity shown by savage tribes in wood-C. is wonderful. The intricate designs which the uncivilised Maori wrought with extremely rude tools upon his house, canoe, weapons of war, &c., are truly remarkable. Wood has been used from the earliest times for C., and the *chryselephantine* sculpture of the greatest artists of ancient Greece points to the extensive use of ivory in works of art. The statue of Minerva, executed in gold and ivory by Phidias, which was placed in the temple of that goddess at Athens, is supposed to have stood over 39 feet in height. The Chinese and Japanese are extremely adroit in C. in ivory, and the French and Italians in decorative woodwork. Machinery has of late years been successfully applied to the cheap and expeditious production of wood-carvings; those of the interior of the Houses of Parliament having been so produced. The woods chiefly employed in C. are the pear, lime, American pine, chestnut, maple, oak, box, ebony, snakewood, and tulipwood.

Ca'ry, Rev. Henry Francis, was born at Birmingham in 1772. He distinguished himself at Oxford by his knowledge of languages, and in 1797 became vicar of Bromley Abbots, Staffordshire. In 1805 appeared his translation of Dante's *Inferno*, and in 1814 a version of the entire *Divina Commedia*, which is admirable for its accuracy and vigour. From 1826-32 he was assistant librarian in the British Museum. He died 14th August 1844. C. also wrote translations of the *Birds* of Aristophanes, and the *Odes* of Pindar, Lives of English and French poets, and published editions of Milton, Pope, Cowper, Thomson, and Young. See the Memoir by his son (1847).

Cary, Sir Robert, a nobleman eminent in the civil service of Queen Elizabeth, was a son of Henry Cary, Lord Hunsdon, and was born about 1500. On her death in 1603, C. rode swiftly to Edinburgh to acquaint James VI. with the intelligence. He was created Earl of Monmouth at the coronation of Charles I., and died in 1639. His curious and interesting *Memoirs* were published in 1759, from an MS. in the possession of the Earl of Cork and Orrery, and again in 1808 (Edinb.).—His son, **Henry C.,** second Earl of Monmouth (born 1596, died 1661), was an industrious author. His writings are chiefly translations from Italian and French authors, and are not remembered.

Car'ya, a genus of plants belonging to the natural order *Juglandaceæ* (walnut order). *C. alba* is the common Hickory (q. v.); *C. olivæformis*, the peccan nuts; *C. porcina*, the pig or hog nut. The nuts are consumed by pigs, squirrels, &c., and the wood is considered superior to that of the rest of the genus.

Caryat'ides (lit. the women of Caryæ in Laconia, and especially the priestesses of Artemis there), is the name given in architecture to female figures used instead of columns to support a cornice. Vitruvius explains its origin thus:—After the battle of Thermopylæ, the inhabitants of Caryæ, having joined the Persians, were attacked by the allied Greeks, the males slaughtered, and the females carried into captivity. Male figures, used as bearing-shafts, were represented as Persians, and known as *Atlantes* and *Telamones*; female figures so used were designated C., to commemorate the disgrace of the people of Caryæ.

Caryo'car, a genus of plants of the natural order *Rhizobolaceæ* (q. v.), *C. butyrosum* (*Pekea butyrosa*, or *tuberculosa*), or, according to some, *C. nuciferum*—also a British Guianean tree—is a tree much esteemed in S. America for shipbuilding. The separated portions of the fruit constitute the Sourari, Suratiwa, or Suwarrow nuts of commerce, which form a pleasant article of food. A table-oil is extracted from them. From *C. Brasiliense* a concrete oil can also be obtained.

Caryodaph'ne, a Javanese plant, belonging to the Laurel family. *C. densiflora* has a bitter bark; its leaves are aromatic, and used in spasms of the bowels and similar complaints.

Caryophylla'ceæ, a natural order of dicotyledonous plants, of the subdivision *Thalamifloræ*, containing about 1100 species and sixty genera, chiefly natives of temperate and cold climates; if found within the tropics, they are generally on the sides of mountains, near the limits of perpetual snow. The C. are always insipid, and contain few species of importance. Some are eaten by small animals, and are said to increase the secretion of the milk of cows fed on them. This idea is perpetuated in the name of *Vaccaria vulgaris*. *Saponaria officinalis* contains a principle called *Saponine*, and has been used in syphilis. The Pinks (q. v.), such as sweet-william, Carnations (q. v.), *Silene*, *Lychnis*, &c., are among the showy garden plants belonging to this order. Chickweed (*Stellaria*), cornspurry (*Spergula arvensis*), &c., are used as fodder for cattle. The order is divided into three sub-orders—(1) *Sileneæ*, the pink tribe; (2) *Alsineæ*, the chickweed tribe; (3) *Mollugineæ*, the carpetweed tribe.

Caryophyll'us, a genus of plants of the natural order *Myrtaceæ*. *C. aromaticus* is the clove-tree, the dried flower-buds of which are known by the name of *cloves*. They possess aromatic, stimulant, and carminative properties, chiefly due to the presence of a volatile oil. The unripe fruits, called *mother cloves*, though much inferior to the ordinary cloves, are used as a spice in China, and are sometimes imported into this country. The buds are collected either by hand or by beating the bushes with a stick, when, owing to their jointed stalks, they readily fall off and are collected on a sheet spread beneath. The clove is now cultivated in the W. Indies, Mauritius, Sumatra, and elsewhere; but for many years its cultivation was restricted by the Dutch to the island of Amboyna in the Malay Archipelago, and the monopoly was even narrowed by the Batavian Government extirpating the trees in every other place except a limited district of the island mentioned. Cloves are used to lull the pain in toothache, and as a carminative in medicine to check nausea and griping caused by the administration of purgatives.

The wild clove-tree of the W. Indies belongs to the same order. See MYRICA.

Caryo'ta, a genus of palms, of which nine species are known, all natives of India and the Indian islands. *C. urens* (or jaggery palm) has a fruit about the size of nutmegs, with a very acrid rhind, and the pulp of which produces a burning sensation when applied to the skin; hence the name *urens* (burning). The natives of Ceylon, Malabar, Bengal, Assam, and other parts of India where it is found, extract from its flowering stalks the juice called 'toddy,' which when boiled yields jaggery or palm-sugar, and also sugar-candy. In the hot season as much as 100 pints will flow in twenty-four hours. In the soft central portion of the trunks of old trees is stored a quantity of starch, which forms excellent sago, which, when made into bread, forms a large portion of the food of the natives. The outer part of the stem is hard, and applicable to many purposes, *e.g.*, the fibres of the leaf-stalk (kittul fibre) into cordage, the leaf-stalk into fishing-rods, the woolly substance at the base of the leaves for caulking boats, &c. The whole of the sugar used in Ceylon is extracted from this palm and two others (*Cocos nucifera* and *Borassus flabelliformis*). The caste of natives called *Jaggeraros* are wholly employed in preparing it.

Casacalen'da (ancient *Calela*), a town of Central Italy, province of Molise, 16 miles N.E. of Campobasso. Pop. about 6000. Silkworms are reared in the neighbourhood, which also yields good wine.

Casa'le, a town of N. Italy, province of Alessandria, on the river Po, 43 miles S.W. of Milan. Its cathedral, the splendid marble chapel of which was completed in 1808, dates from 1474. The citadel, still one of the strongest fortifications in Italy, was built in 1590 by the Duke of Montferrat, of whose duchy C. was the capital. It is the seat of a bishop, and has a considerable industry in silk manufacture. Pop. (1871) 27,514. In the 17th c., C. was several times besieged by the Spaniards, and was captured by them in 1652. It finally fell to Savoy in 1706. The district is rich in corn and wine.

Casal'-Maggio're, a town of N. Italy, province of Cremona, on the Po, 21 miles S.W. of Mantua. Strong embankments protect it from river inundations. Pop. 15,317, largely engaged in the manufacture of earthenware, glass, &c.

Casal'-Pusterlen'go, a town of N. Italy, province of Milan, on a small tributary of the Po, 18 miles W.N.W. of Cremona, and celebrated for its fine Parmesan cheese. The chief industries are silk, linen, and earthenware manufacture. Pop. 6000.

Casamass'ima, a town of S. Italy, province of Bari, 12 miles S. of the town of Bari; has a convent and two abbeys. Pop. 5600. The neighbourhood yields good wine.

Casano'va, Francis, painter and engraver, born in London, of Venetian parents, in 1727 or 1732; went at an early age to Florence, thence to Paris, and afterwards to Dresden. He died at Brühl, near Vienna, 8th July 1815. C.'s works are chiefly battle-pieces, remarkable for spirit and for excellent colour. He painted the battles of Fribourg and Lens for the Prince of Condi in 1771; and later he removed to Vienna, and was employed by the Empress Catherine to commemorate her victories over the Turks.—**Giovanni Jacopo C. de Seingault**, brother of the preceding, was born at Venice, 2d April 1725. His family was of Spanish extraction. He was educated for the Church, but spent his life in amours, intrigues, and peregrinations through Europe, mingling with the highest society, and invariably quitting it in disgrace. Yet his last years were spent in peace at the Castle of Dux, in Bohemia, where he pursued cabalistic 'science' along with his host, Count Waldstein, and where he died, 4th June 1798. It was at Dux that C. wrote those *Mémoires* which give an entertaining account of his vagrant existence, and a valuable picture of his times. They were first published at Leipsic in 12 vols. (1826–38), under the title *Mémoires Écrites par lui-même* (new ed. 6 vols. Par. 1860).

Casau'bon, Isaac, a great French scholar, was born February 18, 1559, at Geneva, of a family belonging to Dauphiné. There he studied languages, theology, and law, and became Professor of Greek in his twenty-fourth year. He married the daughter of the celebrated scholar Henri Estienne in 1586, and continued at Geneva, issuing editions of Greek and Latin authors, until 1596, when he received the Greek professorship at Montpellier. Two years afterwards he visited Paris, where he was appointed royal librarian. On the murder of Henri IV. in 1610, he visited England, where he found an Anglo-Catholic party in closer unison with his views than any Continental school of theology. The story that he was hired by James I. to write against Baronius is a fabrication of the Jesuits. He received two benefices in England, and after his death at London, July 1, 1614, was buried in Westminster Abbey. His theological works are now of slight value, but are singularly placid and tolerant. His learning was vast and recondite; as a commentator he displays rare erudition and candour, and enlivens his annotations by quaint, entertaining gossip. His best works are his edition of *Athenæus*, which occupied him two years, and his edition of *Polybius*. He commented on Aristotle, Diogenes, Laertius, Dionysius of Halicarnassus, Theophrastus, Theocritus, Persius, Pliny the Younger, Strabo, Suetonius, &c., and wrote a treatise on Greek and Roman satire. See *Isaac C.*, by Mark Pattison (Longman & Co. 1875).—**Meric C.**, theologian and critic, son of the above, was born at Geneva, August 14, 1599. After studying at Sedan Academy, he accompanied his father to England, became rector of Ickam and Professor of Theology at Oxford, where he died, July 14, 1671. Like his father, he possessed great learning. His commentaries on Terence, Epictetus, Florus, Diogenes Laertius, and Marcus Aurelius, are of considerable value. He also wrote in defence of his father *Pietas contra maledicos patrii nominis et religionis hostes* (Lond. 1651), and *Vindicatio patris adversus impostores* (1624). See Anthony Wood's *Athenæ Oxonienses* (Oxford, 1694).

Cas'bin, or **Kasvin**, a town in Irak-Ajemi, Persia, 97 miles W.N.W. of Teheran, lies in a fine plain, is defended by walls and towers, and embowered among gardens and vineyards. It has two large mosques, one of which has a high dome, and two minarets of glazed blue bricks. The manufactures include velvets, brocades, weapons, and coarse cottons. There is a large trade, chiefly to the Caspian shores, in vitriol, grain, dried fruits, vine treacle, sheep, and horses. Pop. 25,000, mostly descended from the Turkish nomads that have long frequented the neighbouring plains. C. was capital of Persia for a time.

Cascarill'a (*i.e.*, 'little bark'), the name given in Spanish America to the bitter medicinal barks, like cinchona, which are collected for export. *Cortex cascarillæ* is the bark of *Croton Eluteria* (see CROTON), which is sometimes employed as a substitute for cinchona, especially in Germany. *C.* is also applied by Weddel and other botanists to a sub-division of the genus *Cinchona*, distinguished, *inter alia*, by not containing any of the ingredients that render that bark so valuable.

Case, in grammar. See DECLENSION.

Case, in law, is a formal written argument on the merits of a cause. In England, Scotland, and Ireland, questions in dispute can now be stated and the opinion of court got on them without pleading.

Case, in the art of printing, a shallow drawer, 34 inches long by 15 inches broad, divided into compartments for holding the various letters or 'types' used by the compositor. These compartments are technically called 'boxes,' and vary in size according to the requirements of the English language—the letter *e* requiring the largest box, and others in proportion. The letters are not placed alphabetically, but those in most use are nearest the compositor. There are two cases, an 'upper' and 'lower'—the former containing the capitals, small capitals, &c., the latter the small letters, punctuation marks, &c. They are placed in a stand or 'frame,' 4 feet high, at which the compositor stands. A 'lower-case' will hold about 30 lbs. of type, equal to two pages of the present work, or 18,500 types.

Casea'ria, a genus of plants of the natural order *Samydaceæ*. *C. ulmifolia* is a native of Brazil, and is highly esteemed in that country as a remedy for snake-bites. The Brazilians make a drink of the juice of the leaves, and also apply them to wounds. Nearly a hundred species, many of which have medicinal properties, are known. *C. esculenta* of India has purgative roots, but other species are poisonous. For example, the resin surrounding the young flowers of *C. resinifera* is used to kill dogs and cats.

Case-Hardening, a metallurgical process for superficially converting wrought-iron into hard steel, seldom exceeding $\frac{1}{16}$ inch in thickness, applied to tools, bolts, &c. This result may be obtained by plunging malleable iron raised to a welding heat into liquid pig-iron, and forging out. It is usually effected, however, by heating the iron with substances producing cyanogen, as ferro-cyanide of potassium, leather parings, or horn, and suddenly quenching in cold water. The *rationale* of the process is that some of the carbon, and perhaps a little of the nitrogen, of these bodies, enter into combination with the iron.

Case'ine is an Albumenoid substance (q. v.) contained in milk in quantities varying from 3 to 17 per cent. A substance either identical with or closely allied to C. is found in peas, beans, and other leguminous seeds, and is called *Legumine*. Like other albumenoids, C. exists both in the soluble and insoluble modification. In fresh milk it is present in the state of solution, but it is readily precipitated as *curd*, by the addition to milk of dilute mineral acids, alcohol, and even acetic acid. C. is also coagulated or rendered insoluble by the action of *Rennet*, the lining membrane of the stomach of the calf; this property is turned to account in the manufacture of Cheese (q. v.). Unlike albumen, C. is not precipitated by boiling its solution, but a thin skin or pellicle forms on the surface. C. is readily soluble in alkalies and alkaline solutions, even after coagulation. It unites with alkalies and alkaline earths, and appears to have properties resembling those of an acid. A mixture of cheese and slaked lime has been employed as a cement for porcelain—the two uniting to form a tenacious and insoluble compound. Dried milk-curd is used in calico-printing, and is known by the name of *Lactarine*: it acts as a mordant, *i.e.*, combines with colouring matters forming insoluble compounds which adhere to the cloth. Milk is sometimes given in cases of poisoning by salts of the metals—these forming insoluble precipitates with the C. C. is by no means nutritious, and is the least easily digested of the albumenoids.

Case'mate (introduced in the 16th c. from the Ital. *casamatta*), in fortification, an arched bomb-proof chamber, constructed as a protection from the effects of vertical and enfilade fire, and adapted for use as barracks, magazine, or hospital, and sometimes for mounting guns, which are fired through embrasures.

Casem'be (*i.e.*, 'general'), the title of a sovereign in the interior of Africa, whose territory, called the country of C., has been made known to Europeans by Dr Livingstone. It is partly upland, and is 'generally covered with forest, well watered by numerous rivulets, and comparatively cold. The soil is very rich, and yields abundantly wherever cultivated.' The chief river is the Luapula, which connects Lakes Bangweolo and Moero, entering the latter about 19 miles N.W. of C.'s town. The climate is in some districts unhealthy. The town of C., near the N. end of the small lake Mofwe, at an elevation of 3319 feet above the level of the sea, consists of huts interspersed among cassava plantations, and covers one sq. mile. Each governor builds a new capital for himself. See the *Last Journals of David Livingstone* (2 vols. Lond. 1874).

Case'ment (Ital. *casamento*), in building, a frame enclosing part of the glazing of a window, and opening on hinges. C. windows are general on the Continent, but rare in this country. In architecture, C. is the old English name for the hollow circular moulding now called a *Scotia*, which in Gothic architecture, especially in the Perpendicular style, is very prevalent in cornices and door and window jambs, and which is sometimes richly carved with running patterns of foliage.

Caserns' (Fr. *caserne*, 'barracks;' introduced from the Sp. *caserne*), huts erected for the temporary accommodation of soldiers on duty in a fortified town. They are put up either on the ramparts, or between the ramparts and the houses.

Caser'ta (Ital. *casa erta*, 'steep or tall house'), the capital of a province of the same name, S. Italy, on a hill, 12 miles N.E. of Naples by railway. It is the seat of a bishop, and has one of the largest and finest castles in Europe, built by Carlo III. in 1752, at a cost of £1,575,000. It is surrounded by magnificent gardens, and gives to the town its name. C. has a royal silk factory. Pop. 27,728. The *province* has an area of 2307 sq. miles, and a pop. (1871) of 697,403.

Case-Shot, or **Canister-Shot**, in ammunition, a cylindrical box of iron or tin-plate, charged with sand, shot, and shavings or sawdust in the interstices. They are used for destroying ships' rigging, in defending ditches or narrow defiles, or employed with terrible destruction against masses of troops at short distances, rarely exceeding 300 yards. C.-S., with wooden bottoms projecting slightly beyond the cylindrical body, are discharged from bronze ordnance on account of the injury inflicted by the iron on the bore of the guns. The diameter of C.-S. ranges from 3 to 10 inches, and the size of the sand-shot employed varies accordingly; for the convenience of lifting, the large C.-S. have an iron or rope handle attached to one end.

Cash (Fr. *caisse*, a 'money-chest'), strictly means only coin and bank-notes, but is sometimes used in a wider sense to denote not only ready-money, but also bills, drafts, bonds, and all the immediately negotiable paper in an individual's possession.

Cash Account. See CREDIT, CASH.

Cash'el (Irish Gael. *caiseal*, 'a circular stone fort'), a town in Tipperary county, Ireland, 9 miles W. of Tipperary, with which it is connected by railway. It is built at the base and on the sides of the famous 'Rock of Cashel,' an isolated limestone hill rising from the plain of the Suir. The rock is crowned with some famous ruins, among which are the old cathedral, founded in 1169, Cormac's Chapel (1127), the palace of the Kings of Munster, and a round tower. Of the modern buildings may be mentioned the new cathedral (Church of St John), the town-hall, the county infirmary, and barracks. The archbishopric of C. was reduced to a bishopric in 1834. C. is also a Roman Catholic archdiocese. The trade is chiefly in agricultural produce, and large markets are held here bi-weekly. Pop. (1871) 4317. C. returns one member to Parliament.

Cash'ew Nut (*Anacardium occidentale*), a tropical tree of both hemispheres (though reputed as originally American), belonging to the natural order *Anacardiaceæ*. The milky juice, used in India for varnishing, is exceedingly acrid. The 'nut' is kidney-shaped, seated on the end of the pear-shaped fleshy stalk, which is the edible portion. The kernel is oily, but very pleasant and wholesome, and in tropical countries is a great favourite for making puddings, &c. It is thought to communicate a peculiarly pleasant flavour to old Madeira and other wines, and accordingly, in the W. Indies, it is frequently put into wine. It is also, for the same reason, mixed with chocolate. The vapour which arises from the coating of the kernel during the roasting operation is so acrid as to cause erysipelas in the face if care is not taken to avoid the fumes. The fleshy stalk (or *C. apple*), is very pleasant to the taste, refreshing, and free from acridity. A large quantity of gum exudes from the

bark, but is also without acridity, and is not unlike gum-arabic, though little known in commerce. The juice of the 'apple' when fermented yields a kind of wine, and in Bombay and other places a spirit is also produced from it.

Cash'gar, or **Kashgar**, also known as Eastern Turkestan, an independent khanate of Central Asia, in the basin of the Tarim, is bounded N. by the Tian-shan Mountains, S. by the Kuen-lun range, E. by the great desert of Gobi, and W. by the Bolar Tagh and Pamir steppes. Estimated area, 400,000 sq. miles, and pop. 850,000. It is a vast undulating waste of bare sand and glaring salt, from 3000 to 4000 feet high, and sloping gradually to the E., in which direction flows the Tarim, to lose itself in Lobnur, an enormous stretch of lagoons and swamps. The glaciers in the lofty frontier mountains send down some twenty large tributaries to the main river. There is, however, but scant vegetation, and almost no animal life, except in the Lobnur forests and reed belts, where tigers, wild hogs, panthers, and wolves abound. The inhabitants are massed in some thirteen isolated settlements at oases on the river banks or mountain skirts; of these, Yarkand is by far the most populous. Each township is sheltered by willow, poplar, and elm groves, and its gardens produce small quantities of wheat, barley, maize, rice, cotton, flax, hemp, and tobacco. The country is rich in minerals, including gold, silver, lead, copper, iron, coal, jade, &c. Turfan supplies the Kashmiri with the finest wool in the world for the famous shawl manufacture. The climate of C. is one of extremes, the temperature ranging from about 26° F. in winter to 95° F. in summer, while rain is rare; and a regular N.W. wind in spring is usually followed by sand-storms and whirlwinds. C. was an independent Aryan kingdom as early as 200 B.C., and became subject to China about 60 B.C. It was conquered by the Arabs about the middle of the 8th c., and by Genghis Khan in 1220, under whom its cities rose to wealth and importance. Timur overran C. in 1389, and it was again taken in 1760 by the Chinese, who clung to its possession till the Tungani revolt of 1862–63. After a struggle of six years, Yakub Beg, now *Atalik Ghazi* ('Champion of the Faith'), once more converted it into a Mahommedan state.—C., the capital, on the Tuman, is encircled by high and massive walls, and has well-stocked bazaars, but few good buildings. Pop. 80,000, including many large suburbs. See the works of Johnson (1866), Shaw (1871), Hayward (1872), and Bellew (1875).

Cashier'ing (Fr. *casser*, 'to break') is a punishment sometimes inflicted on officers in the army and navy. Its effect is to dismiss the offender from the service, and to disqualify him from re-entering it. C. is commonly awarded on the verdict by a court-martial of 'guilty of scandalous and infamous conduct.' The sentence of simple dismissal commonly follows the verdict of 'guilty of conduct unbecoming the character of an officer and a gentleman.'

Cash'mere, or **Kashmir'**, an independent state in the Himalayas, has an estimated area of 4500 sq. miles, and a pop. of 1,537,000. It mainly consists of the so-called 'Happy Valley,' famous alike for its fertility and its beautiful scenery, while it also includes Jummu, Bulti, Ladakh, Chamba, &c. The valley, from S.E. to N.W., is 118 miles long, about 17 broad, and is some 5200 feet above the sea. It is enclosed by lofty mountains, and watered by the Jhelum, which flows on through the Baramula Pass to the plains of the Punjab. The highest peaks in the Pansal range are Haramuk (16,015 feet), Muli (14,952 feet), and Ahertatopa (13,042). The range is covered with snow for eight months in the year, and between its spurs are many large glaciers. Ten frequented passes lead into the valley, the highest being 12,560 feet; but many others are practicable. The Jhelum, which is formed by the junction of the Arpat, Bring, and Sandraran, is spanned by thirteen rude but durable bridges, and is navigable for 60 miles, from Islamabad to Baramula. The principal lakes are the Wular, through which the Jhelum flows, and the Dal or 'city lake,' to the N.E. of Srinagar. The climate on the mountains is rigorous, in the valley temperate and healthy, while the seasons nearly correspond to those of England. Of forest trees, the chief are the cedar, pine, fir, elm, birch, and maple. Fruit and flowering and medicinal plants are singularly abundant. Three-fourths of the valley is cultivated, the crops being mainly rice, wheat, maize, barley, flax, and various oil grains. Sheep and cattle are numerous, and of wild animals the principal are the bear, leopard, fox, chamois, wolf, and otter. Besides the famous shawls, the manufactures are woollen cloths, leather, papier-maché, gold and silver articles, and weapons. The rearing of the silkworm was made a Government monopoly in 1871. C. exports annually £130,000 worth of shawls, which range in price from £5 to £300. The shawl-weavers are a most degraded class, physically and morally, though the Kashmiris are, generally speaking, a fine race, well built, tall and strong, with olive complexions and regular features. The Maharaja has an army 3200 strong, and a revenue of £843,000. Hindus are the dominant class, but the Mohammedans (chiefly Sunites) are ten times more numerous. The language (*Kashmir*) is a prakrit of pure Sanskrit, and in its written form contains several histories and poems, besides innumerable legends and songs. C. was under alternate Tartar and Hindu rule till 1341, when it first received a Mohammedan king. It was conquered by Akbar in 1586, and betrayed into the power of Afghanistan on the decline of the Mogul Empire in 1752. In 1819 it was subdued by Runjit Singh; and after the Sikhs were crushed by the British in 1845, it was transferred, on payment of £1,000,000, to Gulab Singh, as a sovereign independent of the Sikhs, who is bound to refer to the arbitration of Britain in all disputes. The Jummu dynasty has continued loyal and friendly to the British Government, and rendered valuable services during the Indian mutiny. Runbir Singh, the present ruler, issued an annual administrative report for the first time in 1872.—**C.**, or **Srinagar**, the capital, lies on the Jhelum, about the centre of the valley, is intersected by canals. The houses are built of wood, and are from six to seven stories high. The two great wooden mosques of the Jummah Musjid and Shah Hamedan are declared by Ferguson to be the most perfect specimens of their kind in the world. The special industries of C. are papier-mâché, engraving on stone, and shawl-weaving. Of late years silk-weaving has been begun, and a special *serai* has been constructed for the Tarkand merchants. Pop. 40,000. In 1878 the state and town were ravaged by famine and cholera.

Cashmere or **Cashmir Goat**, a variety of Goat (q. v.) inhabiting Thibet and Central Asia generally. The males have long flattened horns, which curve backwards and outwards in a series of undulating curves. The fur is of double nature, and consists of an inner coat of woolly greyish hair, and an outer one of long silky hairs. The under coat supplies the material from which Cashmere shawls are manufactured; a single shawl a yard and a half square absorbing the outer coat of at least ten goats. The taxed industry, and not the material, causes these shawls to be sold at very high prices. The C. G. will breed with the Angora Goat (q. v.), the hybrid possessing also a fine mixed wool. The hair is spun by females, and then dyed. It is manufactured into the shawl fabric on looms of primitive construction.

Casimir, a French form of the Polish Kazimierz. See POLAND.

Casi'no (Ital. dim. of *casa*, 'a house'), a place for social meetings, having rooms for refreshments, singing, dancing, and other amusements. The C. is of Italian origin, the nobles having private houses for amusement detached from their palaces, and the people imitating them in a building generally close to a theatre. They are numerous also in France and Germany, and are not unknown in England.

Casino, or **Monte Casino**, a mountain in the province of Caserta, S. Italy, 55 miles N.N.W. of Naples. It is well known through a fine old abbey, founded here by St Benedict in 529 A.D. This abbey has a printing-press, from which the monks, who have, as a rule, honourably maintained the great traditions of Benedictine scholarship, have issued various important works. A key to its valuable library and archives has been given by Luigi Tosti in his *Storia della Badia di M. C.* (3 vols. Naples, 1841–43).

Caso'ria, a town of Italy, province of Naples, on the railway between Rome and Naples, 4½ miles N. of the latter city. The chief produce is silk. Pop. 8000.

Cas'pe, a town of Spain, province of Saragossa, near the Ebro, 57 miles S.E. of the town of Saragossa. It has manufactures of oil and soap. Pop. 7500.

Cas'pian Sea (the *Mare Caspium* of the ancients; Russ. *Chvalinskoi More;* Turk. *Kuzghun Denigi*, 'raven sea;' Turkoman, *Kök-Küz;* Pers. *Darjâ-i-Chyzyr*), the largest lake in the world, lies in the greatest depression of the earth's surface, in the Turanian lowlands, between Europe and Asia, and is bounded by Russia, Turkestan, and Persia. It extends from N. to S., is 765 miles long and 190 broad, and has an area of 178,776 sq. miles. Its greatest depth is 2820 feet, and its surface is 84 feet below the level of the Black Sea. The chief rivers which enter it are the Volga, Ural, Kur, Terek, and Kuma. The C. S. has no ebb or flow, and its superfluous waters, which are more or less salt, are carried off solely by evaporation. Its level sinks in winter, and rises in June and July, when the rivers are in flood. The shores are mostly low-lying, have many deep bays, but are either of a sandy or swampy character. Of the numerous coast-islands, the most remarkable is Tscheleken, S. of the bay of Krasnovodsk, with numerous naphtha springs. The C. S. is not only traversed by the steam and sailing vessels of Russia, but is now the station of a regular fleet. There are numerous Russian forts on or near its shores, as Gurjev, Astrakhan, Kisliar, Petrovsk, Tarku, Derbent, Novo Alexandrovsk, &c. Chief among the Persian towns with which there is an active Russian trade are Resht, Amol, Farahabad, Astrabad, and Sari. Beside the regular trade, which is rapidly increasing, Russia has important caviare, sturgeon, and bream fisheries at the mouths of the larger rivers, worth nearly £1,000,000 yearly. From Aristotle downwards, the C. S. was supposed to open into the Northern Ocean; and to Van Ruysbroeck, a Franciscan monk (1252–53), belongs the credit of declaring it an inland sea. It is believed to have received the Oxus and Jaxartes in ancient times. For the first time it was accurately surveyed by the Russian Government in 1858-62, and a special survey took place, with the view of restoring the Oxus to its former bed, in 1875. See Baer, *Kaspische Studien* (Petersb. 1855), Melguno, *Das südliche Ufer des Kaspischen Meeres oder die Nordprovinzen Persiens* (Leips. 1868), Yule, *The Book of Ser Marco Polo* (2 vols. Lond. 1871), and a critique of this last work in the *Edinburgh Review* (No. 275, 1872).

Casque. See HELMET.

Cass, Louis, an American politician, born in Exeter, New Hampshire, in 1782, began life at the bar of Ohio, and in the Legislature of that state assisted in suppressing the Aaron Burr secession movement. In the war with England, C. was extremely active in the campaigns of Generals Hull and Harrison on the Canadian frontier, rising to the rank of brigadier-general. He successively became Governor of Michigan, War Minister under Jackson, and Envoy at Paris, when the delicate questions of the right of search and the boundary, referred to the King of Holland, were being discussed. Disapproving of Webster's Treaty of Washington with Ashburton (1842), he returned to the States, represented Michigan in the Senate, stood twice as Democratic candidate for the President's chair, for which his vacillating views on slavery and the extradition question unfitted him. He has written, among other things, the *History, Traditions, Languages, &c., of Indians in the United States*, a work partly superseded by the great work of Hubert H. Bancroft. He died at Detroit, 17th June 1866. C. enunciated the 'Squatter Sovereignty' doctrine.

Cassan'der, son of Antipater, King of Macedonia, at whose death, in B.C. 319, he was left at the age of thirty-five in a subordinate position to Polysperchon. Feeling aggrieved, he resolved to wrest the power from his opponent, and succeeded. While leading his victorious forces in the S. of Greece, he heard of the cruelties of Olympias, Alexander's mother, hastened northwards, besieged her in Pydna, forced her to surrender, and put her to death, 316 B.C. In the same year he placed Roxana, Alexander's wife, and her son, Ægus, in custody at Amphipolis, and married Thessalonica, Alexander's half-sister, in whose honour he founded the town of that name. In B.C. 315 he rebuilt Thebes, and became involved in a war with Antigonus, which lasted fourteen years, with a brief interval of peace in 311 B.C., during which he murdered Roxana and her son. Having entered into a league with Seleucus and Lysimachus, he defeated and slew Antigonus at Ipsus, 301 B.C. Four years afterwards he died of dropsy.

Cassan'dra, a town in Roumelia, European Turkey, on the S.W. coast of a peninsula of the same name (anc. *Pallene*), and on the E. shore of the Gulf of Salonica, has a considerable trade in grain, silk, wool, and honey. In 1873 there entered the port 330 vessels of 5596 tons. Pop. 9000. The Gulf of C., an inlet of the Ægean, extends from S.E. to N.W., and is about 10 miles across and 35 long.

Cassandra, the fairest daughter of Priam and Hecuba, and twin-sister of Helenus, was beloved by Apollo, who conferred on her the gift of prophecy, which, from her treating his suit with disfavour, he rendered of no account by ordaining that no one should believe her words. Hence her predictions concerning the wooden horse and the fall of Ilium were disregarded by the Trojans, who deemed her mad. On the taking of Troy she was ravished by Ajax, son of Oileus, in the temple of Minerva. She fell to Agamemnon's share of the spoil, was taken by him to Mycenæ, and there murdered by Clytemnestra.

Cassa'no, an ancient town of N. Italy, province of Milan, on the Adda, 16 miles E.N.E. of Milan, with numerous silk-mills. It is famous for the victory of the Imperialists, under Prince Eugene, over the French, under Vendôme, 16th August 1705, and for the defeat of the French, under Moreau, by the Russians and Austrians, under Suwarrow, 27th April 1799. Pop. 5592.—A second C. is in the province of Cosenza, Calabria, Citeriore, 32 miles N.N.E. of the town of Cosenza. It has a cathedral and old castle, and manufactures of table-linen, cotton, silk, leather, and oil. Pop. about 8000, among whom are numerous Arnauts and Greeks.—A third C. is in the province of Bari, which has some copperworks, and a pop. of 4219.

Cass'areep is the inspissated juice of the bitter cassava root, *Jatropha manihot*, largely prepared in British Guiana as a basis of various sauces, and particularly of the famous W. Indian pepperpot. It possesses remarkable antiseptic powers, and meat boiled with the addition of C. is found to keep very much longer than by ordinary boiling. C. was originally a 'buck' or native Indian preparation. The juice of which it is prepared is highly poisonous when newly expressed, but the heat of boiling entirely dissipates the volatile poisonous matter.

Cassa'tion, Cour de, was established under the name of the Tribunal de C. by the law of 1st December 1790. It sits on appeal on all final judgments, civil or criminal, of the inferior tribunals, especially in matters affecting the due administration of justice, *e.g.*, where there is a conflict of jurisdictions, or an allegation of interest against the judge. It annuls (*casser, quatere*, 'quash') all judgments in which forms have been violated, or a text of the law has been manifestly contravened. The sentences of *Juges de Paix* are not subject to appeal. In all civil cases the appeal must be brought within three months from the date of the judgment appealed against: a period extended to six months for Corsica, and twelve for American colonists. The appeal (except in cases of compulsory taking for public purposes) is first considered by the Bureau des Requêtes, or 1st Section of the Court, consisting of sixteen judges. The *intitulé* of the appeal gives the names of the parties; the *dispositif* gives the law or laws in question. With the appeal must be lodged a *quittance de consignation d'amende.* A vote of three-fourths of the judges is required in the Section for definite rejection or admission. There is then a preliminary report by one judge, the case going before the 2d or 3d Section (each of sixteen judges), according to whether its subject-matter is civil or criminal. The 1st Section also hears certain appeals. In each Section eleven votes are required for a judgment, which, however, is not on the merits, a remit being made to the original court, or to the proper court. A second appeal is allowed in each case to the United Chambers (Law of April 1837), and the Procureur-General may appeal for the public interest in the matters mentioned in Art. 83, Code of Civil Procedure. The salaries of the judges vary from 5000 to 2000 frs., with a *traitement* equal to that of a deputy in Parliament. There are other officers, such as the *commis de parquet* and the *greffier en chef*, connected with the court.

Cassa'va, the purified starch obtained from the roots of the manioc plant, *Janipha Manihot* (*Manihot utilissima*, and *Jatropha Manihot*), and *J. Læfflingii.* The juice of the C. plant is at first poisonous, but after being concentrated by heat it becomes innocuous, and is known as Cassareep (q. v.). See MANIOC and TAPIOCA.

Cassay′, or **Muneepur**, an independent state of Further India, on the frontier of Burmah, of which it was formerly a province. Area, 7584 sq. miles; pop. estimated at 30,000, the majority of whom are Brahminists. It lies mainly in a great valley, encircled by precipitous mountains, and watered by tributaries of the Irrawaddy. Its productions are cotton, tea, indigo, opium, tobacco, &c. Muneepoor is the capital of C., which has been ruled by a native rajah since the Burmese war of 1825, when the British occupied the country for a time.

Cass′el, the French form of the German *Kassel* (q. v.).

Cassel, also **Castel** (the *Castellum Menapiorum* of the Romans), a town and railway station in the department of Nord, France, on a hill 16 miles S. of Dunkirk. The view from Mont Cassel is singularly extensive. C. has manufactures of lace, linen, hosiery, hats, soap, and pottery, and there are breweries, tanneries, and currying establishments. It has besides an important trade in cattle. Pop. (1872) 3069.

Cass′ia, a genus of plants of the natural order *Leguminosæ*. Senna consists of the leaflets of various species, *e.g.*, Alexandrian senna consists of the leaflets of *C. acutifolia* and *C. obovata*, mixed with the leaves of other plants, as well as the pods of two species of C. E. Indian or Tinivelly senna, a fine variety, consists of the leaflets of *C. elongata*. Aleppo senna is composed of the leaflets of *C. obovata*, a native of Northern Africa, but also cultivated in India and elsewhere. *C. Marilandica*, of N. America, possesses similar properties to the sennas mentioned, which are due to the presence of *Cathartin* (q. v.). Various other sennas are known in commerce, but are of less value than the preceding. (See SENNA.) More than 100 species of C. have been described. The bark and roots of several species of the E. and W. Indies and Mauritius are used as applications to ulcers and various skin diseases, and internally in diabetes and other diseases. The seeds of *C. occidentalis* serve in the Mauritius and in Central Africa as a substitute for coffee. It is cultivated in both regions, but is a native of the E. and W. Indies. The seeds of *C. absus* and *C. auriculata* are used as a remedy for ophthalmia, and the bark of the latter species is also used in India for tanning leather. The pods of *C. Fistula*, the pudding-pipe tree—the C. pods, pipe C., or purging C. of the shops, are used in medicine. The officinal part is the pulp surrounding the seeds, which is a mild laxative.

C. bark, or China cinnamon (*C. lignea*), is largely imported in Europe as a substitute for the true cinnamon. The *oil of C.* is similar to the oil of cinnamon. *C. buds* are its dried flower-buds. They are in appearance like cloves, and are used in confectionery. The 'C.' of the ancients and of the Old Testament is probably C. bark.

Cass′ia, or **Poet's Casia**, is a shrub (*Osyris alba*) of the natural order *Santalaceæ*, a native of the S. of Europe. Its beautiful but modest appearance has attracted the attention of various poets. For instance, Keats speaks of—

> 'The drooping flowers
> Of whitest cassia, fresh from summer showers.'

More prosaically the twigs are used for making crates.

Cassia′nus, Joannes, was a monk of Scythian extraction, educated in a monastery at Bethlehem, who resided some time among the anchorites of Egypt before going to Constantinople, where he was ordained deacon by Chrysostom. Having gone to Rome in 404, he was there ordained presbyter; and on the capture of that city by the Goths (410) he settled at Massilia (Marseille), where he founded a monastery and a nunnery; the former being the famous Abbey of St Victor, of which he himself was abbot. It is said to have contained 5000 inmates, and served as a model for similar institutions in Gaul and Spain. C. died about 433. The principles and rules of his monastic system may be seen in his *De Institutis Cœnobiorum*, and his *Collationes Patrum Sceticorum*. He is best known for his writings against Augustine's views on grace and works, on account of which he is regarded as the founder of semi-Pelagianism (q. v.). The best edition of C.'s works is that of Gazäus (Arras, 1628; Leips. 1733). See Wigger's *De Johanni C.* (Rost. 1824-25).

Cass′ican (*Cassicus*), a genus of American *Insessorial* birds, belonging to the *Conirostral* section of that order, and related to the familiar starlings (*Sturnidæ*). The bill is conical in shape, sharp at the apex, and elevated on the forehead and towards its base. The nests are constructed with much ingenuity, by weaving together vegetable materials, such as shreds of bark, &c. The familiar species (*C. cristatus*) known as the crested C., or crested oriole, inhabiting Paraguay, Brazil, and Guiana, thus makes a nest about 36 inches long, and suspends it from the end of the branch of tall trees, in a position so as to secure it against the attacks of monkeys, serpents, and other invaders.

Cassi′ni, the name of a family illustrious in the annals of science. The first and greatest, **Giovanni Domenico C.**, celebrated for his astronomical discoveries, was born at Perinaldo, near Nice, June 8, 1625. He studied at Genoa and Bologna, at the latter of which places he became Professor of Astronomy in 1650. His first work, *Observationes Cometæ Anni* (1652-53), was published at Modena in 1653; and in 1664 and 1665 he observed and determined at Rome the paths of two comets. He then investigated and rectified the motions of Jupiter and his satellites; and through his *Ephemerides Bononienses Mediceorum Siderum* (Bol. 1668) attracted the attention of Louis XIV. of France, who invited C. to France, and appointed him in 1669 Director of the Paris Observatory. Here he made the first observations, after Kepler's, of the zodiacal light; discovered four of Saturn's satellites, and the dual character of that planet's ring; gave the law of the moon's axial rotation, and extended in 1683 the measurement of the arc of the meridian from Paris northward, which had been begun by Picard in 1669. C. died at Paris, September 14, 1712. His treatises and memoirs are very numerous; most are astronomical, and many were naturally of transient interest and importance. His *Autobiography* was published by his grandson, C. de Thury.—**Jacques C.**, son of the preceding, and successor of his father at the Observatory, was born at Paris, February 18, 1677, and died at Thury, near Clermont, April 16, 1756. From his father's latest meridian measurements, in which he assisted, he deduced that the earth was an oblong spheroid—a result quite antagonistic to Newton's laws of the universe. His view will be found in his *De la Grandeur et de la Figure de la Terre* (Par. 1720). His *Éléments d'Astronomie* (Par. 1740), with its supplementary volume of *Tables Astronomiques, &c.* (Par. 1740), is his best work.—**César François C. de Thury**, son of Jacques C., whom he succeeded at the Observatory, was born June 17, 1714, and died September 4, 1784. He is especially celebrated as a topographer, his great *Carte Topographique de France* being unrivalled for its size and accuracy. It was finished in 1793 by his son, **Jean Dominique, Comte de C.** (born June 30, 1747, died October 18, 1845), who also succeeded his father in the Observatory. Besides this great map of 180 leaves, the latter published the *Atlas National* (83 leaves, each of which represented a department) in 1791. With him ended the famous family of C., for his son, **Alexandre Henri Gabriel, Vicomte de C.**, born at Paris, May 9, 1781, had died April 16, 1832, while engaged in the publication of a botanical work, entitled *Opuscules Phytologiques* (3 vols. 1826-34). See *Vie de C. ecrite par lui-même*, in the *Mémoires pour servir à l'Histoire des Sciences et à celle de l'Observatoire Royal de Paris* (1810), and the *Éloges* pronounced on the various members of the family in the *Académie des Sciences*.

Cassiodo′rus, a Latin writer, distinguished as scholar, statesman, and compiler, was born at Scylaceum (*Squillace*), in Calabria, 468 A.D. He was of noble family, and by his talents rose in favour with Odoacer, under whom he filled several important positions. After the fall and murder of Odoacer, he attached himself to the fortunes of Theodoric, was appointed to the highest offices of the state, and conducted affairs with great ability and prudence. Fearing dangers ahead, he resigned his honours and withdrew to the country in 524 A.D., but was recalled after Theodoric's death, and as Prime Minister resumed the conduct of affairs. In his seventieth year he retired to his native province, founded the monastery of Viviers, and devoted the remainder of his long life to the copying of MSS., and the compiling of manuals for the advancement of learning. He died about 568 A.D. His most important work—a valuable collection of state papers, entitled *Variarum Epistolarum Libri XII.*—was first printed at Augsburg in 1533. His lost work, *De Rebus Gestis Gothorum*, partly preserved to us in the abridgment of Jornandes, would have been of still greater value to the world. The

Benedictine Garet published an edition of C.'s works at Rouen (2 vols. 1670), to which is prefixed a *Vita Cassiodori.*

Cassiope'ia, a constellation of the northern hemisphere, the principal stars of which form a somewhat straggling W, about as distant from the pole-star as the Plough, but in the opposite direction.

Cassiquia're a remarkable river of S. America, in the S. of Venezuela, links (like a canal) the Orinoco and the Rio Negro, a tributary of the Amazon, and thus connects the two great water-systems in the N. and centre of the continent. It has a S.W. course of 130 miles.

Cass'is, a genus of *Gasteropodous* molluscs, including forms the shells of which are popularly known as 'helmet-shells.' These shells form the objects so much employed for engraving cameos upon—the *C. cornuta*, or horned helmet, showing white cameos on a rich orange ground; whilst the warty helmet (*C. tuberosa*) shows white on a deep red ground. The ruddy helmet (*C. rufa*) shows saffron-yellow cameos on an orange ground; whilst the queen conch (*C. Madagascariensis*) exhibits, when cut, a white on a claret-coloured ground. All the species of C. are inhabitants of warm seas.

Cassiter'ides. See SCILLY ISLES.

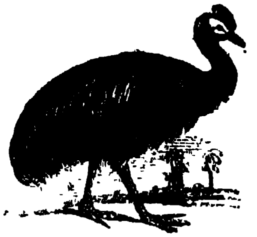
Cass'ius, C., Longinus, a celebrated Roman who held the office of Quæstor under Crassus in the Parthian expedition, B.C. 53, in which he greatly distinguished himself. On the breaking out of the civil war he sided with Pompey; was taken prisoner by Cæsar, but afterwards pardoned and promoted. In 44 B.C. he was made *prætor peregrinus*, and was promised the province of Syria; but his mean and jealous nature led him to conspire against the man to whom he owed everything. He soon won over to his base design many of the malcontents of the aristocracy, and among them Brutus, whose half-sister, Junia, he had married C. carried his plot into execution 15th March 44 B.C., and at the distribution of provinces among the assassins received Cyrene. Dissatisfied, he left the city, seized Syria, united his forces with those of Brutus, plundered Rhodes and Lycia, crossed the Hellespont, and marched through Thrace to Philippi, where he encountered Octavian and Antony, 42 B.C. The left wing under C. was repulsed by Antony, while the right under Brutus routed the troops of Octavian. C., ignorant of the success of his confederate, ordered his freedman Pindarus to run him through the body with the very weapon with which he had, pierced Cæsar. C. was a man of rash and violent temper, but of refined and scholarly tastes, and an Epicurean in philosophy.

Cass'ius, Purple of, is a substance produced when a solution of protochloride of tin is mixed with one of a salt of gold. It is named from its discoverer, C. of Leyden (1683). There are several recipes for its preparation, one of these being as follows:—A solution of protochloride of tin is added to a solution of perchloride (sesquichloride) of iron, till the mixture assumes a green tint; this is then added drop by drop to a dilute solution of chloride of gold free from nitric acid, and the brown precipitate which separates after twenty-four hours is washed and dried. P. of C. is sometimes employed in staining glass and porcelain rose or purple: it was formerly used in medicine. Its production affords a valuable means of recognising either gold or tin. It appears to consist of a mixture in varying proportions of finely divided metallic gold and binoxide of tin or stannic acid (SnO_2).

Cassivelau'nus, a British chief in high repute as a warrior, ruled over the country N. of the Thames, and was invested with supreme command on Cæsar's second invasion of Britain, 54 B.C. Cæsar, learning the site of his capital, attacked and took it, on which C. fled and soon after sued for peace, which he obtained on giving hostages and promising to pay an annual tribute.

Cass'ock (Fr. *casaque*, Ital. *casacca*) is a clerical vestment, of the nature of a long garment, fitting tight, and reaching to the ground. In the Roman Catholic Church the colour for ordinary clergy is black; for bishops, violet; for cardinals, scarlet; and for the pope, white. In the Anglican Church the usual colour for all orders of the clergy is black.

Cass'owary (*Casuarius*), a genus of *Cursorial* birds, including several species, and belonging to the *Struthionidæ*, or Ostrich family. They inhabit the Moluccas, New Guinea, New Britain, and N. Australia. The best-known species (*C. galeatus*) was first brought alive to Europe by the Dutch. It stands about 5 feet in height. The toes number three on each foot, and are provided with claws of nearly equal size, the claw of the inner toe being usually the longest. It is distinguished by a horny crest of varied colours on the head, whence the specific name *galeatus*. The head and neck are naked, but are provided with long, pendant wattles. The plumage, like that of other cursorial birds, is of a loose, unconnected character. The rudimentary wings are furnished each with five pointed quills, destitute of barbs. The body plumage is black, and consists of long, pendant feathers, very much resembling hairs in general appearance. The males are smaller than the females, and sit upon the eggs. The food consists of grass, seeds, and fruits; these birds swallowing stones and hard substances, like the ostriches, to assist the triturating powers of the gizzard. The eggs are greenish. The feet and wings are used as organs of defence; and each wing possesses a terminal spur.



Cassowary.

Cassytha'ceæ, a natural order of plants, by some considered a section of the *Lauraceæ*, consisting alone of the genus *Cassytha*, of which there are nine species, all leafless parasitic twiners, resembling the dodders in habit. In Australia, some of them are called scrub-vines, and in places grow so thickly as to make travel almost impossible. The white drupes of *C. cuscutiformis* of N. Australia are edible. *C. filiformis* of India is used by the Brahmins for seasoning their butter-milk, and also, when mixed with sesamum oil, for strengthening the hair. In medicine it is employed to cleanse inveterate ulcers; and the juice, mixed with sugar, is considered an infallible remedy for inflamed eyes. All the species are tropical, but are found both in the New and Old Worlds.

Cast, a reproduction of a model—as a work of sculpture or other production of fictile or mechanical art—obtained by pouring or pressing plaster, wax, metal, or other substance while in a fluid or ductile state into a Mould (q. v.). The art of casting is of the highest antiquity, and has been of great value in multiplying impressions of the chief works of sculpture, and of the industrial and decorative arts, and thus placing forms of beauty and articles of use in the hands of people of all classes and nations. Reproductions of busts, statues, &c., in bronze are C.; but the process, when applied generally to works in metal, is called Founding (q. v.).

Casta'lia, a fountain on Mount Parnassus, called after the nymph of that name. Being sacred to Apollo and the Muses, its waters were fabled to bestow the poetic afflatus.

Casta'lio or **Castell'io** (the Latinised form of *Châteillon*), **Sebastien,** a French Protestant theologian, born in Dauphiné in 1515, and about 1540 presented to the chair of Humanity at Geneva by Calvin. Banished from this city in consequence of a quarrel with his patron, he repaired to Basel in 1544, where he obtained the Greek chair, and where he died, 20th December 1563. C.'s chief work is a Latin translation of the Bible, of which the best edition is that of Basel (fol. 1573). In addition to numerous theological treatises, he published an edition of Xenophon (1540), and Latin translations of the Iliad (1561) and Odyssey (1567).

Casta'nea. See CHESTNUT.

Cas'tanets, a musical instrument of percussion, consisting of two small shell-shaped pieces of wood or ivory struck together by the forefinger and thumb. They are little used except in ballets, to bring out the rhythm of the dance.

Castañ'os, Don Francisco Xavier de, Duke of Baylen, one of the few Spaniards who showed generalship as well as gallantry in the Peninsular War, was born at Madrid in 1796, and studied the military art in Prussia. Along with his subordinate, the Swiss soldier Aloys Reding, he performed the wonderful feat of compelling (July 22, 1808) a French army of 20,000 men under General Dupont to surrender at Baylen. He fought under Wellington in various battles of the war; and although from his blunt manners he was no favourite at court, his talents procured him various important military offices. He died, 24th September 1852.

Castanosper'mum, a genus of plants of the order *Leguminosæ* (sub-order *Papilionaceæ*). *C. australe* yields the Moreton Bay (Queensland) 'chestnuts,' so called from these seeds, when roasted, having the flavour of chestnuts.

Caste. The divisions of C., as stated in the Code of Menu and the Vedas, are as follow:—(1) The *Brahmins*, or sacred class, whose persons are sacred; they study the Vedas, legislate for the other classes, live upon alms (which include gifts on occasions of religious ceremony), and are exempt from taxation and from capital punishment. They also teach the Vedas: part of their life is that of an anchorite, but its final object is peaceful meditation on the divine order. (2) *Kshatryas*, the military class, from whom officers of Government are selected, and by whom the executive is carried on. Their duties are, to 'give alms, to sacrifice, to read the Veda, to shun sensual gratification, and to defend the people.' Like the Brahmins, they have important privileges in criminal law. (3) *Vaisyas*, or mercantile class, who cultivate the land, breed cattle, carry on trade, and lend at interest. (4) *Sudras*, or lowest class, servants chiefly of the Brahmins; they are incapable of reading the Vedas and of accumulating property, and even (except in times of scarcity) of independent industry. Abusive language used by a Sudra towards a superior is punished by the loss of the tongue; while the penance for killing a Sudra is only what is required in the case of killing a cat. Although thus socially depressed, the Sudras are not slaves. Mixture of C. is prohibited by degradation of the offspring, as where the son of a Brahmin woman and a Sudra becomes a Chandala. The above quadruple division is merely theoretical, the actual division of the Hindu population being into Brahmins and Sudras, and into a great number of special castes, which vary from one part of the country to another, and are often founded on distinctions of trade or locality. Thus the Coolies, the Zemindars (landholders), the Kaits (writers), have been called castes; so also the Rajpoots, the Goojurs. C. as it is described in the Shasters, the Derma Purana, and the Commentaries of the Pundits, probably never existed; in whatever degree it existed, the intercourse with Great Britain must have constantly diminished its effects, especially in industrial relations. For instance, English merchants rank only as Sudras, yet they can hire as servants natives of the highest C. In S. India, indeed, wealthy native Sudras have been known to hire Brahmins as cooks. C. is, in fact, a mass of heterogeneous and often inconsistent regulations with regard to the lawfulness of eating and drinking, the intercourse of one class with another, &c It does not secure the principle of hereditary professions, and the prohibition of intermarriages may be regarded as its most prominent feature in modern times. The regulations of the East India Company in many respects gave a mistaken encouragement to C. conceived as an absolute division of employments. Thus the Rajpoots (the descendants of the Kshatryas) were admitted to the army as Sepoys, while the Coolies, Choomars, Mullahs, &c., were excluded; Vakeels (lawyers) and Moonsiffs (or inferior judges) were maintained in the administration of justice, and native Christians were in 1814 actually declared incapable 'of filling any public office of respectability.' The influence of C. in contracting the feeling of brotherhood within certain limits, and so begetting pride and apathy for what is outside, has been to deaden patriotism and make the Hindus accept without question an arbitrary rule. To awaken them by all means to a sense of political and social responsibility is the main problem of the present enlightened administration. A striking illustration of the inherent selfishness of C., and, perhaps, also of their trust in the undivided authority of Government, occurs in the practice of theft (*decoitee*), which often ravages a neighbourhood, simply because there is no public spirit, the misfortunes of one C. not being those of another. The good discipline which the Sepoy troops rapidly attained has been attributed partly to this want of political solidarity, and to the fact that off parade the native regiments (both officers and men) associated rather according to C. and religion than according to rank, which made conspiracy difficult. In the great mutiny of 1857, the loyalty of the Sepoys in the insurrections of Benares (1781 and 1801) and Mysore (1807) is sometimes forgotten. On the other hand, military discipline has interfered with, and tended to destroy, special rules of C.—*e.g.*, in marching troops beyond the Indus, in providing the cavalry with hogskin saddles, in prohibiting the eating of meals naked, and, above all, in ignoring C. in the selection of officers. So far as civilisation has gone under the system of village communities, it may be admitted that C. has acted usefully as a conservative force, but it seems inconsistent with an advance beyond that system; and in social relations outside the community its immoral tendency is sufficiently obvious. It is responsible for much of the perjury practised by even respectable witnesses in the courts of justice, and it also favoured the growth of the Thugs, the Pindarrees, and the Sennassie Fakirs, coalitions for the commission of crime which could not have existed without the sanction of C. It has also retarded the intercourse of Europeans and natives, and among its minor effects may be noticed the ridiculous *punctilios* of domestic servants in Bengal and elsewhere. Particular castes, as the Rajpoots of Rajasthan, from the difficulty of intermarriage, practised infanticide. In many cases the Brahmins (the symbol of whose order is the *poita* or sacred thread) have sunk into coarse religious *mendicity*. It has been contended that either C. or some other stringent system of minute positive morality was necessary to sustain the Hindu character against an enervating climate and the frequent convulsions of foreign conquest; in support of this the degraded state of the Pariahs, or casteless class, has been quoted. This may have been the case when C. was strong enough to punish both crimes and mere moral delinquencies, but in its present state C. is entirely opposed to social order and progress. To the instance of the Pariahs may be opposed that of the Sikh tribes, whose great leader, Nanik Baba, abolished C. in the early part of the 16th c. It was, however, at one time debated whether C. should not be recognised by the missionaries at Christian communion, and used as a means of discipline in school. The trifling and superstitious ceremonialism of C., which the spread of education, especially among women, does more to destroy than any direct attack of positive law or missionary enterprise, may be seen in chap. 4, 'on economics,' and chap. 3, 'on diet,' of the *Code of Menu*, and in *Kurma Lochma*, a Sanskrit work on 'domestic duties.' A vigorous protest against C. is at present made by Baboo Chunder Sen's new Theistic Church of Calcutta. Theorists have tried to derive C. from the fact of conquest, of superior beauty in one race, of a double migration (an intermediary class being produced by fusion), &c. It would rather appear to be a religious institution, founded on the once natural tendency to hereditary employments and the necessity for abstinence and purification in tropical climates. The notions of purity and impurity were no doubt manipulated by the priesthood. It is remarkable that tradition assigns the institution of C. to gods: in India to Brahma, in Egypt to Isis, in Bactria to Djemschid, in Assyria to Mahabad. The reformer Buddha opposed himself to C., but his followers in Ceylon were forced to re-establish it, the *Radias* of Ceylon being equivalent to the *Pariahs* of India. Ampère has shown reason for supposing that in Egypt there were no castes proper. See Muir's *Sanskrit Texts* (vol. ii. 1870); M'Naghten's *Principles of Hindu Law* (7th ed. by Wilson); Talboys Wheeler's *Hist. of India* (vol. i.); Sherring's *Castes of Benares* (1868); *People of India* (Government publication), edited, with photographic illustrations, by Watson and Kaye (6 vols. 1868-72); Steele's *Castes of the Dekhan*; Colebrooke's *Enumeration of Indian Classes* (in his *Asiatic Researches*, vol. v.), and the Memorandum in his Life (1872); *Report on Progress and Condition of India* (1873).

Casteggio. See MONTEBELLO.

Cas'tel, a town in the Hesse-Rhine province, on the right bank of the Rhine, nearly opposite Mainz, of which it forms a fortress of defence, and with which it communicates by a floating bridge. It is on the Wiesbaden Railway, and has an active trade in cattle. Pop. (1871) 5245. C., as its name indicates, is of Roman origin, and occupies the site of a place called *Castellum Mattiacorum*, which forms the subject of one of Becker's works (Wiesb. 1863). C. is the name of several other small towns and villages in Germany.

Castel is also a prefix to the names of numerous places in Italy, Spain, and France, of which the following merit notice :—

CASTEL-BOLOGNE'SE, a town of Italy, province of Ravenna, 22 miles W.S.W. of that city. Here the Milanese defeated the Florentines in 1434.

CASTEL-BUO'NO ('fair castle'), a town of Sicily, province of Palermo, 8 miles S.E. of Cefalu. It is noted for its mineral springs. Pop. 5288.

CASTELFIDAR'DO, a town in Italy, province of Ancona, near Loretto, among low-lying hills between the rivers Aspis and Musone. It was brought into prominence by a crushing defeat inflicted on the Papal troops under General Lamoricière by the Piedmontese under General Cialdini, on September 8, 1860. Pop. 6275.

CASTELFRAN'CO, a town of N. Italy in the province of Treviso, on the river Musone, about 14 miles W. of Treviso. It contains a cathedral and large palace. Pop. 9319. C. was taken, January 12, 1801, by the French, who also here defeated the Austrians, November 23, 1805.

CASTEL-GANDOL'FO, a town of Central Italy, province of Latium, situated on Lake Albano, 11 miles S.E. of Rome. It is in the midst of very beautiful scenery, and was long a stronghold of the Savelli family.

CASTELLAMA'RE ('castle by the sea'), a fortified city of S. Italy, province of Naples, about 17 miles S.E. of the city of Naples. It has a cathedral, a royal palace, and an ancient castle, built in the 12th c. There are linen, silk, and cotton manufactories, besides dockyards and tanneries, and the town is resorted to for its hot baths and mineral springs. C. stands near the site of the ancient *Stabiæ*, sacked by Sylla during the social war, and from the ruins of which C. has been for the most part constructed. Pop. 21,794. In one of the convents there is an image of the Virgin of extraordinary sanctity in the eyes of the peasantry, who annually visit her shrine.

CASTELLAMARE, a town in Sicily, on a gulf of the same name, 20 miles E. of Trapani. It exports wine, fruit, manna, and some cotton. Pop. 8000.

CASTELLAMON'TE ('castle on the hill'), a town of N. Italy, province of Turin, 10 miles S.W. of Ivrea. It has an ancient castle, extensive market-place, manufactures of pottery, and a trade in wine, cattle, and dairy produce. Pop. 5641.

CASTELLA'NA, a town of Italy, province of Bari, 25 miles S.E. of the city of Bari. Trade in fruits, wine, &c. Pop. 9691.

CASTELLANE'TA, a town of Italy, province of Lecce, on the railway connecting Bari and Taranto, 21 miles N.W. of the latter. It is the seat of a bishop, and has a cathedral and several convents. Cotton is among the chief products of the district. Pop. 6525.

CASTELLAZ'ZO, a town of N. Italy, province of Alessandria, on the Bormida, 5 miles S.W. of the town of Alessandria. Pop. 5749.

CASTELLEO'NE, a walled town of N. Italy, in the N.W. of the province of Cremona, on the railway between Cremona and Bergamo, 16 miles N.W. of the former. The neighbourhood produces cereals, silk, cheese, honey, &c. Pop. about 6000.

CASTELL'ON DE LA PLANA, the capital of a province of the same name, Spain, on the Valencia-Catalonian Railway, 3 miles W. of the Mediterranean. It lies in a fertile plain (*La Plana*), is a modern town, surrounded by a wall pierced by eight gates, and has active manufactures of hemp, linens, sailcloth, &c. Pop. 19,297. The *province* of C. is in great part mountainous, and has an area of 205 sq. miles, and a pop. (1870) of 296,222.

CASTELNAU'DARY, a flourishing town of France, department of Aude, 25 miles S.E. of Toulouse by railway. It lies on the Canal du Midi, which here widens into a fine basin (*le reservoir de St Ferréol*) 1200 feet long and 900 broad, with extensive quays and wharves. It has a court of the first instance, a commercial college, and an exchange, with manufactures of cloth, linen, chalk, glass, and brick. Pop. (1872) 7721. C. stands on the site of the Gothic *Castrum novum Arianorum* ('the new castle of the Arians'), of which the present name is a corruption, and was at one time capital of the county of Lauragais. It witnessed a bloody conflict between Raymond of Toulouse and Simon de Montfort in 1212, and was taken and burned by the Black Prince in 1355, but was rebuilt eleven years later.

CASTELNUO'VO ('new castle'), a fortified seaport in the S. of Dalmatia, Austria, at the entrance to the Bay of Cattaro. It has a naval school. Pop. of commune (1870), 6105; of town, 540.—C. is also the name of a small village in 'the Coast-Land' in the same empire, 21 miles S.E. of Trieste. Pop. of commune (1870), 6718.

CASTEL-VETRANO, a town in Sicily, province of Trapani, 46 miles S.W. of Palermo, has coral and alabaster industries. Pop. (1872) 20,420.

Castell'an, the keeper of a castle, an officer of respectable rank in the middle ages. He was generally a man of some property of his own, and had a voice in the local administration of justice. In Poland, after the 16th c., the title of C. qualified the holder of a certain amount of property for a seat in the upper legislative chamber or senate.

Castiglione ('little castle'), an old town in the province of Catania, S. Italy, a little to the N. of Mount Ætna. It overlooks the valley of the Cantaro, and has a ruined castle and an old church with a picturesque dome. Pop. 5000. C. revolted against Frederick of Aragon in the war of the Vespers, 1297.

Castiglio'ne, Baldassarr'e, Count, an Italian statesman and *littérateur*, was born 6th December 1478, at Casatico, Mantua. He studied at Milan, was sent as ambassador from Guidobaldo, Duke of Urbino, to Henry VIII. of England, and was highly trusted by Popes Leo X. and Clement VII. He died at Toledo, 2d February 1529. C.'s most famous work, *Il Libro del Cortegiano* (Venice, 1528; at Padua in 1733), containing instructions how to become an accomplished courtier, is written with exquisite grace. He also composed poems in Latin and in Italian, which are models of elegance. His *Letters* (2 vols. Pad. 1769–71) are important, both from a literary and a political point of view. See Budik's *Lateinische Dichter*, vol. ii. pp. 136–183.

Castiglione, Carlo Ottavio, Count, an Italian linguist and archæologist, was born at Milan in 1795. He published in 1819 a description of the Kufic coins in the cabinet of Brera there, which at once established his reputation as an antiquarian. In 1819 he was a *collaborateur* with Angelo Mai in editing some fragments of Ulfilas' translation of the Bible into Mœso-Gothic, discovered by the latter among the palimpsests of the Ambrosian Library. These C. afterwards followed up by fragments of some of the Pauline epistles, enriched with erudite excursuses. He died at Genoa, 10th April 1849. His Biography by Biondelli appeared at Milan in 1856.

Castiglione dell'e Stivie're, a town of N. Italy, province of Brescia, 22 miles N.E. of the city of Mantua. It has two beautiful churches and a theatre, and was at one time a residence of a younger branch of the ducal house of Gonzaga. C. is walled and defended by an old castle. Near it Bonaparte defeated the Austrians under Wurmser in 1796. In the neighbourhood is Solferino, where Napoleon III. in 1859 also defeated the Austrians. Pop. 5705.

Castiglione, Lago di, in the province of Siena, Central Italy, is 10 miles long and 1 to 3 broad, receives several rivers, of which the chief is the Bruna, and is connected with the Mediterranean by a canal 42 miles long.

Castile' (so called from the numerous castles erected as a defence against the Moors), formerly the name of an independent kingdom of Spain, has no longer a political or administrative meaning, but geographically denotes that portion of the great central plateau bounded N. by the Cantabrian Mountains, S. by the Sierra Morena, E. by the hills of Aragon, and W. partly by Leon and partly by the Portuguese frontier. A mountain range divides it into Old (*Vieja*) and New (*Nueva*) C., the former of which is now subdivided into twelve provinces, having a total area of 72,447 sq. miles, and a pop. (1870) of 3,182,667, and the latter into five, with an area of 30,882 sq. miles, and a pop. (1870) of 1,541,772. Old C. is in great part an arid waste, but in the E., as in the provinces of Burgos and Soria, there are many fertile valleys and plains, producing excellent wheat, maize, wine, &c. It is about 3000 feet above the sea, has a gentle westward slope, and is watered by the Douro and its tributaries. The rich mineral resources are still unwrought, but there is extensive cattle-rearing in the highlands, which here and there are covered with forests of chestnut, oak, fir, and pine. New C. is almost a counterpart of the more northerly division, but lies 1800 feet lower, and is more fertile in the production of corn and wine. It also yields in some parts olive oil, saffron, hemp, silk, and fruits. There are extensive mines of salt, lead, and quicksilver. Railways now traverse both districts, though most of the produce is still conveyed on the backs of mules. In both divisions the climate is one of great extremes. The Arab conquest of Spain included the whole of C. In 933, while the Ommiades were engaged in the subjugation of Morocco, Fernando Gonzales converted the district of Burgos, an offshoot of Leon, into an independent state. It passed by inheritance (1028) to Sancho III., of Navarre, who, at his death in 1036, made it a kingdom, and placed it under his son, Fernando I. the Great. This king wrested Leon and Navarre from his two brothers, and on his death divided his dominion between his three sons. Alonso VI. of Leon, who succeeded his brother as King of C., conquered the Moorish territory of Toledo in 1085, and held it as New C. for a short time. In 1230 it was permanently annexed by Fernando III., who founded a lasting dynasty. His most illustrious successor was his son, Alfonso X. (q. v.). Isabella, sister of Enrique IV. of C., married the Crown Prince, Fernando of Aragon, in 1469, and succeeded her brother in 1474, so that on the death of Juan II. of Aragon the two lands were united. (See FERDINAND THE CATHOLIC, and ISABELLA.) Fernando conquered Granada in 1492, and Navarre in 1512, thus bringing the whole of Spain under one rule. Intrigues, rebellions, and domestic strifes were what prevented C. from asserting at a much earlier period its pre-eminence, on account of its stronger and more central position, over all the other Spanish states. The Castilians are distinguished for more than Spanish haughtiness, and their language is that of the educated classes and of the national literature.

Castillo'a, a genus of plants of the natural order *Artocarpaceæ*. *C. elastica* is said to yield all the india-rubbers of Central America, Equador, New Granada, and the W. Indies, which are known commercially as 'W. Indian, Carthagena, Nicaragua, Honduras, Guyaquil, and Guatemala rubbers' (Collins).

Castill'on, a town in the department of Gironde, France, on the Dordogne, 10 miles W. of Lilbourne by railway. Here the English were vanquished by Charles VII. of France, July 1453. Montaigne, the essayist, was born and died in the vicinity.

Cast'ing, a technical term in the art of Angling (q. v.), denoting the throwing of the line. It should be raised gently from the water, so as not to be broken should a fish seize the lure at the last moment. It should then be waved over the right or left shoulder, then sharply propelled so as to cause the lure to fall on the spot at which the fish is expected to be lying. Care must be taken not to give the forward movement until the whole of the line is at a right angle, behind, to the rod; otherwise the artificial fly, or bait, will probably be jerked off, and the line will not fall straight on the water, the lure, consequently, not reaching the desired spot. In artificial fly-fishing, it is well to raise the point of the rod slightly when the fly is falling, so as to cause it to fall lightly, which is naturally, on the water.

Casting-Net, a kind of net for the catching of fish, used, with various modifications, in different parts of the world. Those used in England are usually about 15 or 16 feet in circumference. They are netted in the shape of a cone, but so as to be capable of being spread out in a flat circle, to whose circumference perforated leads are attached, with strings to raise the net after it has been sunk. The edges being raised first, they are then drawn together, and the net is lifted. The C.-N. is an illegal implement for the capture of river-trout. See NETS.

Casting Vote is the vote which the president of an assembly is usually empowered to give in the event of the other votes being equally divided. The right to give the C. V. does not, however, exist by common law; it must be created by statute, or agreement, or immemorial usage. In the House of Commons, the Speaker has the C. V. In the House of Lords, the Speaker's vote is counted with the rest, and in case of an equality of votes the *non-contents* are held to have the majority. In an election of a member of Parliament for a county or borough, if there is an equality of votes, the returning officer, if a registered elector of the county or borough, is empowered to give the C. V.

Cast Iron is iron containing from 2 to 5 per cent. of carbon. It is hard, crystalline, comparatively brittle, and readily fusible in an ordinary furnace. It is manufactured in the form of 'pigs' in the Blast-Furnace (q. v.). The C. I. of commerce varies very much in quality. 'Foundry pig,' or grey iron, is known as Nos. 1, 2, and 3, and 'forge pig,' or white iron, as Nos. 4 and 5. No. 1 is used for fine castings; Nos. 2 and 3 are harder, stronger, and more suitable for large structures; Nos. 4 and 5 melt at lower temperatures; they are very hard and strong, but so brittle as to be of little use except for conversion into wrought iron. It is generally supposed that the differences between grey and white iron are due to the different states in which the carbon exists in them, but this does not seem to be definitely proved. See IRON.

Cas'tle (Lat. *castellum*, dim. of *castrum*, 'a fortified place'), originally a military post protected by walls and other defences; later a fortified residence. From the commencement of the historical period fortified works existed in Britain, and it is considered probable that, in many cases, the Roman camps which mark so many of the commanding positions of the country, were constructed on sites that had previously been occupied as strongholds by the tribes that Cæsar conquered. Of distinctively British works, the chief, according to Britton, are the Herefordshire Beacon (Worcestershire), the Caer-Caradoc (Shropshire), Moel-Arthur (Flintshire), Chun C. (Cornwall), Maiden C. (Dorsetshire), the Caterthuns (Forfarshire), and the Barmkin of Echt (Aberdeenshire). Of the Roman castles in Britain, the oldest is supposed to be Richborough C. in Kent, in the remains of which the leading features of the stationary encampments (*castra stativa*) are still traceable. During the earliest English period, the fortresses which existed in the island were neither important nor numerous, and no authenticated remains of them are extant. Properly, the C.-building era in England commenced shortly after the Norman conquest. According to the *Chronicle*, it was enormously accelerated by the civil confusions and social disorders of Stephen's reign. Such was the activity of the Norman barons in rearing castellated residences, that England, in proportion to her population, is richer in castles, especially of the strictly Norman or round-arched Gothic age, than any country in Europe. The Tower of London, and the Castles of Rochester, Norwich, Rising, are, as early examples, unmatched either in France or Germany, while among later structures the Castles of Raglan, Chepstow, Kenilworth, Warwick, and Windsor are unrivalled for picturesque beauty and architectural magnificence. In Domesday Book forty-nine castles are named, and during the reign of Stephen the number erected is said to have been 1115. But in England, as in every country in Europe, the C.-building tastes of the first barons were found to be inconvenient, and the numerous strongholds of the country were as often held against the king as for him. Henry II., therefore, enacted that it was unlawful to erect a C. or fortify a residence without licence. In Scotland there are no remains of Norman castles, for no Norman families had succeeded in taking root in Scotland until the Norman style of architecture had developed into pointed Gothic. But of castles in the latter style there are in Scotland a number of fine examples. The oldest of these, perhaps, is Hermitage, erected in Liddesdale prior to 1244, and the cause of an invasion of Scotland in that year by the King of England, who regarded the erection of this great border fortress as practically a threat on the part of his northern neighbours. Other examples of Scottish castles of the pointed Gothic period are those of Bothwell, Caerlaverock, Kildrummy, and Dirleton. The Castles of Edinburgh, Stirling, Dumbarton, &c., which are mentioned from the earliest times, were places of defence, but were not castles in the strict sense: they were rather fortified ramparts enclosing unfortified buildings, often built of wood. The border Peel Tower (q. v.) sprang up as a necessity during the war of independence to provide against sudden surprise. The Norman C., in its simplest form, consisted of a central keep or stronghold, with a court (in which were situated the stables and other inferior buildings, and offices) protected by walls, often fortified by towers, and surrounded by a fosse or ditch, across which access was obtained into the C. by a drawbridge and gate-house. After the invention of gunpowder, castles which, however strongly fortified, could present no adequate defence against artillery, ceased to be built in England; and in the erection of the later baronial structures, convenience and architectural effect are the objects chiefly aimed at in the plan of the building.

Castlebar' (in the *Four Masters*, '*Caislen-an-Bharraighs*;' called by Downing, 1680, Castle Barry; belonged to the Barrys after the English invasion), the capital of Mayo County, Ireland, on a river of the same name, 50 miles N.W. of Roscommon by railway. It has a west-end square, and its two principal streets extend at right angles. There are some manufactures of coarse linen. C. was the scene of the massacre of the forces of the Parliament during the rebellion of 1641, and here 'Fighting Fitzgerald' was executed in 1786. The town was occupied in 1798 by the French, who retired on the approach of Cornwallis.—The river C. rises in a lake 5 miles S.W. of the town, and enters Loch Cullen after a course of 15 miles.

Castlereagh', Lord. See LONDONDERRY, MARQUIS OF.

Castles are among the *armes parlantes* in heraldry—charges allusive to some feat, or to the name, title, office or property of those who bear them. C. are often given as charges in the shields of persons who have been prominent in a successful siege. They are generally represented as crowned with three turrets.

Cas'tletown (Manx, *Balla-Chastal*), the capital town of the Isle of Man, in the southern extremity of the island, and on the W. shore of C. Bay. Rushen Castle (according to Manx belief) is a Danish fortress of the 10th c., within the town, and was besieged in 1313 by Robert Bruce. The keep is the prison of the island, and the other portions are used as public offices. Near the castle is the House of the Keys—the Parliament of the island. There are breweries, tanneries, and cornmills in the town and its vicinity. C. has a small shipping trade. Pop. (1871) 2320. About 1 mile N.E. is King William's College, founded in 1830.

Cas'tor and Poll'ux, two conspicuous stars in the constellation Gemini, named after the *Dioskouroi*, sons of Zeus, twin-children of Leda. The former is a double star, its period of revolution being nearly 253 years.

Castor and Pollux, a meteor occasionally appearing at sea, and attaching itself in the shape of twin balls of fire to the extremities of the masts of ships. It is now known as the *fires of St Elmo*, believed by sailors to prognosticate fair weather; but one ball, called Helena, forebodes a storm.

Casto'reum, Castor, is the secretion contained in two membranous sacs found near to the genital organs of the Beaver (q. v.). These sacs are pear-shaped, and united at their necks. When dried, their appearance gave rise to the erroneous belief that they were the testicles of the beaver. The secretion is oily, viscid, and possessed of a strong odour. C. is said to contain Salicin (q. v.) and carbolic acid. It has been used in medicine for more than 2000 years as a remedy in spasmodic diseases of the nervous system, and was considered to have a special action over the uterus. C. comes chiefly from Hudson's Bay. Its virtues are more imaginary than real, and it is not now much used.

Castor'idæ, a family of *Rodent* mammalia, represented by the Beavers (q. v.), Musquash (q. v.), &c., and distinguished by the possession of distinct clavicles or collar-bones, and by each foot being provided with five toes, those of the hinder feet being generally webbed. The teeth typically number two incisors, two præmolars, and six molars in each jaw.

Castor-Oil Plant.

Castor Oil. This very well known and extensively used mild purgative oil is obtained from the seeds of *Ricinus communis*, a native of the E. Indies, but now extensively cultivated in the S. of Europe and in various parts of the United States. The seeds are of an ovoid form, vary in size from a small filbert down to a large pea, have a greyish-brown speckled covering, and grow enclosed in a prickly three-partite carpel. Two principal kinds of C. O. are recognised in British pharmacy, E. Indian and Italian, and in both cases the oil is obtained by two separate processes. What is known as *cold-drawn* oil is thus prepared in India. After the seeds have been sifted and freed from impurities they are slightly crushed between rollers, freed from husks, and enclosed in a 'gunny' bag, in which they are pressed into the form of an oblong brick. The bricks are piled up between iron plates and squeezed in a hydraulic press, and the oil which exudes is received into a tin vessel. It is then boiled up with water, in the proportion of a pint of water to a gallon of oil, till the whole of the water evaporates, when it is instantly withdrawn. The boiling coagulates the albuminous matter and precipitates mucilage to the bottom of the pan. The oil is then passed through a bag filter, and is ready for use. The *hot-drawn* is obtained by boiling the seeds, then shelling and pounding to a pulp, and again boiling till the whole of the oil rises to the surface and is skimmed off. The seeds yield from 45 to 50 per cent. of oil. In addition to its medicinal use, C. O. is employed in India for lamps; it yields a good soap, which has been proposed for medical purposes; and it is an ingredient in some excellent pomades and preparations for the hair. The dose of C. O. for a child is from 1 to 2 drachms, and for an adult 1 to 2 oz. It should be slightly warmed and taken in milk, or with the addition of some aromatic oil.

Castrameta'tion (Lat. *castra*, 'huts, a camp;' *metari*, 'to lay out'), the art of encamping. It embraces the entire laying out of camps, whether the troops to occupy them are to be hutted, under canvas, or bivouacked. The selection of a site is a question of great importance in C. See CAMP, ENCAMPMENT.

Cas'trén, Mathias Alexander, famous for his investigations among the European and Asiatic races of the extreme N., was born at Tervolu, not far from the northern boundary of Finland, 2d December 1813. After a preliminary education at the Finnish town of Tornea, he pursued a course of study at Helsingfors University. Between the years 1838 and 1840, C. was busied in making journeys on foot through the northern districts of his native land. He studied its dialects, and also its folk-lore and ballads, with a special view to the illustration of the national myths. The result of these researches was his translation into Swedish of the *Kalevala*. This is the great poem of the Finns; and on C.'s version of it Longfellow modelled his *Hiawatha*. C. was chosen linguist and ethnographer to the Academy of St Petersburg, and afterwards became Professor of Finnic Language and Literature at Helsingfors. The dialects of the Lapps of Norway, Finland, and Russia, of the Russian and Siberian Samoiedes, and of the tribes of Yakutsk, were in turn the objects of his laborious study. C. died 7th May 1852, while engaged in giving literary shape to the ample knowledge he had gathered. Among his works are *Elementa Grammaticæ Syrjaenæ* (1844), *Elementa Grammaticæ Tscheremissæ* (1845), and an *Ostiak Grammar* (St Petersb. 1849). Since C.'s death the Finnic Society have published his *Nordiska Resor och Forskningar* (Hels. 1852-55), and the *Forelasningar om Finsk Mythologie* (Hels. 1853). His Grammar and Dictionary of the Samoiedic Dialects appeared at St Petersburg (1854-55), his Ethnological Lectures on the Altaic Peoples in 1857, and some minor writings in 1862.

Cas'tres (anc. *Castrum Albiensium*), a town in the department of Tarn, France, on the river Agout, 46 miles E. of Toulouse. It is regularly built, has some fine promenades lined with trees, and several handsome public buildings. The manufactures of wool-dyed goods, called *cuirs de laine*, are noted. There are besides tanneries, paper-mills, silk-weaving establishments, and brassfoundries. From 1317 to the Revolution of 1789 C. was the seat of a bishop. It was a stronghold of the Huguenots, and for a time the residence of Henri IV., but in the reign of Louis XIII. it submitted to the royal authority. Pop. (1872) 16,458.

Cas'tri, or **Kas'tri,** a village on the southern slope of Parnassus, nomarchy of Phocis, Greece, on part of the site of ancient Delphi. The Castalian Fount (q. v.), famous in the writings of the classic poets, is a little to the E. of the village, and, from a chapel of St John close to its source, is now called the Fountain of St John.

Cas'tro (the ancient *Mitylenê*), a seaport town on the W. coast of the island of Mitylené, Asiatic Turkey, 55 miles N.W. of Smyrna. It has a double harbour, is defended by a wall with flanking towers, and a castle, and has some shipbuilding. Pop. 6500.

Castro, Ines de, a beautiful Spanish lady, daughter of Pedro Fernandez de C. Dom Pedro, Prince of Portugal, secretly married her in 1345. Alfonso IV., the prince's father, lest this alliance should prejudice the son of Pedro by his former wife, had Ines cruelly murdered in 1355. The prince was scarcely restrained from revolt; and, becoming king on Alfonso's death two years later, had justice done on the assassins, and declared the marriage legal. A strange ceremony was then performed: the corpse of Ines was disinterred, dressed in royal robes, crowned, seated on a throne, and so received homage. This tragic story has formed the theme of dramas and poems; Landor founds a fine tragedy on it, and it is the subject of a splendid episode in Camoens' *Lusiad*.

Castro del Rio, an old town of Spain, province of Cordova, on the Guadajocillo, 16 miles S.E. of Cordova, has manufactures of woollens, linens, and pottery. Pop. 9100.

CASTRO-GIOVANN'I, a town of Sicily, province of Catania, in the *Val di Noto*, 4000 feet above the sea, has some trade in sulphur. It is on the site of the *Enna* of antiquity, the chief seat of the worship of the goddess Ceres. The neighbourhood is the reputed scene of the abduction by Pluto of her daughter Proserpine—'in Enna gathering flowers.' The ancient town played an important part in the Punic and Servile wars. Pop. (1872) 14,633.

CASTRONUO'VO, a fortified town of Sicily, province of Palermo, on a hill 35 miles S.S.E. of the city of Palermo. Near it are some marble quarries. Pop. 4029.

CASTROVILLA'RI, a town of S. Italy, in the heart of a mountainous district in the N. of the province of Cosenza, 33 miles N. of the town of the same name. It is defended by an old Norman castle, stands on the great Calabrian road from Naples to Reggio, and trades in silk, wine, and other agricultural produce. Pop. 7931.

Cast Steel is Blister Steel (q. v.) melted in crucibles. It is the purest and strongest kind of steel, and is used for the finest cutting implements.

Castue'ra, a town of Spain, province of Badajoz, on the Badajoz and Madrid Railway, 78 miles E. by S. of the former town. It has some weaving, and brick and earthenware manufacture. Pop. 5600.

Casual Poor are those temporarily relieved but not put on the *Poor-Roll*. See POOR-LAWS.

Casualties of Superiority, in Scotch law, are certain emoluments arising to the Superior (q. v.) depending on uncertain events. The superior is secured in these by his Charter and Sasine (q. v.). They form a *Debitum Fundi* (q. v.) preferable to the vassal's creditors. This preference is not confined to arrears or current feu-duties, but extends to Non-Entry and Relief Duties, and to the composition for Singular Successors. See these titles.

Casuari'na, a genus of trees constituting the order *Casuarinaceæ*. In appearance they are like gigantic horsetails (*Equisetaceæ*), and are natives of tropical Australia, the Indian Islands, New Caledonia, &c. In the former country they are sometimes called *oaks* or *Cassowary* trees, and from their sombre appearance they are planted in the cemeteries of the antipodes. The wood from its redness is called *beefwood*, and is much valued as a fuel for steam-engines, ovens, &c. That of *C. tuberosa* is used for roofing shingles (Bennett's *Gatherings of a Naturalist in Australia*). *C. muricata* of Southern India furnishes a showy though heavy wood, and its bark a brown dye. The same may be said of *C. equisetifolia*, the *Toa*, *Aitoa*, or ironwood of the South Sea Islands, the natives of which used to make their clubs, &c., of it. At one time the Fiji Islanders made forks of it, with which they ate human flesh, all other kinds of food being eaten with their fingers alone. These forks are highly valued, being handed down from generation to generation, each being distinguished by its particular, often obscene, name (Seemann). Several species of C. are grown in our greenhouses. About twenty in all are known (Masters). The order *Casuarinaceæ* is allied to *Ephedra*, among the *Coniferæ*, and still more so to *Myricaceæ*, and other amentaceous groups.

Cas'uistry is a systematic treatment of difficult and doubtful questions of morality, to which the everyday rules of right and wrong, and the conscientious feelings founded on these, either do not apply, or in answering, seem to conflict with some wider margin of conduct. From the skill and perseverance of the Jesuits in trying to reduce C. to scientific rules, it has been supposed that it is a weapon of Ultramontane ambition. Pascal, in his *Letters Written to a Provincial*, has pointed out that the zeal of the Jesuit confessors led them in some cases to shake the authority of all moral laws; but it is now seen that C., as an habitual practice of mankind, and to some extent as a theory of conduct, is an ancient institution, not confined to one Church, country, or age. Thus the *Talmud* contains much unprofitable refining on morality. Aristotle (*Nic. Eth.* ii.) treats of the circumstances which render anger just, and of immoral obligations contracted under torture. Plato, in the *Euthyphron* and *Crito*, discusses the conflict of public duty with private affection, and of religious duty with political loyalty. The Greek tragedies often turn on points of C. (as the *Antigone* of Sophocles); and in the *De Officiis*, Cicero puts the celebrated question about the sale of corn at Rhodes. The Old and New Testaments abound in problems of C., although they are not treated scientifically; and in the early Church it was keenly disputed whether Christians should use the false certificates of incense-burning issued by the Libellatici or tolerant magistrates. In the Post-Nicene period, Chrysostom (in his *De Sacerdotio*) and Augustine (in his *De Mendacio* and *Contra Mendacium*) are casuists proper, though the latter says all lies are equally wicked. Among schoolmen, Thomas Aquinas (in the *Secunda Secundæ* of his *Summa Theologiæ*) is the chief casuist. Among casuists in Great Britain, Bishop Sanderson (in his Oxford Lectures *De Conscientia*), Taylor (in his *Ductor Dubitantium*), Paley (in his *Moral Philosophy*), Keble (in his *Letters of Spiritual Counsel*), and J. H. Newman may be mentioned. Besides these, Milton, Swift, and Johnson approved of practical C., and Hallam, Sismondi, and Stephen, as historical critics, have justified its existence as a science. Abbé Gaume (*Manual for Confessors*, translated by Pusey and Forbes, 1875) and Cardinal Gousset (*Théologie Morale*) have written the latest books on the subject. Among the problems of C. still extensively canvassed in this country, we select party-obedience, anonymous journalism and authorship, espionage, privileged communications (*e.g.*, between doctor and patient), pleading in court for prisoners who have confessed guilt, social expenses, treatment of lunatics, &c. It is generally admitted that lying may be practised to save the life of a patient, as when Lady Russell told her dying daughter that it was 'all well' with her dead sister. Two very singular cases of C. have recently occurred: the prosecution for manslaughter of the peculiar people, who, founding on Scripture, refuse to obtain medical assistance, and the offer to compound a felony in the case of the Dudley jewels. Massillon justly said that the C. of his time had increased with social depravity; but apart from the abuse which has been made of the confessional, there is no doubt a legitimate province of discussion in which the healthiest moral natures may seek enlightenment without losing faith.

Ca'sus Amissio'nis, in Scotch law, denotes the accident by which a legal instrument is supposed to have been lost or destroyed. This accident, or C. A., must be set forth, if an action be brought for proving the tenor of the lost document. See CANCELLING; TENOR, PROVING OF.

Ca'sus Bell'i is the alleged cause, being presumed a sufficient one, for countries declaring war against one another.

Cat (*Felis*), a name popularly applied to the Carnivorous mammals included in the family *Felidæ*, but also restricted to certain species in that family, of which the wild C. (*Felis catus*) may be selected as a typical example. In the true cats, the ears are not provided with tufts of hairs, and the tail is elongated—the nearly allied lynxes differing in having short tails and tufted ears. The domestic C., described under the name of *Felis domestica*, has been variously supposed to have arisen from the wild C., and from an Egyptian species, the Egyptian C. (*Felis maniculata*), a native of Nubia, and which was highly honoured by the ancient Egyptians, being found frequently embalmed and mummified, according to the custom of that nation. This animal, which also occurs on the W. side of the Nile, possesses upright ears, and fur of a brownish-grey colour, darkest on the back; the under parts being white, and the body being variously streaked and striped with black and ochre. The length is about 2 feet 5 inches; the tail being about 9 inches long. The wild C. occurs throughout Europe and N. Asia, and has been met with in Nepaul. In Britain it has well-nigh been exterminated. The tail of the wild C. is short and bushy; that of the domesticated C. is slender and tapering. The ground-colour of the fur on the former is sandy grey, marked by dark stripes and bands, much resembling the markings in a tiger. The tail is also banded; its tip is black and bushy; and it is not half the length of the head and body. The fur is thick, and grows very dense in Northern specimens. The average length of the adult male is 3 feet. In Ireland it attains a large size, and is found chiefly on waste grounds. The domestic C. appears, even when allowed to become wild, to retain its special characters, seen in its tail, fur, &c. In general character, it is neither so treacherous nor so insusceptible of kindly influences as has been generally supposed. On the contrary, many stories have been related of the affection and extraordinary instinct it has displayed, frequently under unusually curious circumstances. Various branches or sub-varieties of the domestic race exist. The *Angola C.*, possessing long, silky, white hair and an extremely bushy tail, is a well-known form; it attains a large size. The *Manx*, or *tailless cats*, are notable as possessing a very abortive and rudimentary tail, and as in general presenting in habits a near approach to the wild C. The *Chinese C.* is known by its rich glossy fur and its long, pendant ears. The *tortoiseshell C.* may perhaps be hardly deemed a distinct sub-variety, mere colour being in all cases a deceptive guide in the distinction of species. Cats are well known to possess singular electrical properties. The eye is capable of great contraction and dilatation under the influence of light, and is thus specially adapted for nocturnal vision. Whilst in Egypt cats were much reverenced, they have been superstitiously regarded elsewhere as emissaries of evil powers, and as prophesying disasters by their simplest actions—*e.g.*, by washing their faces foretelling rain. See also LYNX.

Cat, a nautical term variously applied. A *C.-hook* fastens the ring of the anchor to the *C.-blocks*, through which works the *C.-fall*, a rope for hoisting the anchor from the water to the bow, where the rope is connected with the *C.-head*, a short, strong timber projecting from the bow. Small ropes for tightening the shrouds are called *C.-harpings*.

Catabro'sa (Gr. 'a gnawing'), a genus of grasses widely distributed through the whole of Europe, and also in tropical America, in moist situations. *C. aquatica* (whorl-grass, or sweet-water grass) is a common British grass, the foliage of which is relished by cattle, as also by carp and other fishes, and by waterfowl, a large portion of whose food it furnishes.

Cat'acombs (Fr. *catacombe*, Low Lat. *catacumba*, from two Greek words signifying 'a hollow' or 'a tomb underground'). These are burial-places formed by excavating subterraneous passages in soft rock, and then hollowing a portion of the rock at the side of the gallery large enough to hold a body. The body being placed in the hollow, the orifice is closed with stones. The most celebrated C. are those near Rome. They were used as places of worship in times of persecution by the early Christians, and in them are buried many of their saints and martyrs—the letters D.M. (Deo Maximo) or X.P. (the two first Greek letters of the name of Christ) commonly marking the last resting-place of the Christian. The original extent of these C. is not known, many portions of them having fallen in. There are also noteworthy C. at Naples, and in Sicily, in Greece, Asia Minor, Egypt, and various other countries. They have also been discovered in S. America. The Neapolitan C. contain some paintings in wonderful preservation. The C. of Paris were constructed in 1784 out of the limestone quarries. In them were deposited the bones of the dead collected from the ancient cemeteries of Paris, and, by decree of the Government, the bodies of some of the victims of the Revolution. See Parker's *Archæology of Rome; The C.* (Oxf. 1877).

Catafal'co, an Italian word meaning 'a scaffold,' 'a funeral canopy,' applied to a temporary piece of woodwork decorated with paintings and sculpture, representing a tomb or cenotaph, and employed in funeral solemnities. The French form is *catafalque*, which first appears in the 16th c.

Catala'ni, Angel'ica, a famous Italian *prima donna*, born in 1783 at Sinigaglia (Ancona), received her early education at the convent of St Lucien, near Rome, where, singing in the choir at the age of thirteen, such was the effect of her marvellous voice, that the priests and monks openly applauded her. Her musical tutor was the celebrated singer Marchesi. In 1798 (at the age of fifteen) she made her *début* in Venice, went to Lisbon in 1801, remained there four years, and there became the wife of Captain Vallabrecque. Accepting an engagement in London in 1806, she set out for England by Paris, where her singing so enchanted Napoleon that he besought her, in vain, to remain at his court. In London, where she remained eight years, she created an enthusiasm unequalled afterwards till the days of Jenny Lind. In 1814-15 she was Directress of the Italian Opera at Paris; she afterwards made the tour of Europe, and in 1830 purchased a villa at Florence, where, in superintending the education of her own children, and in conducting a singing-school for girls which she had founded, she spent nearly twenty years. In the summer of 1849 she removed with her daughter to Paris, and there, on the 13th June of that year, she died of cholera. To great personal attractions and rare intelligence, she added astonishing power and compass of voice and the most perfect technical accomplishment. See Lumley's *Reminiscences of the Opera* (Lond. 1864).

Catalau'nian Plain, the *Campi Catalaunici* of the ancients, a wide plain in the E. of France, on which one of the most momentous battles in the history of the world was fought in 451 A.D. The barbaric hordes of Etzel (Attila) were vanquished by the Roman general Aetius, and the Visigoth King Theoderic, after a murderous fight, in which, according to exultant rumour, some 300,000 Huns were slain. The plain surrounds Châlons-sur-Marne.

Catal'do, San, a town of Sicily, province of Caltanisetta, 5 miles W. of the town of Caltanisetta. Sulphur-mines are in the vicinity, and a railway connecting it with Catania and Girgenti is in process of construction. Pop. upwards of 10,000.

Cat'alepsy (Gr. *katalepsis*, 'a seizure or attack'). This is a name given to a nervous affection characterised by a more or less complete but temporary suppression of sensation and volition, along with muscular rigidity, so that the individual remains in the same position as that in which he happened to be at the beginning of the attack. It is a rare disease in its extreme forms, and it usually happens in nervous and hysterical females. Occasionally it becomes endemic—that is, a number of persons in the same locality become affected. It is also frequently associated with religious excitement, when it is known as ecstasy or trance. The person is absorbed in contemplation of some imaginary celestial object, and, with eyes immovably fixed, becomes insensible to all external objects. Others seeing him or her may become similarly affected, as in the case of the victims of the dancing mania, tarantism, and other semi-religious epidemics. The physiological explanation of C. is by no means clear. The state is closely associated with all those physiological conditions in which there is abstraction of mind. The muscles appear to be removed from the control of the will, and there is also apparently an abrogation for the time of the activity of the muscular sense by which the mind is informed of the state of the muscular apparatus and the position of the limbs. C. is a morbid condition, and those subject to it may become permanently insane. All those exercises which apparently induce it in certain individuals are therefore to be avoided, and the general health is to be improved as much as possible by nervine tonics and good hygienic influences.

Catalo'nia (Sp. *Cataluña*), a former principality and province of Spain, occupies the N.E. angle of the Peninsula, and has a coast-line on the Mediterranean of about 200 miles. It is now divided into the provinces of Barcelona, Tarragona, Lorida, and Gerona, having a total area of 12,180 sq. miles, and a pop. (1870) of 1,773,408. The N. portion of C., which is bounded by the Pyrenees, is a rugged mountain region, and the basin of the Segre in the W. is separated from that of the Llobregat on the E. by a range, the S. part of which is called the Sierra de Lona. This range is about forty miles from the coast, descends to the plains in a series of terraces, and is intersected by numerous valleys. There are rich plains in the W. about Lerida, Urgel, and Manresa, and smaller fertile stretches in the E. in the vicinity of Barcelona, Tarragona, and Tortosa, producing corn, wine, oil, hemp, nuts, almonds, silk, barilla, oranges, &c. The climate is extremely variable; hot, inland, in summer, but tempered on the coast by sea-breezes. There are heavy rains and frequent fogs. A singular scarcity of cattle is due to the limited extent of good pasturage. On the other hand, C. is very rich in metals, of which the chief are coal, copper, manganese, zinc, lead, and sulphur. It has also been called the 'Lancashire of Spain,' on account of its extensive manufactures, which include woollens, cottons, silks, lace, leather, paper, iron, brandy, and liqueurs. The Catalonians (*Catalaines*) are a mixed Franco-Spanish people, distinguished from all other Spaniards by their love of travel and enterprise in trade. Even the educated classes use a dialect originally formed by blending the *Langue d'Oc* with the Castilian; and is still a written speech, with an interesting literature. C. was part of the *Hispania Tarraconensis* of the Romans, and on the decline of the Empire in the W. was overrun successively by the Alans and the Goths, hence receiving the name *Goth-Alania*, altered to Gothalunia, and later to its present form. The S. portion was subdued by the Arabs in the 8th c. In 788 A.D. Karl the Great conquered the country as far as the Ebro; and C., as the principal portion of the 'mark' or 'border,' was subsequently ruled by the Frankish Counts of Barcelona. The latter, however, soon made it an independent principality, and by the marriage of Count Raymund Berengar it was united with Aragon in 1137. In 1469, by the marriage of Ferdinand of Aragon and Isabella of Castile, C. became an integral part of the Spanish monarchy. It still, however, retained a separate constitution till the war of succession of Philip V. in 1714. Since then the Catalonians have been animated by a national hatred of everything foreign. Of late years the peasantry have been distinguished by a turbulent adherence to the Carlist cause, while the large towns, *e.g.*, Barcelona, have been a hotbed of socialistic democracy.

Catal'pa, a genus of *Bignoniaceæ*, containing four or five species of trees, natives of the W. Indies, N. America (where they are known as 'trumpet-flowers'), Japan, and China, but which also thrive in the open air in the S. of England, France, and Germany. The wood is fine-grained, durable, and capable of receiving a good polish. The bark is tonic, stimulant, and antiseptic, but the honey from the flowers is poisonous (*Treasury of Botany*).

Catal'ysis (Gr. 'dissolution'). There are many instances in chemistry of substances combining together or decomposing into other products only when another substance is present, which takes no apparent part in the reaction, but which appears to bring it about simply by its presence. Thus, if metallic silver is dropped into peroxide of hydrogen, water is formed, and oxygen gas escapes. The decomposition which takes place may be thus represented—

$$\underbrace{2H_2O_2}_{\text{Peroxide of hydrogen.}} = \underbrace{2H_2O}_{\text{Water.}} + \underbrace{O_2}_{\text{Oxygen.}}$$

The silver itself remains entirely unchanged. This and similar changes are called *catalytic*, or decompositions by contact, and remain unexplained in the majority of cases.

Catamaran' (Cingalese, *cathamaran*, 'floating trees'), a sort of raft in use on the eastern coasts of India and Ceylon, formed of three long pieces of wood lashed firmly together lengthwise. It is chiefly employed in fishing, and is paddled with wonderful dexterity by the natives, who venture out into the heavy surf prevailing on these coasts, where any ordinary craft would be swamped. C. is also the name for a kind of fireship.

Cata'nia, the finest city in Sicily, lies on the gulf of the same name, in a beautiful plain, near the base of Mount Etna. It is regularly built, and the streets, which intersect each other at right angles, are paved with lava. There are many handsome edifices, of which the principal are the famous Benedictine church and convent of San Nicolo, a chaste cathedral, originally of 1094, rebuilt in 1693, the university, founded in 1445, and an imposing senate-house. C. is not only 'La Bella Catania,' but is also an industrial centre, with manufactures of silks, linens, hosiery, and fancy articles in lava, amber, &c., and an export trade in grain, oil, and wine. Its harbour was filled with lava in 1693, but its roadstead is safe and spacious. Pop. (1872) 83,496. C., the ancient *Catana*, was founded about 753 B.C. by a colony of Greeks from Chalcis, and rapidly rose into prosperity. It was captured by the Athenians during the Sicilian expedition (Peloponnesian War), was subsequently (403 B.C.) pillaged by Dionysius I., but again became an important place under Roman rule. The Goths partly destroyed the city, which once more regained prosperity under the Byzantine Empire. It was all but entirely ruined by an eruption of Etna in 1693, and has suffered much from eruptions at various other times. The *province* of C., part of which is called 'the granary of Sicily,' has an area of 1743 sq. miles, and a pop. (1872) of 495,415.—**The Gulf of C.**, on the E. coast of Sicily, receives the Giaretta, and extends from Aci Reale on the N. to Santa Croce on the S., a distance of 18 miles.

Catanza'ro, the capital of a province of the same name, S. Italy, on a hill, overlooking the Gulf of Squillace and the Ionian Sea. It is the seat of a bishop, of a court of appeal, and of a famous college, and has an old Norman castle, a cathedral, a lyceum, and some ten churches. The chief industry is silk-spinning. Pop. (1872) 24,901. The women of C. are esteemed the most beautiful in all Calabria. The *province* has an area of 2303 sq. miles, and a pop. (1872) of 412,226.

Cat'aplasm (Gr. 'poultice'), generally consists of some soft substance capable of absorbing much moisture and retaining heat. It ought to be light, and of such a consistence as to fit accurately to the part to which it is applied. Cataplasms are of two kinds—(1) Those intended to supply heat and moisture, which are made of linseed-meal and various vegetable substances, as carrots or marsh-mallow; (2) Those designed to produce a beneficial influence, as opium, poppy-heads, or hemlock to relieve pain, charcoal to correct the bad odour from foul ulcers, yeast to hasten sloughs from ulcers, or mustard or turpentine to produce irritation. Such are said to be 'medicated.' Cataplasms should never be heavy nor bulky, and ought to be frequently repeated. They are good in inflammatory affections of the chest and bowels, and generally wherever there is much pain.

Cat'apult, a warlike engine employed by the ancients in a siege for projecting darts, arrows, and other missiles. Catapults appear to have differed greatly in construction; in some the principle of the crossbow was adopted; in others huge beams of wood were set in motion by the aid of twisted fibres, hurling the missiles with great velocity. Similar machines were in use during the middle ages prior to the invention of gunpowder, for throwing large stones, fire-balls, &c. Experiments were lately made in France with catapults fashioned after those represented on Trajan's Column, and arrows were shot to a distance of 300 yards, and with great precision to 180 yards.

Cataract (Gr. 'a rushing down,' as if a veil fell before the eyes), is an affection of the eye in which there is opacity of the crystalline lens or its capsule. Three varieties are usually described—(1) *Lenticular C.*, when the *lens* is affected; (2) *Capsular C.*, when the *capsule* is affected; and (3) *Capsulo-lenticular C.*, when both are opaque. The effect of this opacity is to intercept the rays of light on their way to the retina. In C. the fibrous texture of the lens is broken up. The affection differs in regard to density. *Hard C.* has a dark-brown colour. The lens is often smaller than normal, and the greatest amount of opacity is in the centre. The iris is movable, and when the pupil is dilated by atropine or belladonna, the affection is more distinctly seen. This form of C., common in old people, is often an indication of the decay of the system. First there is dimness of vision, as if a mist or cloud was before the eye. The patient sees best in a dull day or in the twilight, and vision is improved by belladonna or atropine dilating the pupil, and thus allowing the rays of light to pass by the outside of the C. It may be in one or both eyes, but at first it is generally confined to one eye, though it almost always affects both in the end. *Soft C.* is more rare, but occurs in young as well as in old people, and may even be congenital; it is much whiter in colour, and of a semi-fluid consistence. The lens is often enlarged, bulging through the pupil, and not unfrequently adherent to the iris. *Treatment.*—When once C. has commenced nothing will stop its progress, and recourse must be had to an operation. Three modes of this are recommended:—(1) *Extraction* in which the opaque lens is removed through an opening in the Cornea (q. v.). (2) *Depression* or *couching*, performed by inserting Scarpa's needle through the sclerotic about a line from the outer margin of the cornea, and depressing the opaque lens so that the vitreous humour of the eye closes over it and occupies its place, thus allowing rays of light to pass on to the retina. (3) *Solution*, or *absorption*, employed in the case of soft C. It consists in break-

ing up the lens by repeated insertions of a needle, so that the vitreous humour and the lens may come into contact, by which the latter is gradually absorbed. Great care is necessary to prevent the eye becoming inflamed after the operation. The patient requires to use convex glasses. As long as vision remains in one eye no operation should be performed, and only one eye should be operated on at a time.

Catarhi'na (Gr. 'oblique-nosed'), the section of the order *Quadrumana* (q. v.) which includes those monkeys—exclusively confined to the Old World—in which the nostrils are oblique and closely set. The thumbs and great toes are invariably present (with one exception), and the thumb always opposable to the other fingers, so as to convert the hand into a prehensile organ. The teeth are arranged as in man, and thus number thirty-two. The incisors and canines are prominent, especially in the males. The tail is never prehensile, and may be rudimentary. Cheek-pouches and natal callosities are developed. The *Semnopitheci* (q. v.), macaques, baboons, mandrills, gibbons, orangs, gorillas, &c., represent this group, which is the highest in the order.

Catarrh' (Gr. *katarroos*, 'a flowing down') is an inflammation of the mucous membrane of some of the air-passages. It is almost identical with a *cold*. If in the nose, it is called *Coryza*; if in the chest, *Bronchitis* (q. v.). It is one of the commonest of diseases, especially in cold and damp climates. A frequent cause of C. is the sudden change of temperature—*e.g.*, what is experienced in passing from a crowded meeting into the cold evening air. The symptoms are chilliness, lassitude, a slight shivering, pains in the back and limbs, headache, and more or less feverishness. Afterwards there is a copious discharge from the nose, hoarseness, and sore throat, with a foul tongue, and often an eruption about the lips. In simple C. the symptoms generally subside after two days, and the patient gradually gets well; but in more severe cases, the malady leads to bronchitis, inflammation of the tonsils, inflammation of the lungs, &c. *Treatment.*—The patient should be kept warm by means of a Dover's powder, followed by a drink of hot gruel. Bathing the feet in hot water is often beneficial. When a sweating powder cannot be obtained, a good substitute may be made by filling a few black bottles with warm water, putting them in a stocking or a piece of flannel, and placing them along either side of the patient under the bed-clothes. Great care is necessary next day to prevent cold. C. in the head is often cut short by a full dose of morphia, and confinement to the house for two days.

Cataw'ba, Great, a river of the United States, rises in Blue Ridge, waters N. and S. Carolina, and unites with the Congaree to form the Santee, after a course of 250 miles. It gives name to a light sparkling wine, originally made from a wild vine found (1801) near its source, and now extensively produced in Ohio, near Cincinnati. This wine, which has a rich Muscadine flavour, and rivals French wine in delicacy, is much used in the States as a substitute for champagne.

Catbalo'gan, or **Cadvalon'ga,** the capital of the island of Samar, one of the Philippines, has some trade in pepper, rattans, sago, &c. It lies on the W. coast of the island, and consists mainly of Nipapalm-built houses. Pop. 7000.

Cat-Bird (*Turdus fellivox*), a species of Thrush (q. v.), so named from the mewing cry which it utters when alarmed. It is nearly allied to the well-known Mocking-Bird (q. v.), and is confined to America. It feeds upon seeds, fruit, berries, insects, worms, &c., and is by no means shy or timid. The C.-B. migrates southwards in winter, Massachusetts being probably its northernmost limit.

Catch, in music, a short Canon (q. v.), generally humorous, and most often having its words so arranged that when the three parts are sung together their natural meaning is ludicrously altered. The C. seems to exist only in this country.

Catch-Fly, a general name applied to *Silene, Lychnis viscaria*, and other plants of the order *Caryophyllaceæ*, which exude at their joints a sticky fluid in which flies are caught. See also DIONÆA.

Câteau (Le), or **Chateau-Cambrésis,** a town in the department of Nord, France, 15 miles E.S.E. of Cambrai, on the Selle, a tributary of the Scheldt, and a station on the Northern French Railway. It has a communal college, a chamber of manufactures, an hospital (*Hôpital Paturle*); manufactures of cotton and woollen yarn, merinoes, cambrics, starch, leather, and earthenware; sugar refineries, distilleries, breweries, tanneries, brass and iron foundries, and a trade in cattle. The *treaty of C.* between France and Spain was signed here in 1559. Pop. (1872) 9254.

Cat'echism (from the Gr. *katēcheō*, 'to instruct,' especially in religion), is a summary of Christian doctrine in the form of question and answer. The requirements of Catechumens (q. v.) no doubt first suggested the preparation of compendiums of the chief points of instruction, for the help both of teachers and pupils; and such manuals have always been employed in the Church, each sect having its own C. for the indoctrination of the youthful members with its own peculiar tenets.

The following are the most important catechisms, prepared by different sections of the Church:—1. Luther prepared two—a Larger, 'for the use of preachers and teachers,' and a Shorter, intended 'for a guide in the instruction of children'—which were published in 1529, and are yet regarded as one of the standards of the Lutheran Church. 2. Calvin also prepared two—a Larger and Shorter—for the use of the Genevan Church, which were published in 1541, and became acknowledged standards of all the Reformed Churches, although the Church of Geneva herself afterwards disowned them. 3. The *Heidelberg C.* is one of the best of the many systems of Christian doctrine constructed during the Reformation period. Originally composed in German by Ursinus, a student of Melancthon and Olivianus, for the Reformed party in the Palatinate of the Rhine, and published in 1562, it has been translated into Latin, Greek, and Hebrew, as well as nearly all the languages of modern Europe. 4. In the Roman Catholic Church—(1) the *Catechismus Romanus* adheres closely to the canons of the Council of Trent, was published in 1566 under the authority of Pope Pius IV., and introduced into Italy, France, Germany, and Poland; (2) the two *C. of Canisius* were published by the Jesuits in order to weaken the influence of the *Catechismus Romanus*; (3) the *C. of Bellarmine*, however, published in 1603, although he also was a Jesuit, was authorised by Pope Clement VIII. 5. Among the Socinians there are to be noted—(1) the *Cracovian C.*, composed by Schomann, and published in 1574; (2) the *C. of F. Socinus*, published in an incomplete form at Racovia, 1618, which formed the basis of (3) the *Racovian Catechisms*—a Larger and a Shorter—published in Polish in 1605, and in Latin 1609. 6. (1) The first C. in use in England consisted of the Creed, the Ten Commandments, and the Lord's Prayer; (2) in the time of Edward VI. there was published (1553) what was known as *King Edward's C.*, entitled 'A Shorte Catechisme, or Playne Instruction . . . . for all Scholemaisters to teach,' and composed by Dr Nowell, then headmaster of Westminster School; (3) under Elizabeth, Nowell, then Dean of St Paul's, and prolocutor of Convocation (1562), was instructed to draw up a C. for the use of schools and students, which was published in 1570, being simply a revised and considerably enlarged edition of his former work; (4) at the Hampton Court Conference this last was considered too long, and, to make what was to be a sufficient C., to the contents of the first (1) mentioned above there was added an explanation of the sacraments. 7. The catechisms used by the Presbyterians of Scotland, as well as by the Presbyterians and Congregationalists in England and America, are the two drawn up by the Westminster Assembly. 8. The C. of the Greek Church, entitled 'The Great Catechism of the Orthodox Eastern Church,' was drawn up by Philaret, Archbishop of Moscow, and published at Moscow in 1839 by order of the Emperor. See Kocher's *Bibliotheca Theol. Symbolicæ*; Hagenbach's *Hist. of Doctr.* (Eng. 1847); and Mosheim's *Church Hist.* (Reid, Edinb. 1860.)

Cat'echu, an extract prepared from the juice of different parts of several plants, containing a large proportion of a modified form of tannic acid, and now extensively employed in tanning and dyeing. Three varieties are recognised in commerce—(1) Black C., Cutch or Terra Japonica, the variety obtained by boiling the wood and twigs of *Acacia C.*, a leguminous tree growing in the East Indies. It comes into the market in dark-coloured amorphous masses, with a glassy fracture and a shining lustre. (2) Gambir or white C. (the *C. pallida* of the pharmacopœia), which is obtained by boiling the leaves of the *Uncaria Gambir*, a plant belonging to the order *Cinchonaceæ*, native of the Malayan Peninsula. It is imported in the form of cubes of about an inch in size, of a yellowish-brown colour, and a rather earthy appearance, and is more used in pharmacy than in manufactures. The third variety of C. is the produce of the betel-nut, the fruit of the palm *Areca C.*; but little C. from this source comes to Europe. C. is used in the East as a masticatory, along with the betel-pepper leaf. In medicine it is employed as an astringent, but its chief use is in dyeing and tanning and calico-printing. It has also been recommended for use to prevent incrustations in steam-boilers. C. is almost entirely composed of catechu-tannic acid and a basic substance, *catechin*.

Catechu'mens (Gr. *katēchoumenoi*, 'those receiving religious instruction'), in the early Christian Church, were the candidates for baptism, who were put under a regular course of instruction, and were divided into three classes:—1. *Audientes* (hearers), who were permitted to hear sermons and the Scriptures read, but not to stay and hear prayers; 2. *Genuflectentes* (kneelers), who received kneeling the blessing of the bishop; 3. *Competentes*, when their names were delivered to the bishop as candidates for baptism, or *Electi*, if the bishop approved.

Cat'egories (Gr. *katēgoriai*, lit. charges or accusations; then in logic, predicables or forms of predication), the name of the first of six logic treatises that compose the *Organon* of Aristotle. It is uncertain, however, whether Aristotle, or some later Peripatetic, wrote the C. The doctrine of the C., that the 'first essence' is the individual, is opposed to the doctrine of Aristotle's *Metaphysics*, that 'first essences are universals.' In the *Topics* and elsewhere he speaks of the ten C., or 'classes of predications,' sometimes of a smaller number, but always merely in a logical sense. However, Porphyry's *Introduction to the C.* introduced to Europe the great controversy of Nominalism and Realism, in which Aristotelians have taken the side of Nominalism and Platonists the side of Realism. The ten C. are as follow:—(1) Substance; (2) Quantity; (3) Quality; (4) Relation; (5) Action; (6) Passion; (7) The Where; (8) The When; (9) Position in Space; (10) Possession, Habit or Dress. It is clear that this cannot be intended as a classification of existing things except by a philosopher who believes that general terms or ideas have a real existence as well as individual things. Besides, it does not answer to the Aristotelian doctrine that Matter, Form, and Deprivation, or Potentiality and Actuality, were the ultimate Reals. It is probable that the author meant the list to be a rough, unscientific account of all possible predications, not of all describable things; in this view the terms, though not clearly distinguished, are comprehensive enough. Another celebrated deduction of C. was that by Kant in his *Kritik der Reinen Vernunft*:—(1) *Quantity*, including Unity, Plurality, and Totality; (2) *Quality*, including Reality, Negation, and Limitation; (3) *Relation*, including Inherence and Subsistence, Causality and Dependence, Reciprocity; (4) *Modality*, including Possibility and Impossibility, Existence and Non-Existence, Necessity and Contingence. This obviously proceeds on a very imperfect psychological analysis. Perhaps the neatest generalisation of predicables is that of Mr Mill:—(1) Existence; (2) Co-existence; (3) Succession; (4) Causation; (5) Resemblance. Whatever may be affirmed may of course also be denied. The number of C. is naturally extended by those philosophers who maintain that the human mind itself supplies elements of knowledge which are not derived from experience. Kant could not exclude the notion of Necessity from Causation; Hegel could not exclude the notion of Not-Being from Existence; others would insist that Self-Existence is a separate C. In dealing with the Aristotelian C., it should not be forgotten that Aristotle certainly held that Definition was the instrument of Science, and that definitions were not merely of words, but of things.

Cate'nary (Lat. *catēna*, 'a chain'), the curve in which a flexible cord or chain hangs when freely suspended from two fixed points—a curve, therefore, of great importance in the theory of suspension bridges. Its form depends upon the manner in which the mass of the chain is distributed; most of these curves are merely mathematical curiosities, the really important one being that formed by a uniform cord, and known as the common C. The numerous curious properties of this curve are treated of in Poisson's *Mechanics*, Gregory's *Examples*, and Whewell's *Analytical Statics*.

Catenip'ora, a genus of extinct sclerodermic corals found in the *Silurian* rocks of Britain, and of which *C. escharoides* is the most familiar species. The cells of the polypes are of oval shape, and are terminal in position; their arrangement giving a chain-line or network appearance to these fossils.

Cateri'na, Santa, a fortified town in the province of Caltanisetta, Sicily, near the Salso, 22 miles W. of Leonoforte, the present railway terminus. It is noted for its superior earthenware. Pop. 5800. The vicinity is rich in fine jaspers and agates.

Caterpill'ar (Old Eng. *cate*, 'food;' Fr. *piller*; Eng. 'peel'—'a stripper of foliage'), the name popularly applied to the larvæ of *Lepidopterous* insects—that is, of the Butterflies (q. v.) and Moths (q. v.), but occasionally used to indicate the larval stage in the metamorphosis of other insects. The caterpillars of different species present great variations in colour, size, and appearance. Their general appearance is that of worm-like creatures, composed (in *Lepidoptera*) of thirteen segments, and possessing a horny head, provided with antennæ, eyes, and jaws. The mouth, unlike that of the perfect insect, is fitted for mastication or biting. The lower lip or *labium* bears a tubular organ—the *spinneret*—by means of which the larvæ, through the silk secretion furnished by two glands, spins a silken thread to make the *cocoon* or *pupa case*, in which it passes the succeeding or *pupa* stage of its existence. The three joints behind the head correspond to the *thorax* of the perfect insect; and the six legs with which these three joints are furnished correspond to the legs of the adult form. A variable number (usually ten) of soft fleshy legs, known as *pro-legs*, are borne by the hinder segments of the body; but these are characteristic of the C. stage, and have no representatives in the full-grown insect. Pro-legs are never borne by the fourth, fifth, tenth, and eleventh segments of the C.'s body. The digestive system of the C. also differs widely from that of the perfect insect; and the larva also possesses a large mass of a fatty nature termed the *Epiploon* or *fat-mass*, which is doubtless intended to nourish the animal when at rest in its *pupa* or *chrysalis* state. Caterpillars feed voraciously upon the leaves and tissues of plants, and thus cause great damage in gardens. They generally increase largely in size, and frequently moult or change their skins, to accommodate the increasing growth of the body; such a process being known as *Ecdysis*. The C. state may be regarded as representing the *nutritive period* of insect existence, since it is in this state that the animal lays up a due store of nutrition, which in many cases serves it throughout its entire existence. The life—often very short—of the perfect insect is devoted to *reproduction*; we may therefore, in contradistinction, term it the *reproductive period*. The C., sooner or later, encloses its body in a cocoon, and lies dormant for a longer or shorter period as the *pupa*. And from the cocoon the sexual, winged and perfect insect or *imago* finally emerges; the elements of the C. body being metamorphosed into those of the perfect form. In other cases the C. may not enclose itself within a cocoon, but simply attach itself, enclosed within its own skin, by its silky thread to a bush or other fixed object, and may thus undergo the further changes characteristic of its curious existence. See MOTH, BUTTERFLY, INSECT, METAMORPHOSIS, &c.

Cat'gut, the material obtained from the intestines of the sheep, and sometimes from those of the horse, ass, and mule, of which the strings of violins, harps, and guitars, and the strong cord used by clockmakers and in whipmaking, are manufactured. The intestines are prepared by washing, scraping, and steeping, and the larger ones having been laid aside to be sold to the sausage-maker, the smaller ones are treated with an alkaline solution, to render them as clean as possible, and are then drawn through the small holes of perforated thimbles. In making violin-strings, two or more strands are twisted together—according to the required thickness of the string—and the string thus manufactured is then exposed for some time to the action of burning sulphur, to destroy any animal matter that may still adhere, and afterwards rubbed with a horse-hair cloth. The strings made in Italy, and known as Roman string, are the best and strongest. They have the clearness and transparency of glass.

Cath'a. See CAFTA.

Cath'ari (Gr. *katharoi*, 'pure') is a generic term which has been applied to various sects who professed to be 'Puritans' in comparison with the Church. It was assumed in the 3d c. by the Novatians, who would not receive into the Church persons who lapsed into sin after baptism. It was very generally applied to the Manichæan sects in the middle ages, being nearly synonymous with Paulicians (q. v.) or Albigenses (q. v.), to whom were applied a great number of local names—*e.g.*, Bulgarians, Paterini, Publicani, &c. The name (Puritans) was given to a party in England, which, however, was quite distinct from the Continental sects. See Mosheim's and Neander's *Histories of the Church.*

Cath'arine, St, the name of several saints in the Catholic Church, of whom the best known are—1. **C of Alexandria**, who perished (according to the legend of her life) in the persecution of Maximin, A.D. 307. Her history is hidden under the most extraordinary marvels; it is even doubtful if she can be considered a historical personage at all. In the 9th c. there was discovered, it is said, on Mount Sinai the uncorrupted corpse of a virgin. Popular opinion declared it to be that of the Egyptian martyr, and the place became the scene of frequent pilgrimage. The Crusades made St C. known to the W., and the city of Rouen received her relics. She is commonly represented with a wheel, the instrument with which she was tortured. The Roman Catholic Church celebrates her festival on the 25th of November. 2. **C. of Sienna**, born in 1347, made a vow of chastity in her youth, and lived only on bread and herbs. At the age of eighteen she entered the Dominican order, and astonished every one by the rigour of her mortifications. For three years she imposed silence on herself, conversing only with God and her confessor. But her religion was not mere *egoism.* She was ceaseless in her charities, and in her attentions even to those who were suffering from the most repulsive maladies. Christ, it was affirmed, showed her special tokens of his favour, and Popes, notably Urban VI. and Gregory XI., had recourse to her for advice. She died 29th April 1380, was canonised in 1460, and is commemorated in the Church on the 30th of April. Her letters, poems, &c., have been several times printed. The best edition is that entitled *Opere della Serafica Santa C.* (Siena and Lucca, 1707–13).

Catharine I., Empress of all the Russias, born 15th April 1684, of poor parents, who died when she was three years old. Brought up by the Protestant Bishop of Marienburg, Glück, she married, in 1701, a dragoon of the garrison of that town. The town was taken by the Russians in 1702, and C. was sent with others to Moscow, where, in the service of Prince Menchikoff, she first saw Peter the Great, who made her his mistress. She now dropped her real name. Martha Rabe, was baptized in the Greek Church, and took the name of Jékatérina Alexéievna. After three daughters had been born, Peter married C. on 29th May 1711. She was afterwards crowned at Moscow, 1724; and on her husband's death (1725) she became Empress, Menchikoff taking the charge of affairs. She died 17th May 1727. Her influence upon the passionate character of her husband was generally exerted for good. See Motley's *History of the Life and Reign of C. I.* (2 vols. Lond. 1744); Voltaire's *Histoire de Russie sous Pierre le Grand* (1759 63); and Arsenjew's *Zarstwowanie Ekateriny I.* (Petersb. 1856).

Catharine II., born at Stettin, 2d May 1729, was the daughter of Christian August, Prince of Anhalt-Zerbst, an officer in the Prussian army. After receiving an unusually good moral training from her mother, who belonged to the Holstein-Gottorp family, she was married in 1745 to the Russian Emperor, Peter III., or Feodorovitch, who, also a member of the Holstein-Gottorp family, had been adopted by the Empress Elizabeth. It was a marriage of a beautiful, intelligent, and high-principled woman to a cowardly and vicious fool, deeply marked with small-pox. C., while Grand-Princess, lived rather apart from her husband and the Empress, studied much, and became acquainted with the character of the people, their language, religion, &c. In 1754 a son, Paul Petrovitch, was born; in 1761, hatred of his father, who was a slave of Friedrich II., caused a conspiracy to place the boy on the throne. The next year, but after the death of Elizabeth, the great conspiracy of the Orlofs and Rasumofski secured the throne for C., and her husband's abdication. Peter, whose only friend was the upright Field-Marshal Munnich, died soon after. C. recalled many exiles from Siberia, punished official corruption, and reformed judicial procedure. Though her reign was not free from conspiracy, she destroyed the system of court intrigue, and devoted herself to the absorption of Poland into Russia and the diminution of Turkish power. The means she used to attain these objects showed that her public conscience as well as her private character had deteriorated at the Russian court. Poland she deprived of Courland, and then placed on the throne her creature Poniatowski. To the promotion of the internal prosperity of the empire she energetically addressed herself. She tried to codify the laws, introduced a better provincial administration, improved the condition of the serfs, constructed canals, and herself set the example of vaccination. She also founded the Russian Academy, corresponded (like Friedrich the Great) with Voltaire, and invited Diderot and D'Alembert to her court. But while herself superintending public affairs with unequalled skill and sagacity, she entered into a number of disgraceful amours with Russian nobles, of whom only Orlof and Potemkin attained to political importance. She died 17th November 1796. Her popularity may be seen in the correspondence with Voltaire, which fills vol. lxxxviii. of his collected works. He calls her 'the Aurora Borealis of the N.,' and subscribes himself, 'with idolatry, the Priest of your Temple' (22d December 1766). See Castera's *Histoire de C. II.* (3 vols. Par. 1800), and Herzen's *Mémoires de l'Impératrice C. II.* (Lond. 1859).

Catharine of Aragon, born December 1485, was the fourth daughter of Ferdinand and Isabella of Castile and Aragon. She was first married, with a large dowry, to Arthur, eldest son of Henry VII. of England, and afterwards, on 3d June 1509, to Henry VIII., who had been betrothed to her when a boy of twelve immediately after his brother's death in 1502, at which time also, C. not being pregnant, a dispensation for the second marriage was reluctantly granted by Pope Julius II. C. unfortunately disappointed the King and the nation, who were expecting a male heir, the Princess Mary being the only child of several who lived beyond a few days. In 1527 Henry accordingly declared that the safety of the realm required a divorce. This was only a preliminary to another marriage, Anne Boleyn being already singled out as C.'s successor. A dispensation was craved from Pope Clement VII., and next year Anne was openly installed at Greenwich. The cause being appealed to Rome, Clement inhibited Henry from proceeding further with his second marriage, and Henry appealed from the Pope to the general voice of Christendom on the question of the extent of the Pope's power of dispensation. C. declined to submit her cause to arbitration in England, and retired to The More, in Hertfordshire, and latterly to Ampthill, near Dunstable, where she became a centre of communication between the courts of the Continent and the disaffected parties in England—the Nun of Kent, the Poles, the Courtenays, the Nevilles, &c. In 1533 the Statute of Appeal (24 Hen. VIII. c. 12) was passed, excluding appeal to Rome in all matrimonial causes; and after the Houses of Convocation had delivered their opinions on the question of Levitical law, Archbishop Cranmer opened a court at Dunstable to try the matter of fact regarding C.'s first marriage. The judgment (22d May 1530) was never acknowledged by C., who was now called Princess-Dowager: it was afterwards set aside by the Act 1 Mary, c. 1, when it became necessary to set the legitimacy of C.'s daughter beyond doubt. There seems little doubt that C. was implicated in the conspiracy of the Nun of Kent: she constantly corresponded with the Emperor and the Pope on the subject of her divorce. The removal to a distance of the Princess Mary no doubt hastened C.'s death, which took place, 7th January 1536, at Kimbolton. See Froude's *History of England*, and *Letters and Papers, Foreign and Domestic, of the Reign of Henry VIII.*, by J. S. Brewer (1875).

Catharine de Médicis, born at Florence in 1519, was the daughter of Lorenzo de' Médici, Duke of Urbino, and the niece of Pope Clement VII. She was great-granddaughter of Lorenzo the Magnificent, and granddaughter of Leo X. In 1533 she was married to Henri, second son of François I., who was then hesitating between Lutheran alliances against Karl V. and Papal influence in his project of acquiring Milan. Partly because for ten years there were no children of the marriage, C. remained for a long time eclipsed by her husband's mistress, Diana of Poitiers, and the influence of the Guises. She was, however, a favourite with her father-in-law. Henri succeeded his father in 1547, and died himself in 1559. The following were the children of the marriage:—François, Dauphin, who married Mary Stuart, and reigned as François II. for a year; Charles IX., who reigned 1560–74; Henri III., who reigned 1574–89; François, Duke of Alençon, for sometime sovereign of the united provinces of

Holland, and a suitor of Queen Elizabeth; Elizabeth, who married Philip II. of Spain; Claude, Duke of Lorraine; and Marguerite, who married Henri of Navarre. C. became Regent on the accession of her son Charles, and, pretending to favour the Huguenots, formed a party, including the Chancellor L'Hôpital, Condé, and Antoine of Navarre, against the faction of François of Guise and the Cardinal Lorraine. After the two religious wars ended, C., seeing the Paris mob decidedly Catholic, made overtures to the Guises, and arranged the murder of Coligny and the massacre of St Bartholomew. Coligny's influence over Charles IX. was considered dangerous. During the reign of Henri III., the Catholic League, formed by Henri (Balafré) of Guise and Charles of Guise, Duke of Mayenne, which supported the claim of Cardinal Bourbon to the throne, became too strong for C., as was shown on the Day of Barricades and the King's flight to Chartres. This caused C. to form an alliance with Henri of Navarre. Before the siege of Paris, she died at Blois, 5th January 1589. C. appears to have been beautiful in person, of graceful manners, and of great personal courage. She conducted state correspondence. Morally, she was cruel, licentious, and basely treacherous. In religion she was abjectly superstitious on particular points.

Catharine's, St, College or **Hall**, Cambridge, was founded in 1473 by Robert Woodelarke, for a master and three or more fellows. The number of the latter was increased in 1860 to nine. There are twenty-five scholars, and six benefices in the gift of the college. In 1875 the number of undergraduates was fifty-seven.

Catharis'tæ, a local name for the Manichæans (q. v.).

Cathar'tics (from the Gr. *kathairō*, 'I purify') are medicines that increase the discharge from the bowels. They act by increasing either the peristaltic action of the bowels, or the watery secretions of the intestines, or in both of these ways. Some operate on a certain portion of the bowel only, others on the whole canal. C. often cause griping, which is best prevented by henbane or belladonna, or by any of the warm aromatics, as cinnamon, ginger, or pepper. They should be administered on an empty stomach, and their action is assisted by warm drinks and walking exercise. Mild C. are often called *laxatives*, and strong C. *purgatives*.

Cathar'tine, a name formerly given to what was considered the active principle of senna. It is now, however, applied to the active principle of Cathartics (q. v.), and is supposed to be identical with chrysophanic acid ($C_{10}H_8O_3$), which occurs in yellow needle-like crystals, is without odour, nearly tasteless, insoluble in cold water, but soluble in alcohol and ether. It is found in senna, rhubarb, and other vegetables.

Cathcart', William Shaw, Earl, a British politician and general, and son of Baron Cathcart, of Cathcart, Renfrewshire, was born September 17, 1755. Entering the army, he served with distinction in America, Germany, and Flanders, was made commander-in-chief in Ireland in 1803, and commanded the land forces in the attack on Copenhagen, receiving the thanks of Parliament and the dignity of Viscount, 1808. He subsequently acted as ambassador at the Russian court, was present at the congresses of Châtillon and Vienna, and was raised to the rank of Earl in 1814. He died, June 17, 1843, at his country residence, Cartside, near Glasgow. His eldest son, **Charles Murray, Earl C.**, born 1783, served in Spain and Canada, and was made a general and colonel of the 1st Dragoon Guards. He died July 1859.—**Sir George C.**, younger son of Earl William, was born in London, 1794, and educated at Eton and Edinburgh. He entered the Life Guards, fought with the allied army in 1812 and 1813, and was aide-de-camp to the Duke of Wellington at Quatre-Bras and Waterloo. His subsequent career was distinguished. In 1837 he was mainly instrumental in crushing the outbreak in Canada, where he remained for upwards of six years; and in 1852, being sent to the Cape of Good Hope as governor, was successful in bringing the Kaffir war, then raging, to a conclusion. C. went, in 1854, to the Crimea as a general of division, fought at Alma, and at Inkermann met a soldier's death, the place where he fell being known as C. Hill. He was the author of *Commentaries on the War in Prussia and Germany in* 1812 *and* 1813, published in 1850. After his death appeared C.'s *Correspondence relative to his Military Operations in Kaffraria* (Lond. 1856). See Kinglake's *History of the Invasion of the Crimea.*

Cathe'dral Church is the see or seat of a bishop, and is so called from his seat or throne (Lat. *cathedra*), which is placed in it. The clergy connected with a C. consist of a corporation of canons, called a chapter, presided over by the bishop. The cathedrals in England are divided into two classes, namely, of the old and of the new foundation. The latter are those which before the Reformation were monastic institutions, but at that period were refounded as secular cathedrals, that is, with clergy to minister to the laity, or were newly-created sees of that nature. Their chapters consist of residentiary canons, who, till the Act of 1840, were called prebendaries. The former are those which were always held by secular canons. Their officials now consist of dean, precentor, chancellor, treasurer, archdeacons, prebendaries, and canons. In reference to the building, see CHURCH. See Walcott's *Sacred Archæology* (1868).

Cathelectroto'nus is the physiological condition of a nerve in the neighbourhood of the *negative* pole, when it is stimulated by a constant current of electricity. For details see ELECTROTONUS.

Cathelineau, Jacques, leader of the Vendéan insurrection, was born at Pin-en-Mauges (Maine-et-Loire), 5th January 1759. Originally a mason, he afterwards became a pedlar, and acquired great influence in the country districts by his intelligence and piety—the people reverentially naming him *Le saint de l'Anjou.* The immediate cause of the revolt against the revolution was the levy of 300,000 men for the frontier wars. It broke out, 12th March 1793, at Saint-Florent-le-Vieil in the Bocage. C. instantly put himself at the head of the rustics of his parish, mostly armed with scythes, pitchforks, and sticks, captured the village of Chemillé on the 13th, and on the day following took Chollet, capital of the Bocage, where his followers obtained some artillery. Their numbers now rapidly increased, and a large, though undisciplined army, *La grande armée Vendéenne*, was formed. The victories of Vihiers (16th March), of Saint-Pierre de Chemillé (11th April), of Thouars (5th May), of Fontenay (25th May), of Doué (7th June), of Montreuil (8th June), and, above all, of Saumur (9th June), strikingly attest the bravery and the military aptitude of C., who was now chosen commander-in-chief of the 'Catholic and royal' forces. His career, however, was suddenly closed. At the siege of Nantes (30th June), where he displayed prodigies of valour, he was mortally wounded, and after lingering fifteen days, died at Saint-Florent, 14th June 1793. His three brothers, Jean, Pierre, and Joseph, also perished in the Vendean war, and his son, **Jacques**, born 28th March 1787, was shot 27th May 1832, during the abortive insurrection of the Duchesse de Berry. See Muret's *Vie Populaire de Cathelineau* (Par. 1845).

Cath'eter (from the Gr. *kathiēmi*, 'to thrust into'), a surgical instrument for passing along a mucous canal into some cavity of the body, either for the purpose of drawing off or injecting some fluid. It is generally used for drawing off the urine when from accident or disease the patient is unable to pass it. C. may be of metal, in which case it is generally plated with silver, india-rubber, or gum-elastic. Considerable dexterity is required by the surgeon to pass the instrument into the bladder without injuring the Urethra (q. v.). See URINE, RETENTION OF.

Cathetom'eter (from the Gr. *kathetos*, 'perpendicular,' and *metron*, 'a measure'), an instrument for measuring the change in the height of an object situated at some distance off, especially with reference to a column of liquid in a tube. It consists essentially of a tripod stand and an upright brass rod, to which a telescope is so attached at right angles that it is capable of being fixed at any part of the rod, and of being pointed in any direction. The rod is adjusted to a true perpendicular position by means of spirit-levels and screws, and this secures the perfectly horizontal position of the telescope.

Cath'ode. See ANODE.

Cath'olic Church (Gr. *katholikos*, 'universal') means the universal Christian Church; the term having been first employed to distinguish it from the Jewish Church, which was that of a single nation, and cannot therefore properly be appropriated by any section of it. In the popular mind, however, C. C. is synonymous with Roman C. C. (q. v.), as, on the other hand, the Roman C. C. is equivalent to the C. C. according to the members of that Church, who regard it as the only one deserving the name of Church.

Catholic Creditor. In Scotch law, a catholic or universal creditor is one whose debt is secured over several subjects, or over the whole subjects belonging to his debtor. A creditor so secured is bound to claim his debt according to certain equitable rules, so as not unnecessarily to injure the claims of postponed creditors.

Catholic Emancipation was, as Sydney Smith said, an Irish question. Originally the provisions of the Irish Act of Supremacy, 2 Eliz. c. 1, were really less unjust towards Catholics than those contained in the English Act 1 Eliz. c. 1, supplemented by 5 Eliz. c. 1. Thus, in England, a Catholic priest receiving a neophyte into the Church was liable to be hanged, drawn, and quartered; Jesuits forfeited their lives by appearing in the country; and no man could hold office, or become a barrister or schoolmaster, without taking the oath of supremacy. In Ireland these penalties did not exist; the sacramental test and the declaration against transubstantiation were unknown; the oath of supremacy was not exacted, and neither House of Parliament was closed against any religious sect. There was, however, the bitterest political oppression, which at last found expression in the Act of the English Parliament (1691) providing that no person should sit in the Irish Parliament, should hold any Irish office, civil, military, or ecclesiastical, or should practise law or medicine in Ireland, till he had taken the oaths of allegiance and supremacy, and subscribed the declaration against transubstantiation. This statute, 3 Will. and Mary, c. 2 (which was based on the Treaty of Limerick), was followed by the penal legislation against Irish Catholics, which led to so much misery during the 18th c. that Lord Chesterfield declared that the position of a negro slave was preferable to that of an Irish Catholic. At one time (1698) the bishops, dignitaries, and regular clergy were all banished. The right of guardianship, several rights in land, intermarriage with Protestants, and the two franchises were taken away from Catholics. In 1793, after Grattan had introduced the subject to the Irish Parliament, several pains and penalties were removed, but for that purpose the Catholics were obliged to take the oath drawn up by Dr Duigenan, to the effect that it was unlawful to injure persons on account of heresy; that no immoral act could be justified because done for the good of the Church; that the Pope's infallibility was not an article of Christian faith; that, therefore, it was sinful to obey commands of the Pope which were immoral; that sincere repentance, and not mere priestly absolution, was necessary for forgiveness; that the deponent would defend the then settlement of property in the kingdom, and would do nothing to subvert the Church established or the Protestant religion. The main political disabilities remained, although Lord Fitzwilliam's viceregal government and Mr Pitt's ministry of 1801 both came to a termination on account of differences on this question. In spite of the answer given to Mr Pitt by six Catholic universities, and of the fact that Catholics were competent as jurymen and witnesses, it was maintained that Catholics did not keep faith with heretics. The Irish Union was accomplished on the understanding that the Catholic claims would be conceded, but the scruples of George III. and George IV. about their coronation oaths, and the conscientious opposition of the Duke of Wellington, Peel, Lord Eldon, and other members of the Tory party, delayed even the parliamentary discussion of the question. In 1821 a bill passed the Commons by a majority of nine for admitting Catholics to the Lower House, and in 1822 a bill to admit Catholic peers to the Upper House passed the Commons by a majority of five. In the meantime the Catholic Association had been formed, and won a great victory in the election of the Catholic O'Connell for County Clare over Fitzgerald, the Protestant candidate—the first triumph of the 40s. freeholders over the great landed proprietors. O'Connell could not, of course, take his seat, but in 1828 Peel was obliged to take up the cause which Canning had so long maintained, and to introduce a general bill, admitting Catholics generally to offices and municipal rights, modifying the oath required to one of general allegiance, but continuing the exclusion as to all offices connected with the Church. To all commands in the united services they had been admitted previously. At the same time the 40s. freehold franchise was destroyed, and the Catholic Association legally, but not actually, suppressed. There does not seem to have occurred any difficulty in working this measure. The English Government has not interfered with the nomination of bishops or the publication of rescripts. A question was raised about ecclesiastical titles in 1854, and the publication of a bull in 1870 on Papal infallibility caused a warfare of pamphlets, but no serious conflict between the 'two allegiances' has yet occurred.

Catholic Epis'tles is the name given to the last seven epistles of the New Testament, because they were addressed to the general body of Christians (Gr. *katholikos*, 'universal') rather than to a particular church or person; or perhaps also because this name, confined at first to 1st Peter and 1st John as books *universally* received, was afterwards extended to the other five, which were not received by all as authentic when they were admitted into the canon.

Cathol'icos (Gr. *katholikos*, 'universal') is the title of the Primate of the Armenian Church, who resides at Etchmiazin.

Catholics, Roman, Laws as to. See ACT OF TOLERATION.

Catili'na, Lucius Sergius, descended from an old but impoverished family, was born about 109 B.C. From his early youth he was guilty of fearful atrocities, boundless extravagance, and open indulgence in every vice. Though he bore the reputation of murdering his wife and son that he might wed the rich and reckless Aurelia Orestilla, he was elected prætor 68 B.C. and governor of Africa in the following year. In 66 B.C. he was impeached by Publius Claudius Pulcher for oppression, and disqualified for the consulship. Mad with chagrin and harassed with debt, he formed the design, with Autronius and Cn. Calpurnius Piso, of murdering the new consuls—a scheme which failed solely through his own impatience. When the storm passed over, C. began to plan a new conspiracy on a stronger, surer, and more systematic basis. In 64 B.C., in his canvass for the consulship, he threw out hints about the grand venture. Senators, knights, and others, needy and desperate like himself, joined in the plot, which soon assumed vast proportions, and would have led to the ruin of the state but for Fulvia, the mistress of one of the conspirators, who divulged it to Cicero. Meanwhile C. lost the consulship, and in 63 B.C. formed a plan for Cicero's assassination, which was frustrated. On the night of the 6th November, C. met the ringleaders at the house of M. Porcius Laeca, and informed them of the disposition of his forces and the arrangements for Cicero's assassination, an insurrection of the slaves, and the firing of the city. Cicero was at once advised by Fulvia of this, and when the assassins came they were refused admittance. On the 8th November the Senate, for greater safety, met in the temple of Jupiter Stator. C. was present. Cicero with the first sentence paralysed the traitor, who at dead of night fled the city. C. and Manlius were declared enemies of the state, and Antonius was sent against them with an army. Cicero, who was left in Rome, caused Lentulus, Cethegus, and others to be arrested. They were tried, condemned, and strangled in prison. C. meanwhile had led his forces into the region of Pistoria, with the intention of crossing into Gaul, but in this he was foiled by Metellus Celer. In the beginning of 62 B.C., he fell in battle with Petreius, the lieutenant of Antonius, fighting desperately to the last.

Cat'kin, or **Ament** (*amentum*), a botanical term applied to a spike of unisexual flowers, behind scaly bracts instead of a proper perianth. The whole inflorescence falls off by an articulation in a single piece. Willows, hazels, oaks, birch, alders, &c., and the whole of the orders *Cupuliferæ* (q. v.) and *Amentaceæ* (q. v.)—though in some, as the oak and hazel, only the male flowers are in catkins—are distinguished by this inflorescence.

Cat'mint, Catnep, or **Catnip** (*Nepeta Cataria*), a plant of the natural order *Labiatæ*, so called from the fondness of cats for it, common in England, but rare in Scotland. There are various other species in Southern Europe and temperate Asia. Malabar C. is *Anisomeles malabarica*.

Ca'to, Dionysius. Whether or not there ever was a writer of this name is a matter of uncertainty. The little book bearing the title *Dionysii Catonis Disticha de Moribus ad Filium* has exercised the ingenuity of scholars for ages, and its authorship, its period, and its merits are alike unsettled. Seneca, Ausonius, Boethius, and many others have enjoyed the reputation of writing it. One has declared its style to be that of the best period, another, that of the worst, in Roman literature; its precepts have been pronounced splendid by some; by others, the veriest rubbish. One considers the author an earnest Christian; another, a rank Pagan. It would seem that a work which has been the theme of so much discussion must have some merit. On internal evidence we may safely ascribe it to a writer of the silver age. During the middle ages it was extensively used as a text-book. It was translated into English by Caxton. The editions of it are numerous; the best is that of Otto Arntzenius (Amst. 1754).

Cato, M. Porcius, surnamed *Censorius*, from his strictness during his censorship, known also by the names of *C. Major* and *C. Priscus*, was born at Tusculum, 234 B.C. His boyhood was, in great part, spent on his father's estate in Sabinum, where he accustomed himself to outdoor exercises, and, by joining in farming operations, acquired that knowledge of rural economy which he afterwards gave forth in his work *De Re Rustica*. His early ambition was kindled by tales of the career of M. Curius Dentatus, whose humble cot was in the neighbourhood. In the campaign of 217 B.C. he began his military career; was at Capua in 214 B.C., where he gained the friendship of Fabius Maximus; was present at the siege of Tarentum 209 B.C., and two years later helped to win the battle of the Metaurus, in which Hasdrubal was slain. Meanwhile he had made the acquaintance of L. Valerius Flaccus, a young nobleman of kindred sympathies, who, recognising his signal ability, urged him to proceed to Rome and aspire to forensic and magisterial honours. C. did so; distinguished himself as a pleader; became quæstor 204 B.C., ædile 199 B.C., prætor 198 B.C., and in 195 B.C. was elected consul with his friend Flaccus. During his campaign in Spain, which had been assigned as his province, C. displayed great military genius and acted with consummate ability. He shared the food and toils of a common soldier, and inculcated the sternest morality. Having reduced the country from the Ebro to the Pyrenees, he was decreed a thanksgiving of three days. In 194 B.C. he returned to Rome, where he was awarded the honours of a triumph. In 191 B.C. he went to Greece as military tribune under M. Acilius Glabrio against Antiochus, and distinguished himself at the battle of Thermopylæ, which led to the downfall of the Syrian king. This ends the military career of C. In 189 B.C. he stood for the censorship, an office which he did not obtain till 184 B.C., when Flaccus was again his colleague. So vigorous was he in the discharge of the duties of that office, that the epithet *censorius* stuck to him ever after. His severe edicts against luxury, and his improvements in the reservoirs, drainage, &c., did much for the welfare of the people. His native austerity led him to denounce the literature of Greece as dangerous to morals, but this prejudice diminished as he grew older. C.'s censorship was rewarded with a public statue, bearing an inscription recording his services. To the end of his days his life was one of ceaseless activity. In the year before his death he was the most vehement adviser of the third Punic War, and so violent and persistent was his hatred of Carthage, that, whatever was the subject of debate in the Senate, he always concluded his remarks with the famous words, 'Delenda est Carthago' (Carthage must be destroyed). C. died at the age of eighty-five, B.C. 149. He was twice married, first to Licinia, and then to Salonia, who, in his eightieth year, bore him a son, M. Porcius C. Salonianus, the grandfather of *C. Uticensis*. His principal writings were *De Re Rustica*, already mentioned; *Origines*, an historical work; and *Orations*. Of the last two, only fragments remain.—**Marcus Porcius C.**, great-grandson of the preceding, and surnamed *Uticensis* from his death at Utica, was born 95 B.C. Left an orphan in childhood, he was brought up by his uncle, M. Livius Drusus. As a boy he was demure and unsocial, but truthful and independent. In 72 B.C. he served with honour in the Servile war of Spartacus; but, though a brave soldier, he lacked military genius. In 67 B.C. he went as military tribune to Macedonia, whence he proceeded to Pergamus in search of the Stoic, Athenodorus, whom he induced to accompany him to Macedonia, and afterwards to Rome. C. soon obtained the quæstorship, the duties of which he discharged with universal approbation. In 63 B.C. he was elected tribune. He supported Cicero against the Catilinarians, and determined the wavering Senate by his speech, in which he taxed Cæsar with complicity in the plot. He strenuously opposed Cæsar's election to the consulship, as well as the decree of the Senate by which he obtained Gaul for five years. He was sent to Cyprus against Ptolemy, and compelled him to submission. C. vigorously resisted the triumvirs; was made prætor B.C. 54, but failed in his candidature for the consulship. When Cæsar crossed the Rubicon, the Senate, on his recommendation, gave Pompey the conduct of affairs. C. followed Pompey to Dyrrachium, 49 B.C., and after the battle of Pharsalia, 48 B.C., commanded the Corcyrean fleet. Hearing of Pompey's death, he repaired to Africa, and marched through Libya to effect a junction with Scipio, to whom he resigned the command. On the defeat of Scipio at Thapsus, 6th April, 46 B.C., C. fortified himself in Utica, and urged the Romans to hold out, but they quailed at Cæsar's approach. Finding resistance hopeless, he advised his friends to escape and make terms with the conqueror. But he had made up his mind to die rather than submit, and, after reading Plato's *Phædo*, stabbed himself.

Cat'odon. See CACHALOT.

Cat-o'-Nine-Tails. See FLOGGING.

Catop'trics, a term, now disused, for that branch of Optics (q. v.) which treats of reflected light.

Catop'tromancy (Gr. *katoptron*, 'a mirror,' and *manteia*, 'divination'), among the ancient Greeks, a mode of divination by immersing a mirror in water for a sick person to examine his face in. A ghastly and distorted reflection portended death; a serene and healthy one, recovery.

Cat's Eye, a variety of chalcedony, commonly translucent, sometimes transparent; of an ash-grey, greenish, yellowish, reddish, or brown colour, and displaying, when cut in a convex form, a peculiar floating opalescence, due to minute parallel fibres of asbestos. It is found in Ceylon, on the Malabar coast, and in several European localities. It is chiefly set in rings.

Cats, Jakob, a Dutch poet, born at Brouwershaven in Zealand, 10th November 1577, studied law at Leyden, visited Orleans and Paris, and settled at Middelburg, where, amid other peaceful occupations, he wrote a number of his best poems. After the twelve years' peace of Antwerp, C. was compelled to remove to the Hague. He was appointed pensionary of Dordrecht in 1625, and two years later was sent on an embassy to England, where he was knighted by Charles I. In 1636 he was promoted to the dignity of state pensioner, and in 1652 was again sent to England on an embassy to Cromwell. He died September 12, 1660. Among his greatest works are *Houwelyk*, *Trouringh*, and *Spiegel van den ouden en nieuwen Tyt*. The best edition is that of 1790-1800, published in Amsterdam; but the most splendid edition is that published at Zwolle in 1856-62.

Cat'skill or **Cau'terskill Mountains** (*kill* in Dutch means a stream), celebrated for their fine scenery, rise to the W. of the Hudson, in Greene Co., N.Y. Round Top, the highest peak, is 3800 feet above the sea. The C. Mountain House, a summer resort, stands at a height of 2500 feet. The C. Creek, giving name to the mountains, and to a village at its mouth, enters the Hudson 32 miles S. of Albany.

Cat's Tail. See ZYPHA.

Cat's-Tail Grass. See TIMOTHY GRASS.

Catt'aro, a fortified town in the crown-land of Dalmatia, Austria, 36 miles S.E. of Ragusa, at the head of the Gulf of C., on a narrow ledge at the base of precipitous cliffs about 1800 feet high. It has a cathedral, several churches, an hospital, and is overlooked by a castle perched on the top of the cliffs, with which it is connected by crenelated walls. As in most Dalmatian towns, no vehicle is admitted within the walls, and the streets are cleanly kept. The piazza is beautifully paved with alternate coloured marbles. Pop. estimated (1872) 3554. At an early date the capital of a small republic, C., through fear of the Turks, voluntarily submitted to the Republic of Venice in 1420, and passed with it to Austria in 1797, at the Peace of Campo-Formio.—*C., Gulf of*, a sheltered inlet of the Adriatic, consisting of three basins, connected by two channels about half a mile broad. It is 15 to 20 fathoms deep, and 30 miles long.

Catt'egat ('the cat's throat,'—the *Sinus Codanus* of Pliny and Pomp. Mela), the strait between Jutland and Sweden, communicating with the North Sea by the Skager Rack, and with the Baltic by the Sound, and by the Great and Little Belt. It is about 150 miles long, and from 40 to 95 broad, and is dangerous to shipping from its storms, currents, and shallowness; hence the Low German proverb, *Dat Cattegat makt den Schippa den Hals natt.*

Catt'ermole, George, born at Dickleburgh, Norfolk, 8th August 1800, early attained a high reputation as a painter of historical and imaginative works in water-colour, ceased to exhibit in 1853, after which he commenced to paint in oil. He died July 24, 1868. Among his works are 'Luther at the Diet of Spiers,' with thirty-three portraits, and the 'Horn of Egremont Castle.' He found many subjects in the works of Scott and Shakespeare, and designed the illustrations for his brother's *History of the Civil War*. See memoir by Tom Taylor in *Art Journal*, March 1, 1870.

Catt'i, or Chatti, a warlike German tribe, the chief sept of the Herminones, occupying territory corresponding to the modern *Hessen* (a form of the name C. first appearing in the 8th c.), and perhaps part of Bavaria. Cæsar erroneously classes them as belonging to the Suevi. The Romans gained many advantages over them, especially under Germanicus, but never entirely subdued them. They disappear from history towards the close of the 4th c., after which time they are not to be distinguished from the Franks.

Cattle. See Ox.

Cattle-Plague. See RINDERPEST.

Cattley'a, an extensive genus of Central American and Brazilian orchids, found on the bark of trees and on rocks. The flowers are among the finest of the whole order, and many species of C. are cultivated in our conservatories.

Cattol'ica, a town of Sicily, province of Girgenti, situated 14 miles N.W. of Girgenti city, with considerable sulphur-works. Pop. 7200.

Catull'us, C. Vale'rius, one of the greatest of Roman poets, was born at or near Verona, 87 B.C. His father was a man of good position, and the friend and host of Julius Cæsar. On assuming the manly gown, C. went to Rome, where he led the life of a man of pleasure. His expensive tastes and reckless extravagance soon involved him in pecuniary difficulties, from which he endeavoured to extricate himself by going to Bithynia in the suite of the prætor Caius Memmius Gemellus. Thereafter he made a tour of the famous cities of Asia, and on reaching Amastris, on the shore of the Euxine, had a yacht built for himself, in which he sailed home to his villa at Sirmio on the Lacus Benacus (*Lago di Garda*), probably about 56 B.C. He now made Rome his headquarters, and though occasionally in pecuniary embarrassments, he was not reduced to permanently straitened circumstances. He lived on terms of intimacy and friendship with many of the most distinguished men of his time. But the one event in his personal history to which a thrilling interest and an immortal freshness have ever attached, is his love for the beautiful and dissolute Clodia, whom he has immortalised under the pseudonym of Lesbia. In that wondrous series of poems, the tender emotions of dawning love, the wild throbbings of desire, the fulness of delight that springs from undoubting and undoubted affection, the dark nightmare of jealousy, and the desolation of a heart torn by mighty anguish, are all embalmed in musical numbers unparalleled in the poetry of passion. Next to his love in interest, and sung in strains not inferior to his love-lyrics in sincerity and depth of feeling, is his sorrow for the death of a dearly-loved brother, who perished in the Troad, and to whose grave he made a pilgrimage. Indeed, the verses to his memory are among the tenderest and sweetest, as they are among the very earliest flowers of Roman elegy. The works of C. consist of 116 poems, most of them short, embracing lyric, elegiac, heroic, and galliambic compositions. The most famous of them after the Lesbia series are two epithalamia, the stately narrative poem on the nuptials of Peleus and Thetis, the gorgeous setting of the *Lament of Ariadne*, and the wildly-grand poem entitled *Atys*, which, though perhaps of Oriental birth, evinces more originality and vigour than any other poem in Latin literature. The writings of C., in many places disfigured by impurity of expression—the fault of the age rather than of the man—are throughout distinguished for great purity of style, rare intensity of feeling, inimitable elegance and grace, and singular felicity of diction. To C. belongs the honour of naturalising in Roman speech the lyrical metres of Greece. Few of the poets of antiquity have the freshness, few continue to enjoy the well-deserved popularity, of 'the young gentleman of Verona.' The exact time of his death is unknown, but it may be set down at about 46 B.C. The best editions of his works are those of Lachmann (Berl. 1829), Doering (Altona, 1834), Schwabe (Giessen. 1866), and Ellis (Lond. 1867). Among translations may be mentioned those of Lamb (Lond. 1821), Martin (Edinb. 1861), Cranstoun (Edinb. 1867), Ellis (Lond. 1867).

Cau'ca, a river of the United States of Colombia, S. America, rises in the Andes, and after a course of fully 500 miles through Popayan, Antioquia, and Cartagena, falls into the Magdalena in lat. 9° 25′ N. The valley of C., to which the river gives its name, is fertile and populous, with gold-mines in its upper portion.

Cauca'sian Variety of Mankind, an ethnological division introduced by Blumenbach, but now universally abandoned. The evidence of language forbids the conjunction in one group of Hindus, Persians, Assyrians, Phœnicians, Jews, the peoples of the Caucasus, and the European races. These constitute at least three distinct families—Aryan, Semitic, and Turanian. See ETHNOLOGY.

Cau'casus, The, an important mountain range, forming part of the boundary line of Europe and Asia, extends from S.E. to N.W. between the Caspian and the Black Sea. It is 750 miles long, and from 65 to 150 broad; and its principal heights are Mount Elbruz, 18,493 feet above the sea, and Mount Kasbeck, 16,000 feet. The snow-line is about 11,000 feet high, and several of the other peaks rise above it; but there is comparatively little perpetual snow, and only a few glaciers, and these of no great size. The only practicable carriage-road is that through the Terek valley (8000 feet), and the most frequented pass in the E. is that of Derbend, near the Caspian. Of the rivers rising in the C., the principal are the Kur and Terek, which flow into the Caspian, and the Rion or Faz (anc. *Phasis*) and the Kuban, which enter the Black Sea. The central mass of the C. is mainly formed of granite and porphyry, covered occasionally with volcanic tuff, and the offsets are in several places flanked with limestone. At each extremity of the range occur mud volcanoes, and the peninsula of Apsheron is the locality of the celebrated naphtha springs. The minerals found in the C. are chiefly iron, coal, sulphur, lead, and copper. In the wilder parts there are bears, wolves, jackals, and bisons, and almost everywhere there is abundance of game. On the northern declivity the climate is extremely rigorous, but to the S. of the range it is warm and equable, and there is a luxuriant wild growth of the grape and other fine fruits. Only the lower valleys are wide and cultivatable. These, however, produce rich harvests of rice, tobacco, cotton, indigo, &c., while cereals are occasionally grown at an altitude of 8000 feet. Here and there the mountain-sides are clad with dense forests of oak, beech, ash, maple, walnut, and other trees.

C. is now a Russian lieutenancy, with an area of 7938 sq. miles, and a pop. (1871) of 4,893,332, comprising a vast variety of tribes, of which the principal are Circassians or Tsherkesses, Ossestes, Lesghians, Abasians, Georgians, and Mingrelians. The chief occupations are cattle-rearing and agriculture, while there is also much hunting, and not a little robbery. From the preponderance of the Circassians (q. v.), their name is frequently applied to all the inhabitants of the C., but this is inaccurate and misleading. The language of intercommunication is Turkish-Tartar, and there are upwards of 100 different dialects. Mohammedanism is the prevailing religion, but the Georgians and Ossestes profess a rude Christianity, and belong partly to the Greek and partly to the Armenian Church. In the country of the former there are many fine remains of churches in the Byzantine style. For the first fifty years of the present century the united tribes successfully resisted the aggression of Russia, and were only subdued on the capture, in 1859, of the famous Lesghian prophet-chief Schamyl, who died in April 1871. See the works of Wagner (1850), Petzholdt (1867), Radde (1870), Grove (1875), and Thielmann (1875).

Cau'chy, Augustine Louis, a distinguished French mathematician and physicist, was born at Paris, August 31, 1789. He entered L'Ecole Polytechnique in 1805, where, in 1816, he became Professor of Mechanics. At the revolution of 1830, C.

resigned his position, and soon after accepted the chair of Mathematical Physics in the University of Turin. In 1838 he returned to Paris, succeeded M. Biot as Professor of Physical Astronomy in 1849, and died at Sceaux, 23d May 1857. C. published numerous memoirs in the *Comptes Rendus*, and in Lionville's *Journal de Mathematiques*. His best works are his *Cours d'Analyse* (1821), his *Leçons sur le Calcul Différentiel* (1826), and his *Présumés Analytiques* (1833).

Cau'cus is an immense political machinery which lies outside of the United States constitution, yet brings a powerful influence to bear upon the voters, and practically controls all the elections to office in the country. In every town and village each party meets before the time of election, and makes a full list of nominations to office, or appoints delegates to conventions, and this is called holding a C. Those who attend are generally considered bound to vote the regular ticket, but sometimes a C. is 'bolted,' the dissenting party putting up other candidates. The word is a corruption of *caulkers*,—the early political meetings, about the time of the American Revolution, for the preparation of election business having taken place in a caulker's room in Boston.

Cau'debec, or **Caudebec-en-Caux**, an old town in the department of Seine-Inférieure, France, on the Seine, 26 miles E. of Havre by railway. Its most notable building is a Gothic church of the 15th c., one of the finest in Normandy. It has some river trade and fisheries. Pop. (1872) 1874. C. was formerly capital of the *Pays-de-C.*, the land of the ancient *Caletes*. Subsequently a fortified place, it was taken by the English in 1419, by the Huguenots in 1562, and by the League in 1592. Some 6 miles E. of C. is the famous Benedictine Abbey of St Vandrille or Fontanelle, founded in the 7th c. Here the last of the Merwings died as a monk.—**C.-lès-Elbeuf**, a town in the same department, 12 miles S. of Rouen, has extensive cloth manufactures, and active wool-spinning and dyeing industries. Pop. (1872) 10,715.

Caude'te, the name of two Spanish towns. The first is in the province of Albacete, 51 miles E.S.E. of the city of Albacete, and has a pop. of 5500. The second is in the province of Teruel (Aragon), about 5 miles N.W. of the town of Teruel, and has large bone deposits, fossil and otherwise. Pop. 6000.

Cau'dex (Lat.), the axis of a plant consisting of stem and root. It is, however, generally applied as a synonym of the stipe or woody stem of monocotyledons, especially palms—*Yucca*, *Dracæna*, *Pandanus*, &c.

Cau'dine Forks (*Furculæ Caudinæ*), a pass consisting of two narrow wooded defiles, and taking its name from Caudium, a city of ancient Samnium—'where afterwards, in continuation of the Appian Way, a Roman road was constructed from Capua by way of Beneventum to Apulia' (Mommsen). During the second Samnite war it was the scene of one of the most humiliating reverses ever experienced by the Roman arms. In the year 321 B.C., four legions were trapped by the Samnite general, Caius Pontius, in a 'watery meadow' (Mommsen) between the two passes, and after some days of famine they surrendered at discretion, and were made to pass under the yoke. Livy's account of the details of the disaster may be exaggerated, and he was probably in error as to the precise locality. Niebuhr supposes that previous to their being shut up between the passes the Romans had sustained a defeat, but there is no satisfactory evidence of this.

Cau'laincourt, Armand Augustin Louis de, Duc de Vicenza, was born at Caulaincourt, in the department of the Somme, December 9, 1772. Entering the army at the age of fifteen, he served with distinction in several engagements, acted as aide-de-camp to Napoleon when First Consul, and was made general of division and Duke of Vicenza (1805). He distinguished himself more as a diplomatist than as a soldier, was after the establishment of the Empire sent on various missions, and for four years (1807-11) was ambassador at St Petersburg. He subsequently acted as negotiator at Pleswitz, Prague, Frankfurt, and Chatillon, and is believed to have secured Elba for his master when he abdicated. During the Hundred Days, he was Foreign Minister. He died at Paris, February 19, 1827.—His brother, **August Jean Gabriel**, Comte de C., born 16th September 1777, was a distinguished soldier, and fell at the battle of Moskwa, 7th September 1812.

Cauler'pa, a fine genus of 'green-seeded' (chlorospermous) seaweeds of the W. Indies. They form a large portion of the food of turtles; and it is said that the colour of the 'green fat' of these reptiles—so dear to gastronomes—is due to this kind of food.

Caul'iflower, a variety of the Cabbage (*Brassica oleracea*) (q. v.), in which the young inflorescence is condensed 'into a depressed fleshy esculent head.' It has been cultivated as a garden vegetable since the times of the Greeks and Romans, but was little attended to in Britain until about the 17th C. See BROCCOLI.

Caulk'ing, in ships, is making the seams of a deck watertight by driving oakum into them and then coating them with pitch. The same word is used also for a process by which the joints of boilers, &c., are made steam-tight by the use of a specially formed C.-chisel.

Caulophyll'um, a genus of perennial herbaceous plants belonging to the order *Berberidaceæ*, the rhizome of *C. thalictroides*. The 'Blue Cohosh,' the only species, is a native of N. America, Japan, and Manchuria; it is a stimulating and slightly narcotic tonic, said to be useful in some uterine affections.

Caulop'teris, a genus of large extinct and fossil *Tree-ferns* occurring in the Devonian and Carboniferous formations, and represented by numerous species. The stems were hollow, and bear external markings of leaf-scars, as seen in living tree-ferns.

Cause. 'To have the idea of C. and effect, it suffices to consider any simple idea or substance as beginning to exist by the operation of some other, *without knowing the manner of that operation*.' Locke further carefully distinguishes the cases of creation (in which something previously not existent is produced), generation, and alteration. Modern applied logic has preferred to define C. as the assemblage of conditions, positive and negative, under which a phenomenon is produced; but general usage, both popular and scientific, agrees with Locke in calling, *e.g.*, heat the cause of fluidity in wax; it is the positive condition which, when added, detaches the result. In dealing with both the logical and the psychological doctrine of causation, it must be remembered, however, that the necessity of the connection between the C., however defined, and its effect is purely abstract. Exclude the possibility of disturbing conditions, the effect will be reproduced. The uniformity of nature, which is said to depend on the law of universal causation, does not assume that an effect which has been once produced will ever again be produced anywhere; it assumes that, as regards successions of phenomena which are causally related, A=A; in other words, that the scarcely intelligible conception of 'chance' has nothing to do with the succession of events. The history of the idea of C. shows that in one stage of speculation it was universally believed that the 'reason why' things take place in one way, and not in another, could be obtained. The physical *αρχαι* of the early Greek philosophy were understood as explaining the universe. Timæus, the Locrian, found in the words Intelligence and Necessity the two real causes of all things. Aristotle believed that the formal C. or essence, the material C. or substance, the motor or efficient C., and the final C. were not mere ideas, but external forces, which made the world of sense intelligible. Indeed, the collection of 'First Causes' by the Abbé Batteux (Par. 1769) fills a considerable volume. In modern Europe the pious Malebranche spoke of God as the one efficient C., assisted by occasional causes; Cudworth and Leclerc invented a plastic nature, and Leibnitz found a sufficient reason for all things in the monads. It was Newton and Locke that first abandoned the search into the 'manner of operation.' Hume reduced the idea of causation to that of invariable sequence, adding that custom was the sole ground for expecting uniformity in the future; and this conception was to some extent worked out by Thomas Brown in an essay which was his first and best work in metaphysics. The Intuitionalist school protested against this analysis, alleging that no amount of experience could warrant the necessity and universality which the mind attaches to the proposition that every event must have a C. In answer to the question, 'How are synthetic *à priori* judgments possible?' Kant suggested the existence of forms of thought, or categories of the understanding, of which causality was a category of relation. The Scotch Common-sense school classed the belief in causation as fundamental; while in France it was said by Royer-Collard, De Biron, Jouffroy, &c., that the idea of power in volition was transferred by the mind to external phenomena, the successions of which it made intelligible. This was not thought to be inconsistent with a belief in the free, *i.e.*, *un*-caused determinations of the human will, which was thus made the type of invariable sequence. Sir William Hamilton held that the necessity of the causal judgment arose from the inability of the mind to conceive of any change in the 'complement of existence,' a doctrine which he extended even to the case of creation. The Psychological school, on the other hand, contend that the belief in the necessity of causes is a case of inseparable association, formed by the universal and inherited experience of the human race, and intensified by that strong expectation and proneness to believe in the extension of past experience, however slight, which are characteristic of healthy minds before they have undergone scientific training. Although Mr Lewes has lately revived the doctrine of the followers of Leibnitz, that the belief in causation rests upon the axioms of identity and non-contradiction, the majority of this school admit that, in all reasoning from the past to the future, there is a tacit assumption of invariable sequence, for which our only evidence is experience of the past. This is differently put by Mr Spencer, who appeals to the inconceivability of causeless events as the most direct and trustworthy evidence of universal experience. As inconceivability may be produced, however, by very much less than universal experience, and has even been known to resist contradictory evidence, this test cannot be deemed satisfactory, even when confined to the minds of leading scientific men. The view that the consciousness of *will*, whether as control over volitions or control over muscular action, supplies us with an explanation of productive power in external causes is still very popular: many theologians regarding it as essential in the demonstration of an intelligent First C. which constantly sustains nature; a conclusion which they consider to be confirmed by the scientific doctrine of the correlation of forces. Others insist that the doctrine of causation merely affirms a particular C. for every event, and not a general C. for the sum of all effects or events.

Caus'tic substances are those which corrode the skin and other organised tissues. Ordinary or lunar C. is nitrate of silver ($AgNO_3$); C. potash, the hydrate of potassium (KHO).

Caustic, in optics, is the curve or surface of ultimate intersections of rays of light, which have been either reflected from a surface or refracted through a medium, these giving rise respectively to catacaustic and diacaustic curves. The C. produced by the reflection of parallel rays from the inner surface of a circle is a curve of the sixth degree, being the evolute of an epitrochoid. In the case of the paraboloid of revolution, the C. is reduced to a point, *i.e.*, all the rays when reflected pass accurately through one point. The nature of *diacaustics* has not been so fully studied; but the curve produced by refraction at a straight line is the evolute of that ellipse whose foci are the luminous point and its image by reflection. See Malus's *Théorie de la Double Réfraction* and Salmon's *Higher Plain Curves* for detailed information.

Cau'tion, Cau'tionary. In the law of Scotland, where one person becomes security for another, he is said to become C., or to undertake a cautionary obligation for him. According to Stair, C. is 'the promise or contract of one not for himself but for another.' The analogous term in English law is Guaranty (q. v.). A probative writing is required to constitute the obligation. A cautioner who pays a debt has a claim of relief against the principal, and in support of this he can oblige the creditor to assign the debt and any security held by him; and should this support be cut off by any act of the creditor, the C. is freed from his obligation. A cautioner may sue the principal debtor to be relieved of his obligation under certain circumstances before the debt is paid. Mere negligence to take a legal step on the part of a creditor will not usually free a C. from liability. The loss of recourse in case of delay in intimating dishonour of a bill of exchange is an exception to this rule. See BILL OF EXCHANGE.

With regard to cautioners for the due performance of an office, the rules are—That having engaged for the officer's fidelity, they are not entitled to withdraw suddenly, though they may do so after reasonable notice; and that on the death of the cautioner the obligation will subsist against his representatives, who can only withdraw on the same conditions which would have entitled the principal to do so.

Judicial Cautionary is an obligation for appearance or for payment. *Caution judicis sisti* obliges the cautioner to produce him for whom he is bound at all diets of court when required. In case of failure to do so, the bond is forfeited, and the cautioner incurs the penalty without the benefit of discussion. A cautioner *judicis sisti* may at any time free himself from obligation by producing the principal in court, and declaring himself free of further obligation.

Caution Juratory.—When any one is unable to find C., an inventory of his effects may be made up and assigned as security. This is called C. J. See BAIL.

Cau'very, or **Kav'ari**, one of the most useful rivers of India, rises in the Western Ghauts, has a winding course in Mysore and Madras, and enters the Bay of Bengal 130 miles S. of Madras, through many streams (largest, the Colerun), after a course of 472 miles. Its delta is in the district of Tanjore, and extends along the coast for 80 miles. The railways from Beypur and Madras unite at Erode on its right bank, and a line then runs parallel with its stream, in a direction S.E. and E. to the Nagapatam terminus on the coast, a distance of 150 miles.

Ca'va, an intoxicating and narcotic liquor, made from the rhizome of *Macropiper methysticum* (natural order *Pipiraceæ*), in the South Sea Islands.

Cava, La, a flourishing town of Italy, province of Salerno, on the Naples and Salerno Railway, 3½ miles N.W. of the latter. Cottons and linens are here manufactured. Pop. 19,480. Near it is the famous Benedictine monastery of the Trinity, with its valuable library of manuscripts (60,000) and parchment rolls (40,000), and a church containing the tombs of various antipopes.

Cavaign'ac, Louis Eugène, an illustrious French soldier and politician, the son of a member of the National Convention, who afterwards became one of Murat's state councillors in the kingdom of Naples, was born in Paris, 15th October 1802. After a military training in Paris and Metz, he served in the Morea and Algeria, where, in spite of his frankly expressed republican opinions, he rose by his valour and resolute energy to the position of governor-general. Recalled to France by the revolution of 1848, he was elected by two departments to a seat in the National Assembly, and distinguished himself greatly in the crisis. By the skilful manœuvring of his troops as Minister of War, he extinguished the anarchic insurrection of July, and, unlike most conquerors in French conflicts, was merciful to the conquered. He stood as a candidate for the Presidency of the Republic against Louis Napoleon, and obtained a million and a half of votes. On the *coup d'état* of December 1851, C. was imprisoned, but soon released. He steadily declined to recognise the Second Empire, but was allowed to remain in France, where he became a director of the *Siècle* newspaper. He died unexpectedly of heart disease at his country seat in the neighbourhood of Mans, 28th October 1857, and was buried in the presence of a great crowd at Montmartre cemetery. C. was an able soldier, a pointed speaker, and a sincere but moderate republican.—**Godefroi C.**, elder brother of the preceding (born 1801, died 1845), was an able republican politician. He was one of the founders of the famous *Reforme* journal, and also published *Cardinal Dubois, ou Tout Chemin mène à Rome*, and *Une Tuerie de Cosaques, Scene d'Invasion* (Par. 1831).

Cavalier' (Fr. introduced in the 16th c. from the Ital. *cavaliere*, from the Lat. *caballus*, 'a horse'), originally a horse-soldier, then synonymous with knight, and in this sense given to the Royalist party in the times of Charles I. and Charles II. of England, in opposition to the Roundheads or Parliamentarians.

Cavalier, in fortification, a defence-work whose rampart is raised several feet above the ramparts of the fortress in which it is formed. It serves either to defilade them from the fire of an enemy on a neighbouring height, or to send a plunging fire into the trenches of besiegers, and for this purpose it mounts heavy ordnance. The C. is generally constructed on the level ground, or *terre-pleine* of a bastion, and may be bounded either by curved or straight sides.

Cavall'er-Maggio're, an old town in the province of Cuneo, N. Italy, with some trade in agricultural produce. It possesses the remains of two old castles. Pop. 5300.

Cav'alry (Fr. *cavalerie*, introduced in the 16th c. from the Ital. *cavalleria*, Lat. *caballus*, 'a horse'), a military term applied to all horse-soldiers. In the British army the C. is divided into Life-Guards, the Reds, of which there are two regiments; Horse-Guards, or Blues, one regiment; Dragoon Guards, seven regiments; Dragoons, Lancers, and Hussars, of which three designations there are twenty-one regiments. The Life and Horse Guards are styled the Household C., the others are the C. of the line. Cuirassiers (q. v.) is a term applied to Continental C., but does not now describe officially any regiment of the British army. Mounted Rifles is a phrase of comparatively recent importation into the service. On the Continent a distinction is made between *Heavy* and *Light* C., and it is carefully observed regarding both men and horses. The Heavy C. charge the enemy's horse and foot, attack his guns, and cover retreats. The Light C. reconnoitre, carry despatches, maintain outposts, act as scouts and explorers of a hostile country, pursue fugitives, and discharge generally all duties requiring rapidity of movement. In the Franco-German war of 1870, the Uhlans, a regiment of Heavy C., and the Hussars and Dragoons, Light C.—they were all called Uhlans—were employed in the latter kind of service to an extent unprecedented in history. The scout, attended by at least one companion, advanced—sometimes many miles in front of the army to which he belonged—into villages and farmhouses, demanded food and forage, got what news he could, and sent it back, if important, to his commander. The official distinction made among British C., according to the Army Regulations of 1873, is *Heavy*, *Medium*, and *Light*. The Heavy are the Life-Guards, Horse-Guards, 4th and 5th Dragoon Guards, and 1st and 2d Dragoons; the Medium are the 1st, 2d, 3d, 6th and 7th Dragoon Guards, the 6th Dragoons, the 5th, 9th, 12th, 16th, and 17th Lancers; the Light are all the Hussars, and comprise the 3d, 4th, 7th, 8th, 10th, 11th, 13th, 14th, 15th, 18th, 19th, 20th and 21st regiments. A regiment of the C. of the line has generally eight troops, each made up of 55 rank and file, and has, as officers, a colonel, a lieutenant-colonel, a major, 8 captains, 18 subalterns and other commissioned officers, and 59 non-commissioned officers—88 in all. The cost to the country of a full regiment of C. is about £25,000 a year for horses, accoutrements, clothing, and pay. A lieutenant-colonel in the Guards ranks with a colonel of the line, and a major in the former with a lieutenant-colonel of the latter. Canterbury is the C. depôt for this country. According to the army estimates laid before the House of Commons in the session 1874, there were in the Life and Horse Guards 81 officers, 192 non-commissioned officers, trumpeters, and drummers, and 1029 rank and file—total, 1302. In the C. of the line there were 550 officers, 1166 non-commissioned officers, trumpeters, and drummers, and 9906 rank and file—total, 11,622. The entire C. service, therefore, numbered 12,924. In 1873 the total number was 13,051; the highest number since 1815, when it was 14,913. See Col. Denison's *History of C. from the Earliest Times* (Lond. 1877).

Cavalry Tactics is the manner in which cavalry are used in actual warfare. The several duties of heavy and light cavalry have been referred to in the previous article. The threefold division of that arm of the service which obtains in this country renders their separate duties less easily definable, and is said to impair the C. T. When an attack is going to be made by cavalry, they are, when the numbers are sufficient to admit of the arrangement, grouped into an attacking, a supporting, and a reserve body. Thus at the famous charge of the Light Brigade at Balaklava, the attack was made by the 13th Light Dragoons, the 17th Lancers, the 4th Light Dragoons, and the 11th Hussars; the support consisted of the 8th Royal Irish Hussars; and the reserve consisted of the Heavy Cavalry Brigade, which covered the retreat of the survivors. The attack on cavalry is made in line; on infantry, in column; and on artillery, *en échelon* (q. v.). Cavalry cannot fight at a distance; and when two bodies of this force come close, they rarely continue the struggle—one of them usually turning to gallop off, and the other pursuing it for a time. Cavalry seldom win a victory; they prepare for it, and secure its best results, but the work of actually winning is usually done by infantry and artillery. The gallop in which a charge is made is at the rate of 11 miles an hour; the trot in manœuvring, 8 miles; and the walk on general service, 4 miles an hour. There is no fixed proportion generally observed between cavalry and infantry in the armies of Europe. In the British service the proportion is about 1 to 8; in Russia, 1 to 6; in France and Austria, 1 to 5; in Prussia and Bavaria, 1 to 4.

Cav'an (Irish Gael. *cabhan*, 'a hollow'), the capital of a county of the same name, Ireland, and a station on the N. W. Railway, 75 miles N.W. of Dublin, lies in a hollow on the C., a small tributary of the Annalee. It has a court of justice, a county infirmary, barracks, a fine public garden, and some local trade, chiefly in agricultural produce. Pop. (1871) 3532.

Cavan, a county of Ireland, in the S.W. of the province of Ulster, has an area of 746 sq. miles, and a pop. (1871) of 140,735; of whom 113,174 were Roman Catholics, and 21,223 Episcopalians. It is mountainous in the N.W., and is watered by the Erne, Croghan, Annalee, &c. It has also several lakes, of which the chief are Loughs Oughter, Sheelan, and Ramor. In 1871 one-third of the surface was under tillage, producing oats, flax, turnips, and potatoes; nearly a half in pasture; a ninth in bog, mountain, &c.; and there were some 5700 acres in plantation. C. is the most productive mineral county of Ulster, yielding coal, iron, copper, lead, and limestone. Its only considerable industry is the linen manufacture.

Cavarze're, a town of Italy, province of Venice, on the river Adige, 25 miles S.S.W. of the city of Venice. The river divides it into *C. destro* and *C. sinistro*—the S. and N. sides of the city. C. has an active trade in cattle, silk, and firewood. Pop. 11,200.

Cavati'na, a name sometimes given to the simpler and more song-like operatic arias.

Cave, Edward, was born at Newton, Warwickshire, 29th February 1691, educated at Rugby, went to London, where he became a printer, and afterwards held a place in the post-office. In 1731 he founded the *Gentleman's Magazine*, the forerunner of the many literary journals amid which it still exists. He died 10th January 1754.

Cave, William, an English divine, was born at Pickwell, Leicestershire, 30th December 1637. He studied at Cambridge, was appointed to the vicarage of Islington, Middlesex, in 1662, afterwards became chaplain to Charles II.; in 1679 was collated to the rectory of All Hallows the Great, and in 1684 was installed canon of Windsor. He died 4th August 1713. His chief works are *Primitive Christianity* (Lond. 1674); *Antiquitates Apostolicæ* (1676), a continuation of Jeremy Taylor's *Antiquitates Christianæ*; *Apostolici* (1677); and *Scriptorum Ecclesiasticorum Historia Literaria* (1688–98). The last of these—his most important work—was republished at Oxford, 1740–43.

Cav'eat is a law term signifying an intimation made to the proper officer to prevent any step being taken without warning to the person lodging the C., so that he may appear and object to it. In England, the term is specially applied to a process entered in the spiritual courts to restrain the institution of a clerk to a benefice, or to restrain probate of a will.

Cav'endish, Henry, the famous chemist and natural philosopher, was born at Nice, October 10, 1731. He was a son of Lord Charles Cavendish, and brother of the great-grandfather of the present Duke of Devonshire. He studied for four years at Cambridge, and then retired into great privacy, much to the dissatisfaction of all his relatives, except an uncle, who made C. heir to his large fortune. His tastes were always simple, his manners eccentric and very reserved; so much so, that he fixed his fine library at a distance from his house, so as not to be disturbed by visitors. The number of his papers in the *Philosophical Transactions* can give no idea of the immense services which he rendered to physical science. His investigations on carbonic acid gas, on hydrogen, nitrogen, and oxygen, and several of their compounds, form one of the greatest epochs in the progress of chemistry. His analytic and synthetic proofs of the composition of water would alone entitle him to a first place; while the perfection of his processes, the accuracy of his reasoning, and the soundness of his views, taken in connection with his important discoveries, show him to have been a true philosopher, worthy the name of the 'Newton of chemistry.' C. also wrote several papers on electricity, on astronomical instruments, and is further noted for his determination of the mean density of the

Earth (q. v.). He died February 24, 1810, leaving behind him a fortune of more than a million sterling. See Dalton's *Life of C.*, published by the Cavendish Society (Lond. 1854).

Cavendish, Thomas, one of the great navigators of the Elizabethan age, was born in Suffolk in 1560, and studied at the University of Cambridge. He first accompanied the expedition to Virginia, and soon after his return fitted out three ships in July 1586, to levy contributions on the Spaniards on the W. coast of America. After touching the coast of Patagonia, he rounded Cape Horn, sailed N. to California, where he captured a Spanish galleon loaded with treasure, and returned by the Cape of Good Hope to England, where he landed, 9th September 1588. His voyage is chiefly remarkable as being the shortest round the world that had up to that time been made. A second voyage was not so successful; his crew mutinied, and C. died of vexation in 1592, on the coast of Brazil. From him 'Cavendish' tobacco takes its name.

Cavendish, William, Duke of Newcastle, an enthusiastic Royalist, was the son of Sir Charles Cavendish, younger brother of the first Earl of Devonshire, and born 1592. Originally a favourite of James I., he was made Earl of Newcastle by Charles I., who intrusted him with the education of his son, afterwards Charles II. On the civil war breaking out, C. supported the royal cause in the N. with much spirit, and for a time with some success. After the battle of Marston Moor he retired to the Continent till the Restoration, when he was made a duke. He died December 25, 1676. C. wrote a book on the management of horses, and some plays and poems entirely void of merit. C.'s Life was written by his wife.—**Margaret C.**, Duchess of Newcastle, second wife of the above, and a daughter of Sir Charles Lucas, was born about 1592, married in 1645, and died in 1673. She is remarkable for writing nineteen plays and ten folio volumes in prose and verse, which, though praised at the time of publication, are now generally admitted to be utterly worthless. Among them are *The World's Olio*, *Nature's Picture*, *Orations of Divers Sorts*, *Philosophical Letters*, *Poems and Phancies*, and *Sociable Letters*.

Caves or **Cav'erns**, the name applied to hollow excavations in the earth or in the rocks of the earth's crust, and which have been formed either by art or nature. The physical agencies of most repute in forming C. are water generally and the sea. By the slow percolation and dripping of water on rocks of soft or dissolvable nature (*e.g.*, limestone), aided by *chemical action*, C. are hollowed out; and similarly by the eroding action of the sea-waves caverns on the sea-coasts are formed. In some cases, the rush of inland water towards the sea, and the force of the sea-waves from without, may together combine to form caverns. Inland C. sometimes afford valuable evidence to the geologist of the former sites and scenes of sea-action. The well-known Mammoth C. of Kentucky, which penetrate internally for miles in numerous branches, are examples of C. which have been formed by the solvent action of underground water on limestone rocks. These latter rocks, indeed, are those which most frequently are so eroded to form caverns. The oolitic limestone is in this way perforated in various parts of the world. In the nearly allied triassic rocks, many of which contain easily dissolvable materials, C. are also found; and the formations or lime-pillars known as *Stalactites* (q.v.) and *Stalagmites* (q.v.) found in limestone caverns are formed by the dripping of water containing calcareous salts, which, in the course of years, are deposited to form solid pillar-like structures. In igneous rocks (*e.g.*, Fingal's Cave, Staffa), C. are occasionally met with; and in lava formations (as in Iceland, &c.), they may also be formed. The interiors may be incrusted with calcareous matter, which is frequently coloured, or may be pure white, and may light up the C. with a brilliant lustre. C. afford valuable evidence to the palæontologist, from the fact that deposits of organic remains are frequently found in them. This fact depends, firstly, on their having been used as habitations by the animals (*e.g.*, Kirkdale Cave in Yorkshire); or secondly, animals may have accidentally fallen into and died in the C.; or thirdly, and more commonly, the rivers and streams flowing into the cavern, have swept into it, along with debris, the remains of animals, which, in either of these three cases, have become entombed amid the stalagmitic calcareous crust forming the floor of the cave. Thus, in the *Cave-deposits* of England, the remains of man, of hyænas, of bears, of the mammoth, rhinoceros, bison, hippopotamus, and many other genera of mammals now extinct or foreign to Britain, have been discovered.

Cav'iare (in the 16th c. *cavial*, from the Ital. *caviale*; perhaps from the Turk. *haviâr*; the Russian name is *ikra*), the roe of the sturgeon preserved by salting, and very highly esteemed in Russia as a food delicacy. A considerable trade exists in the article, the chief seat of which is at Astrakhan, on the Volga, and it brings a high price in Russian markets.

Cavicor'nia ('hollow horned'), the family or group of *Ruminant* mammalia, including the oxen (*Bovidæ*), sheep and goats (*Ovidæ*), and antelopes (*Antilopidæ*). The upper jaw in all is destitute of incisors and canine teeth, and the lower incisors bite against the hardened gum in the front of the upper jaw. The lower jaw has six incisors, two canines, and twelve molars; the latter separated by a wide interval from the canine teeth. Both sexes (as generally in sheep and goats), or the males only (as in some genera of antelopes), may possess horns. These horns, it is to be noted, are hollow structures, consisting each of a hollow sheath of horn surrounding a central bony core. They are not deciduous or shed, as in the *Cervidæ* or Deer (q. v.), but permanent. The feet are cleft, and provided with two accessory hoofs at the back.

Cavite, the capital of a province of the same name, in the island of Luzon, Philippines, on the Bay of Manilla, 10 miles S.S.W. of Manilla. It is the chief naval station of the Philippines, and has manufactures of cigars. Pop 7000. The *province* of C., which yields rice, indigo, sugar, and coffee, has a pop. of 57,000.

Cavor', or **Cavour'**, a town of N. Italy, province of Cuneo, on a feeder of the Po, in a marble and slate quarrying district, 24 miles S.S.W. of Turin. Pop. 7000, engaged in the manufacture of linen, silk twist, &c.

Ca'vo-Rilie'vo, an Italian compound, meaning 'hollow-relief,' and applied to a species of carving in which the highest surface of the object represented is on a level with the plane of the block, the rounded sides being cut into it. The stone carvers of ancient Egypt employed this style of art.

Cavour', Count Camilla Benso di, the greatest Italian statesman of modern times, was born of a noble Piedmontese family at Turin, August 1, 1810. He was educated originally for the army, but his liberal opinions in politics compelling him to withdraw from the public service, he devoted himself to agriculture. He paid a visit to England (1835), and the fruits of this visit were seen when he returned to public life in 1842, and both in the press and in the Chamber of Deputies opposed extreme Democratic opinions, while he advocated the adoption of a Liberal constitution for Sardinia. During a second visit to England in 1843, he carefully studied its agricultural, industrial, and politico-social condition. After the disastrous battle of Novara, C. was called to office, and filled in succession the offices of Minister of Agriculture and Commerce, Minister of Marine, and Minister of Finance. Finally he succeeded, in 1852, the Marquis d'Azeglio as Premier. From that period to his death, 6th June 1861, the history of Sardinia may be said to have been that of C. It was he who introduced free trade, and completed the remodelling of the Sardinian constitution upon that of England; who made his country of account in Europe by making it the ally of England and France in the Crimean war, and who conducted the war with Austria in 1859. With the exception perhaps of Garibaldi, none was so responsible as he for the events which led to King Victor Emanuel being made King of Italy. Although he did not live to see Venetia and Rome ceded to Italy, he must be considered the author of Italian unity. He has often been compared to Bismarck (q. v.), but the resemblance is superficial. Both, it is true, laboured with indefatigable energy and singular skill to secure the unity of their respective countries, but C. was always a moderate and constitutional Liberal, while the German statesman, though surcharged (latterly) with patriotic sentiment, has never even pretended to respect parliamentary institutions. Among the best works to consult for a proper idea of the great statesman are *Œuvres Parlementaires du Comte de C.*, by his secretary, M. Artom; *Lettres inédites du Comte de C.*, à M. M. Ratazzi (1862); and above all, *Le Comte de C., Recits et Souvenirs*, by De la Rive (Par. 1863).

Ca'vy, a name popularly applied to animals such as the Guinea-pig (*Cavia aperea*), Patagonian C. (*Dolichotis Patachonicus*), &c., included in the Rodent family *Cavidæ*, which is distinguished by the hairy nature of the body-covering and by the rudimentary tail. No clavicles are developed. The ears are short and the nails are hoof-like. The molars number four on each side of each jaw, and exhibit complicated foldings of their enamel. The common Guinea-pig is a true rodent, and comes from S. America, not from Africa, as its name would lead some to suppose. It is readily tamed, and very prolific. The colour varies, but usually consists of white, red, and black patches, differently disposed in different individuals. The Capybara (q. v.) is also included in this group, and the Agoutis (q. v.) form another genus (*Dasyprocta*) of the family.

Cawk, the term applied by miners to a massive, earthy-looking variety of the mineral sulphate of baryta, or heavy spar, which is very common in Derbyshire. See BARIUM.

Cawnpore', or **Khanpur**, the chief town in a district of the same name, N.W. Province, British India, on the right bank of the Ganges, at the junction of the Rohilkund and Oude Railway and the E. Indian line, 55 miles S.W. of Lucknow. It is of comparatively recent origin, but has many fine mosques and other public buildings, while its streets are rendered shady and picturesque by an abundance of trees. The cantonments here, which before the mutiny covered 6 miles of ground, are still among the largest in India. C. has considerable trade in rice, indigo, opium, oil-seeds, tobacco, &c. It is almost as cheap a place of residence as Calcutta. Pop. (1871) 113,601. C. formerly belonged to the Nawab of Oude, but became British in 1777. Here Nana Sahib brought about the massacre of 205 British women and children, June 15, 1857. The *district* of C., a rich alluvial flat stretching between the Ganges and Jumna, has an area of 2353 sq. miles, and a pop. (1871) of 1,155,439.

Caxamar'ca, a town of Peru, in a rich silver and iron mining district, at an elevation of some 9000 ft., 74 miles N.N.W. of Truxillo. Pop. 18,330, engaged chiefly in artificing silver and iron articles, and in manufacturing cotton and woollen cloths. In its neighbourhood are the hot *Baths of the Incas*. C. is celebrated in history as the scene of the treacherous capture of Atahualpa (q. v.) by the Spaniards. It gives the name to a department. Pop. (1862) 173,000.

Caxamarquill'a, a Peruvian town on the eastern slope of the Andes, in the department of Caxamarca, 65 miles E.S.E. of the town of Caxamarca.

Cax'ton, William, introducer of printing into England, was born about 1421, and became a mercer at London, and freeman of the Mercers' Company. In 1411 he journeyed to the Low Countries, and in 1464 was employed as 'ambassador and special deputy' by Edward IV. to frame a commercial treaty with the Duke of Burgundy. C. learned the art of printing in the Low Countries, and after a residence at the household of Margaret of Burgundy, brought it into England, probably in 1476. His press was set up in the almonry at Westminster, the first work from it being the *Game and Playe of the Chesse;* the second, *Dictes and Notable Wyse Sayenges of the Phylosophers*. These are printed in black letter. C. was busied in printing to the last day of his life, and sixty-four books were issued in twenty years. He died in 1491 or 1492. See Lewis's *Life of C.* (8vo, Lond. 1737); Knight's *William C., a Biography* (Lond. 1844); Ames's *Typographical Antiquities* (1810); and Blade's *Life and Typography of C.* (2 vols. Lond. 1861–63; new ed. revised, 1877.).

Cayenne', the capital of French Guiana, S. America, lies on an islet near the coast, and at the mouth of a small river, both of the same name. It is partly well built, and has a beautiful church and several other fine buildings. Its harbour is deep and commodious, and it has now all the commerce of the colony. The exports are cotton, coffee, cloves, maize, gums, &c. Pop. 5200. The climate of C. is hot and unhealthy.

Cayenne Pepper is the seeds of Capsicum (q. v.) reduced to powder.

Cay'man, or **Caiman**, a term popularly applied to *Alligators* (q. v.), but also given generally to the *Crocodilia* of S. America, which include species of true crocodiles, as well as of the first-mentioned. The *Alligator palpebrosus* of Surinam and Guiana sometimes receives the distinctive title of 'C.' This animal is remarkable for a circle of bony plates surrounding each eye like an eyebrow.

Cazall'a de la Sierr'a, a town of Spain, province of Seville, 36 miles N.E. of the city of Seville. The principal industry is the smelting of metals, the casting of cannon, and the manufacturing of machinery and agricultural implements. Tanning, weaving, and distilling are carried on, and marble is quarried in the neighbourhood. Pop. upwards of 6500.

Cazor'la, a city of Spain, province of Jaen (Andalusia), on the river Vega, 41 miles N.E. of Jaen; has a trade in fruits, grain, and cattle, and manufactures of leather, soap, bricks, wine, and oil. C. figured in the contests with the Moors in the 13th c. Pop. between 7000 and 8000.

Ceano'thus. See REDROOT.

Ceara', or **Ciara'**, a province on the N. coast of Brazil. Area, 50,260 sq. miles; pop. 550,000. It stretches up from the Atlantic in the form of an amphitheatre. The principal products are medicinal plants, balsams, gums, and resins; the minerals include gold, silver, iron, copper, lead, salt, saltpetre, alum-stone, and rock-crystal. The forests furnish exhaustless supplies of timber, and abound in game. The capital, also called C., is the oldest town in the province, lies on a bay between the promontory of Mararanguape in the N. and the tongue of land Mocoripe, and is sometimes named Port Mocoripe. It exports coffee, sugar, cotton, and has a pop. of 12,000.

Cebadill'a, or **Cevadill'a.** See SABADILLA.

Ce'bus, a typical genus of *Platyrhinæ* (q. v.) or S. American monkeys, forming the type of the family *Cebidæ*. In this group there are four incisors, two canines, six præmolars, and six molars in each jaw. No cheek-pouches or callosities exist, and the jaw may either be naked or possess whisker-like appendages. The tail is long, and for the most part prehensile. The thumbs, if present, are not opposable to the other fingers, which are all provided with flattened nails. Numerous species are included in this family, and in the typical genus *Cebus*. The Capuchins (q. v.), *C. apella*, and *C. capuchinus* or Sai, the horned sapajou (*C. fatuellus*), &c., are familiar genera. The genera *Callithrix, Mycetes, Ateles,* or popularly the Squirrel Monkeys (q. v.), Howlers (q. v.), and Spider Monkeys (q. v.), also belong to it.

Cecido'myia, a genus of *Diptera* or Flies, included in the family *Tipulidæ*, and exemplified by the *C. tritici* or 'Wheat-fly' (q. v.), and by the dreaded Hessian-fly (*C. destructor*) of the United States, which attack the wheat and corn crops respectively. The larvæ of the former attack the flower of the wheat and destroy the plant; the larvæ of the latter destroy the stem and root. *C. cerealis* destroys the barley crops, and is hence known as the 'barley midge.' This fly is of a reddish colour, has wings of greyish or silvery hue, long legs and antennæ, and downy wings, which lie horizontally when at rest.

Cec'il, William, Lord Burleigh or Burghley, described by a biographer as the boldest, the greatest, and the gravest statesman in Christendom, was born September 13, 1520, at Bourne, Lincolnshire, educated at St John's College, Cambridge (1535–40), and studied law at Gray's Inn, showing in the course of his studies great aptitude for learning, especially in law and theology. In the last year of Henry VIII.'s reign he held the place of *custos brevium* in the Court of Common Pleas; while in the reign of Edward VI. he secured, through his marriage with a daughter of Sir Anthony Cook, the patronage of the Protector Somerset, became privy councillor and state secretary (1550), and in the following year was knighted. In the last office he showed himself to be much in advance of his time by abolishing several stated monopolies, and endeavouring to make trade free. On the accession of Mary he resigned office, but escaped persecution. Under Elizabeth he obtained the highest honours of the state, and was till his death her trusted adviser, whom no favourite could overthrow. In 1571 he was created Baron Burleigh, and in 1572 was made Lord Treasurer, which office he held till he died, lamented by the mistress whom he had served with perfect fidelity, August 15, 1598. C. was admirably adapted for the post he filled, being a man of no strong passions or vices, devoid of anything like fanaticism, and although of robust sense, disposed to serve rather than to thwart Elizabeth. Macaulay has said of him with truth, that he was 'a moderate, cautious, flexible minister, skilled in the details of business, competent to advise, but not aspiring to command,' and that he 'belonged to the class of the Walpoles, the Pelhams, and the Liverpools, not to that of the St Johns, the Carterets, the Chathams, and the Cannings.' See Nares' *Memoirs of the Life and Administration of William C., Lord B.* (3 vols. Lond. 1828–32).—**Robert Cecil**, Earl of Salisbury, son of the preceding, was born about 1550. He was educated at St John's College, Cambridge, sat in Parliament for Westminster and the county of Hereford, and succeeded his father in the favour of Elizabeth. On her death he was continued in the offices he held by James I., with whom he had, before his mistress's death, been in secret correspondence; was made Earl of Salisbury in 1605, and on the death of Dorset, Lord Treasurer. C. was a sagacious and energetic statesman, free from meanness and petty dishonesty, although his conduct towards Essex and Raleigh shows him in an unfavourable light as cold and unscrupulous. He died May 24, 1612.

Cecil'ia, St, the patroness of music, according to the legend of her life, belonged to a distinguished Roman family, and suffered martyrdom in the reign of Alexander Severus, about A.D. 230. Shortly after her conversion to Christianity, her heathen parents compelled her to marry an unconverted Roman youth named Valerian, but she soon induced him, his brother Tiburtius, and an imperial officer named Maximus, to embrace the Christian faith. They were all arrested and condemned to death, the male converts suffering first, and C. three days afterwards. A church dedicated to her was built at Rome, in the Trastevere, or right bank of the Tiber. It is mentioned as early as the 5th c., and in it the bones of the saint were deposited in 821 A.D. by the orders of Pope Paschal. Musicians have assumed St C. as their patron, because she sang the praises of the Lord, and frequently joined instrumental with vocal music in public worship. Her festival, November 22, is celebrated in the Roman Catholic Church with grand musical performances. Carlo Dolce, Raphael, Rubens, Domenichino, and other artists have lent their genius to immortalise this saint, and her praises have been sung in English by Chaucer, Dryden, and Pope There was another St C., of African origin, who suffered about the year 304 A.D. during the persecution of Diocletian, and whose festival falls on the 11th of February.

Cecro'pia, a genus of trees of the natural order *Artocarpaceæ*, natives of tropical America. About twenty-five species have been described, all large-leaved, soft-wooded, milky-juiced trees *C. peltata*, the trumpet-tree of the W. Indies and S. America, so called because musical instruments are made out of its hollow branches by the Uaupé Indians of the Rio Uaupés, a tributary of the Rio Negro. Cordage is made out of the inner bark, and the old bark is used medicinally. The young buds serve as a potherb; the old leaves are eaten by the sloth, and a kind of caoutchouc is formed from the hardened milky juice. Of the light wood are made floats for fishing-nets, and razor strops. The Indians also use it, when dry, to produce fire by friction. (*Treas. of Bot.*)

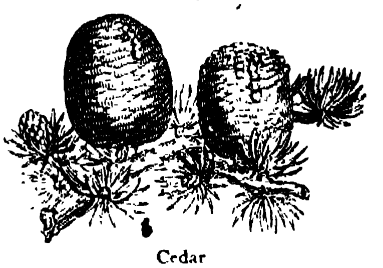
Ce'crops, the mythical hero of the Pelasgian race, and the first King of Attica, which from him was sometimes named Cecropia. The oldest myths make him autochthonous, and represent him as having introduced the elements of civilised life by the institution of marriage, the substitution of cakes instead of bloody sacrifices in the worship of Zeus, and the political division of Attica into twelve communities.

Ce'dar Bird. See WAX-WING.

Cedar Mountains, an extensive range in Clanwilliam, Cape Colony, from 1600 to 5700 feet high, runs between the Great Roggeveld and the coast, and takes name from the cedar-trees on its summit.—A mountain of the same name in America, near Cedar Run, in Virginia, was the scene of a Confederate victory gained by General 'Stonewall' Jackson over General Banks, August 9, 1862.

Cedar of Barbadoes (*Cedrela odorata*), one of the natural order *Cedrelaceæ* (q. v.), a native of the W. Indies and the warm regions of America. The wood is fragrant, and used for making canoes, shingles, cigar-boxes, black-lead pencils, &c. *Juniperus Barbadensis* is also called the *Barbadoes cedar*, while *C. odorata* is termed the *Bastard B. C.*, or *sweet-scented C.* The name *Bastard C.* is also given to *Guazuma almifolia.*

Cedar of Lebanon, a famous tree frequently referred to in the Scriptures, belonging to the order *Coniferæ.* It is the *Cedrus Libani* of modern botanists, and is by some considered identical with the deodar of India and the Mount Atlas cedar. Frequently it is put into the genus *Abies*. The cedars of L. consist of a grove containing about 400 trees, most of which may be from 200 to 800 years old. The height of some much exceeds the average of 50 feet, but their girth is more remarkable. Two of the trees held in great veneration by the Maronites, Greeks, and Armenians, are believed to be about 2000 years old.



Cedar

The C. of L. has been long ago introduced into our parks and grounds One at Sion House, near London, is 8 feet in diameter 3 feet above the ground.

The deodar of the Himalayas (*Cedrus Deodara*) is found at great elevations, and attains a height of 150 feet. The cedar of Algiers (*C. Atlantica*) is closely allied if not identical. The name *cedar* is given to a variety of trees which have no connection with the genus—*e.g.*, the cedar of N. W. America (see THUJA and LIBOCEDRUS); the Siberian cedar (see PINE); *Abies religiosa* of California (see FIR); the white cedar (see CYPRESS); the Virginian cedar (see JUNIPER), &c.; while the cedar-wood of Guiana is *Icica altissima* (natural order *Amyridaceæ*), and the cedar of the W. Indies (see CEDAR OF BARBADOES) belongs to the *Cedrelaceæ*, and the bastard cedar of India is one of the *Byttneriaceæ* (q. v.). The Honduras cedar is the *Cedrela odorata*; the Japan cedar, *Cryptomeria Japonica*; the cedar of N. S. Wales, *Cedrela australis*, the prickly cedar, *Cyathodes Oxycedrus*; the white cedar of Australia, *Melia australis*; and the white cedar of Dominica, *Bignonia Leucoxylon.*

Ce'drat. See CITRON.

Cedre'la, a genus of trees of the natural order *Cedrelaceæ*, natives of the tropical parts of Asia and America, producing fine timber. *C. odorata* is hollowed into canoes. *C. Toona* of India furnishes a timber like mahogany, but lighter. The bark is astringent, and used in fevers, dysentery, &c.; from the flowers a red dye is produced. *C. australis*, the red cedar of Australia (see CEDAR), is used for building houses, and is now getting scarce.

Cedrela'ceæ, a natural order of plants belonging to the division *Dicotyledons* (sub-div. *Thalamifloræ*), natives of tropical America, India, and Africa, though rare in the last of these countries. Most of them are fragrant, aromatic, and tonic. Mahogany (*Swietenia Mahagoni*, q. v.), Satin-wood (*Chloroxylon Swietenia*, q. v.), yellow-wood of N. S. Wales (*Oxleya xanthoxyla*), &c., belong to the order—in which, in all, there are nine genera and twenty-five species known. The barks of several are used as febrifuges in diarrhœa, &c.

Cef'alu ('on the headland;' anc. *Cephalœdium*), a seaport of Sicily, province of Palermo, 37 miles E.S.E. of the city of Palermo, on a headland stretching far into the sea. It has a cathedral, and the ruins of a castle built by the Saracens. Sea-fishing is actively prosecuted, but the harbour can accommodate only a few vessels. Pop. 10,790.

Cegl'ie, a town of Southern Italy, province of Terra d' Otranto, 22 miles W. of Brindisi, and 4 miles from the railway to that port. The staple trade is in grain and cattle. Pop. about 10,000.

Cehegin', a town of Spain, province of Murcia, 36 miles W.N.W. of the city of Murcia. It has manufactures of paper and cloth. Pop. about 10,000.

Ceil'ing (Fr. *ciel*, Lat. *cœlum*, 'the vault of the heavens,' 'the sky') is a name now restricted to the inner covering portion of any room, apartment, or hall. The ceilings of rooms in private houses are usually horizontal surfaces of plasterwork, relieved only by a surrounding cornice of moulded or cast plasterwork. In apartments of large dimensions, and in public halls, the ceilings may be either horizontal, 'coved,' that is, rising from the walls with a curve, or vaulted. When a coved roof is used, the height of the cove varies from one fifth to one-third of the whole height, according to the proportions of the apartment. All such ceilings, of whatever form, should be divided into panels, the main divisions of which represent the principal timbers of the roof. Such panelling affords a basis for a great variety of rich and effective ornamentation, either with decorative guilloches or frets, or by the application of colour, &c. In domed or vaulted ceilings, the panels of course decrease in size as they approach the centre of the vault. Ceilings of wood, framed and panelled, and often richly moulded, carved, and otherwise decorated, are also frequently found. Timber-groined ceilings exist in the choir and Lady Chapel at St Albans, in the cloisters at Lincoln and Gloucester, in the towers at Exeter, in the lantern at Peterborough and at Ely, and in the choir at Winchester, while the entire roof of York Minster is so finished. A fine example of an enriched timber roof exists in the Parliament House, Edinburgh.

Cel'andine (*Chelidonium*), a genus of plants of the Poppy order (*Papaveraceæ*). *C. majus* is a common wayside plant in many parts of Britain and the continent of Europe. Its yellow milky juice has been applied as a cure for warts, and mixed with milk for the cure of opacities of the cornea of the eye. It is also a drastic purgative, and poisonous in large doses. Its other uses are doubtful.' The 'lesser C.' is *Ficaria ranunculoides*, while the 'tree C.' is *Bocconia frutescens*.

Cela'no Lagodi. See FUCINO LAGODI.

Celas'trus and **Celastra'ceæ.** See SPINDLE-TREE.

Cel'ebes, an island of Malaysia in the Indian Archipelago, E. of Borneo, from which it is separated by the Strait of Macassar. It is of very irregular form, branching into four peninsulas, two to the E. and two to the S., separated by three deep gulfs. In the centre and N. are high mountains, some nearly 7500 feet in height, and several active volcanoes. The principal rock is a crumbling basalt, in many places covered with a layer of earth from 10 to 20 feet thick, of extraordinary fertility, producing heavy crops of rice, maize, coffee, and cacao. The sago and cocoa-palm abound, as well as ebony and other useful timber trees. There are rich pastures, supporting numerous herds of buffaloes, horses, goats, sheep, and game is abundant. The minerals are gold, copper, iron, tin, and coal in the S. The sea produces fish, turtles, and pearls. The climate is hot, but tempered by regular sea-breezes and winds from the N. C. exports cotton, edible birds'-nests, wax, tortoise-shell, pearls, sago, cassava, coffee, cacao, Muscat nuts, &c. The Portuguese first visited C. in the 16th c., but were expelled by the Dutch in 1663, who have held it ever since, except between 1811 and 1816, when it was in the hands of the British. The Dutch possessions now occupy an area of 45,700 sq. miles, with a pop. (1872) of 349,756. The entire pop. has been estimated at from two to three millions, but is probably much less. The Malays carry on the commerce of the coast; the natives of the interior (Alfures) form numerous independent states. C. is properly the name only of the E. part of the island; the S.W. part is called Macassar, which has a capital of the same name, the residence of the Dutch governor. See MACASSAR.

Cel'ery (*Apium*), a genus of plants of the natural order *Umbelliferæ*. The wild C., or smallage (*A. graveolens*), is a plant chiefly found near the sea-shore, and in other saline situations, in ditches, brooks, &c. It has been long cultivated for the sake of its root and the thick leaf-stalks, which, when blanched by being covered with earth, are eaten. They act as a stimulant of the urinary organs. *A. australe* grows in the Cape of Good Hope, and is almost as good as our cultivated plant.

Cel'estine (Lat. *cœlum*, 'the sky'), the native sulphate of strontia, occurring crystallised according to the trimetric system, but more usually massive, columnar, fibrous, or stellated. It is colourless, white, or grey, often tinged with blue, more or less deep—hence the name. It is found in considerable quantity near Bristol, where it is employed for making nitrate of strontia, which is used for producing the 'red-fire' of pyrotechnic displays.

Celestines, a monastic order founded about 1264 by Pietro da Morrone, who became Pope in 1294 as Celestine V., after which the members took the name of C. They adopted the rule of St Benedict, and devoted themselves to religious meditation. Pope Gregory granted the order many privileges, and it became very rich, especially in France and Italy. But the secularisation of its property in the former country in 1776-78 by order of Pope Pius VI., and in Naples a few years later by King Ferdinand IV., has led to the almost complete extinction of the order.

Cel'ibacy (from the Lat. *cœlebs*, 'unmarried'). The origin of the practice of continence on the part of the priesthood lies in the dualistic notion of the essential impurity of matter, and the supposed necessity thence arising for crucifying the flesh for the sake of greater purity and spirituality of mind, combined with the desire to separate the sacerdotal order from the rest of society, and to raise the clergy to a seemingly higher level than ordinary men. Among the ancient Egyptians the priesthood were obliged to preserve the most rigid chastity; the priestesses of Vesta, Juno, Diana, Minerva, &c., were pledged to perpetual virginity; and the priests of Cybele had to be eunuchs. On this principle, that woman is sensuality, that generation, conception, and birth are a defilement of the soul, many of the early heretical sects forbade marriage both to their priests and adherents, or at least denounced a second or third marriage as fornication.

In the Catholic Church, during the first three centuries, the marriage of the clergy was permitted. Still those were regarded as more holy and excellent who lived in C., because those who were married were more exposed to the assaults of evil spirits. In order to conform to this idea, many of the clergy at this time kept as concubines females who had vowed perpetual chastity, with whom, they asserted, they had no sexual intercourse. At the Council of Elliberis (Elvira) in Spain (305), continence was enjoined on the clergy of the first three grades after their ordination. At the Council of Neocæsarea (314) it was enacted—'If a presbyter marry, let him be removed from his order.'

Hitherto the usage had been that those married previously to ordination were not required to separate from their wives; an attempt made at the Council of Nice (325) to make this also a part of the law was baulked at this time. It was done, however, by a decretal of Pope Siricius (385), Jovinian, a Milanese monk, striving in vain to stem the tide of authority and popular sentiment. The decretal of Siricius, not being generally received as of binding authority, was reimposed by Pope Gregory VII.; but the law as it now stood (that a priest could not marry after ordination, and had to put away his wife if he were married before), being systematically evaded or openly resisted, so far from being effectual, only tended to increase the existing moral corruption; and the profligacy of the clergy, which must have been in great measure due to this unnatural law, was one of the chief causes of the Reformation.

When at the Reformation the Protestants all declared against C., the subject was discussed in the Romish Church at the Council of Trent, and the majority decided in favour of it. According to the canons of the Romish Church, therefore, the two sacraments of Matrimony and Holy Orders so exclude each other, that he who receives the one must, as a general rule, renounce the other. The provisions regarding it are, that the four lower orders of the clergy are permitted to quit the profession and marry, but from subdeacon upwards they cannot do so without permission from the Pope. See Neander's *Kirchengesch.*

Cell (Animal). However varied in structure the different tissues of the animal body may be, it is now a recognised fact that all originate from a primary element termed a *C.* This important generalisation was first made regarding animal textures by Schwann, who followed quickly in the footsteps of the eminent botanist Schleiden, who first made the discovery that vegetable textures were derived from a primary C. The discovery was the commencement of the celebrated C.-doctrine—namely, that all structures originated in cells—and it must be regarded as the greatest ever made by the microscope.

According to the conception of Schleiden and Schwann, a C. may be defined as a microscopic globular body, consisting of an envelope termed the *C.-wall*, which encloses *contents*, in which lies embedded a minute body called a *nucleus*, in which, in turn, there may be a still smaller particle known as a *nucleolus*. Since the days of these distinguished observers, however, the definition of a C. has become modified, as histological investigations revealed the existence of structures having certain of the properties of cells, without necessarily being possessed of wall, nucleus, or nucleolus. Schultze, Brücke, and Lionel Beale described cells which have no C.-wall. Max Schultze further described minute jelly-like particles of living matter, which, though they possessed neither C.-wall nor nucleus, still lived and multiplied. Thus a C., in the language of modern histology, may consist only of a small mass of contractile protoplasm. It is evident that an entirely new meaning has been given to the word C., and in one sense, the C. theory of Schleiden and Schwann has been abandoned, inasmuch as structures are now termed *cells* which do not fall within the definition they gave of that structure.

Size of Cells.—They may vary in size from the $\frac{1}{3000}$th of an inch to the $\frac{1}{100}$th of an inch. The smallest cells are probably the coloured blood corpuscles; the largest is the ovum, which is the parent of all the other cells.

Form of Cells.—The primary C. is spherical; but this form varies according to the degree and direction of compression, and the amount of room for expansion. Two well-marked varieties are found: (1) flattened, scale-like forms, such as pavement epithelium; and (2) elongated, narrow cells, such as columnar epithelial cells, involuntary muscular fibre cells, and certain nerve cells.

Composition of Cells.—Actively growing cells consist of an unstable albuminous compound, possessing frequently the property of contractility, and termed *protoplasm, bioplasm, cytoplasm*, or *sarcode*. Sometimes this substance is replaced by different kinds of matter, such as by a hard substance termed *keratine*, as in old epidermic cells, or by globules of oil, or by pigments, or, finally, by crystals.

The C.-Wall.—Sometimes, as already stated, there is no C.-wall. When it does exist, it is usually very thin, structureless, and without openings or pores which can be seen with the highest magnifying powers. The C.-wall is smooth or granular, or presents irregular elevations and depressions on the surface.

The Nucleus.—This structure is not soluble in acetic acid, and thus differs from the C.-contents and the C.-wall. It is quickly stained by colouring matters. The nucleus is smooth or granular on the surface. The nucleolus is a still smaller body, also not affected by acetic acid. It is supposed by some to consist of a globule of fat or oil.

Vital Properties of Cells.—Cells have the power of absorbing matter from the fluid or pabulum in which they exist, and of converting this matter into protoplasm, or into substances which are stored up in the interior of the C. They also appear to have the power of excreting materials which are either not necessary to the life of the C., or which may be injurious to it. Lastly, many of them have the property of contractility—that is, they may change their form. As an example of contractile cells, none can be examined more readily than the colourless cells of the blood. These movements are termed amœboid, from their resemblance to those of a minute microscopic aquatic organism known as the *amœba*. By means of these movements, the C. can take into its substance small solid particles which may afterwards be digested or dissolved; and, as was discovered some years ago by Von Recklinghausen, these amœboid cells can pass bodily through the interstices of living parts. (See INFLAMMATION.) Certain cells have contractile appendages attached to them termed *cilia* (see CILIA); while a third class appear to resemble a nucleus, having attached to it a long contractile filament, by the movements of which the body is propelled through the fluid. This phenomenon is seen in the spermatozoon. See SPERMATOZOA.

Multiplication of Cells.—Cells may multiply either (1) *indogenously*, C. arising within C.; (2) *exogenously*, by the C.-wall bursting, and new cells originating in the extruded contents; (3) *fissiparously*, by fission or division; and (4) *gemmiferously*, by a process of budding.

Classification of Cells.—The classification of C. adopted by Professor Hughes Bennett commends itself for its simplicity. It is as follows:—

I. *Normal Isolated Cells*, which never proceed beyond the C. form.

1. Lymph corpuscles.
2. Chyle corpuscles.
3. Blood corpuscles.
4. Nerve cells.
5. Fat cells.
6. Pigment cells.
7. Gland cells.

II. *Transitional Cells*, which may become so altered and arranged as to form a tissue.

1. Embryonic cells.
2. Fibre cells.
3. Epithelial cells.
4. Cartilage cells.

III. *Morbid Cells*, or those which are commonly found in diseased conditions.

1. Plastic cells.
2. Pus cells.
3. Granule cells.
4. Cancer cells.
5. Tubercle corpuscles.

Conditions of C.-Life.—The conditions favourable for C.-development are—(1) They must be in a nutritive fluid or *blastema*, from which they derive nourishment. (2) A moderate temperature—C.-life does not exist below zero or above 145° F. As a rule, cold checks while warmth encourages C.-growth. (3) They must have room for expansion, and (4) the C. must itself be in a healthy condition. If the C. becomes filled with fat or mineral matter, or if the C.-wall becomes so thickened by deposits as to prevent fluid matter from reaching the C.-contents, the structure ceases to grow.

Theories of C.-Development.—Various theories have been put forward to account for the origin of cells. In chronological order, the following are the chief of these:

1. *The Theory of Schleiden and Schwann*, 1839.—These observers stated that cells originated in an amorphous fluid or blastema, which was derived from pre-existing cells. The nucleus was first formed, and around it a C.-wall was slowly developed. The C.-contents then collected between the C.-wall and the nucleus.

The Theory of Goodsir, 1845.—This distinguished anatomist and physiologist was impressed with the physiological importance of the nucleus. The nuclei he termed *centres of nutrition* or *centres of germination*, and he supposed that such a centre exercised an influence over an area in its vicinity. He held that the nucleus was the primary and important element.

The Theory of Huxley, 1853.—He attaches importance not to the nucleus but to the C.-contents. In a homogeneous plasma, spaces or vacuoles are formed, and in these are found C.-walls, contents, and nucleus. The wall of the space he terms *periplast*, and the included matter, or nucleus and contents, *endoplast*; and he holds that all important changes occur in the periplast. Thus his theory is almost the reverse of that of Goodsir.

The Theory of Hughes Bennett, 1855.—This physiologist was almost alone in asserting that the primary organic element is not the C. as a whole, nor any part of the C. specially, but the individual molecules of which the C. is formed. Bennett's view is therefore generally known as the *molecular theory*. He held that cells may originate *de novo*, without the agency of pre-existing cells. Molecules group together to form a nucleus, and round this a C.-wall is formed, as Schleiden and Schwann described.

The Theory of Beale, 1861.—He holds that living tissues consist always of two portions—one living, active, and germinating, which he terms *germinal matter*, and the other dead, passive, and inert, except as regards chemical or physical changes, to which he gives the name of *formed material*. He states also that an ammoniacal solution of carmine stains deeply the germinal matter without affecting the formed material, and thus he differentiates between the two. The germinal matter of Beale is simply the nucleus, with which all histologists are acquainted, but the peculiarity of his theory is that all outside the nucleus is regarded by him as formed and dead. There is no proof at the present time that contractility of muscle is a purely physical act, and yet this phenomenon occurs in the formed material which Beale regards as dead. At the same time there can be no doubt that the matter, which is alive in the sense of taking up new pabulum from the blood, and elaborating this into muscle, is the protoplasmic matter called the nucleus. This may be conceded without asserting that all outside of the nucleus is dead.

None of these theories are to be regarded as final. New discoveries may lead to change of view, but in the present state of science, biologists incline to the opinion that the primitive material is the living protoplasm or jelly-like matter, which, though derived from pre-existing protoplasm like itself, is capable of growth, assimilation, and also of modification into cells and all other tissues.

Cell (in botany), the more or less rounded, minute, bladder-like organs, of which a great portion of the plant is made up, and which, in the early condition of all plants, constitute the whole structure. These are of various shapes and sizes, but primarily consist of a wall of Cellulose (q. v.) lined by the premodial utricle, and containing in the interior a slimy fluid called Protoplasm (q. v.) and the nucleus (a minute more condensed portion of protoplasm), in addition to oils, sugars, acids, and the various other substances which give character to the plant or can be extracted from it, starch grains, Chlorophyl (q. v.), and frequently Raphides (q. v.), or crystals. Wood fibres and Vessels (q. v.) are only modifications of cells. Some plants, like the Red-Snow Plant (q. v.), consist of a single C. only, but which can perform all the functions of vegetable life. All cryptogamic plants, except ferns and other allies, are made up entirely of cells. The Pollen Grains (q. v.) are also cells. From its importance in plant life, the C. has been made the subject of most elaborate research, especially by German botanists, and a multiplicity of names applied by Nageli and others to the different parts, particularly of the C.-wall, which are only doubtfully useful to science, and in a popular work do not require to be mentioned.

Cell'e, a growing town of Prussia, province of Hanover, on the Aller, 15 miles N.E. of Hanover, with which it is connected by railway. It has a fine antique castle, the residence of the Princes of Brunswick-Luneburg, 1369–1705. Its old town-church contains the tombs of the family, as also that of Queen Caroline Matilda of Denmark, who died here 1775. C. does an active river trade with Bremen, chiefly in wool, timber, wax, and tobacco. It has important manufactures of waxcloth, soap, paper, printing-ink, paperhangings, cigars, &c. Pop. (1872) 16,126, of whom 671 were soldiers. In the beautiful neighbourhood there are several large suburbs. C. is the birthplace of the great agriculturist Thær, and of the poet Ernst Schulze.

Celli'ni, Benvenuto, a versatile and erratic Italian genius, sculptor, engraver, chaser, gold-worker, engineer, musician, and author, was born in Florence, 1500, studied music for some years, established himself with a gold-worker in 1515, but being implicated in an affray, he left Florence and travelled to Rome He returned to Florence, but engaging in another affray, was obliged a second time to fly to Rome, where Pope Clement VII. engaged him in the double capacity of artist and musician. He also found him useful as a soldier; for at the siege of Rome (1527) C. was the lucky marksman who shot down the Constable Bourbon, the besieging general, a service which, on his own authority, he also performed for the Prince of Orange when that general subsequently laid siege to the Castle of St Angelo. After a roving, fighting life, in which, however, he executed many splendid works, and won the friendship of the nobles to whom he had recourse whenever his customary free handling of the sword got him into difficulties, and after a lawsuit in which C., vexed with 'the law's delay,' effectually simplified matters and brought the cause to an end by taking again to the sword, ridding himself of his adversaries in the manner with which he was most familiar, he died at Florence, 25th February 1571. His bronze group of 'Perseus with the Head of Medusa,' at Florence, and his numerous portraits, attest his skill in high art; though his fame more securely rests upon the richness and beauty of the work in his cups, salvers, sword and dagger hilts, clasps, medals, and coins. His autobiography, which he commenced to write in 1558, is one of the most curious and valuable of biographies, as giving at once the personal details of an important career, and reflecting the morals and social life of Italy and France in the middle of the 16th c. The best edition of this work, entitled *Vita di B. C., da lui medesimo scritta*, &c., is by Tassi (Flor. 1829). In the beginning of 1876 a number of C.'s original papers, comprising inventories and accounts of sculptures executed by him at Florence, Fontainebleau, &c., were discovered in the monastery of the Campomazzo, and are to be published at Rome.

Cellular'es, a term sometimes applied to those cryptogamic plants which, like most fungi, lichens, and algæ, are altogether made up of cellular tissue, without fibres or vessels.

Cellular Tissue. This is the tissue found underneath the skin, and in the interstices of the structure of organs. It is usually known as *areolar tissue.* See AREOLAR TISSUE.

Cellular Tissue or Parenchyma (in botany).—Cells increase either (1) by the original cell dividing in two by *merismatic multiplication*, as it is called; (2) by the middle cell producing others in its interior; or (3) by gemmation or budding.

In one or in all of these ways, acting at once C. T., or the collection of cells in union with each other, is produced. By pressure the original more or less rounded form is altered, until the cells become, in most cases, more or less angular; in other cases, oblong or square. Various names have accordingly been applied to such C. T. according to the shape of the cells entering into its composition. But these names being practically unnecessary, do not call for repetition. The fluid passes from C. T. by Endosmose and Exosmose (q. v.), and in this tissue the whole life of the plant goes on.

Cell'ulose is the material composing the walls of the cells and vessels of plants. Linen, unsized paper, and cotton wool consist of C. in an almost pure condition. A substance closely resembling C., and by many supposed to be identical with it, is found in the tissues of certain marine animals belonging to the order *Tunicata*, and is called *tunicine*. C. is composed of carbon, hydrogen, and oxygen in exactly the same proportions as in starch, the formula by which the composition of both these substances is represented being $C_6H_{10}O_5$. C. differs from starch, however, in many important properties. It is white, tasteless, and odourless, insoluble in water, alcohol, ether, &c., but soluble in a solution of sulphate of copper to which excess of ammonia has been added. C. is coloured yellow by iodine, whereas starch is coloured blue by the same reagent. C. is dissolved in concentrated sulphuric acid, but if water be added to this solution, a substance is precipitated in white flocks (amyloid), which gives the same reaction with iodine as does starch. Paper soaked for a few moments in a mixture of two parts of oil of vitriol and one of water has its surface covered by a thin layer of amyloid, which causes it to be very tough and impervious to liquid: paper thus prepared is called Vegetable Parchment (q. v.). C. may be converted into glucose or grape-sugar by dissolving it in oil of vitriol, allowing the solution thus obtained to remain for some time undisturbed, then diluting with much water, and boiling. In this operation the C. is first converted into Dextrine (q. v.), and the latter by boiling with the dilute acid takes up water to form glucose.

$$\underbrace{C6H_{10}O_5}_{\text{Dextrine.}} + \underbrace{H_2O}_{\text{Water.}} = \underbrace{C6H_{12}O6}_{\text{Glucose.}}$$

The action of concentrated nitric acid, or of a mixture of that reagent with oil of vitriol, on C., gives rise to interesting derivatives possessing highly explosive properties. See GUN COTTON.

Cel'sius, the name of a Swedish family, several members of which have attained celebrity. Among these may be reckoned: 1. **Magnus C.**, born 16th January 1621, in Helsingland, died Professor of Astronomy, 5th May 1679. He is the discoverer of the Helsing runes.—2. **Olof C.**, his son, born 1670, died 1756, was Professor of Theology, and Provost of the Cathedral at Upsala. He was a great student of botany and Oriental languages, of which his *Hierobotanicon* (Ups. 1745–47) is evidence, and was the first to recognise the genius of Linnæus, whom he liberally aided.—3. **Anders C**, nephew of the latter, and the most distinguished of the family, was born 27th November 1701, at Upsala, where he became Professor of Astronomy in 1730, and died 25th April 1744. His chief works are *Nova Methodus Distantiam Solis a Terra Determinandi* (1730), and *De Observationibus pro Figura Telluris Determinanda in Gallia Habitis* (1738); but he is best known as the constructor of the centigrade thermometer.—4. **Olof von C.**, son of the Cathedral Provost, born 1716, became Professor of History at Upsala, 1747, was raised to the rank of a noble in 1756, made Bishop of Lund in 1777, and died in 1794. He founded (1742) the first literary society in Sweden, *Tidningar-om de Lärdas arbeten*, and wrote a *Svea-rikes Kyrko-Historia* (Stockh. 1767), besides histories of Gustavus I. (2 vols. 1746-53) and of Eric XIV. (1774).

Cel'sus, an Epicurean philosopher under the Antonines. Origen, in his answer *Contra Celsum*, calls him the author of an attack on Christianity entitled *Logos Alethes* ('The True Account'); but Neander thinks this a mistake. C. was the first to call in question the Mosaic authorship of the Pentateuch, and asserted that Christianity was irreligious and immoral, because founded on an anthropopathic idea of God, and that the disciples of Christ had craftily given currency to an exaggerated picture of the life of a good man.

Celsus, Aulus Cornelius, a celebrated Roman physician who flourished in the reign of Tiberius. Of the various works which he composed on philosophy, rhetoric, agriculture, military art, and medicine, there have only come down to us the eight books of his *De Medicinâ*, of which there have been several good modern editions, as that of Targa (Pad 1769) and of Daremberg (Leips. 1859). Kissel, in his *Monograph on C.* (Giess. 1844), has also made a collection of the fragments of his other writings. An English translation was published by Grieve (1756).

Celt (Gael. *celtis*, 'a chisel') is the name given to one of the most ancient and primitive forms of tool or weapon used by the human race. The C. has an axe or wedge form, and was used with a handle probably much in the same manner that the axe is employed at the present day. The most ancient examples, of which large numbers are found in the tumuli, lake-dwellings, kitchen-middens, and cave-dwellings of the earliest members of the human family, were only roughly fashioned in hard stones of various kinds. The stones used for C.-making were selected with great care and skill, toughness and capacity to take a fine edge being chiefly regarded, these properties being found in flint, felstone, and basalt, which were all employed. It is remarkable that although no deposits of jade are known to exist or to have ever existed in Europe, celts of that mineral are by no means rare; and it is assumed the material must have originally been obtained from the E. of Asia. As we approach the period now known as the Bronze Age, stone celts gradually become finer in shape, more elaborately finished, and even polished, and there is no doubt that they continued to be used long after the casting of weapons in bronze was understood and practised. Many of the early metallic celts are composed of almost pure copper, which is not so hard as the bronze more commonly employed. Numerous remains of the moulds in which celts were cast have been found, and the forms they assumed were very numerous. They varied in size from an inch to about a foot, and were in some cases ornamented with ridges, dots, or lines. Bronze celts are divided into three classes according to the manner in which the weapon is attached to the shaft. In the first type, which is supposed to be the most primitive, the tapering end of the weapon is made to pass through the shaft; in the second form, the handle is bent, and two tangs projecting from the C. fit on the bent portion and are lashed to it; and in the third the end of a bent handle passes into a hollow part at the back of the weapon. The use of stone weapons of this form appears to have been universal among the primitive savage races of mankind, and they are yet found among many uncivilised tribes.

Celtibe'ri, a brave and powerful people of Hispania, who occupied the great plateau now known as Old and New Castile. They are believed to have been (as their name implies) a mixed race formed by an amalgamation of the primitive Iberian stock of the Peninsula, which was probably non-Aryan, with the earliest Celtic invaders. According to Strabo, they were divided into four tribes. The stubborn resistance of the C. to the Roman arms is the most heroic episode in ancient Spanish history, and the capture of their capital, Numantia, by the younger Scipio (B.C. 146) was only achieved after hunger had reduced the citizens to the last extremities.

Celtic Nations, The. Herodotus (B.C. 450) speaks of a people whom he calls *Keltai*, 'who, next to the *Kynetæ*, were the most western population of Europe;' and he further mentions them as mingling with the Iberians, who dwelt around the river Ebro in Spain. This is the first notice we have of the *Keltai*, as they continued to be called by Greek writers. The Romans generally called them Galli; a very numerous branch of themselves took the name of Gäel, which they retain to the present day. *Kel* or *Gal* appears then to be the root of this name; but no probable explanation of its meaning has hitherto been reached. It is not known to what language it belongs, nor whether it was a name adopted by the race themselves or imposed by strangers. That the Celts are a branch of the great Aryan or Indo-European family of nations is placed beyond all doubt by their language, which bears close resemblance, alike in grammatical structure and vocables, to Sanskrit, Greek, Latin, Teutonic, &c. Further, they were the first of the Aryan races to leave the great common cradle in the E. for Europe. They were driven onwards and sideways by succeeding waves of Teutons, Slavonians, and others; but we have no means of forming even an approximate guess of the period at which any of these movements took place. The Celts were the first Aryan settlers in Europe, and it seems probable that they found portions of it waste and unoccupied. It is at the same time maintained by many ethnologists that, in Spain, in the French Pyrenees, and in Britain, they found before them a Turanian people, the remains of whom are still to be seen in the Lapps and the Finns of the N., and in the Basques (see BASQUE PROVINCES) or Euskarians of Spain and Portugal. It is evident that, at the very dawn of history, these two races were contemporaneous occupants of Spain, and of some other places in Europe, but it is difficult to determine which of them was the first in possession. When we enter on the historic period, we find ample proof that the Celts ruled in Britain and in Ireland, in France, Belgium, Switzerland, the N. of Italy, and various portions of the S. of Germany. They had settlements in other quarters of Europe—in the S. of Italy, in Spain, Portugal, and elsewhere; but it is impossible to determine the exact extent of their possessions, or to ascertain whether in these cases they were temporary intruders or permanent settlers.

We see the C. N. thus widespread in Western Europe, and for a long period holding their own against Romans, Teutons, and all their neighbours. More than this, they often carried terror and devastation into their enemies' territories. In B.C. 398, Brennus, king of the Cis-Alpine Gauls, plundered the city of Rome, and burned much of it to the ground. About a hundred years later, three Gallic tribes, passing the Alps, took possession of Illyria for a time, invaded Greece, plundered the temple of Delphi, overran Thrace, and crossing the Bosphorus, made extensive conquests in Asia Minor, finally settling in the region, to which they gave their own name of *Gal*atia, or *Gallo*-Græcia. Here they retained their own language and their distinctive character down to the 5th c. of the Christian era, after which we lose all separate trace of them.*

In the 2d and 3d centuries B.C., the Celts possessed very extensive power in the W. and S.W. of Europe. Before this period they had yielded in many instances to the encroachments of the Teutonic tribes; but it was the resistless and ever-growing power of Rome before which they were fated to go down. Galatia was made a Roman province in the reign of Augustus. Long before this time Cis-Alpine Gaul had been incorporated with Italy, and the final blow was given by Cæsar (50 B.C.) in the conquest of Gaul, including Helvetia and Gallia Belgica. He invaded Britain twice over, but met with such resistance as prevented him from making any permanent settlement in the island. A hundred and thirty years later the whole southern portion of the kingdom was subdued by the Roman general Agricola. The northern parts of Scotland, however, maintained an unceasing warfare with their great enemies, and retained their independence, being the only country attacked by the Romans which was able to make that boast; though it cannot be denied that the remoteness of the region and the poverty of the soil contributed to this result no less than the valour of the natives. Ireland was never invaded, and for hundreds of years after this remained in the undisturbed and prosperous possession of its native Gael.

We must now glance for a moment at the different effects, in regard to a distinct ethnological existence, which these conquests produced on the Celts in the different parts wherein they resided. In Asia Minor, as well as in the S. of Germany, they became absorbed in the surrounding population, and speedily lost their language, as well as every characteristic of a distinct race. In France, where we know the immense majority of them were allowed to retain possession of the soil, they for a time adopted the language of their Roman conquerors; but when the northern invaders—Franks, Allemanni, &c.—in their turn seized the country, the provincial Latin, mixed with their ruder tongues, produced modern French. The N. of France alone, known as Armorica or Brittany (see BRETAGNE), clung to its old Celtic speech, and there it is spoken to this day by a population numbering more than a million. In Britain the Romans never attempted to extirpate the original inhabitants more than they did in other conquered countries; and the heathen English, fierce as they were, do not seem to have in this respect differed from their predecessors. They took possession of the fairest and best portions of the country, apparently retaining the old population as their subjects, or driving into remote corners of the land those who refused to serve them. There are traces of the Celtic language having been spoken in Herefordshire in the reign of Henry II., in Devonshire down to the time of Elizabeth, while in Cornwall it continued to be the language of the inhabitants until the latter part of the last century. In the Principality of Wales, subdued by England in the reign of Edward I., it is still spoken by hundreds of thousands, preached in hundreds of churches, and written in newspapers, as well as in literary periodicals. In the Isle of Man, also, it was till recently the almost universal language of the people, and is still spoken. In Scotland, Celtic continued to be the language of the kingdom down to the reign of Malcolm Canmore in the 11th c. After his marriage with the English princess Margaret, English gradually became the language of the court. The sons of Margaret, viz., Edgar, David I., Alexander I., and, in truth, all the subsequent rulers of Scotland, were anti-Celtic in their policy; and so English continued to advance from its basis in Lothian, until now it is spoken by all the inhabitants of Scotland, except about 300,000 in the W. and N.W. Highlands, who still cling to the old Gaelic. In Ireland, which was invaded by England in the 12th c., and finally subjugated in the 16th, though the Gaelic has been, from the beginning of the English invasion, denounced and discountenanced in every way, it is still dearly cherished by fully three millions of the people, who speak no other tongue; and in the British colonies, as well as in the States of America, it is spoken by thousands whose ancestors dwelt in Wales, in the Highlands of Scotland, or in Ireland.

---

* It may be well to say that this account of the *Gal*-atians is confirmed by such ethnologists as Niebuhr, Rawlinson, and above all, by the great authority in Celtic matters Zeuss, as also by such theologians as Conybeare and Dean Lightfoot.

The Celtic race has hitherto, for convenience' sake, been spoken of as one. But it is necessary to state that at an early date it was divided into two leading branches, speaking dialects differing widely from each other, probably as widely as the modern English differs from modern German, yet so nearly allied as to prove that those using them belonged, beyond doubt, to the same stock. The one is known as Gaelic, and is still spoken, with variations which warrant three subdivisions, in Ireland, in the Scottish Highlands, and in the Isle of Man. The other, known as the Cymric, is spoken in Wales and in Brittany, and was the language of Cornwall. This is also subdivided into British, Armoric, and Cornish.

History gives us no information as to the period when the Gael and the Cymri separated from one another, nor of their conduct towards each other after separation; but a careful study of the topographical names of the various countries which they occupied reveals several interesting facts concerning them, though these are only of a relative, not of an absolute character: and here the names of rivers, being more permanent than those of cities, or even of other natural features of a country, afford us the most trustworthy information.

It appears, then, from the researches of Diefenbach, Keferstein, Mone, Duncken and others, that the Gaelic branch was the most numerous people in ancient Germany, and the original settlers in the greater part of it, displacing no preceding settlers, for no Cymric or Teutonic names are found which have been changed according to the idiom of the Gaelic language. But Gaelic names changed according to Cymric rules, or, to use a barbarous word, *Cymricised*, are found over a portion, though not by any means the whole, of the Celtic-German area: and this proves that a smaller band of Cymri followed their Gäel cousins, and subdued or expelled them, settling themselves down in their place. Then came the Germans, who further changed the names that had previously passed through both the Celtic dialects. The names in Northern Italy are principally Cymric, in Southern Italy, Gaelic. Professor Newman, some think, has proved what was long ago contended for by Mr Grant of Corriemony in his very ingenious little work, *Origin of the Gäel*, (Edinb. 1814), that Gaelic entered largely into the language of the founders of Rome, and that the Sabines were entirely a Gaelic race. France was principally Cymric, nor are the stories of Brittany having been peopled by exiles from Wales of any weight; for a Cymric topography is to be found almost everywhere throughout ancient Gaul, as well as in Britain. The Gäel again, beyond question, occupied *Gal*-atia. Several Gaelic names are to be found throughout England; but the Cymric are in an immense majority from S. to N., though it is very interesting to observe a thin line of Gaelic names extending across the island from the Thames to the Mersey, as if indicating the path by which the Gäel, probably urged onwards by wave after wave of the stronger Cymri, sought refuge in Ireland, where their descendants still remain. In Scotland, the Cymri extended from the S. as far as the Highlands of Perthshire: beyond these the Gael dwelt, and continue yet to dwell.

Religion and Laws.—Cæsar, in his sixth book *De Bell. Gall.*, says that all the Gauls were much given to religious observances, and it is remarkable that the whole Celtic race, wherever situated, and whatever their form of religion may be, continue to this day to manifest very much of a devotional spirit, and a strong love of show and excitement in their religious worship. Very little, however, is accurately known either of their religious views or rites in the times of old. Their priests were called Druids. According to Cæsar, they taught much sacred lore to their pupils, through verses which were committed to memory, but they allowed nothing sacred to be written; so we depend, for our knowledge of this subject, on the accounts of strangers and enemies, or on vague traditions and faint resemblances of some of their rites still preserved among their descendants. It is worth recordin; that not Cæsar alone, but Strabo and Lucan also, speak of the Druids as more learned than their neighbours, and possessing a profound spiritual discipline. They are said to have taught the immortality of the soul, as also its transmigration, and to have carefully studied both astronomy and geography. The names of several Greek and Roman deities are mentioned as the objects of their worship, and human victims are said to have been frequently offered by them.

How far these accounts are to be depended on it is impossible now to determine, but it is certain that the Druids held the sun among the principal objects, if not the sole object, of worship; that he was known by the name of Bel or Baal; that two great annual festivals were held in his honour, when the fire on every hearth throughout the land was extinguished, and every house, occupied by high or low, was relighted with consecrated fire given by the priest. One of these festivals was held in the beginning of winter. It is still known in Gaelic as *Samhuin-Sāmh-Theine*, or 'the fire of peace,' and is throughout Scotland generally observed with many superstitious rites, the meaning of which is altogether lost. The other was held on the 1st of May, and is known as *Beltane* or *Beltein* (q. v.), 'the fire of Baal.' There are various places in the Highlands where, if a person allows his fire to die out about the beginning of summer, he will in vain go for a kindling to any of his aged neighbours. The taking fire out of a house at this season is regarded as a dangerous thing, certain to bring evil on the house sooner or later. In Orkney, in Perthshire, and Banffshire, young people still kindle fires on hill-tops in the beginning of summer, rush through the flames, or roll cakes through them, which are afterwards carefully divided and eaten by the company; and even in the southern parts of the kingdom, there are many who still go forth before sunrise 'to doon their observance to May' (*Knightes Tale*, l. 642), quite unconscious that they are still maintaining a part of the once great Druidical sun-worship.

Groves of oak are said to have been the favourite places of worship with the Druids, and what may well be called 'groves of stones' were also used by them as temples. The remarkable 'circles of stones,' commonly known as 'Druidical circles,' are still to be seen, and of most imposing dimensions, in the most distant places which were inhabited by the Celts. Stonehenge and Avebury in England, Stennis in Orkney, and Callernish in the remote island of Lewis, are the most striking remains of these 'sun-temples' in Britain; but there are hundreds of smaller ones, and Carnac, in the N. of France, far surpasses in magnitude any to be seen elsewhere.

It is singular that some learned men have of late asserted that these circles were never used as temples, but were merely monuments of the dead. They base their assertion on the circumstance that graves have been found in the neighbourhood of many of them. Now, it appears to be just as reasonable for a stranger who, on a week-day, visits one of our old churches, whose floors are covered with flags marking the graves of those who sleep underneath, to say that these churches and cathedrals are mere monuments to the dead, having nothing to do with the devotions of the living. Were there nothing else to throw light on this point but the Gaelic language as spoken to the present day, it would prove abundantly that these 'stone circles' were places of Druidical worship, and that the Druids were held, not in respect only, but in deepest reverence and awe, as persons endowed with supernatural power.

Laws and Institutions.—No long time has passed since to speak of written laws and enlightened institutions having been known among Celts, especially Irish Celts, fully eight or nine centuries back, would have raised a laugh of contemptuous scorn wherever the English language is spoken; but such laws and institutions did exist among them nevertheless. Every tradition we have on the subject confirms what Cæsar says about the absolute power of the Druids, not in religious matters only, but in civil and criminal jurisdiction as well. They exercised despotism as extensive and as thorough as ever belonged to any set of rulers; yet it must have been in many respects a wise and beneficent despotism. The Irish 'Brehon Laws,' as they are called, now published at the expense of the British Government (as ought to have been done three centuries back), were written at least 800 years ago, nearly 400 years after Ireland had embraced Christianity; but they embody many laws which by consuetudinary usage had acquired the force of statute long before Christianity had been preached in the country, going far back into Druidical times.

It is impossible within our narrow limits to attempt the briefest summary of those most interesting volumes, now, through translations and explanatory notes, accessible to all who choose to examine them; but it is not too much to say that, both in civil and criminal law, they are in point of equity and comprehensiveness very far in advance of any legislative code which at that period, or for centuries after, belonged to any modern nation of Europe. We may remark that, in regard to one very important point, the ownership of land, these Brehon Laws clearly show that in Ireland, as was the case universally among the Celts, the soil was originally held as a tribal possession; the chief or landlord, to use modern terms, was regarded in the light of a public servant, to whom certain payments were due as the chief magistrate of the community; but as long as the members of this community discharged their relative duties, he had no power to deprive them of their holdings. The new laws regarding the ownership of land, which were made after the great French Revolution, showed that the memory of the old Celtic tenures had not died out in France even in the 18th c., and the new title given to their ruler—Emperor of the French, instead of Emperor of France—shows that they remembered the old patriarchal relation of clanship or children to a common father; while the ever-festering and running sore of agrarianism in Ireland proves the conviction to be still strong and ineradicable there, that the old occupants of the land have right to continuous occupation while they pay a reasonable rent. Sir Henry Maine's interesting work on the history of early institutions, proves amply that at a certain stage of progress in the social condition of every nation, Celtic, Teutonic, or Hindu, these views of land-tenure are held and acted on. See article BREHON LAWS for a brief description of the matters with which ancient Celtic legislation concerned itself.

Language and Literature.—This part can only be touched on here, but the reader is referred to articles CYMRIC LANGUAGE AND LITERATURE, GAELIC LANGUAGE AND LITERATURE, for a more detailed account.

Since the days of Sir William Jones, all philologists admit the Celtic to belong to the Aryan or Indo-European family of languages. What distinguishes it from all its sisters is its inflection by changes on the initial consonants of its nouns and adjectives. These changes are in Irish-Gaelic called *eclipsis*, in Scottish, *aspiration*, and in Cymric, *mutation*.

The extent of Celtic literature still existing is immensely more than English readers are generally aware of. In Welsh, the *Myvyrian Archæology*, published by Owen Jones, occupies volumes. The four ancient books of Wales, published with an English translation and a most learned introduction by Mr Skene of Edinburgh, contain poems composed about the 6th c., and committed to writing in the 12th, while there are hundreds of MSS. still unpublished.

For an account of the MS. treasures of Ireland, we must refer to the works of the truly able and industrious Professor O'Cuory (Dubl. 1861). He shows that there are many thousand pages of the most miscellaneous description—historical, theological, and scientific—still preserved, mainly in the Trinity College, Dublin, but in many other libraries also, both British and foreign. These have been written from the 9th to the 16th centuries. The Government of the country, as already observed, are publishing several of them. The Royal Irish Academy is also showing liberality and activity in the same direction, and the time is not far distant when full justice will be done to the learning which flourished in Ireland during what was well called in other kingdoms the 'dark ages.'

In Scottish Gaelic there is a small collection of MSS. in the Advocates' Library, Edinburgh, some of which belong to the 12th c. The *Book of the Dean of Lismore* was written by the middle of the 16th c. There is a large number of songs from the middle of the 17th c. to the present day, some of high poetic merit, others sufficiently commonplace. There is one volume of truly beautiful prose by the late Rev. Dr Norman Macleod, of St Columba, Glasgow, but Ossian (q. v.) is the main name connected with Scottish Gaelic literature. All that need be said here is, that the poetry attributed to him is, in the opinion of competent judges, unsurpassed in its combination of sublimity with tenderness, and that, while few judicious men will maintain that Macpherson acted faithfully in publishing from MSS. collected by him, fewer still will *now* assert that these poems were composed by him in English, and afterwards translated into Gaelic. They contain abundant internal proofs of the Gaelic being the original, and there is every reason to conclude that *Ossian* contains, in spite of Macpherson's crooked procedure, genuine fragments of the old heroic Caledonian poetry.

The C. N. which at one time had the chief place in all Western Europe have now passed away, but they have necessarily had a very great influence in forming the character of those who now occupy their old places; and in estimating the amount of that influence, it must be remembered that, while they have perished as nations, they have not perished individually. They were neither slaughtered nor banished by those who successfully invaded their lands,—Romans or Teutons. It is needless to state that there is a very great proportion of Celtic blood in France, and everything favours the supposition that there is an immense deal more of it in England than is generally supposed. In his *Words and Places* (2d ed. p. 243), Isaac Taylor says, 'These facts, taken together, prove that Saxon immigrants, *for the most part*, left the Celts in possession of the towns, and subdued, each for himself, a portion of the unappropriated waste. It is obvious, therefore, that a very considerable element of Celtic population must, for a long time, have subsisted side by side with the Teutonic invaders, without much mutual interference. In time the Celts acquired the language of the more energetic race, and the two peoples, at last, ceased to be distinguishable.' In Scotland the Celts were never to any great extent displaced.

Whatever, then, be the character of the present mixed race inhabiting Britain, a considerable share of it necessarily belongs to the strain of Celtic blood which runs in their veins. Matthew Arnold's opinion of what this share is, is sufficiently high to satisfy the most ardent Celt. He speaks of steadiness, self-reliance, and perseverance as the good qualities of the German, in all of which the Celt is very deficient. On the other hand, the German is heavy, commonplace, humdrum, destitute of sentiment and wit. This may be a grotesque exaggeration of some Germanic traits, but none can doubt that the Celt is particularly strong in sentiment and wit, in reverence for all that is great and sacred, strong in imagination, fond of poetry and of music, and brave even to rashness. Mr Arnold quotes with approbation from Mr Morley, who says that it is the Celtic mixture alone which has enabled German England to produce such a poet as Shakespeare. If the Celt, then, has added grace to the vigour of the Teuton where the two races have been blent into one, he has a claim to respect and admiration which has not always been conceded.

Cel'tis. See Nettle-Tree.

Cem'bra Nut and **Cembra Hive.** See Pine.

Cementa'tion, the process by which Blister Steel (q. v.) is made.

Cements' (Fr. *ciment*), factitious compounds for joining closely and firmly together the surfaces of homogeneous or heterogeneous bodies. C. are used liquid, semi-liquid, or plastic; and when placed in a thin layer between the surfaces to be united, they quickly dry and harden, and, by adhesion, effect a strong union. There are many kinds of C., of very varying composition, to suit diverse applications, but all may be embraced in three classes—(1) stony and hydraulic C.; (2) asphaltic or bituminous C.; and (3) resinous, glutinous, and oily C. The first class comprehends architectural and building mortars, as common mortar, Portland cement, Roman and other hydraulic C., which have lime for their bases. (See Mortars and Mastics.) The second class deals with those C. that are prepared from natural asphalt by pulverising and melting it, and combining with it pitch, chalk, sand, &c., in varying proportions. They are extensively used for street pavements, lining water reservoirs and cisterns, as mortar in the foundations of buildings to prevent dampness, &c. (See Asphalt.) The third class is by far the most numerous, and it is impossible to enumerate here the numberless recipes for their preparation, or detail their uses in everyday handicraft. We subjoin from the host of recipes a few of the more useful kinds, referring for fuller details to Cooley's *Cyclopædia of Practical Receipts* (5th ed. Churchhill, Lond.), and Spon's *Workshop Receipts* (Lond. 1873). (See Glue and Paste.) As a rule, the least possible quantity of cement should be applied, as a closer and consequently stronger junction is thereby effected.

Diamond or Armenian Cement, for repairing fractured glass, earthenware of all kinds, &c.—Dissolve 15 to 20 grains of gum-mastic in a small quantity of alcohol, add 2 oz. alcoholic solution of isinglass (previously softened in water, and two small pieces of gum-ammoniacum; mix the whole, and keep closely stoppered; gently heat before use. This most valuable cement is used by Armenian jewellers to fasten diamonds to metallic surfaces, and is even capable of uniting surfaces of polished steel.

Electrical or Philosophical Apparatus Cement (Singer's), for connecting articles of brass and glass, &c.—Resin, 5 parts; beeswax, 1 part; calcined red ochre, 1 part; dry plaster of Paris, ⅛ part; mix by applying heat.

Acid Proof Cement.—Form a putty with concentrated solution of silicate of soda and powdered glass; suitable for corks of jars, &c. A syrupy solution of shellac in benzole, and of caoutchouc in the same, mixed together, resists chlorine.

Leather Cement.—Dissolve gutta-percha in bisulphide of carbon to the consistence of treacle, thin down parts to be joined, and spread cement well into the pores of the leather, then heat, press, and hammer together.

Cutler's Cement.—Resin, 4 parts; beeswax, 1 part; brick-dust, 1 part; heat and mix intimately, and apply in liquid state.

Optician's Cement, for temporarily fastening lenses, &c., while grinding or polishing, adapted also for lapidary use.—Resin, 4 parts; wax, ½ part; calcined whiting, 4 parts.

Iron Cement, for joints of pipes, &c.—1 part each of sal-ammoniac and flowers of sulphur, and 16 parts of cast-iron borings or filings; mix well in a mortar and keep dry. When required for use, mix 1 part of the powder with 20 parts clear iron-filings, and incorporate the whole into a stiff paste with water. A cement containing the above ingredients—flowers of sulphur, sal-ammoniac, and iron-filings—in equal parts, triturated in a mortar, and rendered plastic with raw linseed oil and white lead, is, according to Klein, well adapted for aquaria. Finely-sifted wood-ashes and powdered clay, in equal parts, with a little salt and water, sufficient to form a stiff paste, form an excellent covering for the joints of ovens and iron stoves.

Miscellaneous C.—Quicklime beat into a paste, with equal parts of the white of egg and grated cheese; for marble and alabaster. Portland cement, 12 parts; slaked lime and fine sand, 6 parts each; infusorial earth, 1 part; make into a thick paste with silicate of soda; for broken stone ornaments, steps, &c.

Cem'etery (Gr. *koimeterion*, lit. 'a sleeping-room'), a place for the burial of the dead, distinct from the churchyard, and one of the most beneficial arrangements for the protection of the health of cities and towns made in modern times. The primitive Christians constantly used burial-places for purposes of worship, but to bury in churches was a custom of later date, and was frequently denounced. The privilege was first conceded to princes and priests, and the laity subsequently claimed it. In all Mohammedan countries, the C. is a striking feature in the neighbourhood of cities. In Europe, celebrated public burying-grounds were consecrated at Naples, Bologna, and Pisa. (See Campo Santo.) Père la Chaise at Paris, named after a confessor of Louis XIV., and first used in May 1804, gave the modern impetus to this arrangement for interring the dead. Kensal Green C., in London, opened 2d November 1832, was the first in England; the Necropolis, in Glasgow, opened March 1833, the first in Scotland; while Glasnevin, Dublin, was the earliest in Ireland. There are now few considerable towns in Great Britain near which there is not at least one C. They are also common in other European countries; and in the United States there are cemeteries of great elegance and extent, such as those at New York and Philadelphia.

Cen'ci, Beatrice, executed 11th September 1590, for alleged complicity in the murder of her father, Francesco Cenci, a wealthy Roman noble, who, after being married a second time, conceived an unnatural hatred to his children by the earlier marriage, of whom Beatrice was one. Inspired at once by hate and incestuous passion, Cenci forced his daughter to submit to his brutal desires. The girl sought redress of Pope Clement VII., and on being refused, she, together with her stepmother and her brother Giacomo, planned and executed the murder of the unnatural father. All were condemned to death. In the Barberini Palace, Rome, a beautiful head, by Guido, is shown as the portrait of B. C. Her story, written by a contemporary, was first published in the original at Rome in 1849, but a German translation appeared at Leipsic in 1840 under the title of *Briefe von einem Florentiner*. More recently the history and trial of B. C. has been handled by Scolari (Mil. 1856) and Dalbono (Nap. 1864). It forms the subject of Shelley's famous tragedy, and also of a romance by Guerrazzi.

Ceneda, an ancient episcopal city of Italy, 21 miles N. of the city of Treviso. Rich and populous under the Venetian republic, it is now decayed, and has little more than 8000 inhabitants.

Cenis, Mont, or **Monte Cenisio,** a pass of the Cottian Alps, between Savoy and Piedmont, the highest point of which is 6775 feet above the sea. The pass was used from the earliest times, but the road was bad and dangerous. In 1810 an excellent road, begun by the orders of Bonaparte in 1803, was completed at an expense of £300,000. By this Napoleon III. sent his troops into Italy in his campaign against Austria in 1859. The most remarkable tunnel in the world is that of M. C., fully 7½ miles long, begun in 1857, and completed in December 1870, by which the railway systems of France and Italy are connected.

Ceno'bites. See Monachism.

Cen'omyce. See Reindeer Moss.

Cen'otaph (Gr. *kenos*, 'empty;' *taphos*, 'a tomb'), a monument or tomb erected in memory of the dead buried elsewhere, or not found for burial—*e.g.*, those who perish at sea. A tomb built during lifetime for subsequent burial has latterly come to be called a C.

Cen'ser (Fr. *encensoir*, from *incenser*, Lat. *incendere*, 'to burn'), a vessel used for burning and wafting incense. The Hebrew C. was a portable metal vessel which received from the brazen altar burning coals, on which incense was sprinkled by the priest, who conveyed it to the golden altar, or altar of incense, on which it was offered up morning and evening. Solomon prepared censers of pure gold, and throughout the great Day of Atonement a golden C. was used. In the Greek Church the C. is wafted by the ministering priest. It is called a *thurible* (Lat. *thuribulum*, from *thus* or *tus*, 'incense') in the Roman Catholic Church, and the acolyte who carries it is called a *thurifer*.

Cen'sors (lit. 'reckoners,' 'valuators,' from the Lat. *censere*, 'to count, assess,' &c.), were two magistrates of high rank and authority in the Roman republic, whose duty was originally to take the *Census* (q. v.), or register of the citizens and their property.

Special magistrates were not appointed for this purpose till B.C. 443. At first they were chosen exclusively from the patricians, but in B.C. 339 it was enacted that one of them must be a plebeian; and in B.C. 131 both were for the first time plebeians. The C. were elected in the *comitia centuriata*, and exercised a general control over the morals of the citizens. Hence they possessed peculiar dignity. Their own sense of right was their sole guide in exercising their functions. The office continued till B.C. 22, but sometimes during the 421 years of its existence there were lustra in which no C. were chosen. In addition to the duties already mentioned, the C. were intrusted with the administration of the public finances, including the superintendence of the public buildings and the construction of new public works. Their duties are summarised by Cicero (*De Leg.* iii. 3). As possessed of the *regimen morum*, or supervision of public morality, they exercised a function similar to what is now called public opinion, and hence they were both revered and dreaded.

Cen'sorship of the Press is a term denoting the system regulating publication in countries in which the press is not free. Previous to the Reformation the clergy in England claimed a share in the C. of the P. in all matters connected with religion. At the Reformation this claim of right was held to have vested in the crown. It was exercised by the Long Parliament, and established by Act of Parliament in the reign of Charles II. It was continued at the Revolution of 1688, but in 1693 the House of Commons refused the re-enactment. See COPYRIGHT, LAW REGARDING; LIBEL, LAW OF; BOOK TRADE; PRESS, FREEDOM OF THE; OBSCENE PUBLICATIONS; CONTEMPT OF COURT; CONTEMPT OF PARLIAMENT.

Cen'sus is a Latin word denoting the register kept by the *Censor* (q. v.) of the citizens and of their property. In modern parlance it means the periodical enumeration of the inhabitants of a country. In Great Britain this has been made decennially since 1801. In Ireland, the first attempt to take the C. was made in 1811, but it was not considered successful, nor was that of 1821. In 1831 it was supposed to be more accurate, and each subsequent decennial C. has been considered trustworthy in its results. The enumeration for England and Scotland is made under the authority of the Registrars-General. (See REGISTRAR-GENERAL.) Each house is visited by an enumerator, who enters the information collected by him in a book, which, after careful revision by the local registrar and some other qualified officer of the town or county, is transmitted to the C. office. The schedules for the C. of 1871 give the 'name, sex, age, rank, profession or occupation, condition, relation to head of family, and birthplace of every living person' who passed the night of Sunday the 7th April in the house. The French C. is taken once in five years, the last being in 1872; some European countries, as Belgium (last 1873), have a triennial C.; others are very irregular: Spain, for example, has not taken one of the towns since 1860. That of the United States is, like the English, once in ten years, the last being in 1870. In the U.S. the practice exists of particular States, and in England of particular towns, taking a C. for themselves at shorter intervals than ten years. The first great general C. of India was completed in the beginning of 1874.

Cent (Lat. *centum*, 'a hundred'), a common name for a coin. Thus there are the American, the Spanish, and the Dutch cents, being respectively the $\frac{1}{100}$ part of a dollar, real, and guilder. The French *centime* = $\frac{1}{100}$ of a franc. The Italian *centesimo* = $\frac{1}{100}$ of a lira.

Centau'rea, a genus of plants of the natural order *Compositæ*, containing many annual and perennial herbaceous and half-shrubby plants, including some common weeds, such as the knapweed or horse-knot (*C. nigra*) and *C. Cyanus* (the bluebottle or corn bluebottle), the water distilled from the blue flowers of which were at one time greatly valued as a cure for weak eyes. With alum they give out a fine blue dye. *C. montana*, the large bluebottle, is a perennial species, a native of Central Europe, but common in our gardens. Sweet Sultan (*C. moschata*), of the Levant, is also a garden plant in Britain. Among other species may be enumerated *C. macrocephala*, *C. dealbata*, *C. Ragusina*, *C.* (*Plectocephalus*) *Americanus*, and *C. depressa*.

Cen'taurs ('bull-goaders'), according to the Homeric legend, were a hirsute savage race dwelling between Pelion and Ossa, in Thessaly, who were extirpated in a war with the Lapithæ; later mythologising accounts—*e.g.*, that of Pindar—represent them as monsters, half human, half equine. The notion of their twofold nature may have arisen from the neighbouring tribes regarding the Thessalian bull-hunter and the horse he rode as constituting a single personality.

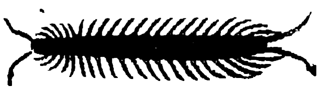
Centau'rus, one of the constellations of the southern hemisphere, so called because in the celestial globe it assumes the double form of a *centaur*. It contains two stars of the second magnitude, both in the head and shoulders, which are the only parts visible from Britain.

Centen'es. See TENREC.

Cen'tering of an arch, the framework (generally of timber) used to support the arch during construction. The C. is removed within as short a time after the keystones are in place as has been sufficient to allow the mortar to harden.

Cen'tigrade. See THERMOMETER.

Cen'tipede (*Scolopendra*), a genus of *Annulose* animals belonging to the class *Myriapoda*, and included in the order *Chilopoda* of that group. They are carnivorous in habits, feeding on insects, earthworms, &c.; the legs number from fifteen to twenty pairs. The antennæ are composed of not less than fourteen joints, but the number may also exceed forty in some cases. The mouth is provided with a pair of mandibles, with *palpi* or organs of touch, a *labium*, or lower lip, and four *maxillipedes* or 'foot-jaws.' The second pair of the latter organs possesses fangs for the discharge of a poisonous fluid. Each joint of the body bears but a single pair of legs, the last pair of limbs forming a kind of tail. The body is flattened, and the reproductive organs open at its hinder extremity. The C. is represented in Britain by small species, but those of tropical climates average 12 inches or more in length. Their bite is not necessarily fatal or dangerous, except in debilitated subjects. *S. gigantea*, *S. morsitans*, *S. cingulata*, &c., are familiar species. The genera *Lithobius* and *Geophilus* are also represented in Europe and elsewhere.



Centipede.

Centlivre, Susannah, a dramatic authoress, daughter of a Mr Freeman, was born in Ireland in 1678. Left an orphan, she went alone to London, where she married a nephew of Sir Stephen Fox. After the death of a second husband, poverty forced her into dramatic composition, in which she won decided success. Her third husband, Joseph Centlivre, was a cook to Queen Anne. She died in 1722. The best of her plays, *The Busy Body* and *A Bold Stroke for a Wife*, are sprightly and full of incident. See Ward's *Dramatic Literature*, vol. ii. C.'s plays were reprinted in 3 vols. in 1872.

Cen'to (Gr. *kentron*, Lat. *cento*, 'patchwork'), the name given to a certain trick of verse-manufacture popular in the decline of the Roman Empire, in which a medley was produced by putting together distinct passages of an author or of different authors in such a way as to present a new sense. The *Homerocentones* (Teucher, Leips. 1793) are specimens; also the *C. Nuptialis* of Ausonius, and the *C. Virgilianus* of Proba Falconia in the 4th c. Both of these Latin pieces of patchwork are misuses of Virgil's language, the latter resulting in an epitome of sacred history. This barbarism was a favourite pastime in the middle ages. A C. of spiritual hymns was made up by this perverse ingenuity from Virgil and Horace by a monk named Metillus in the 12th c.

Cento, a town of Central Italy, province of Ferrara, on the Reno, 18 miles S.W. of the city of Ferrara. It is celebrated as the birthplace of Guercino, the painter. Pop. about 5000.

Cen'tral Forces are forces which act to or from a fixed point. According to Newton's first law (see MOTION, LAWS OF), any body moving with a given velocity in a given direction will continue so to move, unless acted upon by some external force; and hence any change in the rate or direction of motion indicates the presence of such a force, which may or may not be central. If, however, as first proved by Newton, the body describe its otherwise than straight path, such that the straight line joining it with a certain fixed point sweeps over equal areas in equal times, that point must be the centre of attraction or repulsion. The converse also holds true, being merely a particular case of the dynamical principle, that the Moment (q. v.) of the resultant of any number of forces with respect to any point, is equal to the sum of the moments of the components with respect to the same point. Another important property of all C. F. is that the change of kinetic energy (see ENERGY) of a mass in moving from one position to another under the action of such a force, is dependent only upon its initial and final positions, and not upon the form of the particular path described. Given the orbit of motion of a body, and the law of force can be easily deduced by a simple process of differentiation. The inverse problem, given the force to find the orbit, is much more difficult, and in some cases is soluble only by approximation.

When the force is attractive, there must obviously be another force generated so as to neutralise the attraction, otherwise the body would be dragged to the centre. This force, which is due to the constant tendency of the moving body to continue in a straight line, and which has no other effect than that mentioned above, has been erroneously called the *centrifugal* force, in contradistinction to the attractive or *centripetal* force. The amount of this so-called *centrifugal* force at any point of an orbit is found by dividing the square of the velocity of the body by the radius of curvature at that point, or $f = \frac{v^2}{\rho}$.

The first clear comprehension and rigorous mathematical treatment of C. F. are due without question to Sir Isaac Newton, who deduced from Kepler's second and third laws, combined with his own principles, the grand theory of universal gravitation, that *every particle of matter in the universe attracts every other particle with a force whose direction is that of the line joining the two, and whose magnitude is directly as the product of their masses, and inversely as the square of their distance from each other;* and this law contains within itself the complete statement of Kepler's three laws.

Cen'tralisation is a name for the process, sometimes forcible, sometimes fraudulent, but in modern history seldom natural, by which political power over several inferior communities is collected in one sovereign town or state. Absolute C. was aimed at in temporal matters by the Roman Empire; in spiritual matters it is still claimed as a right by the Vatican. As, however, the larger states of Europe are now in stable independence, so the papal claims, whether of jurisdiction, nomination of bishops, material contributions, or promulgation of dogma on faith and morals, are denied in Protestant countries, and recognised in Catholic countries only under constitutional checks. The C. which rose in Europe with the growth of municipalities and the decay of pure feudalism, consisted chiefly in the final recognition of sovereignty in matters of peace and war and other external politics (including the relation of the national church to the Pope), and in the establishment of a supreme court of justice. No doubt it was the sovereign who, by the grant of municipal charters, conferred not only rights of trade and local taxation, but also an independent local jurisdiction; but it was long before the C. implied in annual national subsidies, controlled by the voice of the nation in Parliament, appeared. These subsidies are now to a large extent returned in grants to particular localities, but are still mainly contributions to public and political objects. In Great Britain there is complete freedom in the election of the various county, municipal, and parochial authorities; and under Acts relating to the Poor Law, the Police, Education, Public Health, &c., these authorities have acquired powers of taxation and administration which ancient custom did not give them. These powers are exercised under the general control of Central Boards, but for the most part their interference is occasional, and is defined in narrow limits.

Cen'tre, in the geometry of curves and surfaces, is the point with respect to which the curve or surface is symmetrically disposed, and every straight line drawn through the C. will cut the curve or surface in points which, taken two and two, are equally distant from the C. In the case of a curve of odd degree, the C. must be a point of inflexion; in the case of one of even degree, however, it is not generally on the curve. This geometrical C., or C. of figure, often corresponds in position with the Centre of Inertia (q. v.).

Cen'tre of Gravity. If the attraction of a mass upon a rigid body be reducible to a single force, in a line passing through one point fixed relatively to the body, whatever its position may be with respect to the attracting mass, that point is its C. of G., and the body is a *centrobaric* body. Hence every centrobaric body attracts all external matter as if its own mass were collected in its C. of G., which centre coincides with the Centre of Inertia (q. v.), though differing essentially from the latter in its fundamental conception. If the centre of inertia should fall without the body, as in the case of a homogeneous ring, there can be *no C. of G.*, since it is a further property of this point that it must necessarily be *within* the body. For detailed discussion of centrobaric distributions, see Thomson and Tait's *Natural Philosophy*, vol. i. s. 526–535.

Centre of Gyra'tion of a rotating body, is that point at which, if the whole mass were collected, the moment of inertia with respect to the axis of rotation would remain unaltered. The circle described by this point is called the *Circle of Gyration*, and its radius k is obtained from the equation $k^2\Sigma m = \Sigma mr^2$, where r is the distance of an element m from the axis of rotation.

Centre of Inertia, commonly but inconveniently called the centre of gravity, is that point with respect to a system of material particles whose distance from any plane is equal to the sum of the products of each mass into its distance from the same plane, divided by the sum of the masses. Hence, taking as coordinate axes the intersections of three rectangular planes, the point is given by the equations—

$$x\Sigma m = \Sigma mx,\ y\Sigma m = \Sigma my,\ z\Sigma m = \Sigma mz.$$

In these the whole theory is contained. Thus, by simple differentiation with respect to *time*, the equations become $x\Sigma m = \Sigma m\dot{x}$, &c., from which we deduce that the sum of the momenta of the parts of the system in any direction is equal to the momentum in the same direction of a mass equal to the sum of the masses, moving with a velocity equal to the velocity of the C. of I. Another interesting property, for a simple demonstration of which see Thomson and Tait's *Elements of Natural Philosophy*, vol. i. s. 196–198, is that the sum of the products of each mass into the square of its distance for any point exceeds the corresponding quantity for the C. of I. by the product of the whole mass into the square of the distance of the point from the C. of I. *The moment of inertia* of a system about any axis is the sum of the products of each mass into the square of its distance from that axis; from which we have the interesting proposition that the moment of inertia of a system about any axis exceeds the moment of inertia about a parallel axis through the C. of I. by the moment of inertia about the first axis of the whole mass supposed condensed at the C. of I. The above theorems are easily applicable to the case of a *continuous* solid body instead of a system, by merely substituting integration (see CALCULUS) for simple summation.

Centre of Oscilla'tion is that point in an oscillating body at which, if the whole mass were collected, the single pendulum so formed would oscillate in the same time. Its distance from the point of suspension is found by dividing the moment of inertia of the body about the supporting axis by the product of the mass into the distance of the centre of inertia from the same axis. An important property, applied successfully by Captain Kater for finding the length of the second's pendulum at any place, is that the centres of suspension and oscillation may be interchanged without affecting the time of oscillation.

Centre of Percuss'ion is that point of a moving body at which the momentum may be supposed to be concentrated. For a body moving without rotation in a straight line, this point coincides with the centre of inertia, and for an oscillating body, with the centre of oscillation. Further, it is at this point that the moving body would strike the hardest blow upon any opposing obstacle; and if the obstacle were immovable, and the body perfectly rigid and inelastic, the collision would be followed by repose. Hence, if there be rotation, the C. of P. must be so situated that the collision may generate a rotation equal and opposite to that already existing.

Centre of Press'ure, or **Met'acentre**, is that point of a body immersed in a fluid at which the resultant pressure is applied. See HYDROSTATICS.

Centrif'ugal and **Centrip'etal Forces.** See CENTRAL FORCES.

Cephaëlis. See IPECACUANHA.

Cephalas'pis, a genus of extinct Ganoid fishes, forming the type of the family *Cephalaspidæ*, the members of which are distinguished by the possession of a peculiar bony, cephalic head-shield, or buckler, which has its angles produced into long processes, giving it much the shape of a 'saddler's knife.' The presence of this shield gave the generic name *Cephalaspis* ('buckler-headed') to the group. The shield was also prolonged in its hinder margin in the middle line. The orbits are set closely together, and exist nearly in the middle line of the shield. No jaws or teeth have been discovered, the mouth having probably been soft. The body was covered by ganoid scales, and a dorsal fin existed. The tail-fin was unequally lobed or *heterocercal*, and *pectoral* or breast fins existed. These fishes occur in the Silurian, but chiefly in the red-sandstone formations. As in most other *Ganoidei*, the skeleton was cartilaginous and of rudimentary nature. *C. Lyellii* is the most familiar species.

Cephalo'nia (anc. Gr. *Kephallenia*, Ital. *Cefalonia*), an island of Greece, and the largest of the Ionian group, has an area of 255 sq. miles, and a pop. (1870) of 77,382. It lies near the entrance to the Gulf of Patras, is only separated by a narrow strait from Ithaka, also called Little C., and has a much indented coast-line. The island, which is about 30 miles long and 10 broad, is traversed by a range of mountains, which attains in Mount Nero (anc. *Ænos*) a height of 5497 feet. There is a great scarcity of water, but even the high mountain terraces are made to yield grapes, or 'currants,' and olives. The climate is delicious; earthquakes, however, are not infrequent, the last severe shock being that of 1867. In 1874 the exports, chiefly currants and olive oil, amounted to £189,308, and the imports to £240,409. The population is composed mainly of Greeks, Italians, and Jews; and a Greek dialect is the spoken language. The capital is Argostoli. In the Homeric poems C. bears the name Same or Samos, and belongs to Ulysses. It in turn became the possession of the Athenians (431 B.C.), Romans (189 B.C.), Byzantines (395 A.D.), Venetians (1215), and Turks (1479–1502). Its later history is bound up with that of the Ionian Islands (q. v.).

Cephalopod.

Cephalop'oda ('head-footed'), the name given by Linnæus to the highest class of the Mollusca (q. v.), represented by the cuttlefishes,—including the famed paper-nautilus or *Argonaut*, the pearly nautilus, the poulpes, Calamaries (q. v.) or squids, &c. This class is readily known and defined as a group of higher mollusca, by the possession of a circle of arms or tentacles, borne on the head and surrounding the mouth; by the body being enclosed in a muscular Mantle (q. v.); by the effete water of respiration being ejected from an *infundibulum* or funnel placed on the front aspect of the body; by the breathing being carried on by two or four plume-like gills placed within the mantle-sac; and by the intestine having its first turn towards the *neural* or nervous aspect of the body. The head is distinct, and the mantle-sac or body is covered by a loose transparent skin or integument, beneath which colour cells or *chromatophora* are situated. By changing the position of these cells the C. can alter the hue of their bodies. The body may be provided with fin-like expansions of the mantle, as in the Calamary or Loligo (q. v.), in which the fins are terminal, or in *Sepia*, where a membraneous fin surrounds the body. The head with its circle of arms presents a singular appearance, and a glance at the figure of an ordinary cuttlefish will show that the name 'head-footed' has not been misapplied. The arms are modifications of the ordinary molluscan 'foot,' and in all cuttlefishes, save the pearly nautilus (*N. Pompilius*), are provided with rows of suckers, which may be sessile (as in *Octopoda*), or pedunculated or stalked (as in *Decapoda*). Each sucker consists of a cup-like structure provided with a firm rim and a muscular disc, by the contraction of which, by means of a little piston or papilla, a vacuum is produced, and the sucker is thus at once and firmly made to adhere to any surface. By pushing out the piston, the vacuum can be as readily destroyed, and the sucker released. The suckers are in some cases (*Onychoteuthis*) provided with hooked processes, or may be surrounded by a horny-toothed ring (as in decapods). Where ten arms exist (as in decapods like the calamary), two are elongated to form tentacles, the other eight arms being of equal and shorter length. Locomotion is effected in these animals by the arms and their suckers, the cuttlefishes thus walking head downwards; or they may propel themselves backwards through the water by aid of *jets d'eau* from the funnel, which consist of the water used in respiration; whilst they are capable of moving in other ways by means of their fins. The digestive system includes a mouth, horny jaws, gullet, crop, stomach, and intestine, liver, and salivary glands. An organ called the *ink-sac* is developed in all, save the pearly nautilus, and this structure secretes an inky fluid, which may be ejected from the funnel to darken the surrounding water, and so enable these animals to escape amid the obscurity thus produced. The heart consists of a *systematic* heart propelling pure blood through the body, and of a *branchial or gill heart* at the base of each gill to propel the venous blood into the gills for purification. Each gill is enclosed in a branchial cavity placed at the side of the body. Water is admitted by the front opening of the mantle, and ejected after being used in breathing, and—as already mentioned—by the 'funnel.' There are two gills in all cephalopods, except the pearly nautilus, in which four exist. The nervous system consists of a large cephalic or brain mass enclosed within a cartilaginous case, and from which nerves originate to supply all parts of the body. Large well-developed eyes and organs of hearing exist. The shell is internal, and exists in the form of a horny or limy pen (*gladius sepiostaire*, or *cuttlebone*) in most of these animals. In the paper-nautilus, an outside single-chambered shell (but not strictly agreeing with the true shells of other molluscs) exists; but in the pearly nautilus a perfect and true external shell is developed, and this latter is many-chambered. The sexes are distinct, and one of the arms of the males generally becomes modified to form a *hectocotylus*, which conveys the male generative elements to the female for the fertilisation of the eggs. These forms are classified as follows:—

ORDER 1. *Dibranchiata*—Two gills; arms, eight or ten, provided with suckers; ink-sac developed; shell internal, or if external, not chambered; funnel, a complete tube. Ex. Paper-nautilus or Argonaut, Octopods or Poulpes, Calamaries (*Loligo*), Sepia, Spirula, Eledone, Belemnites (extinct), &c.

ORDER 2. *Tetrabranchiata*—Gills, four; arms, numerous, not provided with suckers; no ink-sac; funnel, not a complete tube; shell, external and many-chambered. Ex. Pearly nautilus (only living example); fossil examples numerous, such as Ammonites (q. v.), Ceratites, Hamites, Goniatites, Turrilites, &c.

The C. are represented by numerous fossil examples: thus all the Tetrabranchiates are fossil and extinct, with the exception of the pearly nautilus. The several groups of this class are described under their respective headings (*e.g.*, Calamary, q. v.), and the stories of gigantic cuttlefishes, &c., are noted under the head of KRAKEN (q. v.).

Cephalop'tera ('head-winged'), a genus of Rays (q. v.) or *Elasmobranchiate* fishes, forming types of the family *Cephalopteridæ* or horned rays. Agreeing with the characters of the *Raiina* generally, they are distinguished by having the muzzle or head flanked on each side by a membraneous horn-like process, whilst the pectoral fins extend broadly outwards. The eyes are large, and are placed laterally. The tail is slender, and bears a long serrated spine. A small dorsal fin exists, and the teeth are numerous and of small size. *C. giorna* of the Mediterranean is the familiar species. The C. sometimes attain an enormous size. Risso mentions a male which weighed 800 lbs. and a female of 1200 lbs.

Cephalotax'us, a genus of Japanese and Chinese conifers, one of which, *C. Fortunei*, is now common in British collections of hardy trees and shrubs.

Ce'pheus, a constellation of the northern hemisphere, occupying the space between the stars Polaris and Deneb, but containing no star greater than the third magnitude.

Cepo'la. See BANDFISH.

Ceram', an island in the Indian Archipelago, one of the Moluccas, lies W. of New Guinea. Area 7000 sq. miles; pop.

said not to exceed 30,000. C. is mountainous, some of the elevations exceeding 10,000 feet. Maize is extensively cultivated, and there are large forests of the sago-palm. The Dutch assert the sovereignty, and the Malays, who trade under the Dutch flag, and supply the Chinese with sea-slugs, have several settlements on the coast. The natives (Alfures), negroes of the Papuan type, are mostly idolaters.

Ceram'byx, a genus of *Coleoptera* or beetles, founded by Linnæus, but not now much recognised in entomology. They possess long antennæ or feelers (*Longicornia*), and the British musk-beetle (*Callichroma moschata*) exemplifies the group. It is handsome, of a pure metallic green colour, and emits a strong musky odour. The larvæ live in timber and burrow in trees.

Ceramia'ceæ, a sub-order of *Algæ* (q. v.), very abundant in the Northern Seas. Dulse (q. v.), Carrageen (q. v.), Placaria (q. v.), and various other species are remarkable for their beauty or utility.

Ceram'ics (Gr. *keramos*, 'earthenware'). Under this name all varieties of the potter's art, from the rough-baked brickwork up to the finest productions in artistic porcelain, are included. The term is, however, usually restricted to the finer varieties of earthenware and porcelain, regarded as works of art.

Ceras'tes, a genus of *Viperine* snakes, represented by the horned viper (*Cerastes Hasselquisti* or *vulgaris*) of Egypt and N. Africa generally, where it is found in sandy or dry places. It is known by the presence of a horn-like process above each eye. The average length is about 15 inches or 1¼ feet. The C. is very poisonous, and some authorities consider it to be the 'asp' of Cleopatra's tragic end. Other species (*C. nasicornis* and *caudalis*) belong to W. and S. Africa.

Cer'ate (Lat. *cera*, 'wax'), a medicine made with wax and fatty matter as a basis, and other substances as active ingredients. It resembles Ointment (q. v.).

Cer'atite, a genus of extinct *Tetrabranchiate* or four-gilled Cephalopoda (q. v.) or cuttlefishes, the discoidal shells of which occur as fossils chiefly in the Trias rocks. Some are found in the cretaceous rocks, but more occur in Jurassic strata. The genus is included in the family *Ammonitidæ* or Ammonites.

Cerato'nia, a genus of plants of the natural order *Leguminosæ* (sub-division *Cæsalpinieæ*), one of which (*C. Siliqua*) is the Carob Locust (q. v.). It is said that the seeds formed the original carat weight of the jewellers.

Ceratophylla'ceæ, the horn-weeds, an order of plants (division *Dicotyledons*, sub-division *Corolliflor*æ) comprising one genus (*Ceratophyllum*), containing one species (*C. demersum*), a common inhabitant of pools or slow streams in the northern hemisphere.

Cer'bera, a genus of trees belonging to the natural order *Apocynaceæ*, natives of tropical Asia. The seeds of most of them are poisonous. The bark of *C. Odollam*, of the Malabar coast, is purgative, and the unripe fruit is used to destroy dogs, the teeth of the animals being, it is reported, 'loosened so as to fall out after masticating it' (*Masters*).

Cer'berus (Gr. *Kerberos*), according to Hesiod, the fifty-headed dog that guarded the entrance to Hades. He is represented as the son of Typhon and Echidna. Later writers—*e.g.*, Sophocles—reduce his heads to three. By a poetic licence Horace calls him *Bellua centiceps*, 'the hundred-headed beast.'

Cerca'ria, the name applied to the larva or immature stage of certain parasitic *Entozoa* known as *Trematoda*, and represented by the 'flukes' (*Distoma*) and allied forms. A cercariform larva consists of a body possessing a tadpole-like tail, by which locomotion in the water is subserved. These *cercariæ* appear to be developed from a mother-cyst (*C. cyst*) or 'nurse,' produced in turn from the egg, or embryo, of the fluke, which has gained admittance to the breathing-chamber of such a form as the fresh-water snail. The C. thus liberated from the snail may swim about until it in turn may find a resting-place within the body of some aquatic insect-larva, or of a snail. Here it becomes encysted in its turn, and if it gain access to the sheep or other warm-blooded vertebrate, it becomes there developed into the adult *Distoma* or fluke. These flukes imbedded in the liver of sheep cause the 'rot' in that animal. See also FLUKE.

Cer'cis. See JUDAS-TREE.

Cercoce'bus, a genus of Catarhine (q. v.) monkeys, popularly, and together with the allied genus *Cercopithecus* (q. v.), known as 'Guenons.' The *C. fuliginosus*, or sooty mangabey, or negro monkey of W. Africa, is a good example of this genus, in which the tail is elongated.

Cercopithe'cus, a genus of Catarhine or Old-World monkeys, which with the genus *Cercocebus* (q. v.) includes those forms known as Guenons. These monkeys are typically African in their geographical distribution, and among the best-known species are the grivet (*C. Engythithia*), the vervet (*C. Pygerythrus*), the white-nosed monkey (*C. Petaurista*), and the Diana monkey (*C. Diana*). The tail in this genus is elongated, and cheek-pouches and nasal callosities exist.

Cerdo'cyon, a genus of *Canidæ* (q. v.) or dogs inhabiting S. America, and supposed to present features of structure intermediate between the dogs and foxes. The name *Aguara Fox* is occasionally applied to these animals, which may be domesticated, and trained to exhibit much intelligence.

Cere. See BILL.

Cere'a, an old town in the province of Verona, N. Italy, 19 miles S.S.E. of Verona, has a ruined castle, and was the scene of a victory gained by the Austrians over the French in 1798. Pop. 5930.

Cerea'lia, or **Cereal Grasses**, another name for the corn or bread plants—though the name is generally reserved for those that belong to the order of grasses, such as wheat, barley, rye, oats, rice, maize or Indian-corn, millet, Durra or Guinea corn, &c., all of which have been cultivated for so long that it is difficult to say what the origin of any of them is. There are also a number of other grasses cultivated for the sake of their seeds, but these are not usually spoken of as cereals, and their origin is known. Among these may be ranked *Elusine* (Mand) of India, Teff (*Poa*) of Abyssinia, *Zizania*, Canadian Rice (q. v.), &c., and a variety of other plants, from the ground seeds of which bread is made, such as buckwheat, &c. Spirituous and fermented liquors can be made from most of them.

Cerebell'um. This organ is sometimes termed the lesser or hinder brain. It is situated in the posterior fossa of the skull. In many of the lower animals it is not completely overlapped by the posterior lobes of the cerebrum or greater brain, but in the higher quadrumana or apes, and in man, it is completely concealed by the cerebrum when the brain is placed on a flat surface, and the eye is directed to the vertex.

Anatomy.—The C. consists of a body, and of three peduncles or bands by which it is connected with adjoining parts of the nervous system. Superiorly it is connected to the cerebrum, and inferiorly to the *medulla oblongata*, and through it with the spinal cord. The body consists of two lateral hemispheres, having between them a mass of nervous matter termed the vermiform process. The two lateral hemispheres are connected together by the middle peduncles or bands, which pass from one side to the other, forming the transverse fibres of a structure called the *Pons Varolii.* The surface of the C. presents convolutions to which special names have been given, which may be found in every work on anatomy.

Minute Structure of the C.—When a section is made through the organ, it is found to consist of grey and of white matter, so arranged in leaflets as to present a peculiar arborescent appearance, which has been called by the older anatomists, the *arbor vitæ*. The surface of the lobes of the C. consists of leaflets. Each leaflet has white matter internally, and grey matter externally. When a portion of C. is hardened, so that a thin section may be made, stained, and mounted, according to the methods of modern histology, a leaflet is found to consist of three layers, arranged as follows:—Most internally, a layer of nerve-fibres; outside of this a broad layer of granules or cells closely placed together; while most externally, and next the surface, there is a finely molecular layer. At the junction of the molecular with the granular layer, there is found a single row of large nerve-cells, termed the *cells of Purkinje*, after their discoverer. These cells are shaped somewhat like a tadpole, the head being directed to the granular layer, while the tail, which splits up into many delicate fibres, passes outwards and is lost in the molecular layer. According to certain histologists, there are fibres connecting the granules of the granular layer with Purkinje's cells, but these have not yet been satisfactorily demonstrated. In the centre of the body of the C. there is a nucleus of grey matter, known, on account of its corrugated or toothed appearance, as the *corpus dentatum*.

Physiology.—No part of the nervous system is more obscure as regards its function than the C. Disease of the organ is rare. When it does occur, the most common symptoms are blindness or indistinctness of vision, unsteadiness of gait, and a tendency to fall backwards. The mental faculties are not affected. Experimental inquiry shows that when the organ is injured or partially removed, the animal does not lose consciousness, nor is it paralysed, but it appears to have lost the power of directing or of controlling its movements. It moves its feet in an irregular manner, and is unable to perform any action requiring careful adaptation of motions. Intelligence and sensation are unaffected. From these pathological and experimental data the following theories have been put forward regarding the functions of the C. :—

1. That it is somehow connected with the senses. The exact connection of the C. with the senses is unknown.

2. That it is the co-ordinator of muscular movements. In grasping any small object, such as a pea, delicate adjustments of the various groups of muscles are required. It has been supposed that the C. effects this, but no one knows how.

3. That it is the seat of the muscular sense. This is the sense by which the mind becomes cognisant of the position of any limb and of the degree of contraction of the muscles. It is through it we have a feeling of weight or resistance, and it gives the information on which the mind acts in determining further movements. It has been supposed that when the C. is diseased or injured there is no guiding sensation on which the mind can act with definiteness, and hence the movements that follow volition are vague and purposeless.

4. Some phrenologists assert that the C. is the seat of the sexual instincts. This view is not generally adopted by physiologists. It has not been found that there is any distinct relation between the size of the C. and the development of sexual passion, while other facts directly militate against this view. Thus the C. is not smaller in animals which have suffered castration.

The preponderance of evidence is in favour of the view that the C. is connected with the co-ordination of the muscular movements, but the exact method by which it effects this is unknown.

Cer'ebric Acid. This is a fatty acid contained in the brain, and obtained by a complicated process (see Watts' *Dict of Chem.*, vol i. p. 820). It is a white, granular crystalline substance, soluble in boiling alcohol, insoluble in water. Ultimate analysis by Frémy showed that it contained 66·7 per cent of carbon, 10·6 of hydrogen, 2·3 of nitrogen, 0·9 of phosphorus, and 19·5 of oxygen. The acid forms salts with nearly all bases. It is doubtful whether it forms a constituent of brain-tissue as C. A.

Cer'ebrin. This name is given to matters extracted from brain-matter by means of alcohol. They probably consist of a mixture of cerebric acid and phosphuretted fats. Preparations of brain which have been long immersed in alcohol sometimes yield crystals of cholestrin.

Cer'ebrol. This has been described as an oily substance, of a reddish colour, obtained by the action of alcohol and ether on brain-matter. It is probably composed of oleo-phosphoric and cerebric acids and cholestrin.

Cer'ebro-Spi'nal Axis. This term is usually applied to the central part of the nervous system, as distinguished from the nerves or peripheral part. The C.-S. A. consists of the brain and spinal cord. The brain is contained in the cavity of the cranium, and the spinal cord or marrow in the bony canal formed by the vertebræ. Both structures are surrounded by three membranes as follows :—1*st*, and most externally, a strong fibrous membrane termed the *dura mater; 2d*, and in the middle, a serous membrane called the *arachnoid;* and 3*d*, and directly covering the brain and cord, a vascular membrane named the *pia mater.* The C.-S. A. consists of a right and left half, exactly symmetrical, which are united together by commissures or connecting masses of white or grey matter. The spinal portion of the C.-S. A. is well developed in all vertebrate animals, but the cranial portion in the skull presents many degrees of development in different genera, from the imperfect condition of the *Amphioxus lanceolatus* to the highly complex cerebrum of man. See BRAIN, CEREBELLUM, CEREBRUM, SPINAL CORD, &c.

Cer'ebro-Spinal Fluid. This fluid is found bathing the surface of the brain and spinal cord underneath the sac of the arachnoid membrane. It has been obtained for purposes of analysis from a case of *spina bifida*, a congenital condition in which a portion of the posterior wall of the vertebral canal is deficient. The analysis of 1000 parts by Hoppe-Seyler and Schwaberg was as follows :—

	Percêntage Composition.
Water	989·33
Solid matter	10·67
The solid matter was—	
Albumen	0·25
Extractive matter	2·30
Soluble salts	7·67
Insoluble salts	0·45

Cer'ebrote. Alcoholic extracts of brain-substance yield a deposit; this deposit treated with ether is C. It is no doubt a complex substance, similar in nature to cerebrol and cerebrin.

Cer'ebrum. The C., or greater brain, forms the largest division of the nervous mass in the skull. It gradually increases in size and complexity of structure as we ascend from the lower to the higher groups of vertebrate animals, and it attains its maximum size in man. The human brain is absolutely larger than the brain of any animal, except the elephant and the larger whales; and it is larger, relatively to the size of the body, than in any other animal, except in certain small birds and mammals. The average weight of a well developed brain of a European is 49 to 50 oz. in the male, and 44 to 45 oz. in the female. The brains of many highly intellectual men have been found to exceed the average size. The following are examples :—Cuvier, 64½ oz.; Dr Abercrombie, 63 oz.; Goodsir, 57 oz.; Spurgheim, 55 oz.; Sir James Y. Simpson, 54 oz., and Dr Thomas Chalmers, 53 oz. The brain may, however, be heavier than usual in the insane. Thus the records of the West Riding Asylum show that out of 375 males examined, in thirty cases the brain weighed over 55 oz.; while in 300 females, in twenty cases the weight was 50 oz. or upwards. Thus it appears that, beyond a certain limit, there is no necessary relation between weight of brain and degree of intellectual power. On the other hand, it has been ascertained that an individual having a brain weighing less than 30 oz. is invariably an idiot. Some idiots have a brain weighing only 10 or 12 oz.; but idiocy may also be associated with a brain weighing from 45 to 50 oz. The inference, therefore, is that quality as well as quantity of brain is essential to intellectual vigour. Little is known definitely regarding the weight of the brains of uncivilised races, but the few records made show conclusively the average brain-weight is lower in savage races than in the European.

In considering the C. we shall describe—(1) general anatomy, (2) minute structure, (3) physiology.

1. *General Anatomy*.—The C. is an oval mass consisting of two hemispheres, separated from each other by a deep fissure, which runs from before backwards in the median line. The hemispheres are united by a broad band of fibres passing transversely, called the *corpus callosum*. Each hemisphere is convex on its upper surface, and flattened underneath. The upper surface presents a peculiarly folded appearance, forming the convolutions of the C. The furrows or *sulci* between these are generally from half an inch to an inch in depth. These convolutions have received special names, which will be found in any standard work on anatomy (see Quain's *Anatomy*, 7th ed. Lond. 1867). Their outer surface is adapted to the inner table of the bones forming the vault of the cranium. Convolutions are also found on the lateral and inferior aspects of the brain mass.

When the base of the brain is examined, it presents an irregular mass, from the under surface of which the cranial nerves issue to be distributed to the organs of sense, the face, and structures in the neck, chest, and abdominal cavity. Posteriorly, there is the under surface of the *cerebellum* and the *medulla oblongata*, while in front of the latter, the *pons varoli* is seen passing transversely. Emerging from the fore part of the *pons*, and separating from each other as they pass upwards and outwards, are two bands of white matter, called the *peduncles* or *crura* of the C. Each of these is crossed by a flattened band named the *optic tract.* The two optic tracts converge to form one mass, the *optic commissure,* from the fore part of which the optic nerves issue.

The interior of the C. may be examined by making transverse sections from above downwards. This was the method pursued by the older anatomists, who gave fanciful names to the various parts thus displayed, which render the subject singularly difficult to the modern student. When a horizontal section is thus made a little above the level of the *corpus callosum,* it is seen that the central mass of the C. is composed of white matter—that is, of nerve-fibres, while the margins are covered by a layer of grey matter, consisting of nerve-cells, connective tissue, &c. When the section is cut as low as the *corpus callosum,* it will be seen that the white matter of this structure passes into the hemisphere on each side. If the fibres of the *corpus callosum* are now divided longitudinally a short distance on each side of the median line, two cavities in the interior of the C. are opened, named the *lateral ventricles.* These cavities are lined by a serous membrane, which secretes a thin fluid, and they are connected with similar cavities in the brain.

There are certain special structures to be briefly alluded to, because they are usually included by anatomists and physiologists in what is known as the C.

Corpora Striata.—These are two large masses of nervous matter seen in the floor of the lateral ventricles.

Optic Thalami.—These are two masses, composed chiefly of grey matter, seen in the lateral ventricles, and forming the outer walls of the third ventricle. They are in intimate connection with the cerebral peduncles.

Corpora Quadrigemina.—These are four bodies composed of nervous matter placed above a foramen which leads from the third to the fourth ventricle. The latter ventricle is the space between the posterior aspect of the *medulla oblongata* and the cerebellum.

Pineal Gland.—This is a small red body found in front of the *corpora quadrigemina.* It is not a nervous organ, although the ancients believed it to be the seat of the soul, but it in all probability belongs to the group of glands known as the Bloody Glands (q. v.).

2. *Minute Structure.*—The C. is composed of white and of grey matter. The white matter consists of nerve-fibres, and the grey matter of nerve-cells and delicate nerve-fibres embedded in a very fine variety of connective tissue known as *neuroglia.* The grey matter is distributed over the surface of the convolutions, and is also collected in masses in the interior of various parts. These local masses are usually termed *nuclei.* When examined in the fresh condition, the cerebral matter is so soft and pulpy that little can be learnt regarding its minute structure. If it is hardened, cut, stained, and mounted in a proper manner, the structure can be studied with ease. (See MICROSCOPICAL MANIPULATION.) When a vertical section is made through a cerebral convolution, and examined under a power of thirty diameters, it is seen that there are no fewer than six layers of white and grey matter alternating with each other. There is, however, no distinct line of demarcation between the various layers. They glide gradually into each other. When seen under a magnifying power of 250 or 300 diameters, the surface of the convolution presents a molecular appearance. Here and there are minute vessels which pass into the brain from the *pia mater.* The remainder of the structure is composed of *neuroglia.* Deeper in the substance of the convolution two kinds of nerve-cells are found : (1) small round cells about $\frac{1}{4000}$ of an inch in diameter, similar to those found in the middle or rusty layer of the Cerebellum (q. v.); and (2) larger cells of a pyramidal shape, having the apex directed towards the surface of the brain. Each of these cells has at least three processes (sometimes four), by means of which they are connected together, and by which they unite with nerve-fibres which may ramify through the body. In addition to these nerve-cells there are numerous delicate nerve-fibres ramifying in various directions. Many of these pass longitudinally, forming a commissural system which connects one convolution with another. Still deeper in the substance of the brain modern investigation has shown the existence of large multipolar cells, that is, cells having five or more processes, somewhat similar to those found in the spinal cord.

Grey matter in the form of *nuclei* has also been found in the *corpora striata, optic thalami,* and *corpora quadrigemina,* but the exact connection of these with other parts has not been satisfactorily demonstrated.

3. *Physiology.*—The C. is the part of the brain more immediately connected with all mental acts, including intellect, will, emotion or feeling, and sensation. It is also the part associated with the power of voluntary motion. That these functions are dependent on the integrity of the grey matter on the surface of the brain is proved by the following considerations :—(1) In the animal kingdom generally a correspondence is observed between the quantity of grey matter and the sagacity of the animal. (2) At birth the grey matter of the C. is thin, so much so that the convolutions are marked out only by shallow fissures, which afterwards become the *sulci* by development of the grey matter *pari passu* with the growth of intelligence. (3) Experimental research proves that on slicing away the grey matter from the surface of the brain, the animal loses all the phenomena of mind, and becomes dull and stupid in proportion to the quantity of cortical substance removed. (4) Observation of diseases of the brain at the bedside shows that in those cases in which the disease has been afterwards found to commence at the circumference of the brain, and proceed towards the centre, the mental faculties are affected *first ;* whereas in those diseases which commence at the central parts of the organ, and proceed towards the circumference, they are affected *last.*

The function of the *white* matter of the brain is to conduct nervous impressions in various directions. Disease of the white matter, such as destruction by a clot of blood, as in Apoplexy (q. v.), is followed by paralysis, either of motion or of sensibility, according as motor or sensory nerves are affected.

The deeper nuclei in the *corpora striata, optic thalami,* &c., have no doubt special functions, though these have not yet been accurately determined.

Corpora Striata.—These bodies are generally believed to be connected with motion. Destruction of even a small portion, from any cause, produces paralysis on the opposite side of the body. (See HEMIPLEGIA.) This is owing to the fact that the motor fibres, which pass down from these bodies to the spinal cord, from thence to be distributed to various muscles, decussate or cross over to the other side in the *medulla oblongata.* (See MEDULLA OBLONGATA.) Disease limited to the convolutions, and not affecting the *corpora striata,* is not attended by paralysis, but causes insanity.

The *Optic Thalami* are connected with sensation, that is, they receive sensory impressions from various parts of the body which they transmit to the cerebral hemispheres. Disease of these structures causes either perversion or loss of sensibility in various parts of the body, sometimes on the same side as the lesion, but usually on the opposite.

The *Corpora Quadrigemina* are undoubtedly connected with vision. They are the homologues of the optic lobes of birds. They attain a great size in birds, but are much smaller in mammals. Disease of the *corpora quadrigemina* is followed by loss of vision, with complete dilatation of the pupil of the eye. Brown-Séquard found that, puncturing these bodies on the left side, the right eye was convulsed while the other was normal. After the injury, also, the animal walked round and round in a circle, after the manner of a horse in a circus, that is, it appeared to be impelled by an irresistible force to move in one circular direction.

Recent Researches.—The method of research by vivisection is open to many objections, the chief of which is, that the severity of the operation and the loss of blood may cause such a state of shock as to vitiate any inferences that might be drawn from the facts recorded. A new method, however, has been devised, namely, that of stimulating the nervous centres by electricity, and observing the results. Until recently it has been accepted by all physiological authorities that the cerebral hemispheres are destitute of irritability. It was apparently shown by Longet, Majendie, Matteucci, Weber, Budge, Schiff, and others, that irritation of the surface of the hemispheres called forth no muscular movements. It was consequently concluded that the cerebral convolutions over their entire extent were associated with the phenomena of the mind. The method of irritating the surface of the brain with a weak galvanic current was pursued in Germany by Fritsch and Hitzig conjointly, and in England by Ferrier.

The commencement of this method of inquiry dates from an observation made by Hitzig on a wounded soldier during the Franco-Prussian war, that galvanic irritation of a portion of the cerebral hemispheres excited contractions of the muscles of the orbit. Experiments on the lower animals were begun by Hitzig and Fritsch when peace was restored. The method was very simple. A portion of the *calvarium* was removed from dogs, the sensitive *dura mater* was split up and carefully removed from the surface of the convolutions, and areas on these were then irritated by a weak continuous current. The result of these inquiries may be briefly stated as follows:—1. In the anterior portions of the surface of the hemispheres there are certain definite regions irritation of which causes muscular movements on the opposite side of the body. 2. Irritation of the posterior lobes produce no muscular movements.

Dr Ferrier's researches were made in the first instance in the pathological laboratory of the West Riding Asylum, and afterwards in the laboratory of the Brown Institution, London. Dr Ferrier has experimented on pigeons, fowls, guinea-pigs, rabbits, jackals, and monkeys. The method of experiment is that already described as the one pursued by Fritsch and Hitzig. The irritating current was derived from the secondary coil of Du Bois-Reymond's induction machine, the primary coil of which was in connection with one Stöhrer's cell (with carbon and zinc elements). By moving the secondary coil in the sliding board, and thus increasing or diminishing the distance from the primary coil, the strength of the current may be carefully graduated. Dr Ferrier has observed the following phenomena:—1. Stimulation of the surface of the hemispheres causes a determination of blood to the part stimulated. 2. Stimulation of areas on the surface of the anterior lobes of the hemispheres causes muscular movements on the opposite side of the body. 3. Long-continued Faradisation causes convulsions of an epileptiform character. The convulsions were always preceded by 'an excited hyperæmic condition of the cortical matter of the hemispheres.' 4. As regards the presence of motor centres in the C., the two sides of the brain are completely symmetrical. 5. Irritation of the posterior lobes is not followed by muscular movements. 6. In certain animals the centres for special movements are more differentiated than in other animals, in a manner corresponding to the habits of the animal. Thus, the centres for the lips of the rabbit, the tail of the dog, and the paw of the cat are highly differentiated. Various other methods of experimentation recently employed support the view that in the anterior lobes of the cerebral hemispheres there are centres connected with voluntary movements, and that these centres are distinct from each other. These facts so far are in support of the doctrine long ago put forth by Gall and Spurzheim, the founders of phrenology, that the brain is a compound organ, having parts connected with special faculties. (See PHRENOLOGY.) These researches have also important bearings on the diagnosis and treatment of many diseases of the brain. See EPILEPSY, INSANITY, CHOREA, HEMIPLEGIA, PARAPLEGIA.

Cereop'sis ('wax-face'), a genus of natatorial birds, nearly allied to the *Anserinæ* or geese, and of which the *C. Novæ Hollandiæ*, of New Holland, is a familiar example. These birds have the front of the head covered with a yellow skin. The legs are longer than in ordinary geese, and the extremities of the tibiæ or shins are invested by a naked skin.

Ce'res, the name under which the Romans worshipped the *Dêmêtêr* of the Greeks. According to the Greek myth, she was the daughter of *Kronos* and *Rhea*, and the mother of Proserpina, Cora or Persephonê, whose rape by 'gloomy Dis' (Aïdoneus or Pluto) forms the chief incident by which C. is individually known. She wandered in human form in search of her daughter, and deprived the earth of its fertility till Zeus was compelled to send Hermes to Erebus to bring back the maiden. Aïdoneus allowed her to return on the condition that Proserpina should spend the winter in Erebus, while the rest of the year should be spent with her mother. It is difficult to believe that the myth is not symbolic of the apparent concealment of natural life in the under world during the gloom of winter, and its joyous reappearance in the spring. The analysis of the names favours this view. The Greek myth has its counterpart in some measure in the tales told by the Norsemen of the Niflungs. As the all-nourishing Earth-mother, C. is the inventress of agriculture, the ameliorator of life, the creator of the feeling of patriotism, and of a regard for law and order, whence she was called *Thesmophoros*. C.'s worship was established at Eleusis, but soon extended over Attica, the Peloponnesus, the Isles of the Ægean, the coasts of Asia Minor and Sicily, whence it passed to Rome. (See ELEUSINIA.) From the colour of the ripened grain, she was known as the yellow goddess, and from the bounties of the harvest-time, as the mother of riches. The sacrifices offered to her consisted of pigs (the symbol of fertility), cows, honey-cakes, and fruits. In works of art she is represented with a long robe, a wreath of poppies or corn-ears, and carrying a sickle or a torch. Her feast at Rome (*Cerealia*) was celebrated on the 13th, or, according to others, on the 7th of April.

Ceres, the first-discovered of the Asteroids (q. v.), observed by Piazzi of Palermo on January 1, 1801. It is very small, appearing as a star of the seventh magnitude, and having a diameter variously estimated from 160 to 1600 miles.

Ce'reus, a genus of plants of the natural order *Cactaceæ*. There are in all about 100 species, many of them producing magnificent flowers. Some, like *C. speciosissimus* of Mexico, are common in our conservatories. *C. giganteus*, the Suwarrow or Saguaro of Mexico, will reach a height of 50 or 60 feet. The fruit is eaten. (See CACTACEÆ.) *C. Macdonaldiæ* is a native of Honduras, and *C. grandiflorus*, the night-flowering C., is another well-known species of the W. Indies.

Cerigno'la, La, a town in the province of Foggia, S. Italy, 25 miles S.E. of Foggia, stands on rising ground, and has an active trade in almonds, and extensive cotton manufactures. Pop. of commune, 21,639. Here, on the 28th April 1503, the Spaniards, under Duke Gonsalvo of Cordova, achieved supremacy in Naples by a victory gained over the French, led by the Duke of Nemours, who was killed. In the vicinity of C., on the W. shore of Lake Salpi, are the ruins of the Apulian town of *Salapia*, which was destroyed by the Romans during the great Punic War.

Cer'igo (anc. *Cythêra*), the most southern of the Ionian Islands, lies to the S. of the Morea, and is a heptarchy in the nomarchy of Argolis and Corinth. Area, 107 sq. miles; pop. (1864) 14,454. It is in general mountainous and barren, but some of the valleys produce grain, vines, and olives, and other southern fruits. The honey of the island is celebrated, and so are the fish of its shores, in which a large trade is carried on. The capital, Kapsali, has a pop. of 1500. Near San Nikolo, where there is safe anchorage, are some ruins, supposed to mark the site of the ancient city of Cythera, where Venus had a splendid temple, and from which she took the name of Cytherean.

Cerin'thus was a heresiarch of Jewish extraction in the 1st c., whose system was a mixture of Judaism and Gnosticism, and against whose errors the Gospel of John is supposed to have been written. His esoteric doctrine being chiefly founded on the Cabala, he was the precursor of the Ebionites, and also of the Gnostics. His Judaism amounted to this, that circumcision and the ceremonial law were still binding on Christians. Regarding Christ, C. held with Basilides that the Logos (Christ) descended on the man Jesus at his baptism. In his system Millennarianism (q. v.) also first appears, and that of a very gross description, the delights of the millennium being to consist chiefly in carnal gratifications. See Paulus' *Historia C.* (Jena, 1779), and Neander's *Kirchengeschichte*.

Cerith'ium, a genus of *Gasteropodous* molluscs, representing the family *Cerithiadæ*, which in turn is included in the *Prosobranchiate* division of the above class. The genus *Cerithium* (of which *C. adversum*, *C. reticulatum*, and *C. metula* are familiar species) possesses a long, spiral, tapering shell, the aperture being small, and its canal tortuous. The outer lip is expanded, the inner lip thickened, and the operculum is horny and spiral. Many fossil species are known.

Ce'rium is a rare metal contained in the minerals *Gadolinite*, *Cerite*, and *Cryptolite*, and was named after the planet Ceres. It was discovered in 1803 by Klaproth, and by Hisinger and Berzelius. Oxalate of C. has been used medicinally in cases of pyrosis and obstinate vomiting. C. is usually accompanied in its ores by two other metals, called *Lanthanum* and *Didymium*, possessing much the same properties, and separable from it with difficulty.

Cerope'gia, a genus of herbaceous plants and shrubs, comprising about fifty species, natives of India and Africa, belonging to the natural order *Asclepiadaceæ*. Several species are eaten either as a salad, or the leaves, stems, and tubers are boiled as potherbs.

Cerox'ylon. See WAX-PALM.

Cerre'to, a town of S. Italy, province of Benevento, 22 miles N.E. of Capua, on the slope of Mount Matese, has a cathedral and manufactures of coarse cloth. Good wine is produced in the neighbourhood. C. was partly destroyed by an earthquake in 1688. Pop. 6469.

Cerr'o de Pasco, a mining city of Peru, the capital of the province of Pasco, department of Junin, 140 miles N.E. of Lima, and 14,100 feet above the level of the sea. The pop., a mixture of all races and nationalities, fluctuates with the state of the mines, being sometimes as high as 14,000, and sometimes much less. The silver-mines, discovered by an Indian in 1630, are the richest in the republic, and coal is found in the vicinity.

Certal'do, a town of Central Italy, province of Florence, on the right bank of the Elsa, and 18 miles S.W. of Florence, with which it is connected by railway. Boccaccio at one time resided at C., and here he died. His house still exists, and contains some memorials of the great author. On the 21st December 1875, exactly 500 years after his death, a solemn commemoration was here held in his honour, and the first stone of a monument to his memory was laid in the Piazza Solferino. Pop. 6562.

Certhi'dæ, a family of Tenuirostral *Insessores* or perching-birds, popularly known as that of the 'Creepers.' These birds are distinguished chiefly by their negative characters. The bill is elongated and slender, the nostrils opening at its base; the legs are usually short, and the toes are long, and provided with long sharp claws. The song is generally melodious. The name 'creepers' indicates the habits of these birds in running swiftly about trees in search of insects, which form their chief food. They are for the most part of small size. Examples of the group are seen in the wrens, lyre-birds, nuthatches, true creepers (*Certhinæ*), tree-creepers, oven-birds, &c.

Certificate, as a legal term, has nearly the same meaning as in ordinary language.

Certifica'tion, in Scotch law, signifies properly the *assurance* given to any one before the court of the course which it will follow in case of disobedience to the summons or other order of the court. C. is either expressed or implied. In the summons, the C. is nothing more than an absolute assurance to the defender that, if he fails to appear in the usual manner, the judge will decree in his absence. The most important C., however, is that in the process of Reduction-Improbation (q. v.). In that action, two terms are allowed to the defender for production of the writ sought to be reduced, and after the expiration of these terms ten days longer are allowed, but should the writ not then be produced, decree of C. may be pronounced by the judge, the effect of which is to hold the writ false and fabricated; and this decree can hardly be recalled, even though it has been pronounced in absence.

Cer'tified Copy. See EVIDENCE.

Certiora'ri, in English law, is an original writ issuing out of Chancery, the Queen's Bench, or other divisions of the Supreme Court, directed in the Queen's name to the judges or officers of inferior courts, commanding them to return the record of a cause or matter depending before them, to the end that the party may have the more sure and speedy justice before Her Majesty, or such justices as she shall assign to determine the cause. This writ can only be granted on matters of law, and cannot be had to remove causes after issue is joined.

Certo'sa di Pa'via, La, a celebrated Carthusian monastery in the neighbourhood of Pavia, founded in 1396 by Giovanni Galeazzo Visconti, first Duke of Milan, as an expiatory offering for the murder of his uncle. The church is a splendid building; some of its twelve interior chapels are finely decorated with frescoes and paintings. Its façade, designed by Ambrogio Borgognone (da Fossano) in 1473, is a gorgeous specimen of the Early Renaissance. It is formed throughout of white marble, and so lavishly adorned with sculptures that the architectural design is almost hidden. In the interior there are several handsome monuments; but the most striking objects are the magnificent high altar and the monumental tomb of the founder.

Ceru'men. This is a yellow secretion yielded by a variety of sebaceous glands (see SKIN) found in the skin lining the canal of the external ear. (See EAR.) It has a bitter taste, and appears to consist of a mixture of oily and nitrogenous matter. It also contains carbonate of soda and phosphate of lime. Its bitter taste may possibly prevent the entrance of insects into the external ear. When in excessive quantity it is known as *ear-wax.* Occasionally it must be removed by gentle syringing with tepid soap and water, as an excessive amount causes partial deafness.

Cervan'tes, Saave'dra, Miguel de, author of *Don Quixote,* was born at Alcala de Henares, October 9, 1547. After studying at Salamanca and Madrid, and devoting himself particularly to poetry and romance, at the age of twenty-three he served as a volunteer against the Turks, and had his left hand maimed by a gunshot wound at the battle of Lepanto. To this accident coarse and cruel reference was subsequently made by the so-called Avellaneda in the prologue to his continuation of *Don Quixote.* C., captured by Algerine pirates, was a slave among the infidels for four years; but being ransomed in 1580, he rejoined the army, and acquired fresh distinction in the expedition to the Azores. He retired from military service in 1584, and in the same year published his *Galatea,* a pastoral romance. For several years after this he was a prolific dramatic writer, and experienced the fate then attending too many writers of this class, that, namely, of chronic poverty. In 1605 appeared at Madrid the first part of his *Don Quixote,* one of the highest efforts of imaginative genius which universal literature can boast of. The work is a satire, but is informed with the finest spirit of poetry. Its object was not, as many suppose, to ridicule knight-errantry, for that had expired a century before his birth, but the absurd romances written about it, the morbid appetite for which had become a national weakness, and was growing by what it constantly fed on. Like all works of the highest genius, it was replete, in the midst of its extravagances, with the most genuine human interest: its inner object being to show that the finer a nature is—the deeper, truer, purer, less selfish—in the same proportion will it be the butt of a coarse and selfish world. It presents us with a touching picture of the efforts of a pure but unpractical spirit to ameliorate the conditions of human life. The success of the work was complete; nor was it confined to Spain. But increased fame did not bring with it increased fortune. The proverbial poverty of authors still clung to C., though in the meantime he laboured hard at his vocation. In 1614 appeared a continuation of *Don Quixote* by an author under the assumed name of Alonzo Fernandez de Avellaneda. It was a poor travesty of the realistic portion of the work of C., of whom it was full of the bitterest abuse. C. felt this keenly, as may be gathered from several portions, especially the preface, of his own second part of *Don Quixote,* published in 1615. He represents the work of Avellaneda as being kicked up and down hell by devils, one of whom says, 'It is so bad, that if I myself wished to make it worse I should not succeed.' For some time before his death, which happened at Madrid, April 23, 1616 (the day on which Shakespeare died), his poverty had been relieved by the generosity of the Count of Lemos. His grave is unmarked by a stone, but the house in which he lived in Madrid was rebuilt in 1835, and attention is called to it by his bust, which adorns its front. It has been said that 'except, perhaps, the Bible, no book is so much and so little known.' Innumerable translations of it have been published. It has lately been translated into Norwegian, and copies in fifty languages are to be shown in the Exhibition at Philadelphia (1876). But from an ignorance of the language and of the allusions, most translations are defective; and Spanish scholars say that the English versions of Skelton, Smollett, Jarvis, and even of Clark, are extremely untrustworthy, most of them being merely renderings of imperfect French versions. That of Clark (Lond. 1868–69), however, is illustrated by Doré's splendid plates. An *edition de luxe* of a translation into Portuguese by the Viscount de Castillo, with Doré's illustrations, is to be issued by the Campanhia Litteraria of Oporto. One of the best known and happiest of the imitations of *Don Quixote* is Butler's *Hudibras.* Among the editions of the original it is sufficient to mention that of Madrid, 4 vols. 1780; that of the Madrid Academy, with a biography of C. by Navarette (5 vols. Mad. 1819); and Clemencin's edition, with an admirable commentary

(6 vols. Mad. 1833–39). C.'s collected works are contained in Baudry's *Collection de los Mejores Autores Españoles* (Par. 1840–41).

Cerve'ra, a town of Spain, province of Lerida, 31 miles E. of the city of Lerida, surrounded by dilapidated walls. Its university, transferred by Philip V. from Lerida in 1717, was removed to Barcelona in 1837–41, and since then the prosperity of the town has greatly declined. C. has a Gothic church and a Dominican convent; linen, woollen, hempen, and cotton, manufactures; and some trade in grain and cattle. Pop. 5300.

Cervet'ere', or **Cervet'ri** (the ancient *Cervæ*, called by the Greeks *Agylla*), a village of Latium, Central Italy, 27 miles W. by N. of Rome. Pop. 750. It was formerly one of the most powerful cities of S. Etruria, and many interesting Etruscan remains have been found here, especially in its sepulchres.

Cer'via, an episcopal city of Italy, province of Ravenna, on the Adriatic, 13 miles S.S.E. of Ravenna. In the *Valle di C.* are productive saltworks, which give employment to a large number of the population, estimated at from 5000 to 6000.

Cervidæ and **Cervus**. See DEER.

Cer'vin, Mont. See MATTERHORN.

Cervina'ra, a town of Italy, province of Avellino, 12 miles N.W. of Avellino, has a convent and six churches. Pop. 6328.

Ces'ari, Giusepp'e (called also *Giuseppino* and *Il Cavaliere d'Arpino*), was born in Rome about 1568, painted a number of figures at the age of thirteen, and on the credit of these was introduced to Pope Gregory XIII., by whom, and by his four successors, Popes Sixtus V., Clement VIII., Paul V., and Urban VIII., he was held in high favour as an artist, and liberally patronised. During his lifetime he monopolised public favour, although among his rivals were A. Caracci and Caravaggio; but his style, though animated, was superficial, and destitute of all the essential qualities of art. C. died in 1640.

Cesarott'i, Melchiore, an Italian poet, born 15th May 1730, at Padua, in the university of which he subsequently held the chair of Greek and Hebrew. He was an especial favourite of Napoleon, who loaded him with benefits. C. died 3d November 1808. His style, both in poetry and prose, is vigorous. A complete edition of his works in 42 volumes was published at Pisa (1805–13). Among these are a translation of Ossian (*Poësie di Ossian*), and versions of the Iliad both in verse and prose (*Iliade in Versi* and *Iliade in Prosa*). His essay on the philosophy of languages (*Saggio sulla Filosofia delle Lingue*) is C.'s most meritorious performance.

Cese'na, a town of Italy, province of Forli, on the right bank of the Savio. Its finest buildings are the cathedral, the town-hall, and the Capuchin church. C. has silkmills and a trade in wine, hemp, and vegetables. In the neighbourhood are valuable sulphur-mines. Pop. (1872) 33,871. Popes Pius VI. and VII. were born here, the latter of whom, in whose honour a colossal statue has been erected, founded a large hospital at C. Its library, established in 1452, has many valuable MSS.

Cess or **Assessment**. See LAND-TAX.

Cess'io Bono'rum, is a process in the law of Scotland by which a debtor, by making a cession of all that he has to his creditors, obtains an equitable relief. Jurisdiction in questions of C. B. is vested in the Court of Session and in the sheriffs. Any debtor in prison, or against whom a warrant of imprisonment has been issued, may apply for decree of C. B. and for interim protection. This petition is intimated in the *Edinburgh Gazette*. The petitioner then must lodge a statement of his affairs, with relative books and papers, with the sheriff-clerk. On an appointed day the debtor is examined on oath. If any creditor objects to the prayer of the petition, he is heard, and proof of averment will, if necessary, be allowed to him. The sheriff's judgment is subject to the review of the Court of Session, or of the Lord Ordinary during vacation, the Lord Ordinary's judgment being subject to review.

A decree of C. B. operates as an assignation of the movable estate of a debtor in favour of a trustee for his creditors. The trustee is under the supervision of the accountant in bankruptcy. (See ACCOUNTANT IN BANKRUPTCY.) The effect of a decree of C. B. not being to discharge the debtor, but merely to relieve him from the operation of personal diligence (see DILIGENCE), it affords no protection against the attachment by his creditors of any property which he may acquire subsequent to the decree, by his industry or otherwise. But the creditors are bound to realise and apply the property conveyed by the disposition *omnium bonorum* before they can attach that subsequently acquired.

Ces'tius, Pyramid of, built in the reign of Augustus, and still standing at Rome, commemorated a C. Cestius, who had filled respectively the offices of Epulo, prætor, and tribune of the people. It was used as a burial-place, and stands near the Porta Ostiensis (Porta San Paolo). The pyramid is 125 feet high, and 100 wide at the base. It is constructed of brick and tufa faced with marble, and the interior, coated with stucco, is decorated with paintings. There are extensive chambers for sepulture. In the Protestant cemetery in the neighbourhood repose the remains of Keats and Shelley.

Ces'toid Worms, a term formerly applied in zoology to the *Tæniada*, an order of Entozoa represented by the Tapeworms (q. v.) and allied genera on account of their flattened band-like or ribbon-like shape. For the same reason, the newer name of *Platyelmia* or 'Flat-worms' has been applied to the larger division, including the *Tæniada* and *Trematada* or Flukes (q. v.). The *Cystic Worms* (q. v.) are now also ascertained to be merely the immature forms of the Tæniada. The tapeworms, presenting us with familiar examples of C. W., are not true *worms*, and are not allied to the animals ordinarily known as such. Each tapeworm, composed of its numerous *joints* or *proglottides*, is in reality a compound organism; the joints being produced by budding from the *head*, or *nurse*, as it is termed, which latter portion constitutes the true animal. The segments so formed are to be viewed as *zooids*, or individuals, which make up by their assemblage the compound form. Each joint is the exact prototype of its neighbours, and contains little else than perfect male and female reproductive organs, together with certain vessels, belonging to the *water vascular system*, and nerve-cords. The joints forming the neck and head are modified; the head being very small and rounded, and provided with hooks and suckers for the adhesion of the organism to the walls of the intestine of its host. The first few joints constituting the neck are also small and immature; new joints being intercalated between the head and the already formed segments—these joints furthest from the head being thus the oldest or most mature. These organisms thus, in the absence of any distinct digestive system, live by simple imbibition of the fluids of their hosts.

Whilst the growth by budding of the single and compound individual worm is thus provided for by continuous budding, new organisms are also produced by a true process of generation. The joints with their contained eggs or ova—amounting in each joint to several thousands—are continually dropping away from the organism, and being voided by the animal infested by the tapeworm. The eggs can undergo no development within the host which contains their parent organism. But being voided, they are liberated by the decay of the joint, and such of the ova as are swallowed by another warm-blooded vertebrate animal are placed on the further road to development. Each little embryo thus swallowed liberates itself from the egg-capsule, and then consists of a minute vesicle provided with three pairs of flinty hooks. By means of the latter organs, the *proscolex*, as it is called, bores its way through the tissues of its first host, and proceeds sooner or later to ensconce itself within some organ—such as the liver, brain, &c. Here it surrounds itself with a capsule or cyst, and ultimately comes to consist of a little head provided with hooks and suckers, and of a terminal vesicle containing fluid. It is now known as the *resting-larva* or *scolex*; and formerly, when the connection of such organisms with the tapeworms was not understood, the scolices were accounted distinct animals, and were named *cystic worms* and *hydatids*. In this scolex form the animal must finally remain within its first host, and until it becomes introduced into the digestive canal of a second warm-blooded vertebrate host, it cannot develop further. If the flesh containing scolices be swallowed, however, by a second host, each little scolex simply attaches itself by its head to the wall of the intestine; the terminal cyst or vesicle drops off; the scolex head becomes thus the head of the future and mature tapeworm or *strobila*; and a process of budding produces the joints characteristic of the latter form. These developmental stages may thus be summed up:—

1. The egg set free by the liberation of the proglottis from the animal infested by the mature tapeworm or *strobila*.
2. The *proscolex* or embryo burrowing through the tissues of first host, and liberated from the egg.
3. The *scolex* or resting-larva in first host formed from the proscolex.
4. The scolex introduced into second host, losing its cyst, and by budding producing,
5. The perfect and mature *strobila* or tapeworm.

The cystic worms forming measly pork, when eaten by man, thus become developed into the *tænia solium* or tapeworm of man. The cystic worms of the sheep's brain which cause staggers in that animal, if swallowed by the dog, become the *tænia serrata* or dog's tapeworm; and the scolex of the mouse becomes the tapeworm of the cat. See also TAPEWORMS.

Cestra'cion, a genus of *Elasmobranchiate* fishes, including the form popularly known as the Port-Jackson shark (*C. Philippi*), inhabiting the Australian and Chinese seas. This form is the only living representative of the genus, which is included in a special division of the above order—that of the *Cestraphori*. This division is distinguished by the C. possessing a strong spine in front of each of the two dorsal fins, and the hinder teeth are obtusely shaped. An anal fin exists. The mouth of the Port-Jackson shark is filled with flat pavement-like teeth, adapted for crushing the molluscs and crustaceans on which this creature feeds. It is a harmless species of shark. The mouth is placed in front of the head, which is of large size, as also are the eyes. The group is well represented in a fossil state—the fin-spines and teeth of *Hybodus* and *Acrodus* being well preserved in the Mesozoic rocks.

Ces'trum, a genus of Solonaceous shrubs, natives of Brazil, some of which, from the possession of a bitter principle like quinine, can be used as diuretics and for other medicinal purposes. A few are cultivated in our gardens.

Ces'tui que Trust, in English law, is the person or persons in a trust for whom the trustee holds an estate or any interest connected with it. Neither the common law nor spiritual courts having any cognisance in matters of trust, should any question arise between the trustee and the C. q. T., it must be determined by a court of equity. The analogous term in Scotch law is Beneficiary (q. v.). See also TRUST, TRUSTEE.

Cestui que Vie is one for whose lifetime lands or tenements are granted.

Ces'tus (Gr. *kestos*, 'stitched, embroidered'), any band or girth embroidered with love-awakening representations, but applied particularly to the charmed zone or girdle of Venus. With this she captivated Mars; and Juno borrowed it to secure the affections of Jupiter.—**C.**, otherwise **Cæstus** (Lat. *cædere*, 'to kill'), thongs of leather bound round the hands of Greek and Roman boxers to enforce their blows. Latterly it was a most formidable implement, covered with knots and nails, and loaded with lead and iron, and therefore not inappropriately called a 'limb-breaker.'

Ceta'cea, the order of Mammalia including the whales, dolphins, porpoises, and their allies. The Manatees (q. v.) or Sea-cows and Dugongs (q. v.) have been separated from the C., on account of structural differences, to form a separate mammalian order, that of the *Sirenia*. The C. are adapted for an aquatic life, the body being fish-like in conformation. The front limbs are present in the form of swimming-paddles, but no hind limbs are developed, although traces of the pelvic or haunch bones, and even of rudiments of the thigh, may be found in the skeletons of some forms. The body terminates behind in a powerful caudal or tail fin, which is set transversely, or across the body, instead of vertically as in fishes. A dorsal fin may or may not exist. No external ears are developed. The nostrils may be double or single, and being placed towards the top of the head, form 'blow-holes.' The body may be completely destitute of hairs. The testes remain within the abdominal cavity throughout life. The teats number two, and are placed in the groin. The head is generally of disproportional size when compared with the rest of the body, and no distinct neck is perceptible, the vertebræ of this region in fact being anchylosed or ossified together. The lumbar region, or that of the loins, is elongated, and none of the vertebræ coalesce to form the bone seen in most other forms, and known as the *Sacrum* (q. v.). No collar-bones are developed. A single set of teeth only is developed in C., and frequently the adult, as in *Balænidæ*, may be entirely destitute of teeth, although they may be represented in the fœtal or embryonic state. This order of mammals includes the largest of living beings, and is exceedingly interesting, not only from a structural point of view, but also from a commercial aspect, inasmuch as these animals form objects of pursuit for the sake of the oil afforded by the thick layer of fat or blubber which invests the body, reducing its specific gravity and maintaining an equable temperature, and also for the whalebone afforded by some members of the group, for their skins, and for other less notable and special products, such as spermaceti and ambergris.

The order is classified generally into five families. The *Balænidæ* or Whalebone whales, represented by the *Balæna mysticetus*, or Greenland whale; the *B. Australis;* the furrowed whales, such as those belonging to the genera *Megaptera*, *Balænoptera* (Rorqual), and *Physalus* (Finner whales), are chiefly distinguished by the want of teeth in the adult state, and by the presence of baleen or whalebone plates borne by the palate; the blow-holes being placed on the top of the head. The second family is that of the *Physeteridæ*, or sperm-whales, sometimes known as that of the *Catodontidæ*. In these forms no baleen is developed; the lower jaw only possesses teeth in the adult; the head being very large, and forming about one-third the length of the body. The dolphins, porpoises, grampuses, and narwhals (*Delphinidæ*) form the third group, these animals being recognised by their generally possessing numerous teeth in both jaws; by the nostrils being united and placed on the top of the head; and by the head not being disproportionately large—forming only about one-seventh of the body's length. The fourth division is that of the beaked whales (*Rhynchoceti*), represented by the genera *Hyperoodon* of the N. Atlantic, and *Ziphius*, found in the S. Atlantic Ocean and Mediterranean Sea. These whales have a pointed snout or rostrum, a small dorsal fin, a single blow-hole, and a single pair of teeth only, borne by the lower jaw; the other teeth do not cut the gum. The fifth family contains only fossil genera, and is known as that of the *Zeuglodontidæ*. The best-known examples are *Zeuglodon* (from Eocene and Miocene rocks), and *Squalodon* (from Miocene and Pliocene strata). These latter forms had molar teeth implanted by two fangs, and they must therefore have possessed two sets of teeth, or were *diphyodont*.

Cet'erach, a genus of Ferns, to which in former times extraordinary properties were ascribed, *e.g.*, that it had so 'marvellous an influence on the spleen' that it destroyed that not very important organ in the Cretan swine that fed upon it; hence it and other ferns are called to this day 'spleenworts.' On the coast of Wales, our only British species, *C. officinarium*, is used as a bait in rock-cod fishing.

Ceto'tolites, the name applied to certain fossil remains, believed to be the ear-bones, and to teeth presumably of *Cetaceans* (q. v.) or whales. These organisms occur chiefly in the red crag of the Pliocene formations, and may be found in large quantities. It is probable that they may have been deposited in older strata than the Pliocene, and that they may have been washed out into these deposits.

Cetra'ria. See ICELAND MOSS.

Cetra'ro, a coast-town of S. Italy, province of Cosenza, 19 miles N.W. of the city of Cosenza. Pop. about 6000, employed to a considerable extent in anchovy-fishing.

Cette, next to Marseille, the most important haven in the S. of France, and a fortified town of the first rank, in the department of Hérault, lies at the mouth of the Canal du Midi, and is connected with Bordeaux and Lyons by railway. It is built on a tongue of land between the Mediterranean and the navigable Etang de Than, and at the base of a precipitous chalk hill, some 500 feet high, from which it is overlooked by the citadel, while it is further defended by several forts. The harbour admits some 400 vessels, and is sheltered by long moles, on one of which is erected a lighthouse, about 100 feet high. Two beacons also are placed on Fort Richelieu, at a height of 230 feet above the sea. The manufactures are chiefly liqueurs, perfumeries, soap, and chemicals, which are exported in addition to large quantities of wine (Madeira, white Roussillon, &c.), brandy, salt, oil, and southern fruits. C. trades with all parts of the world, and in

1874 there entered the port 1397 vessels of 275,119 tons, and cleared 1598 of 339,997 tons. The sardine and oyster fisheries employ over 350 boats. As a bathing-place, C. attracts yearly some 4000 visitors. Pop. (1872) 24,103. The Mount of C. is the Mons Setius of the ancients.

Cettign'e, or **Cetin'ji**, the capital of Montenegro, 15 miles inland from the Austrian seaport of Cattaro, lies in a rock-girt valley some 3000 feet above the sea. It is a mere village with 700 inhabitants, but is the seat of the government of Montenegro, the see of a bishop, and has a small cathedral and a palace. C. arose round a convent founded here in 1478.

Ceu'ta (Span. *Ce-üta*, Arab. *Sebta*), a fortified town on the coast of Morocco, belongs to Spain, and has slight fishing and weaving industries. It is situated on the Punto-Leona, opposite Gibraltar, and at the foot of Mount Acho, the ancient *Abyla*, and one of the pillars of Hercules. The seat of a bishop, C. is also the strongest of the four Spanish *Presidios* (penal settlements) on this coast, but it has a bad harbour, and a commonplace cathedral is its only building of any pretence. Pop. 8200, of whom 3500 form the garrison, and some 2500 the prisoners for state and other offences. The other inhabitants are chiefly Arabs, negroes, and Jews. At the base of Abyla lay the two Roman colonies *Ad-Septem-Fratres* (Seven Brothers) and *Ad-Abylam*. A fort here, which was taken (534) by Justinian from the Vandals, bore the name of Septum or Septo in the 7th c. In 618 it was seized by the Western Goths, and in 711 by the Arabs, under whom it became an important town, where paper is said first to have been made by an Arab who brought the art from China. It successively belonged to the Almorades (1084), the Morinides (1273), and the Portuguese (1415). With the subjugation of Portugal by Philip II. it became Spanish in 1580. C. was the only possession on the African coast retained by Spain in 1640, when Portugal regained independence.

Cevennes' is a mountainous district, chiefly in the former political division of Languedoc, which separates the Rhone valley from the northern sources of the Garonne. It is traversed from N.E. to S.W. by a chain of mountains composed of granite overlapped by strata of the Jurassic system, and in the S. by limestone, which forms the '*causses*,' or plateaux terminating in cliffs 600 to 800 feet high. The whole district is tilted up towards the S.E., the highest point, M. Mezen, being 5794 feet in height. Sheep-farming on the upper slopes, and the rearing of silkworms on the lower, are the chief industries. The long winter has created a domestic manufacture of drugget and serge. The population is poor and primitive. It was this district which, after the revocation of the Edict of Nantes (1685), became the scene of the most furious *Dragonnades* against the Huguenots, who were too poor to leave the country, which Louvois wished to make literally 'a desert.' After the martyrdom of Claude Brousson, the people were maddened by the cruelties of the ecclesiastical inspector of missions, Chayla; a prophesying mania descended on them, and under Pierre Seguier, Cavalier, Laporte, Roland, and others, they rose in arms in the year 1702. They were called *Camisards* (from *camisole*, 'a blouse,' or *camise*, 'a white shirt,' or *camis*, 'a road-runner'), and by the Catholics *Barbets* (waterdogs). They burned Catholic churches, killed priests, levied imposts, and for three years maintained a guerilla war against an army of 60,000 veterans commanded by De Broglie and Montrevel. Châteaux were also burned, the priests and Catholics taking refuge in fortified towns. There is no doubt that the French generals were worsted, for the policy by which they prevailed was that of burning 466 Protestant villages, and slaughtering their inhabitants, as well as all those who attended conventicles. Pope Clement XI. granted a general remission of sins to all who should join the Florentines, or White Camisards, a body of royalist bravos organised to suppress them. It was Marshal Villars who finally suppressed the revolt in 1705. See *Histoire des Camisards* (2 vols. Lond. 1744); Court de Gebelin's *Histoire des Troubles des C., ou de la Guerre des Camisards* (3 vols. Villef. 1760; new ed. 1820); and Schulz's *Geschichte der Camisarden* (Weim. 1790).

Ceyl'anite. See SPINEL.

Ceylon' (the *Taprobane* of the classical geographers; Sansk. *Singhala*, Arab-Pers. *Sailan*), a beautiful and productive island, belonging to Britain, lies in the Indian Ocean, to the S.E. of the peninsula of India, from which it is only separated by the Gulf of Manaar and Palk's Strait, lat. 5° 55'-9° 51' N., and long. 79° 42'-81° 55' E. It is 266 miles long from Point Palmyra in the N. to Dondera Head in the S., is 140½ miles broad from Colombo to Sangemankande, and has an area of 24,454 sq. miles, and a pop. of 2,128,857, of whom 14,201 are white. The areas and populations of the provinces are as follows, according to an official return of 1870:—

Provinces.	Sq. miles.	Population.
Western	3,345	662,658
North-Western . . .	2,805	214,699
Southern	1,927	353,989
Eastern	4,545	90,601
Northern	6,062	426,597
Central	5,770	371,466
(Military)		2,847
Total . . .	24,454	2,128,857

Physical Features, &c.—In outline C. is pear-shaped, with the apex to the N., and its coast to the N. and N.W. is low and indented, but on the S. and S.E. it is bold and occasionally rocky. Trincomalee on the E. coast has a splendid harbour, and the roads of Colombo on the W. also afford secure anchorage. A rich alluvial belt, some 40 miles broad, encircles the island, and in the N. there is an extensive and fertile plain, while in the S. occurs the lofty highland region containing the heights Pedrotallagalla (8280 feet), Adam's Peak (7420 feet), and the plateau of Newerra Ellia. The centre of the island is partly occupied by a tableland, from 2000 to 3000 feet high, and the mountains are everywhere intersected by picturesque valleys, and are clad with rich forests. By far the largest river is the Mahavelli Ganga (200 miles), but there are many other streams. Those on the E. and N. filled the numerous but now ruined tanks, which formerly contributed so materially to the richness of the country. In the highlands there are several lakes, which supply abundant means of irrigating the rice-lands, and in the flat coast districts lagunes, occurring at intervals, have been made the basis of an extensive system of canals, the massive embankments of which are the ancient work of the Singhalese. The interior is traversed by several carriage-roads, but is still in parts a region of impenetrable jungles, mighty cataracts, and deep ravines.

Climate.—Throughout C. the climate is singularly diversified, but as a whole it is more healthy than that of the Carnatic. The mean temperature at Colombo is about 80°, and on the tableland of Newerra Ellia 62°; while the annual rainfall ranges from 30 to 120 inches. The hottest season is from March to May, after which the monsoons set in, accompanied by torrents of rains. A thunderstorm of terrific violence preludes the S.W. monsoon in May and the N.E monsoon in November, but during the rest of the year there is little atmospheric disturbance. After the rains malaria prevails at the foot of the mountains and on the banks of the rivers.

Productions, Animals, &c.—The far-famed beauty of the island is in great part due to the luxuriance of its vegetation, and the variety and magnificent hues of its flowering plants. Of these, together with ferns (250) and lycopods, there have been enumerated as many as 2670 indigenous species. But the flora of C. contains few genera not to be found on the Indian peninsula. Of the trees, the principal for timber and cabinet-wood are the satin-wood, teak, oak, calamander, ebony, and the Palmyra palm. Near the Buddhist temples the fig is grown, and the cocoa-nut, tamarind, lime, orange, cinnamon, plantain, rose-apple, and cachew-nut are among the other trees. The forests are rank with parasites, and brilliant with the flowers of the coral-tree, ixoras, Jonesias, erythrinas, &c. In the highlands the tree-fern and rhododendron grow to an enormous size. The principal products of the soil are coffee, rice, cotton, pepper, and tobacco. There are now (1876) some 500 coffee plantations, of 150,000 acres, and the average crop is about 950,000 cwt. annually. Of the animals of C., the chief are the elephant, leopard, tiger-cat, hyæna, jackal, bear, racoon, wild boar, and monkey. There are over 320 species of birds, including eagles, peregrine falcons, sunbirds, kingfishers, bulbuls, orioles, swallows, parroquets, pigeons, flamingoes, &c. Crocodiles swarm in the still water-tanks, and land tortoises are numerous. Only a few species of the snakes found are venomous.

Geology, Mineralogy, &c.—The geological formation of C. is mainly metamorphic, and the surface rock is invariably gneiss, overlaid occasionally by crystalline limestone. There is an absence of fossiliferous rocks, with the exception of recent formations on the coasts, as coral, &c. The famous gems of the island, the export of which amounts to £10,000 yearly, are sapphires, rubies, the oriental topaz, garnets, amethysts, cat's-eye, and cinnamon stone. Among the other minerals are the ores of iron, tin, tellurium, nickel, and cobalt, and also plumbago and anthracite. The great pearl-fishery of the Gulf of Manaar yields to the Government an annual revenue of £40,000.

Administration, Commerce, &c.—According to the constitution of 1831, the administration of C. is vested in a governor, an official executive council of five members, and a legislative council of fifteen, including four unofficial representatives. In 1872 the revenue, which mainly arises from customs and sales of public land, was £1,174,698, and the expenditure £1,062,994. The public debt incurred for the construction of railway lines was reduced in the end of 1872 to £640,000. In 1873 the various exports to Great Britain alone amounted to £4,331,006. Besides coffee, the annual value of which is £2,350,000, the staples of export are cocoa-nut oil (in 1873, £285,033) and cinnamon (£113,725). A railway, since 1867, runs from Colombo to Kandy, a distance of 75 miles. The coffee-planting employs some 129,200 Malabar coolies.

Ethnology, Religion, and History.—The inhabitants of C. are mainly Singhalese, a people most probably descended from the Gangetic nation, which is said to have colonised the island in 543 B.C. This people are in great part degraded and effeminate, and of their ancient customs they still cling to polyandry. Another numerous race, the Malabars or Tamils, especially occupying the small island of Jaffna in the N., are the descendants of invaders from the S. of Hindustan. The 'Moormen,' who are variously supposed to be of Arab and Persian origin, are by far the most intelligent of the native communities; while the Veddahs, a tribe of the aboriginal Yakkhos, are little better than savages, one section of them, the Rock Veddahs, having almost, if not altogether, sunk out of the order of human beings. Naturalised Europeans are called 'burghers.' Buddhism is the religion of the Singhalese, and according to the census of March 26, 1871, the number of Buddhists was 1,520,575; of Sivites, 464,414; of Roman Catholics, 182,613; of Mohammedans, 171,542; and of Protestants, 24,745. The treaty of 1815 secures the maintenance of Buddhism in the interior; and the British Government gave up the temple patronage, and the guardianship of the *Dalada* relic, or sacred tooth of Buddha, to the priests in 1847. These latter are divided into two orders—(1) the Samanaros, or ordinary priests, and (2) the Upasampada, or higher grade; but neither are educated, nor receive much respect apart from their office. C. has many splendid temples and shrines of great antiquity, of which perhaps the most remarkable is the ruined Dagoba of Jaytawanarama, 249 feet high, and 360 feet in diameter. It has been estimated that the erection of such a massive structure, even now, would occupy 500 bricklayers from six to seven years. The cave-temple of Dambool, built in 100 B.C., is loaded with sculptured ornament, at once gorgeous and grotesque. Another object of interest is the sacred Bo-Tree (q. v.) of Anarajapoora, which was planted, according to record, in 288 B.C., and is therefore the oldest known tree in the world. The prudence and energy of the old Singhalese kings is seen in the colossal reservoirs and numerous tanks, now partly ruined, scattered throughout the country.

The history of C. as far back as 543 B.C. is made known to us chiefly by the famous *Mahavanso*, a poetical chronicle in the Pali language, the authority of which, however, as a historical document, is at present challenged by scholars. The writer describes the invasion in 543 B.C. of Wijayo, a Gangetic prince, who subdues the Yakkhos, and founds the dynasty of Sihala (hence *Singhalese* and *C.*). Of the many kings of this line, the most renowned was Prakrama Bahu (1153), during whose reign 1470 tanks ('the seas of Prakrama') were constructed. Several invasions are recorded of hordes from the Malabar coast, but more noteworthy is the first visit, in 1505, of the Portuguese, who formed a settlement near Colombo, and after a career of gross cruelty and extortion, were driven out by the Dutch in 1658. The island was captured by a British expedition commanded by Colonel James Stuart in 1796, and was eventually ceded to Britain at the Peace of Amiens, March 27, 1802. The interior was still held, however, by the Kandyan king, Wikrama Raja Singha, who continued to rule his subjects with savage brutality. Certain native merchants, British subjects, having been seized and murdered by the King, war followed, and the Kandyan territory was annexed to the British crown in 1815. See Sir James Emerson Tennent, *C., Physical, Historical, and Topographical, &c.* (Lond. 1859); *Christianity in C.* (Lond. 1850); Dr Paul Goldsmidt, *Official Report on the Ancient Inscriptions in C.* (1875); L. de Zoysa, *Official Report on the Ancient MSS. in the Temple Libraries of C.* (1875); and *C., a General Description of the Island, Historical, Physical,* and *Statistical,* by an Officer, late of the Ceylon Rifles (2 vols. Lond. 1876).

Ceylon Moss, a seaweed sometimes imported, under the name of *Agar-agar*, for the sake of the nutritive, emollient, and demulcent jelly or decoction which can be made of it for the food of invalids and children. It is the product of *Gracilaria lichenoides* (*Plocaria candida*), *Gracilaria confervoides*, and other species of *Gracilaria*.

Ceyx. See KINGFISHER.

Cezim'bra, a seaport town, province of Estremadura, Portugal; about 20 miles S. of Lisbon, with an active fishing trade. Pop. about 5000.

Chab'lis, a town of France, department of the Yonne (Lower Burgundy), 11 miles E. of Auxerre. It has manufactures of cotton fabrics and biscuits, but the great source of its prosperity is the trade in wine. C. gives name to a white Burgundy of the second quality, which keeps its colour better than all other wines of the same sort, has considerable strength, and is very pleasant to the taste.

Chac'ma. See BABOON.

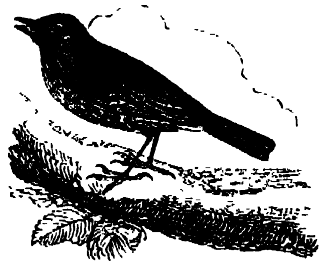
Chadd'a. See BENUE.

Chad'wick, Edwin, C.B., an eminent social reformer and economist, was born near Manchester, January 24, 1801, and was called to the bar in 1830, but never practised. An article on life assurances in the *Westminster Review* in 1828 attracted the notice of Jeremy Bentham, who left him a part of his library and a legacy. He was appointed assistant-commissioner to inquire into the working of the poor-laws in England and Wales, and his report, which was published in 1833, may be said to have been the main cause of the poor-law reforms which followed. C. was appointed secretary to the new Poor-Law Board, and subsequently Commissioner of the Board of Health. He retired from this post in 1854 with a pension. C. has been of great service to his country by the reports on various subjects, such as the condition of the Civil Service, the constitution of the constabulary force, the sanitary state of the country, pauper and industrial education (1859-60), which he has given either voluntarily or as a special Government commissioner. From the first he has taken a keen interest in the proceedings of the Association for the Promotion of Social Science. In 1868 he unsuccessfully contested the Kilmarnock Burghs against the sitting member, Mr Bouverie.

Chæronei'a (said to have been named after Chæron), a town of Bœotia, ancient Greece, near the Cephissus. Standing in a plain that commanded the entrance from Phocis to Bœotia, it became naturally the scene of many important military operations. It was captured by the Athenians B.C. 447, and again by Phalæcus during the Phocian war. At C., Philip, by defeating the allied forces of the Athenians and Bœotians (B.C. 338), destroyed the separate autonomies of the Greek states. The mound which covered the Thebans who fell in the battle was recently opened, and a colossal lion, emblematic of the spirit of the Thebans, and referred to by Pausanius and Strabo, was disinterred. At C. (B.C. 86) the generals of Mithridates were defeated by Sulla. A few remains of the citadel and some traces of the theatre still exist. The site of C. is now occupied by the modern village of *Kápurna*.

Chæ'todon, a genus of Teleostean fishes belonging to the family *Chætodontidæ*, a group distinguished by the compressed body, by the median fins being covered with scales of the ctenoid kind, by the dorsal fin being single, with a few spiny rays at its front portion, and by the ventral fins being jugular, or placed beneath the pectorals. These fishes mostly inhabit the tropical seas, and are generally brilliantly coloured, being banded in various elegant ways. From the scaly nature of their fins, the name *Squamipennes* was formerly applied to them. In C. itself the teeth are slender. In the genus *Brama*—of which genus the species *B. Raii* occurs in British seas—the teeth are curved and of stronger make. *Chelmon* is another genus common in Chinese waters, and, together with the *Toxotes* of Java, has the curious habit of shooting at flies with drops of water, so as to cause the insects to fall into the water, a habit which has gained for them the name of 'Archer fishes' (q. v.).

Cha'fer, a popular name given to many beetles (*e.g.*, rose C., cock C., bark C., &c.), the larvæ of which burrow into plant-tissues, and cause much damage to trees and shrubs. The name is merely a popular one, and has no scientific value.



Chaffinch.

Chaff'inch, Sc. **Shilfa** (*Fringilla cœlebs*), a species of *Fringillinæ* or true finches, Conirostral birds belonging to the order Insessores. The C. averages about 6 inches in length; the male being coloured bluish-grey in summer on the head and neck, with a chestnut back and black wings, which bear two white bars; the tail is black. The female resembles the male in her colours, which, however, are much less bright than those of her mate. The bird is found in Europe, Asia, N. Africa, and the Azores. It flies southward in winter from its northern habitats. In winter the sexes seem to separate, this fact having induced Linnæus to apply to the C. the specific name *Cœlebs*. Other naturalists, however, have suggested that these winter flocks really include young males, which somewhat resemble the females in their colours. The eggs number four or five, and are of a buff colour streaked with brown. The food consists of insects, but also of seeds and young plants—these birds are therefore destructive in gardens. The notes are clear, and the song, when trained, is very fine.

Chaff-Cutter. When it was found that chopped straw was much more economical than straw as it comes from the thrashing-machine, the chaff-cutter was designed to do away the old knife. The cutter is composed of two curved knives set in an iron wheel frame, and the straw is put in in bunches. It is self-feeding and can be made to cut any length.

Chag'res, a seaport in the department of Colon, republic of Columbia, at the mouth of the Rio de C., 6 miles W.S.W. of Aspinwall. It had a good trade prior to the opening of the Panama Railway in 1855, but is fast sinking into insignificance. The climate is extremely hot and unhealthy. Pop. 1000, mostly negroes. A project of basing an inter-oceanic canal on the *Rio de C.* was abandoned on account of the rapid flow of the river and the numerous waterfalls in its course.

Chaill'u, Paul Belloni du, the author of several works of African travel and adventure, was born in the S. of France about 1820. His father, a trader and consular agent of France at the river Gaboon, in the French West-African settlement of that name, carried C. thither when still a child. Educated at a Jesuit school in the Gaboon settlement, C. soon made himself acquainted with the customs and languages of the native tribes. In 1855 he visited North America, was naturalised at New York under the name of *Chaylion*, and became a member of the Philadelphia Academy of Natural Sciences, from whom in the same year he received the commission to penetrate from the W. coast into the interior of Equatorial Africa towards the sources of the Congo, and to report on the botany and zoology of the regions he should visit. This expedition employed C. for four years, during which time he made many surprising discoveries, the chief of which was his discovery of the Gorilla (q. v.). The first specimen of this immense creature killed by C. is preserved, together with many specimens of birds previously unknown, in the British Museum. A subsequent expedition was undertaken from the mouth of the Fernan-Vas River to Ashango Land in 1863. C.'s chief works, which are tinged with a certain hue of insincerity and exaggeration, and the first of which was, for a time, regarded by many as an imposition, are *Explorations and Adventures in Equatorial Africa, &c.* (New York and Lon. 1861), and *A Journey to Ashango Land*, (1867). Since 1867 C. has been established in America, where, as a lecturer and a writer of books of adventure for the young, he has won considerable popularity.

Chain, a measure used in surveying. 'Gunter's' C. is 66 feet long and divided into 100 links. One square Gunter's C. is one-tenth of an acre. Engineers frequently use a C. of 100 feet long, which has many advantages over the shorter one.

Chain Bridge. See SUSPENSION BRIDGE.

Chain Cables. See CABLES.

Chain-Mail or **Chain-Armour**, a defensive garment made of hammered iron links, which was much used in the 12th and 13th centuries. It was more flexible than plate-armour, but was not a certain protection against the thrust of a lance.

Chain-Shot, a nearly obsolete kind of ammunition, consisting of two cannon balls connected by a short chain, designed to destroy the rigging of ships. As Grapeshot (q. v.) has been found to answer the same purpose, the manufacture of C.-S. has been discontinued.

Chains, Hanging in. In former times it was usual to hang the bodies of atrocious criminals, after execution, in chains, on a gibbet near the spot where the crime had been committed. The spectacle was supposed to have a deterrent effect, and to give consolation to those who had suffered by the crime. An Act abolishing the practice was passed in 1834.

Chair, an article of furniture used as a seat, differing from a stool in having a rest for the back, and occasionally with supports for the arms. In a dwelling-house chairs are usually designed to harmonise with the other furnishings of the apartment in which they are placed, and therefore they vary very much in form and constructive materials. The chairs of the ancients were often of the most costly description, and their elegant forms have been frequently reproduced and varied by modern cabinetmakers. Numerous examples of antique seats are preserved in national European collections. Of the Egyptian chairs in the British Museum, one is formed of ebony, inlaid with ivory, except the seat, which is of plaited cane, as in modern chairs. The Romans, as well as the Greeks and Egyptians, constructed seats long enough to suit two persons. Two such *bisellia* in bronze, discovered at Pompeii, are now in the *Museo Borbonico* at Naples, and reproductions of them may be examined in the South Kensington Museum. Among other ancient and interesting chairs meriting notice may be mentioned that of St Peter, formed of wood overlaid with carved ivory work and gold, preserved in the Church of St Peter at Rome, and that of Dagobert, King of France in the 7th c. (now in the Louvre at Paris), made of bronze, partially gilt, and beautifully chased and chiselled. The chief English seat of the C. trade is at High Wycombe and neighbourhood, where extensive beech-woods supply material for common chairs. For the finer kinds of chairs, walnut, rosewood, mahogany, birch, oak, sycamore, and cherry are employed.

Chala'za. See OVULE and EGG.

Chalce'don, a city of ancient Bithynia, at the mouth of the Euxine, about 2 miles S. of the modern Scutari. It was founded by colonists from Megara seventeen years before Byzantium; and the settlers are said to have been alluded to by the oracle as 'blind,' for having selected an inferior site when a better was in their choice. It soon, however, acquired importance, and possessed many temples. During the struggles between Athens and Lacedæmon it changed sides several times: in B.C. 74 it came into the possession of Rome; under the empire it was a free city; Chosroes, the Persian, took it A.D. 616; and finally under the Turks it sunk into absolute ruin.—The *Council of C.*, held here A.D. 451 by command of the Emperor Marcian, condemned the heresies of the Nestorians (q. v.) and Monophysites (q. v.). It declared that in Christ there were two natures, so distinct that they could not be intermixed, yet so conjoined that in Christ there was but one person.

Chalce'dony, a variety of quartz occurring in mammillated, botryoidal, and stalactitic forms, found abundantly in many parts of Europe, and deriving its name from Chalcedon in

Asia Minor, where it was originally obtained. Agate, chrysoprase, carnelian, cat's eye, plasma, onyx, sardonyx, sard, flint, and hornstone, which are separately described under their respective heads, are all varieties of C. Common C. is usually semi-opaque, of a milk-white colour, tinged with yellow or blue, and occurs in Fifeshire, the Pentland Hills, the Hebrides, Faroe Isles, and in Cornwall and other English localities. It was largely used for minute sculpture by the ancients, and at the present day seals, brooches, vases, &c., are made of it.

Chalce'donyx, a variety of chalcedony, with alternate stripes of opaque white and translucent grey.

Chal'cis, the capital of Eubœa (Negropont), on the Strait of the Euripus, here 40 yards across, separating the island from the coast of Bœotia, but bridged over now, as it was also in ancient times. C. was a city of great antiquity, and is mentioned by Homer. It was one of the greatest of the Ionian cities, and sent out colonies to Macedonia, Italy, Sicily, and the Ægean Isles. It had at first an aristocratic government of its own, but afterwards became tributary to Athens. Under the Macedonians and the Romans it rose to great importance, as it commanded the navigation between the N. and S. of Greece. After the Venetians had held it for three centuries it was taken by the Turks in 1470. C., now called *Egripo* (q. v.), a name which is a corruption of Euripus, is the only considerable place in the island. Pop. (1870) 6447.

Chalcis, a genus of *Lacertilia* or lizards, included in the family *Chalcidæ*, and distinguished by being covered with scales arranged in cross rows; those of the back being prominent or keeled, and frequently spinous, whilst the sides may possess folds of skin covered with scales. The eyelids are developed, the ears exposed; the tongue fleshy, short, and bifid at the top. These lizards occur in both America and Africa, and a few in Asia.

The name C. is also given to a genus of *Hymenopterous* insects of minute size, with nearly veinless wings, and bent antennæ. The palpi are short, and the pupa destitute of a cocoon.

Chalcog'raphy (Gr. *chalcos*, 'copper or brass,' and *graphein*, 'to write'), engraving on copper. See Engraving.

Chaldæ'a. See Babylonia.

Chaldee'. See Aramæa.

Chal'der, a dry measure, formerly used in Scotland, which contained sixteen bolls. See Boll.

Chal'dron (Fr. *chaudron*, Lat. *caldarium*, 'a vessel for warm water'), an old dry measure, containing thirty-six heaped bushels, sometimes used in selling coal.

Chaleur' Bay, an inlet of the Gulf of St Lawrence, separates New Brunswick from the district of Caspé, receives the Ristigouche, extends from E. to W. for a distance of 100 miles, and has a maximum breadth of 20 miles. It receives its name (Fr. *chaleur*, 'heat') from its comparative freeness from ice in winter.

Chalif'erous Membrane. See Egg.

Chalk, Black, or **Drawing-Slate**, a kind of clay-slate, soft, black from the admixture of carbon, and used for drawing or writing.

Chalk, Red, a compact earthy clay, coloured with from 15 to 20 per cent. of oxide of iron, also called *reddle*.

Chalk, French, a variety of soapstone or steatite, a magnesic silicate.

Chalk Rocks. See Cretaceous System.

Chalk'ing the Door is, in Scotland, a mode of warning the tenants of burghal tenements to remove. The principal door of the tenement is marked with chalk forty days before Whitsunday, the Scotch term for removal. A certificate of execution, subscribed by the officer and two witnesses, is a warrant for a decree of removal by the burgh court. If the tenant does not obey the decree, he may be forcibly ejected on the expiration of a charge of six days.

Chall'enge. See Duel and Jury.

Chalm'ers, George, a historical antiquary and critic, of good family, was born at Fochabers in Morayshire in 1742. Educated at King's College, Aberdeen, he was trained to law in Edinburgh, but emigrated to America in 1763, and practised as a lawyer in Baltimore. A strong royalist, the revolutionary troubles compelled him to return to England, where he was appointed clerk to the Board of Trade in 1786. The remainder of his life was spent partly in erudite toil, and partly in miscellaneous pamphleteering. He died May 31, 1825. C.'s chief work is his *Caledonia, an Account, Historical, and Topographical, of N. Britain* (1807–24). It shows immense research, and the introduction is marked by a vigorous, and on the whole rational, conception of the state of Scotland ethnologically in the long and obscure period between the Roman invasion and the reign of Malcolm Canmore. The style lacks elegance and dignity, but its polemical tone gives it a factitious energy and liveliness. Of C.'s other productions, the most important is his edition of the *Poetical Works of Sir David Lindsay, with a Life of the Author, Prefatory Dissertations, and an Appropriate Glossary* (3 vols. 1806), which cannot be held to be superseded even by the later edition of Laing (2 vols. Edinb. 1871). His Lives of Defoe (1786), Ruddiman (1794), and Allan Ramsay (1800) are also noteworthy.

Chalmers, Thomas, an illustrious Scottish preacher, theologian, Church leader, philanthropist, and social reformer, was born at Anstruther, March 17, 1780. He matriculated as a student in St Andrew's University in 1791, became a licentiate of the Church of Scotland in 1799, having been admitted at an unusually early age, on the special plea that he was 'a lad o' pregnant pairts,' and in 1803 was ordained minister of Kilmany, a sequestered parish in the E. of Fife. At this time he was engrossed in scientific studies, which he pursued with such success, that he felt warranted in becoming a candidate, successively, for the Natural Philosophy chair at St Andrews, and for the Mathematical chair at Edinburgh. In 1808 appeared his *Inquiry into the Extent and Stability of National Resources.* About 1811, after a severe illness, and while preparing the article 'Christianity' for the *Edinburgh Encyclopædia*, C. experienced 'a great revolution in all his opinions about Christianity,' and 'this very great transition of sentiment' he attributed to the reading of Wilberforce's *Practical View.* As a result of this change, he abandoned his scientific pursuits, and put forth all his strength as a pastor and as a preacher of evangelical Christianity. In 1812, C. married Miss Grace Pratt. In 1814 he was appointed minister of the Tron Kirk of Glasgow, and during the nine years of his Glasgow ministry (from 1819 in the parish of St John's), he exercised a most commanding influence by the brilliancy and power of his pulpit oratory. His pulpit fame may be considered to have reached its height on the delivery of his famous *Astronomical Discourses* in 1816, and on his visit to London in 1817. 'All the world,' wrote Wilberforce, 'mad about C. Mighty London seems to do him homage.' 'The tartan,' said George Canning, 'beats us all.' During his residence in Glasgow, C. grappled manfully with the appalling ignorance and immorality of his populous city parishes, and indeed he accepted the incumbency of St John's on the condition that he should work 'his own parish in his own way,' and with the view of making, in opposition to the poor-law system of England, the famous experiment, in which he managed the whole pauperism of the parish by a Church agency, and with an income of about £300 kept down the pauperism of a population of 10,000. These great exertions, however, were too much for his constitution, and he accepted the proffered chair of Moral Philosophy at St Andrews, whence, in 1828, he was translated to the chair of Divinity at Edinburgh. His *Political Economy* appeared in 1832, and his Bridgewater treatise on *Adaptation of External Nature to the Moral and Intellectual Constitution of Man* in 1833. C. was chosen Moderator of the General Assembly of 1832. Between 1835 and 1841, by his great exertions in the cause of church extension, a sum of £305,747, 11s. 2½d. was raised, and 222 churches, more than one-fifth of its whole complement, were added to the Establishment. In 1838 he delivered in London his brilliant course of lectures in defence of religious Establishments. Throughout the Ten Years' Conflict of the 'Evangelical Party' on behalf of the Church's 'spiritual independence,' C. was their resolute and unwearied leader; and on the formation of the Free Church, May 18, 1843, he was called to the chair of its first General Assembly. He rendered it great service, especially by the constitution of its general Sustentation Fund, and he was chosen Professor of Divinity and Principal of its New College at Edinburgh. During his closing years of life, he planted in the West Port the territorial agencies that have since been so successfully employed both in Edinburgh and Glasgow in elevating the most degraded of our population. C. died suddenly at Morningside, Edinburgh, May 30, 1847. C. was elected D.D. of Glasgow in 1816, corresponding member of the Royal Institute of France in 1834, a Vice-President of the Royal Society of Edinburgh in 1835, and Doctor of Laws, Oxford, in the same year. These and many similar honours attest the great reputation enjoyed by C. during his life, a reputation which his books, wise, eloquent, and powerful though they be, can scarcely be expected adequately to maintain. The fame of C., however, will not be affected by the good or ill fortune of his books. His fiery energy, his perfervid genius, his single-hearted devotion to philanthropic work, the nobility of his aims, the width of his sympathies, and the goodness of his heart, secure for his name a place in the brief roll of great representative Scotchmen. See *Memoirs of the Life and Writings of Thos. C.* (Edinb. 1849), by his son-in-law, the Rev. Dr Hanna. The standard edition of his works is in thirty-four volumes (Edinb. Edmonston & Douglas).

Châl'ons-sur-Marne, the capital of the department Marne, France, on the Marne, the Marne-Rhine Canal, and the Strasburg Railway, 107 miles E. of Paris. It is old, irregularly built, and its ramparts are in great part destroyed, but it has many fine edifices, as the cathedral St Etienne, which was partly rebuilt in the 17th c., after having been burnt three times; the church St Alpin, dating from the 12th c.; the abbey St Pierre; the church of Notre Dame, &c. By the side of the canal of the Marne is a splendid public park (*Jard*) of 19 acres. The river is here crossed by a fine stone bridge. C. has manufactures of woollens, serge, bonnets, rope, &c., and a large trade, chiefly in Champagne wine, of which it exports annually about 1,000,000 bottles. Pop. (1872) 15,186. To the N.E. of the town is the Camp of C., formed by the Emperor Napoleon III. in 1856, and occupied successively by Canrobert and MacMahon during the late Franco-Prussian war. The Germans took possession of C. without opposition, August 21, 1870. C. is the ancient *Catalaunum* or *Durocatalaunum* of Gallia Belgica. Here Aurelian, in 274 A.D., overthrew Tetricus, and in 366 Jovinus defeated the Allemanni. The neighbouring plain (*Campi Catalaunici*) witnessed, in 451, the grand repulse of Attila and his Huns by the Roman and Visigothic forces.

Châlon-sur-Saone, a town in the department Saône-et-Loire, France, 35 miles N. of Mâcon by railway, on the Saône, here crossed by a magnificent iron bridge. It has a fine church of the 14th c., and is an active industrial centre. There are several distilleries, foundries, and a Government naval yard supplementary to that of Creuzot. The river is navigable for steamboats from this point, and C. does a large trade with the Mediterranean and the Atlantic in wine, iron, and cereals. Pop. (1872) 18,951. C. is the ancient *Caballonum* or *Cabillinum*, and was a flourishing place during the Roman occupation.

Chalybæ'us, a genus of birds inhabiting New Guinea, and noted for the brilliant metallic tints and lustres of their plumage. Skins of *C. Paradisæus*, with the feet cut off (to imitate the condition in which Birds of Paradise (q. v.) skins are generally imported), have been sold as skins of the latter birds. The bill in the genus is thick, and the nostrils are pierced in a broad Cere (q. v.).

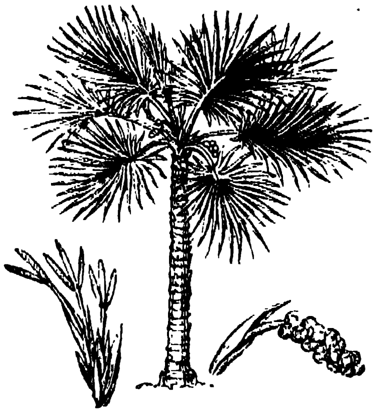
Chalybæus, Heinrich Moritz, a German philosopher, was born 3d July 1796 at Pfaffroda, Saxony, and studied at Leipsic. After teaching for several years at Vienna and Dresden, he was in 1839 appointed a professor in the University of Kiel. After the Slesvig-Holstein war he had to resign his professorship, but in a short time he was restored. He died at Dresden, 22d September 1862. Of his numerous works, the most important are the *Historische Entwickelung der Speculativen Philosophie von Kant bis Hegel* (Dresd. 1836, 5th ed. 1860), of which there is an English translation by Tulk (Lond. 1854); *System der Speculativen Ethik* (2 vols. Leips. 1850); and *Fundamental Philosophie* (Kiel, 1861).

Chalyb'eate (from Gr. *chalups*, 'iron') **Waters**, a form of mineral water, containing salts of iron in solution, the most common being that in which carbonate of iron is held in solution by an excess of carbonic acid. On exposure to the air such a water gives off carbonic acid, and deposits ferric hydrate in a state of fine division, which is the cause of the ochry appearance around such springs. C. W. have a kind of inky taste, and are in high repute for their tonic and invigorating effect on invalids. They are very numerous, Tunbridge Wells being an excellent example of the carbonated series.

Cha'ma, a genus of Lamellibranchiate mollusca, belonging to the *Siphonate* division of that class, and forming the type of the family *Chamidæ* or 'Clam-shells.' They possess inequivalve shells, which are attached to fixed objects. The mantle is closed, and the foot is of very small size. These shells occur chiefly in warm and tropical seas. The genus *Diceras* is also included in the family *Chamidæ*.

Chamade'. See PARLEY.

Chamædo'rea, a genus of palms containing upwards of forty species, natives of the forests of tropical America. The reed-like stems are used for walking-sticks, and the other unexpanded flower-spikes by the Mexicans as a potherb, under the name of *Tepejilote*.



Chamærops—Palmyra Palm.

Chamæ'rops, a genus of palms, the most northern of its order containing ten or twelve species, natives of Asia, Africa, America, and Southern Europe. They are generally dwarf in habit. *C. humilis* is the only European species, extending, however, only as far N. as Nice. From the leaves are made hats, brooms, baskets, thatch for houses, &c., and a fibre which is used as a substitute for horsehair. The coarse fibre at the base of the leaves is mixed by the Arabs with horsehair, to weave their tent-covers out of. In Algeria a paper and pasteboard are made of it, and in Spain, cordage and sailcloth; in France, where it is known as *African hair*, carpets are wove out of it. *C. fortunei* is a Chinese species. The coarse fibre from the base of the leaves is used in China to make hats, and the capes worn in wet weather by the rural population. The genus will grow in the open air very well as far N. as Edinburgh.

Chamala'ri, or **Chumalarhi**, a lofty peak of the Himalayas, on the N.W. frontier of Bhotan, some 80 miles N.E. of Darjiling, has a height of 23,944 feet. On its W. side rises the Ammochu river, a tributary of the Brahmaputra.

Chamber-Counsel, a barrister, or advocate, who devotes himself chiefly to giving legal opinions, seldom pleading in court.

Chamber of Commerce. Associations of merchants and others interested in trade, for the promotion and benefit of trade, are so called. Of foreign origin, these institutions have in Great Britain proved themselves especially valuable to the country. The Edinburgh C. of C., instituted in 1785, and incorporated by royal charter in 1786, was the first public body in the country which petitioned Parliament for an adoption of free-trade principles and for the abolition of the corn-laws. It also originated the movement which ended in the telegraph service being taken over by the state. This chamber consists of about *six hundred members*. The Manchester C. of C. was established in 1820. Its exertions in the cause of free-trade and their splendid results are of world-wide renown. (See FREE TRADE.) Chambers of Commerce now exist in all the great mercantile towns of Great Britain and Ireland. In 1860 there was established an 'association of Chambers of Commerce of the United Kingdom.' The C. of C. endeavours to attain its object by the consideration of all proposed legal measures affecting trade, and by petitioning Parliament according to the views of a majority of its members; by the collection of statistics bearing on the especial trade of its district, and by the advantage which combined has over individual enterprise. The C. of C. is also sometimes useful as a court of arbitration in mercantile questions; though it is to be feared that the expense and anxiety of ordinary legal procedure can never be wholly got rid of by any scheme for settlement by Arbitration (q. v.). The oldest C. of C. in France is that of Marseille, which was founded upwards of four centuries ago. The next in seniority is that of Dunkerque, established in 1700. The various chambers of France were suppressed in 1791 by a decree of the National Assembly, but they were reconstituted by a consular decree in 1802. Their organisation is now regulated by ordonnances of September 1851 and August 1852, their functions being to advise the Government as to the means of improving the national industry by legislation and the execution of public works, and as to taxation. The oldest C. of C. in Great Britain is that of Glasgow, which was instituted by royal charter in 1783.

Cham'berlain, Lord, was in former times an important member of Government in England, but his functions are now chiefly connected with the royal household. The Queen's tradesmen and artificers are appointed by him. All theatres in towns in which there is a royal palace require a licence from him, and without his licence no new play can be acted anywhere. He has a vice-chamberlain under him, and both are privy councillors, their tenure of office being dependent on that of the ministry of the time, of which the L. C. is a member. The salary of the L. C. is £2000 a year, that of the vice-chamberlain, £924. The Chamberlain of Scotland was an officer of high dignity and of supreme jurisdiction, but the office has been long since abolished.

Chamberlain, The Lord Great, is an officer of considerable importance. He is governor of the palace of Westminster, and on a coronation, or other solemn occasion, the keys of Westminster Hall are delivered to him. He has the care of the House of Lords during the sitting of Parliament. The Gentleman Usher of the Black Rod, Yeoman Usher, &c., are under his authority. The office is hereditary. It was originally conferred by Henry I. on Alberic de Vere. From the De Veres, Earls of Oxford, it passed to the Berties. It is now held conjointly by Lady Willoughby de Eresby and the Marquis of Cholmondeley as coheirs of the fourth Duke of Ancaster.

Cham'bers, Ephraim, F.R.S., born at Kendal towards the close of the 17th c., formed the plan of his Encyclopædia, the earliest work of the kind in English, while apprentice to Mr Senex, a mathematical instrument maker in Fleet Street, London. The 1st edition, in 2 vols. folio, was published in 1728; the 2d, in 1738; the 3d, in 1739; the 4th, in 1741; a 5th, in 1746; and a 6th, with additional matter, in 1750. C. died at Islington, 15th May 1740. Considered as the work of a single individual, the Encyclopædia of C. is an extraordinary production.

Chambers, William and **Robert,** eminent publishers and authors, were born at Peebles, William in 1800, and Robert in 1802. After a grammar-school education at his birthplace, the former became, in his fourteenth year, apprentice to an Edinburgh bookseller. In 1819 he commenced business on his own account—a somewhat adventurous attempt, since he was, as he himself says, 'without stock, capital, or shop-furniture.' Robert began business in his sixteenth year, after a still more humble fashion than his brother, by starting a street bookstall for the sale of works cheap and old. A magazine called the *Kaleidoscope* (1821), written by the younger brother, and printed by the elder, was their first joint literary venture. Among the productions of Robert in this early and less distinguished period of his career were *Traditions of Edinburgh* (1824), *Popular Rhymes of Scotland* (1826), several histories of Scotch rebellions, and a *Life of James I.* (1830). He also edited a *Biography of Distinguished Scotchmen,* in 5 vols. In 1832 William originated *Chambers's Edinburgh Journal*—a periodical which was at once successful, and still retains in undiminished degree its excellence and its popularity. After the fourteenth number, Robert became joint-editor, and the firm of William and Robert C. was established. By the sterling merits both of the publishers and their works, it soon became, and has ever since continued to be, one of the foremost firms in the northern part of the kingdom. The people of Scotland have long regarded it with a feeling of national pride not bestowed on any other firm however eminent. Among the works published by them are an *Educational Course, Cyclopædia of English Literature* (new ed. 1876), and *Encyclopædia of Universal Knowledge* (1868, new ed. 1874). These works are all meant for the people, but the literature and the instruction are of a high order of merit. Robert C. has also produced incomparably the most valuable biography of Robert Burns (4 vols. 1851), and has written on geology and antiquities. In 1863 the degree of LL.D. was conferred on him by St Andrew's University. This distinguished author and archæologist died 17th March 1871. William C. has written books on America, pamphlets on social questions, notes of travel, and a *Memoir of Robert C., with Autobiographic Reminiscences of William C.* (3d ed. 1872). He gifted a free library and lecture-hall to his native town of Peebles. In 1865 he was chosen Lord Provost of Edinburgh, and signalised his rule by a great scheme for the improvement of the city, of which Edinburgh is now witnessing the splendid result. The career of both men presents a fine example of the industrious, successful, and intellectual Scot.

Chambers, Practice before a Judge or Vice-Chancellor at. This term of English law is applied to the arrangement of certain minor matters by the summary decision of a single judge at chambers.

Cham'bery, the capital of the department Savoié, France, lies in a rich valley on the Leyse, 45 miles W.S.W. of Geneva, at an elevation of about 1000 feet above the sea. It is the see of an archbishop, the seat of a superior tribunal, and of the Academy of Savoy, and has manufactures of gauze, silk-lace, leather, hats, watches, &c., and a trade in iron and wine. Pop. (1872) 13,417.

Chambe'ze, an important river of Central Africa, forming the head-waters of the Luapula, rises in the Kitwelte Mountains, 75 miles S. of Lake Tanganjika, flows S. and S.W., and enters the W. end of Lake Bangweolo, after a course of 100 miles. It is 1200 feet broad before entering the lake, and has numerous tributaries, of which the chief are the Lokutu, Mansia, Lokischa, and Mapampa. The C. was confounded with the Zambeze (q. v.) till Livingstone explored the region in February 1867. See *The Last Journals of David Livingstone* (2 vols. Lond. 1874).

Cham'bord (Henri Charles Ferdinand Marie, Dieudonné d'Artois, Duc de Bordeaux), Comte de, the representative of the elder or Legitimist branch of the Bourbons, grandson of Charles X. and son of Prince Charles Ferdinand d'Artois, Duc de Berri (murdered February 14, 1820), and was born September 29, 1820. As the Duc, at the time of his death, left only a daughter, there were great rejoicings on the occasion of C.'s birth seven months afterwards, and he was baptized in water brought from the Jordan by Chateaubriand, and termed 'the Child of Miracle.' Charles X. attempted to abdicate in favour of C. in 1830, but the French people banished the elder Bourbons, and C. along with them. C. then travelled through Europe, lived for a time at Holyrood, and on the death of his rival, the Duc d'Angoulême, in 1844, held a court in Belgrave square, and received the homage of all the Legitimists. In 1846 he married the Princess Maria-Theresa, daughter of the Duke of Modena, but is childless. After the fall of the Third Empire, and the capitulation of Paris in 1871, C. returned to France, and a 'fusion' of Legitimists and Orleanists was effected to support his claims to the throne as Henri V. In 1873 there was for a moment a probability that he would be proclaimed king, but the foolish and fanatical manifesto he issued, maintaining his divine right to the throne, and asserting his intention to maintain in its ancient integrity the temporal power of the Pope, has apparently blasted his prospects.

Chambord, a village and château in the department Loire-et-Cher, France, 12 miles E. of Blois. The château, one of the most magnificent structures in France, was begun by François I. (1526), and finished by Henri II., and has received many subsequent additions, containing now as many as 450 chambers. It was the temporary seat of the brilliant courts of Henri II., Louis XIII., and Louis XIV.; and a fête given here by the latter was the occasion on which Molière first performed his *Bourgeois Gentilhomme* in 1670. Napoleon I. bestowed C. on Marshal Berthier, and in 1821 it was bought by the Legitimist party and presented to the Duc de Bordeaux, who derives from it the title of Comte de C. (q. v.).

Cham'bre Ardente' was the name of a court established in 1535, in connection with an inquisitorial tribunal, by François I. Its function was the extirpation of heresy. It was famed for the severity of its punishments, the most common being, as its name would lead us to suppose, death by burning. It was very active under Henri II., whose entry into Paris in 1549 was signalised by a burning of heretics. In 1679 it was employed in investigating into the reports of poisoning cases which arose on the trial of the Marchioness Brinvilliers, after which time it does not appear to have ever again become active, and has long been abolished.

Chambre Introuva'ble (which may be translated 'Nonsuch Parliament'), was the ultra-royalist Chamber of Deputies which met on the second restoration of Louis XVIII. under the presidency of Lainé, and which, led by De la Bourdonnaye, De Villèle, and De Bonald, surprised everybody by its extreme reactionary policy. The Chamber acted as if resolved to stamp out the possibility of revolution, and had the services of men who afterwards occupied a very different position. Thus the bill to make more summary the jurisdiction of the Prevôtal courts was under the charge of Royer-Collard and Cuvier. A cruel law on sedition was also passed, but it was the famous debates on the amnesty question that most clearly showed the spirit of the implacable Right-hand Royalists, who opposed the Cabinet, and insisted upon extending the classes of exception from the amnesty, and upon the policy of confiscation and banishment of the regicides implicated in the Hundred Days. De Serre distinguished himself by moderate counsels in this debate. The leading clerical champions on the right hand were De Castelbajac (who had a bill to take all restrictions from mortmain), Lachèze, Murel (who wished the clergy to recover the custody of civil records), De St Romain (who attacked the lay character of the universities), De Bonald (who called for the abolition of divorce), and De Blangy (who opposed the continuance of official pensions to married priests). Then the outrages against Protestants broke out in the departments of the S.; Generals Ramal and Lagarde and Marshal Brune were murdered, and it required all the efforts of Pasquieu to secure a condemnation of the murderers in the local tribunals. It was no doubt the spirit of the Right-hand Royalists (as expressed in a pamphlet by De Vitrolles, replied to by Guizot) that made it impossible for the Government to pardon Marshal Ney. When the Chamber met after adjournment, it was decidedly unpopular. Its chiefs got such nicknames as Contractor for Burials, Gravedigger, Rattlesnake, Dispenser of Holy Water, &c. Accordingly, in spite of the pleading of Chateaubriand, in his *Monarchie selon la Charte*, the King dissolved it, 14th August 1816.

Chameleon.

Chame'leon, a lizard genus belonging to the family *Chameleontidæ*, and represented by the familiar *C. Africanus* of the N. of Africa and Egypt, so long celebrated for its power of altering the hue of its body when irritated or alarmed. The eye is large, and covered by a circular lid formed of the united two lids, and perforated in the centre for the admission of light to the pupil. The tongue is long and fleshy, and can be protruded with great celerity, so as to catch the insects upon which the C. feeds. The tail is rounded and prehensile. The body is compressed, and covered by small granules or scales, so as to resemble shagreen. The legs are well developed, the toes being situated so as to form two equal and opposable sets in each foot, and are thus adapted to aid the creature in its arboreal life. The lungs are of very large size. The C. is confined to the warmer regions of the eastern hemisphere, and is slow in its movements. Various species, besides the familiar one above noticed, are known, and of these, *C. Petersii* and *C. bifurcus*, or the large-naped C., are familiar forms. The latter occurs in Madagascar, India, &c., and is so named from the muzzle in the males being deeply cleft.

These reptiles have long been celebrated for their power of changing the hues of their bodies. The usual colour of the C. is green, although in Britain it appears to alter to a yellowish or greenish grey. It may even range through the shades of green, blue, violet, and yellow—all of which are hues allied to green. The mode in which the change of hue is effected is similar to that seen in the *Cephalopoda* or cuttlefishes, and consists of colour-cells (*chromatophora*), which exist in the deep layer of the skin; and by altering the position of these cells, seen through the transparent upper skin, the characteristic colour changes are produced. The influence of light and of the nervous system have much to do with the changes of colour.

Chameleon Mineral is the name sometimes given to manganate of potash (K_2MnO_4) on account of the curious changes of colour which take place in its aqueous solution if left to itself. These changes in the tint of the solution are caused by the gradual decomposition of manganate of potash (solution of which is green) into permanganate of potash (solution of which is carmine coloured).

$$\underbrace{3(K_2MnO_4)}_{\substack{\text{Manganate of}\\ \text{Potash.}}} + \underbrace{2H^2O}_{\text{Water.}} = \underbrace{2KMnO_4}_{\substack{\text{Permanganate}\\ \text{of Potash.}}} + \underbrace{MnO_2}_{\substack{\text{Binoxide}\\ \text{of Manganese.}}} + \underbrace{4KHO}_{\substack{\text{Caustic}\\ \text{Potash.}}}$$

C. M. is readily obtained by fusing together equal weights of binoxide of manganese and caustic potash.

Cham'fering (Port. *chanfrar*, 'to slope or hollow'), cutting or paring off the edge of anything originally right-angled. If the new plane is besides rendered slightly concave, it is called a *hollow chamfer*. In Gothic architecture there are frequently ornamental terminations to a chamfered surface.

Cham'ier, Frederic, an English novelist of French extraction, was born in London in 1796, and died November 1, 1870. He may be described as an inferior Marryat, like whom he served in the navy before he began literary labour. He wrote many novels, some of which, such as *Ben Brace*, *The Arethusa*, *Tom Bowline*, *Jack Adams*, &c., have been very popular, both here and on the Continent, and a *Review of the French Revolution of* 1848.

Chamiss'o, Adelbert von, properly **Louis Charles Adelaide de Chamisso de Boncourt**, an eminent German lyric poet, was born, 27th January 1781, in the Castle of Boncourt, in Champagne. His family emigrated in 1790 to Prussia. C. was at first (1796) page to the Queen of Prussia, then served in the Prussian army, but as a Frenchman by birth would not fight against his former countrymen; took part in an expedition (1814) to discover the N.W. Passage, and finally obtained a situation in the Botanical Garden of Berlin, where he died, 21st August 1838. C. was great as a naturalist, but still greater as a poet. His *Gesammelte Werke* were published at Leipsic in 1836-39 (5th ed. 1864), and are marked both by humour and a romantic imagination. They embrace ballads, songs, &c. Humour is the chief characteristic of his popular fiction of *Peter Schlemihl* (7th ed. 1860), which is an amusing story of a man that loses his shadow. See Hitzig's *Biographie von C. nebst Briefwechsel*, edited by Kurz (2 vols. 1869).

Chamois.

Cham'ois (*Rupicapra Tragus*), a genus of Antelopes (q. v.), of goat-like conformation, inhabiting the precipitous steeps of the Alps, Pyrenees, and other European mountain ranges. The horns are peculiar in their conformation, rising straight from the top of the head for some inches, and curving suddenly backwards to form a pair of hook-like processes. The colour is a yellowish-brown on the upper parts, and lighter below, the spine or back ridge being marked by a black stripe. The winter fur is darker than the summer coat. The face is marked by a dark band of colour, which runs from each angle of the mouth to the eye, and around each eye forms a dark circle. The horns are of black colour, and have a polished appearance. When full-grown, these forms may average 2 feet in height, the horns being from 5 to 8 inches long. The food consists in summer of mountain herbs and grasses, and in winter of sprigs of fir, pine, and juniper trees. The flesh has a peculiar flavour, owing to the diet. The skin is largely employed in the manufacture of the well-known C.-leather, used for a variety of purposes in this and other countries. The hind-legs are larger than the fore-limbs, and aid the C. in ascending steep cliffs, whilst the rudimentary hoofs placed on the back of the feet assist it in gaining a firm foothold in its perilous descents. These animals are very agile and wary. They are exceedingly acute and sensitive, both through the senses of sight and smell. They live in small herds, and on one member of the flock devolves the duty of watching for enemies, and of giving due alarm. C.-hunting is one of the most dangerous of Alpine pursuits.

Cham'omile. See CAMOMILE.

Cham'ond, St, a manufacturing town in the department of Loire, France, on the Janon, 7 miles E.N.E. of St Etienne by railway. It has large iron-foundries, silk-factories, and works for the construction of steam-engines. Pop. (1872) 12,382. C. possesses the ruins of a château built by the Counts of Forez.

Cham'ouny or **Cham'onix**, also **Cham'onis** and **Cammuni'ta** (Lat. *Campus munitus*), a wild and beautiful vale in the department of Haute Savoie, France, about 13 miles long and 2 broad, lies far away from all high roads, at a height of 2150 feet above the Lake of Geneva. The village of C. on the Arve (pop. 2415) is much visited by tourists. From the vale of C. the ascent of Mont Blanc is usually made.

Champagne', a former province of France, was bounded N. by the Ardennes, E. by Lorraine, S. by Burgundy, and W. by the Isle de France and Picardy, and had an area of 9997 sq. miles, and a pop. of 1,238,720. It is in great part a plain, from 300 to 600 feet high, and is divided into a dry and wretched district in the N.E. (*C. Pouilleuse*), and the fertile region of the S.W., famous alike for the production of flints and of the wine to which the province gives name. Its capital was Troyes on the Seine. C. formed a part of ancient Gallia, conquered by Cæsar, and later fell into the hands of the Franks, but was ruled from the 11th c. by semi-independent counts. It was annexed to the French crown by the marriage of Philippe IV. with Joanna, heiress of Navarre, in 1284, and was incorporated formally by Philippe VI. in 1328. During the campaigns of 1792 and 1814, C. was the principal scene of the fighting. After the Revolution the province was split into the departments of Ardennes, Aube, Marne, and Haute-Marne, and parts of Aisne, Yonne, Seine-Marne, and Meuse. See Arbois de Jubainville's *Histoire des Ducs et des Comtes de C.* (5 vols. Par. 1859–63).

Champagne Wine, an effervescent wine, named from the district of France in which it is prepared. C. is chiefly manufactured from the same dark grape—the black *pineau*—used in making Burgundy, and is kept uncoloured by having the husks removed before the fermentation of the must or juice sets in. After the must has undergone the first fermentation, it is carefully clarified by isinglass mixed with a proportion of sugar, and in this state it is bottled up and fastened with wire as it comes into the market. It is then put to undergo a further fermentation in rooms having a rather high temperature, and the progress of the fermentation is marked by the liqueur assuming a ropy appearance, and by the occasional bursting of a bottle through the pressure of the carbonic acid gas which is generated. After the wine has again cleared itself the bottles are uncorked, and the yeast which has been made to collect under the cork is removed. A small quantity of sweetened liqueur is then added, varying in quantity according as the wine is desired 'sweet' or 'dry.' It is now corked, wired, covered with the tinfoil, and labelled, ready for the market. The most esteemed brands of C. are Veuve Clicquot, Moet et Chandon, Mumm, Roederer, and Heidsieck. There is very good reason to believe that a large proportion of wine sold as C. is spurious, and either prepared from fruit juices other than the grape, or by artificially aerating still white wines.

Cham'party, or Champerty (lit. *partnership*; Fr. *champ parti*; Lat. *campus partitus*, 'land shared or divided'), in English law, is a bargain with a plaintiff or defendant to share the land, debt, or other matter in dispute if he prevails at law, the *Champertor* agreeing to carry on the suit at his own cost. The contract is not only void in equity, but it is criminal. No one is permitted to assign any interest or contingent profit of a *matter in dispute*, or to enter into an agreement to share it with any one, on consideration of his recovering it and bearing the expenses. In *Strachan* v. *Branchi* a gift from an heir-at-law resident abroad, on the death of his ancestor, ignorant of his rights, to one who had given him information and supported him in recovering his rights, was set aside, as was also a bond for £2000, payable in the event of success, in consideration of £1000 advanced for carrying on the suit, Lord Rosslyn observing that the transaction savoured of C. The analogous term in Scotch law is *Pactum de quota litis* (q. v. under PACTUM ILLICITUM).

Cham'pignon, the French name for mushrooms, but in Britain only applied to *Agaricus* (*Marasmius*) *Oreades*—the 'Scotch Bonnets'—which is one of the edible species.

Cham'pion (either Old Eng. *cempa*, 'a warrior'—compare Ger. *kämpfen*, 'to fight'—or the Lat. *campus*, 'a field'—*i.e.*, of battle), a man who, according to agreement, fights a public combat on his own or another person's account. Champions are mentioned as early as the reign of Charlemagne. In the early part of the middle ages the judicial combat was fought by a C. on behalf of women, children, aged and infirm persons, and also of ecclesiastics. It was a profession, and was not considered an honourable one. But later on in the ages of chivalry a knight who entered the lists on behalf of any one incapable of self-defence was called a C., and then the name began to carry with it more dignity. In England the ancient office of C. of the crown was held by the family of Dymocke from the twentieth year of the reign of Edward I. A member of this family appeared in Westminster Hall at every coronation in complete armour, and proclaimed, by herald, a challenge to wage battle with any man who should three times gainsay the title of the new monarch. This form was last gone through at the coronation of William IV. by Mr Henry Dymocke, at whose decease, without male heirs, the office became extinct.

Champlain', a lake between the states of New York and Vermont, with its northern extremity in the Dominion of Canada, named after Samuel C., who discovered it in 1609, and emptying itself into the St Lawrence by the Richelieu. It is about 120 miles long, and varies in breadth from ½ to 15 miles; is navigable for ships of 100 tons, and is connected at its southern extremity with the Hudson by a canal. C. abounds in salmon, shad, and other fish. The chief towns on its banks are Burlington on the E., Whitehall at the S., and Plattsburg on the W.

Champoll'ion, Jean François, surnamed **Le Jeune**, was born 23d December 1790, at Figeac (department of Lot). He showed great precocity in the acquisition of Oriental alphabets and in drawing medals. His first idea was to reconstruct the geography of Egypt under the Pharaohs, by collecting the names of districts and towns found in Greek and Latin authors, and by detecting the Coptic element in such names as had been overlaid by Hebrew and Arabic. In 1807 he made at Paris the acquaintance of Milan, De Sacy, and Van Præt, and got access at the College of France to the valuable Coptic manuscripts which had been taken from the congregation of the Propaganda at Rome. He worked at a Coptic grammar and a dictionary, which he believed would give a key to the hieroglyphics, and in 1808 by a comparison with a demotic or enchorial papyrus, he identified in the Rosetta inscription the twenty-five letters mentioned by Plutarch. Next year C. became Professor of History at the new University of Grenoble. In 1814 appeared *L'Egypte sous les Pharaons* (2 vols.), the geographical-descriptive part of a work in which he intended to treat of all Egyptian civilisation. After the second Restoration he added Geography to his chair. In 1822 he read at Paris the brilliant essays on the Demotic and the Hieratic writing, maintaining that the latter was a shorthand equivalent of the full hieroglyphic, and his letter to M. Dacier on the phonetic hieroglyphics used in the inscription on Egyptian monuments of the titles, the names, and surnames of the Greek and Roman sovereigns. In the latter he claimed to have deciphered the names Ptolemy, Alexander, Berenice, Arsinœ, Cleopatra, and the word *autocrator*. In 1824 appeared his chief work, *Précis du Système Hiéroglyphique*, which is accompanied by a volume of plates and explanations of the three elements into which he resolved Egyptian writing—the figurative, the ideographic, and the alphabetic. C. afterwards visited, and in various forms wrote upon, the Drovetti collection at Turin, the Salb collection at Leghorn, the papyri in the Vatican Library, and the royal collections of Florence and Naples. In the first he deciphered the royal chronological papyrus; in the second, a basso-relievo representing the infancy of Sesostris. On his return to France he became keeper of the new Egyptian Museum of the Louvre, in which he lectured on Egyptian archæology. This course was afterwards transferred to the College of France. Charles X. sent C. with a staff of draughtsmen to Egypt and Nubia, the result of which was a valuable collection of classified drawings of the monuments. An essay in 1831 on the notation of time in Egypt was followed by the *Grammaire Egyptienne, ou Principes Généraux de l'Écriture Sacrée Egyptienne, appliquée à la Représentation de la Langue parlée*, not published till 1836. He had only finished the prospectus of a great work on the industry, religion, government, and astronomy of Egypt, when death came, at Paris, 4th March 1832. His manuscripts were thought of so much importance that they were acquired by the state by a special law; most of them, including the *Grammaire Egyptienne*, being subsequently published by his brother.—**Jean-Jacques Champollion-Figeac**, the elder brother of the preceding, born at Figeac in 1778, was librarian and Professor of Greek at Grenoble, and latterly held the post of librarian to Napoleon III. He has written largely on French and other antiquities. We may mention his *Nouvelles Récherches sur les Patois ou Idiomes Vulgaires de la France* (1809); *Annales des Lagides, ou Chronologie des Rois Grecs d'Égypte, Successeurs d'Alexandre le Grand* (2 vols. 1819,); *Traité élémentaire d'Archéologie* (1843); *Traité élémentaire de Chronologie* (1843); the historical and descriptive part of Silvestre's *Paleographie Universelle* (1839–41); *L'Egypte Ancienne et Moderne*, 1840 (in the *Univers Pittoresque*); editions of mediæval charters and fragments.—**Aime Champollion-Figeac**, son of the preceding, has edited several important historical works, such as the Memoirs of Turenne, Francis of Guise, Omer Talon, and Cardinal de Retz. He has also written *Le Cardinal de Retz après la Fronde* (1843).

Chanak-Kalessi ('Pot Castle'), or **Kale Sultanieh**, a town of Turkey in Asia, vilayet of Brussa, 116 miles W. of Brussa, has a strong castle which commands the Dardanelles. It is named from this castle and from its manufacture of pottery. Pop. 4000.

Chance may be fairly defined as a term which we use to denote the operation of cause of which we are ignorant. Thus, it would be said that the tides ebb and flow according to law, but that it is an affair of C. whether a given future day be a rainy or a dry one. This simply means that in the former case we know the cause, and can calculate on its operation; and that in the latter case we do not know the cause, and cannot calculate on its operation. But religion and science unite in teaching us that every event has a cause, although it may lie beyond the scope of human vision; and, therefore, that the power which regulates the weather is just as fixed in its operation as that which regulates the tides. Religion excludes the idea—if the idea be possible—of effect without cause, as inconsistent with belief in Divine government; while science demonstrates that, in effects produced by causes of which we are ignorant, there is, nevertheless, a regularity of result which proves the existence of cause, and not unfrequently leads to the discovery of it: thus, we find that the marriage-rate in England in the lower classes, in a given year, may be almost absolutely predicted from the price of wheat during that year. 'The marriages again,' says the Registrar-General (34th Report), 'by a natural law determine the birth-rate, which in its turn becomes one of the factors that in combination determine the death-rate; and thus the sequence of events by which the life of communities is sustained completes itself.' When there are conflicting forces bearing on the determination of an event, their relative force expresses itself according to a law called the Law of Probability. See PROBABILITY, LAW OF.

Chan'cel (Lat. *cancelli*, 'railings, a lattice'), the eastern division of a church, separated generally from the nave by an arch with steps, and sometimes screened off with lattice-work, which prevents intrusion by the people, but does not hinder either seeing or hearing. The rector or vicar has the freehold in the C., and it is his duty to keep it in repair. No monument can be set up in the C. without the consent of the ordinary incumbent.

Chancellor (Lat. *cancellarius*) was originally the notary or secretary of the Roman emperor, and received his name either because he was empowered to *cancel* or cross out expressions in the imperial edicts, or because he sat with his master *intra cancellos*, within the latticed railings that prevented the emperor from being crowded by the people while administering justice. There is an officer of state bearing this title in most European countries; but the duties and powers of the office vary. Formerly there was a C. of France, whose functions were almost equally important with those now exercised by the C. of England. The office was abolished at the Revolution, and, though subsequently revived, many of its duties were transferred to the Minister of Justice, who continues to discharge them. In the Church of Rome each bishop has his C.

Chancellor, Lord.—The L. C. of England is the highest temporal officer under the crown. He is the confidential adviser of the sovereign in state affairs, and is called the 'keeper of the king's conscience.' He is appointed to office by the delivery of the great seal into his custody. He is a privy councillor *ex officio*, and Speaker of the House of Lords by prescription. He has the appointment of all the justices of the peace throughout the kingdom. In England he is the guardian of all infants, idiots, and lunatics, and has the general superintendence of all charitable institutions. In his judicial capacity he exercises the very extensive jurisdiction of the division of the supreme Court of Chancery. (See CHANCERY, COURT OF.) All patents, commissions, warrants, &c., from the crown are examined by the C. before being signed. The salary of the office is £10,000 a year, with an annuity of £5000 on retirement. For many centuries the chancellors, like most state functionaries, were ecclesiastics, and an office so confidential could not fail to grow in importance, so that the king's clerk gradually enlarged his powers, and from chief scribe and reader became the confidential adviser of his sovereign. From having merely to affix the king's seal to judicial writs or mandates, he became a powerful judge, sitting in the *Aulior Regia* as its chief legal director, or in the marble chair of Westminster Hall, with a great marble table before him, covered with the writs and charters waiting to be sealed in his presence with the great seal of England.

Chancellor of a Cathedral is an officer who superintends arrangements for the celebration of religious service.

Chancellor of a Diocese is an officer who advises the bishop in questions of civil law. He must at least have the university degree of Master of Arts. He may hear certain cases on behalf of the bishop, but in some cases the bishop must sit in person.

Chancellor of an University is usually the highest officer connected with an university. See UNIVERSITY.

Chancellor of Scotland.—This office was abolished at the union with England in 1707. The C. of S. was an officer of very great importance. He presided in the Scotch Parliament and in all courts of judicature, and had direction of the Chancery. (See CHANCERY or CHANCELLARY.) He had the custody of the Great Seal (q. v.), and was chief counsellor to the king, taking precedence of all others *ratione officii*. On the abolition of the office, a keeper of the great seal was appointed, who acts ministerially in affixing the seal to the writs passing under it. The last C. of S. was the Earl of Seafield, who held the office at the Union. The first was Constantine, Earl of Fife, in the reign of Alexander I.

Chancellor of the Exchequer. See EXCHEQUER.

Chance Medley, and **Chand Medley** or **Mellé**, are legal expressions borrowed from the French. The former means a casual affray, the latter an affray in passion. They are admitted as pleas in mitigation of the offence of Homicide (q. v.).

Chan'cery. In former times the office or chamber in which the Chancellor (q. v.) performed his functions was called the C. It was generally divided by lattice-work (*cancelli*), the outer half for the accommodation of the people, the inner for the accommodation of the Chancellor and subordinate officers.

Chancery or Chancellary of Scotland is an office in the General Register House of Edinburgh, managed by the Director of C. and his deputies. In it are recorded charters, patents of dignities, gifts of office, remissions, legitimations appointed to pass the great or the quarter seal. All writs passing through C. are recorded before they are given out to be sealed.

Chancery, Court of, is in England the division of the Supreme Court next to the House of Lords in jurisdiction. This is either *ordinary* or *extraordinary*: in the first, procedure is according to common law; in the last, it may by equity abate the rigour of the common law, and afford a remedy to which common law is inadequate; but when that is adequate, the C. of C. will not interfere. It will not entertain a suit for any amount under £10, except in case of charity. Several modern statutes have been passed affecting the C. of C., but the general orders still chiefly guide its practice. These were consolidated in 1860, and the regulations as to fees and charges condensed and arranged in one volume under the auspices of Lord Chelmsford. Alterations and additions have since been made, especially by the Supreme Courts of Judicature Acts of 1873 and 1875. The Lord Chancellor is the highest judicial officer in the kingdom. He is a privy councillor by his office, and Speaker of the House of Lords by prescription. Assistant to and subordinate to the Lord Chancellor are the Master of the Rolls and three Vice-Chancellors. Each of the judges presides over a separate tribunal, and any cause or motion may be brought before them, except such as relate to lunatics, which are always heard by the Lord Chancellor. Those interested in questions cognisable by the C. of C. are now empowered to state special cases for the opinion of the court, by which means the expense and delay of a lawsuit may be prevented.

Chandairee′, a town in the state of Gwalior, Central India, 100 miles N. of Bhopal, near the river Betwa, has a strong fort and extensive ruins of caravanserais and mosques. It was formerly a place of importance, became infested with freebooters under Mahratta rule, and was brought under British control by the treaty of 1844. Pop. 8000.

Chandernagore′, a town and petty territory (2330 acres), belonging to France, within the province of Bengal, and on the left bank of the Hoogly. The town is 21 miles N. of Calcutta by railway, and has a pop. of some 30,000, who are mainly natives. Its trade, which was at one time little inferior to that of Calcutta, has been greatly injured by the silting up of the river. Founded by the French in 1676, C. was captured by Clive in 1757, but restored in 1763; again taken by the British in 1793, and once more restored in 1816.

Chand′ler, Dr Richard, a learned English antiquary, born in Hampshire in 1738, and educated at Magdalen College, Oxford, first distinguished himself by the publication in 1763 of *Marmora Oxoniensia*. Next year he was sent by the Dilettanti Society to make observations in Greece and Asia Minor, the result of which appeared in his *Ionian Antiquities* (1769). In 1773 he was presented to the living of Worldham in Hampshire, and afterwards to that of Tilehurst in Berks. In 1774 he published *Inscriptiones Antiquæ pleræque nondum editæ, in Asia Minore et Græcia præsertim Athenis collectæ*, and in 1775-76 his *Travels* in these countries. His *Life of William of Waynflete* was not published till after his death, which took place at Tilehurst, 9th February 1810.

Chandore′, a town in the district of Ahmednuggar, province of Bombay, British India, 150 miles N.E. of Bombay. It is defended by a strong hill-fort, and has some slight trade. Pop. about 8000. It originally belonged to Holkar, but capitulated to the British in 1804, was temporarily restored, and finally ceded to Britain in 1818.

Chand′os Clause is the name given, from its being originally proposed in 1831 by the Marquis of Chandos, afterwards Duke of Buckingham, to a clause in the Reform Act of 1832, which gave the county franchise to tenants-at-will paying a rent of £50 a year. Although strongly opposed on the ground that it would place county elections at the mercy of landowners, it was ultimately carried by 272 to 32 votes. Under the latest Reform Act, that of 1867, occupants of lands of a rateable value of £12 a year are entitled to the county franchise.

Chandpore, a town in the district of Bijnour, N.W. Province, British India, 80 miles N.E. of Delhi, in a hilly country. Pop. (1872) 11,286.

Changar′nier, Nicolas Anne Théodule, a French general, was born at Autun, April 26, 1793. Entering the army, he distinguished himself so much in Algeria, that, in 1848, he took Cavaignac's place as Governor-General. He subsequently commanded the garrisons and National Guard of Paris during the revolutionary excesses of 1848 and 1849, and suppressed the insurrectionary movements of the time. He was, however, opposed to the ambitious schemes of Prince Louis Napoleon, and was in consequence imprisoned after the *coup d'état* of December 2, 1851. Under the Third Empire he lived in exile till the Franco-German war of 1870, when he fought for his country, and was imprisoned with Marshal Bazaine in Metz. After peace was made he returned to France, aided in the reorganisation of the French army, and was elected a senator in the new French Assembly of 1876, created by the republican constitution of the previous year. He died at Paris, 14th February 1877.

Change′ling, a term applied, during the belief in elves and fairies, to a weakly child, peevish, and backward in walking and speaking, which was supposed to be an elf substituted by fairies for the fine infant that had been born. According to this belief, the substitution could only take place before the child was christened, and hence it was carefully watched till that rite was performed.

Chan′gi, the juice of *Coriaria thymifolia*, of a reddish colour, but which in a few hours after exposure turns black. In S. America, during the Spanish *régime*, state documents were written with it. It is said that it does not corrode steel pens, and that the writing made with it is more indelible than that with ordinary artificially-made ink.

Chann′el, English. See English Channel.

Channel Islands, a well-known group in the English Channel, of which the principal members are Jersey, Guernsey Alderney, and Sark, described under their respective names. They lie about 80 miles S. of the English coast, and some 10 miles W. of the peninsula of Cotentin in Normandy, with a total area of 112 sq. miles, and a pop. (1871) of 90,596. The C. I. have belonged to England since the Conquest, and are now all that remain to it of the Dukedom of Normandy. See Professor Ansted and R. G. Latham, *The C. I.* (1862).

Chann′ing, William Ellery, was born at Newport, Rhode Island, U.S., April 7, 1780. His father was an extensive merchant. He graduated at Harvard College in 1798, and after acting as a private tutor in Virginia, became minister of a Congregational church in Boston. At first he was allied with no theological party, though afterwards he became a zealous Unitarian. C. was a very popular preacher, and gained wide reputation by his sermons, which were published in 1812. He was made D.D. in 1820, and in 1822 visited England and the Continent. During his later years he devoted himself to criticism and discussion of social questions, proving himself an earnest advocate of social reforms and negro emancipation. He died at Bennington, Vermont, October 2, 1842. He was sincere, pious, and pure-spirited. Coleridge said he had 'the love of wisdom and the wisdom of love.' His Unitarianism was deeply coloured by scriptural sentiment. It was quite distinct from the Rationalism of Parker, and had not even much in common with the system of Priestley. C.'s works—of which the chief are *Essay on National Literature* (1823), *Remarks on the Character and Writings of John Milton* (1826), *Character and Writings of Fénélon* (1829), *Negro Slavery* (1835), *Self-Culture* (1838)—though seldom profound or moving, are marked by earnestness of tone, judiciousness, and elegance of style. See *Memoir of C.*, by his nephew, W. H. Channing (3 vols. 12mo, Bost. 1848; 2 vols. Lond. 1850).

Chantill′y, a town in the department Oise, France, on the Nonette, 23 miles N.N.E. of Paris by railway. It has a famous racecourse, and is noted for its industry in black lace. Pop. (1872) 3335. Anne de Montmorency built here a splendid château, where the great Condé spent the decline of his life, in the occasional society of Boileau, Bossuet, Racine, and Molière. The building was partly destroyed on the outbreak of the Revolution of 1793. It is surrounded by a finely wooded park of 6700 acres.

Chan′trey, Sir Francis, an eminent English sculptor, born at Jordanthorpe, Derbyshire, 7th April 1781, was the son of a carpenter, and at the age of sixteen was apprenticed to a carver and gilder. He early showed a distinctive ability in drawing and modelling, went to London in the beginning of the century, commenced to study at the Royal Academy (of which he became a member in 1818), and exhibited a bust in 1805 which won the high approbation of Nollekens. He established his fame by his colossal busts of Howe, St Vincent, Duncan, and Nelson, for Trinity House and Greenwich Hospital. He modelled an immense number of busts, including those of most of the celebrities of his time, and among his best-known statues are those of George IV. in Edinburgh, Brighton, and London, and the Duke of Wellington in front of the Royal Exchange, London. His conceptions were seldom ideal—never poetic. Truth, expression full of character, and conventional but always graceful drapery are the characteristics of his busts. He was knighted in 1837, and died 25th November 1841, leaving a fortune of £100,000, to be retained for the use of Lady C. during her lifetime, and after that event to be remitted to the Council of the Royal Academy, who were empowered to use the interest of that sum—less a few small annuities—'for the promotion of British art.' Lady C. died 3d January 1875, and the interest of C.'s fortune, amounting to about £3000 a year, is now received by the Royal Academy, to be expended, according to the wish of the testator, in the purchase of the best works in sculpture or painting executed in Great Britain. See Holland's *Memorials of Sir Francis C.* (Lond. 1851), and Jones's *Recollections of the Life of C.* (Lond. 1849).

Chan'try (Fr. *chanterie*, from *chanter*, 'to sing'), a term applied both to the office or benefice which provided for the chanting of masses for the souls of the founder and his friends, and also to the little chapel in or attached to the cathedral or parish church in which the masses were performed. The tomb of the donor was generally erected in the middle of a C., and the endowments were either in lands or revenues. The emoluments derived from the office of chanting-priest in these little chapels were eagerly sought after, as may be inferred from Chaucer's beautiful sketch of the 'Pore Persoun,' in the prologue to the *Canterbury Tales*:—

> 'He sette not his benefice to huyre,
> And lefte his scheep encombred in the myre;
> And ran to Londone, unto seynte Poules,
> To seeken him a chaunterie for soules.'

Chanteries were dissolved by Henry VIII., and his decree was confirmed by Act of Parliament, 1 Edward VI. c. 14.

Cha'os (from a Gr. verb signifying to yawn or gape), that vacant immeasurable space antecedent to the creation of the world, out of which, according to the ancient cosmogonies, gods, men, and all things sprang. Hesiod makes C. the mother of Erebus and Nox. It is generally conceived of as implying confusion and disorder, and as the opposite of *kosmos*.

Chaos Islands, a small group of islets at the mouth of Algoa Bay, S. coast of Africa, 35 miles E. of Port Elizabeth.

Chap'books, so called because sold by the Chapman (q. v.), a homely kind of literature, once extremely popular, and forming almost the sole reading of the humbler classes, especially in the rural districts. They are now very scarce, and are eagerly sought after by the bibliomaniac. The volumes of the more recent C. generally consisted each of a twenty-four page single sheet, price one penny, and were illustrated by one or more execrable woodcuts. Most of them were what would now be deemed offensively coarse, and even gross; but allowance must be made for the altered condition of society, and for the change in the public taste. Consequently such of them as are still republished are excised and expurgated till their character and spirit have evaporated. The older C. were printed in black-letter, and their contents were of a miscellaneous character, consisting of songs, ballads, wonderful tales, dream-books, &c. Some account of them may be found in *Notices of Fugitive Tracts and C.*, and in *Descriptive Notices of Popular English Histories*, by J. O. Halliwell. A similar service was rendered to French literature of this class in 1854 by M. Charles Nizard in his *Histoire de la Littérature du Colportage*, and Mr John Fraser has partially carried out a design long contemplated by the late William Motherwell, by publishing at New York in 1873 two parts of *The Humorous C. of Scotland*, in which some account is given of the more popular brochures, and of Dugald Graham, bellman or town-crier of Glasgow, who wrote, either in whole or in part, many of the best of these. His *History of the Rebellion of* 1745, first published as a chapbook, was an especial favourite with Sir Walter Scott.

Chapa'la Lake, the largest Mexican lake, lies on the tableland of Anahuac, in the province of Michoacan, has an area of about 1300 sq. miles, and is studded with numerous islands. It empties into the Pacific by the Rio Grande or Rio Santiago, of which it is only an expansion.

Chapel (Fr. *chapelle*, Low Lat. *capella*; originally the place in which was preserved the *cappa* or cope of St Martin, but after the 7th c. applied to any sanctuary containing any relics), came to signify a separate erection attached to a church or cathedral, a domestic oratory, and also a place of worship for a corporate body, such as a university C. The name is now generally applied to a place of worship built apart from the parish church, such as chapels of ease or dissenting chapels. The word also denotes the ecclesiastical staff of a sovereign, the divine office when recited by the Pope with the clergy of his household, and the working staff of a printing-office, the last meaning being a relic of the first printing-office in England, which was set up by Caxton in Westminster Abbey.

Chapelle, the name of six small towns of France, of which the principal are—1. **C.-sur-Erdre**, in the department Loire-Inférieure, with well-known mineral springs, and a pop. (1872) of 2610.—2. **C.-de-Guinchay**, department of Saône-et-Loire, has a trade in wine, timber, and cattle. Pop. 2130.—3. **La-C.-la-Reine**, in the department Seine-et-Marne, 37 miles S.E. of Paris, near Fontainebleau, has a church of the 15th c., and a pop. (1872) of 757.

Chapelle de Fer. See Helmet.

Chap'eron (Fr. *chaperon*, 'a hood,' a dim. of *chape*, from Lat. *caput*, 'the head'), a cap worn by Knights of the Garter, by doctors, and by licentiates of colleges. The term C. is also applied to the guide or protector of a lady at public places, and to ornamental devices placed on the heads of horses at funerals.

Chap'lain (Fr. *chapelain*, from *chapelle*), an ecclesiastic who performs divine service in a chapel, as at court, in the household of a noble, in a jail, a lunatic asylum, the army, or the navy. There are forty-eight court chaplains in England, four of whom are in attendance each month. In Scotland there are six clergymen called Deans of the Chapel Royal; but their only official duty is to offer up prayer at the election of representative peers for Scotland. A statute of Henry VIII. regulates the number of chaplains allowed to different grades of the nobility—eight to an archbishop, six to a duke, three to a baron. The name C. is sometimes given to members of cathedral and collegiate churches, especially to the non-capitular assistants of the canons. The office of *army-C.* used to be filled only by clergymen of the Church of England, but now Roman Catholics and Presbyterians have clergymen of their own persuasion appointed by Government to attend to their spiritual wants. The army-C. belongs not to a regiment, but to a brigade, or other group of regiments. He is attached to a military station at home, in the field to headquarters, the hospitals, or is with his brigade. The *C.-General* is the head of all the chaplains in the army. His office is a department of the War-Office, he assists in selecting chaplains, and in regulating religious matters in the army. There are at present about eighty army-chaplains, besides assistant-clergymen and chapel-clerks. The *navy-C.* performs divine service on shipboard, visits the sailors when they are sick, and attends generally to the morals of the crew. Every ship in commission down to fifth-rates has a C. The superior officers are instructed to be observant of the conduct of both army and navy chaplains, and also to see that the men pay them all the respect that is due to their sacred office.

Chap'let (Fr. *chapelet*, a dim. of *chape*), a headband or garland of entwined leaves and flowers. The C., in heraldry, is generally composed of four roses and leaves. A C. of rue is blazoned bendwise on the shield of Saxony.

Chap'man (Old Eng. *ceapman*; comp. Ger. *Kauffman*), the cheapening, bargaining man, or trader, applied originally to every kind of merchant, whether buyer or seller, but now restricted to itinerant dealers in smallwares, broadsides, single-sheet literature, &c. The C. used to be a prominent figure at Scottish fairs, the conclusion of which was marked by his disappearing from the scene—

> 'When *chapman* billies leave the streets,' &c.
> —Burns's *Tam o' Shanter.*

Chapman, George, was born in 1557 or 1559, near Hitchin in Hertfordshire, and studied at Oxford and perhaps at Cambridge. Almost nothing is known of his life. He died in 1634. He was a prolific dramatist and translator. His comedies, *The*

Blind Beggar of Alexandria, *A Humorous Day's Mirth*, *All Fools*, *Monsieur d'Olive*, *The Gentleman Usher*, *May-Day*, *The Widow's Tears*, display genuine comic invention, and resemble Jonson's plays in the exhibition of 'humours,' the frequent practical jokes, and the general absence of romantic sentiments. His tragedies, *Bussy d'Ambois*, *Revenge of Bussy d'Ambois*, *Biron's Conspiracy*, *Biron's Tragedy*, *Cæsar and Pompey*, *Alphonsus*, *Chabot*, *Revenge for Honour*, notwithstanding occasional turgidity and pedantic quaintness, contain much genuine passion and lofty eloquence. *Eastward Hoe*, a comedy which he wrote along with Jonson and Marston, is a brilliant and entertaining picture of old London life. C. is best known for his translation of Homer (1598-1615). It is full of fire and energy, and its fourteen-syllable verse has a grand, sonorous roll, but it loses the Homeric simplicity and grace through its prevailing Elizabethan mannerisms. Among C.'s other works are translations of *Hesiod's Georgics* and the so-called *Homeric Hymns*, a continuation of Marlowe's *Hero and Leander*, and *The Shadow of Night* and *Ovid's Banquet of Sense*—poems marked by extreme descriptive minuteness. The best edition of C. is in 3 vols. (Chatto & Windus), with an elaborate introduction by Swinburne. See also Ward's *English Dramatic Literature*, vol. ii. (Lond. 1875).

Chapped Hands are generally caused by imperfect drying after being washed, by the use of some irritating substance, or by cold. The treatment consists in avoiding the cause, using glycerine soap and zinc or borax ointment.

Chap'ter. See DEAN, DEAN AND CHAPTER.

Chapter (Fr. *chapitre*, old Fr. *chapitle*, from Lat. *capitulum*, a dim. of *caput*, 'the head'), the society of canons and prebendaries in a cathedral, of which the dean is the head, and which forms the council of the bishop. Prior to the time of Henry VIII., the election of a bishop rested with this body; but now its power is merely nominal in England.

Chapter-House, the apartment attached to a cathedral or collegiate church in which the heads of the Chapter (q. v.) meet to transact business. (See CATHEDRAL.) The C.-H. is frequently adorned with elaborate architecture, as, for example, at York, Wells, Salisbury and Lincoln; it is of various forms, but is pretty frequently polygonal, with a central shaft supporting the roof. It used often to be employed as a burying-place; those at Westminster and Wells have crypts under them.

Chara'ceæ, a small natural order of Cryptogamous plants, allied to the *Algæ* (q. v.), consisting of two or three genera, all the species being aquatic, and found in almost all parts of the world, but chiefly in temperate countries. In the cells the phenomenon called *Gyration* (q. v.) is seen. *Nitella* and *Chara* are the two best-established genera. Many of the species have their stems encrusted with calcareous particles. There are a number of species found fossil in the later Tertiary beds.

Characin'idæ. See SALMONIDÆ.

Char'acter, from the Gr. *charaktēr*, primarily denoted an instrument for marking, then the mark itself, and lastly the distinctive nature of any object by which it is separated from all others. It may be physical or moral, in either case being produced by appropriate agencies, and of both classes there are three species, essential, accidental, and relative. In the fine arts, the C. imparted to the work by the idiosyncrasy of the artist may be called its *subjective* C., and that which suits it for the end contemplated, its *objective* C.

Character, to servant.—A master (or mistress) is not bound either by English or Scotch law to give a servant a C.; but if he do give a C. it must be given without malice, otherwise the servant will have ground for an action for damage. On the other hand, wilfully giving a false C. in favour of a servant may render the giver liable in damage to any one injured by the deception. A small act of dishonesty will not warrant a master or mistress in branding a servant as a *thief*. Terms denoting criminality should be avoided; and if a criminal act is charged against the servant, care must be taken that proof can be given. When a servant merits a decidedly bad C., perhaps the safest and most effective course is to refuse to give any. A servant producing a forged certificate, or altering a certificate of C., is liable by statute to a fine of £20.

Charade' (a word of Provençal origin, passed into standard French as late as the 18th c.) denotes a species of riddle or syllable-puzzle—*silbenräthsel*, as the Germans call it—in which a word consisting of several syllables is indicated, first by an enigmatical description of each separate syllable, and then by a similar description of the whole word. The puzzle for the reader or hearer is to solve the riddle by telling the word so described. Wit and point are always aimed at in a good C., like the French one on *chiendent*, 'dog's grass,' which is: 'My first makes use of my second to eat up my whole.' Instead of being spelt, the C. is sometimes acted, and this has given rise to the *acting C.*, in which a scene representing each syllable is enacted by several members of a company, and during it the syllable is used as a word; so with the syllables put together, when a scene representing the whole word is gone through, and the word itself is audibly pronounced. The persons who take part in an acting C. must not be too self-conscious, must have some little power of mimicry, and a ready flow of talk.

Charadri'adæ, a family of *Grallatorial* or wading-birds, including several sub-families, of which the best known is that of the *Charadrinæ*, or true plovers and lapwings. The members of this family possess a straight, short bill, the apex of which may be strong and arched. The nostrils are placed in a groove running along the sides of the bill. The legs are long and slender, the toes being small, whilst the front toes are united at the base by a membrane. The hinder toe is small, rudimentary, and raised off the ground. The oyster-catchers, turnstones, pratincoles, coursers, &c., are also included in this family.

Char'bon Roux, the French designation of imperfectly charred wood of a deep-brown or russet colour—the *brown charcoal* of English metallurgists—which is well adapted for the manufacture of gunpowder for sporting purposes. It is prepared by forcing hot gases into a closed chamber containing piled billets of wood. Violette gives the percentage composition of a yellowish red variety (*très-roux*) as follows:—Carbon, 70·45; hydrogen, 4·64; oxygen and nitrogen, 24·06; ash, 0·85.

Char'coal. The fixed residue of the decomposition by heat of vegetable and animal products, rich in carbon. See CARBON, WOOD C., BONE BLACK, LAMP BLACK, CHARBON ROUX, &c.

Charcoal, in medicine. See CARBON, in medicine.

Chards, the late summer-blanched leaves of the artichoke.

Charente', a western department of France, part of the old province of Angoumois, has an area of 2200 sq. miles, and a pop. (1872) of 367,520. It mainly consists of the basin of the river C., which is confined by a low range of hills in the S. and by a continuation of the mountains of Auvergne in the N.E. Beyond the former of these ranges C. is watered by the Dronne, an affluent of the Dordogne, and to the W. of the latter by the Vienne, a tributary of the Loire. It has a mild and equable climate. The surface is in great part chalky, and the principal minerals are granite, iron, antimony, and limestone. In various parts occur vast chestnut forests, while the district of Champagne is famed for the production of the red wines *Saint-Saturnin* and *Asnières*. The arrondissement of Cognac gives name to a well-known brandy. Among the chief occupations are the cultivation of cereals, and the rearing of cattle for the Paris markets. There are extensive distilleries, iron-foundries, paper and cloth factories, tanneries, and potteries. C. is traversed by the Paris and Bordeaux Railway. Angoulême is the capital, and among the other towns are Cognac, Barbezieux, and Confolens.

The *river C.* rises in Haute-Vienne, enters the department in the E., and after a sinuous course, flows W. through C.-Inférieure, and falls into the Atlantic. It is about 200 miles long, has numerous affluents, several of which are liable to inundations, and is navigable to within a few miles of Angoulême.

Charente-Inférieure, a department of France, on the Bay of Biscay, between La Vendée and the Gironde, has an area of 2740 sq. miles, and a pop. (1872) of 465,653. It is hilly in the S., but the rest of the surface is singularly flat, while the coast-line is greatly indented, and has a length of over 100 miles. The principal rivers are the Charente, Seudre, and Curé. Among the products are wine, hemp, flax, beetroot, and saffron. The wine, which is partly converted into brandy, yields 15,000,000 francs yearly. There are extensive manufactures of lace, woollens, leather, machinery, glass, bricks, &c., and numerous distilleries and sugar-refineries. Salt is found in great quantity in the marshes and lagunes, and a large number of boats are employed in the oyster and sardine fisheries. La Rochelle is the capital, and Rochefort is one of the best harbours. The department is connected with the Paris and Bordeaux Railway by a branch line. Off the coast there are several islands, of which by far the largest are St Martin de Ré and St Pierre.

Charen'ton, a town of France, department Cher, is situated on the Marmande, in a rich mining district, and has large iron-works. Pop. (1872) 1760.—**C.-le-Pont**, in the department Seine, 1½ miles beyond the fortifications of Paris, in a south-easterly direction from the city, on the right bank of the Marne, where it joins the Seine. It has manufactures of lace, artificial flowers, bijouterie, &c. The Marne is here crossed by the bridge of the Lyon Railway, and by a new stone bridge, at the S. end of which is the Alfort fortress. Pop. (1872) 6690.

Charge (Sp. *cargar*, 'to load;' Ital. *caricare*, from Lat. *carricare*, used by St Jerome for 'to load'), in gunnery, is the quantity of gunpowder requisite for one discharge. There are certain charges fixed for all guns, called *service charges*, and the aim is to make them such as will give the greatest initial velocity to the projectile, without unduly straining the gun. The service C. for a heavy and medium smooth-bored gun is one-third of the weight of the projectile; for light smooth-bored guns, one-fourth. The charges are smaller in firing with red-hot shot, and in ricochet firing. Rifled guns, on account of the absence of windage, and the longer time the shot is in the bore, and the consequent greater strain exerted by the gas, require smaller charges than smooth bores. The C. for an Armstrong breech-loading gun is only one-eighth the weight of the projectile. In the navy there is the *distant*, the *full*, and the *reduced* C. *Charge*, in the law of Scotland, is the command of the sovereign by letter to perform some act. The term is also applied to the messenger's copy for service requiring the person to obey the order of the letter.

Charge, in heraldry, is any heraldic figure or device. A shield, banner, or any other field, is said to be *charged* or *chargé* when such device or figure is blazoned on it. The shield of the head of a house has nearly always fewer charges than that of a collateral branch or of a junior member of the family. But charges in a shield should always be as few as is consistent with a clear and vividly expressed meaning.

Charge' d'Affaires is an inferior diplomatic agent, accredited not to a court but only to the Minister of Foreign Affairs, and holding his credentials from the same official in his own country.

Char'ger, a name formerly given to a horse employed in battle (hence its name), but now applied only by imaginative writers to the animal prosaically called a cavalry-horse. In the middle ages, the war-horse was nearly altogether encased in defensive armour, or *barded*. A *chanfron* protected the entire head; *crinières*, the neck; a *poitrinal*, the breast; and *croupières*, the buttocks and haunches. These pieces of armour were generally made of metal, but sometimes of leather. Occasionally the horse was covered with chain-mail; and sometimes there was a gambison of stuffed or quilted cloth under the armour.

Charities, Law as to. In England, the sovereign, as *parens patriæ*, is the guardian of all charities, and the Attorney-General may take legal proceedings to restore any abused or dilapidated foundations. Means are provided by statute for securing a due administration in certain cases of *charitable trusts*, and for the beneficial application of charitable funds, by empowering the crown to appoint four commissioners, one secretary, and two inspectors for these purposes. Reservation is made of the rights of the Church of England, and the Act does not extend to the universities or to charities partly supported by voluntary contribution.

Charity Commissioners, a body created by Act of Parliament in 1853 to inquire into the working of charities in England and Wales. The scope of inquiry does not embrace Scotland nor Ireland, nor the English universities, nor London.

Charivar'i is a French word now chiefly applied to a satirical newspaper of the type of *Punch*, which ridicules public men, and especially politicians, such as *Le Charivari*, established in Paris in the end of 1832. Originally C., the etymology of which is doubtful, meant a hubbub of noises produced by whistling, howling, singing, and the clattering of pans, kettles, &c., which in the middle ages was raised on the occasion of an unequal marriage or the marriage of a widow, and which did not cease till money was paid to make peace. The C. was frequently characterised by violence and the singing of indecent verses, and in the 14th c. attempts were frequently made to put it down by the Church. See Philip's *Katzenmusiken* (Treib. 1849).

Char'kov. See KHARKOV.

Char'latan (introduced into Fr. in the 16th c. from the Ital. *ciarlatano*, 'a babbler or chatterer') is a word for a mountebank, quack, or empiric, because his chief art consists in prating in his own favour, and in making unwarrantable pretensions. Charlatanism manifests itself differently as character and circumstances vary, and accommodates itself skilfully to the fluctuating weaknesses of mankind. Sometimes, however, men have been classed with charlatans because they were in advance of their age, as Theophrastus von Hohenheim, better known as Paracelsus. See Büschel's *Ueber die Charlatanerie des Gelehrten seit Mencke* (Leips. 1790, with plates).

Char'lemagne, the Romance name of the Frankish monarch Karl der Grosse (q. v.). It may here be stated that all the Teutonic kings and princes, German and Norse, commonly found in Encyclopædias under a Romance form of their name, are treated of under the native and proper spelling, KARL.

Charleroi, a town in the province of Hainault, Belgium, on both sides of the Sambre, the high town on the left bank being strongly fortified. C., which is a station on the Brussels and Namur Railway, stands on an extensive and valuable coal-field, and there are numerous smelting-furnaces in the neighbourhood. There are besides, forges, nailworks, brickworks, and foundries for casting ordnance, and manufactures of woollen-yarn, glass, and hardware. The large ironworks of Couillet, producing one-third of all the cast-iron of Belgium, are within 2 miles of C. The fortifications, begun in 1666 by the Spaniards, were demolished by the French in 1794, but were restored after Waterloo. Pop. (1873) 12,150.

Charles I., King of Great Britain and Ireland from 1625 to 1649, was born at Dunfermline, 19th November 1600. He was the second son of James I. of England (VI. of Scotland), and became, in 1612, through the death of his elder brother Henry, heir-apparent to the throne, to which he succeeded in 1625. The nation greeted his accession with a burst of loyalty. His personal dignity contrasted with the garrulous vulgarity of his father, and the failure of the scheme for a marriage with the Spanish Infanta (even although he subsequently married Maria Henrietta of France, also a Roman Catholic princess) gratified the English people, who hated Spain above all countries. His early popularity, however, waned, when it was seen that he retained in all positions of trust his father's unpopular and imperious favourite, Buckingham. C. soon showed that the chief anxiety of his obstinate mind was to become an absolute monarch; and, in consequence, the Parliaments that met in 1625 and 1626 struck severely at Buckingham, the latter, led by Sir John Eliot and Mr Dudley Digges, going so far as to impeach the favourite. The King, however, stood by Buckingham, dissolved Parliament, threw Eliot and Digges into prison, and besides other arbitrary measures, resorted to forced loans, and a tax originally levied on seaports and known as ship-money. In 1628, C. found himself compelled to summon a Parliament, which, nevertheless, proved more resolute to maintain popular rights than its predecessors, and presented to him the celebrated *Petition of Right* (q. v.). A reaction in his favour, however, following upon the assassination of Buckingham, C. dissolved this Parliament also. Aided by Laud (q. v.) and Strafford (q. v), who had once been a member of the Parliamentary party, and by the Star Chamber and Court of High Commission (q. v.), he endeavoured to govern without a Parliament. Scotland, however, upon which he had sought to thrust a liturgy and the Episcopal form of government, rebelled, and proving victorious in the contest with C., he summoned a Parliament, subsequently known as the Long Parliament, which began to sit on 3d November 1640, and which showed itself more opposed to his despotism than any that had preceded. Headed by Pym and Hampden, it declared the decrees of the Star Chamber and Court of High Commission null and void, passed a bill for triennial Parliaments, impeached Strafford, and caused him to be executed. For a time C. submitted, but on a rebellion breaking out in Ireland, and the Parliament increasing its demands, he drew his sword and threw away the scabbard. On the 4th January 1642, he appeared with a force of armed men in the House of Commons, and demanded that five members—Pym, Hampden, Hollis, Hazelrig, and Stroud—should be surrendered to him on a charge of treason. The two Houses of Parliament and the city of London took the side of the five members, who had escaped, and the King, retiring from London, raised the standard of civil war. For some time the Royalists had the advantage in the engagements that took place with the soldiers of the Parliament, but in the end they were unable to stand against the 'new model' army under Fairfax and Cromwell. Finally, the Royal army was crushed at the battle of Naseby, 15th June 1645, and C. sought refuge in the army of the Scots. They, however, delivered him up to Parliament. He now commenced a series of intrigues both with and against the Scots, and with the English Presbyterians, which enraged the Independents (who, under the leadership of Cromwell, formed the strength of the army) to such an extent, that they expelled the Presbyterians from the House of Commons, and appointed a court composed of men from the army, the 'Rump' or remnant of the House of Commons, and the city of London, to try the King. The trial, presided over by John Bradshaw, took place in Westminster Hall, and lasted from the 20th to the 27th January 1649. It resulted in the condemnation of C. to death, and, in spite of protests from the Scots and foreign nations, he was beheaded, 30th January. C. was personally a man of virtuous character, dignified, and adorned with a graceful culture, but politically an unscrupulous dissembler and intriguer. See Clarendon's *History of the Great Rebellion*; Carlyle's *Life and Letters of Oliver Cromwell*; Forster's *Statesmen of the Commonwealth*.

Charles II., King of Great Britain and Ireland, was the eldest son of Charles I., and born 29th May 1630. During the civil war he resided at the Hague with his mother. On his father's death, he assumed the title of King, and, on the people of Scotland offering him the crown in 1650, he proceeded thither, and was crowned at Scone in the beginning of 1651. But he never had much love for the Scots or for the Presbyterian form of worship. In spite of the defeat at Dunbar he put himself at the head of the Scotch army, and marched into England, but was followed, overtaken, and defeated by Cromwell at Worcester, September 3, 1651. After numerous remarkable adventures, C. succeeded in escaping to France, and subsequently to the Netherlands. There he remained till after Cromwell's death, when, on the suggestion of General Monk, he was restored to the throne, landed at Dover, 26th May 1660, and was received with extravagant demonstrations of loyalty, which were followed by the restoration of Episcopacy, the persecution of English Nonconformists and Scotch Presbyterians, and the execution of all who had had anything to do with the beheadal of his father. His reign proved one of the most disgraceful and humiliating in British annals. C., a shrewd, cynical, and in many respects able and resolute man, was a thorough sensualist and man of pleasure. He married the Portuguese Princess Catharine of Braganza, but he was guilty of the most shameless adulteries; and during his reign the British court was more unblushingly immoral than at any other period in history. To support his extravagance and debaucheries, he sold Mardyke and Dunkirk to the French, and entering into a secret treaty with their King, accepted a pension from him to make war against Holland, which, however, resulted in the Dutch fleet, under De Ruyter, entering the Thames, and in the conclusion of an ignominious peace, which he broke again on the receipt of fresh pecuniary gifts from France. By cleverly playing off, however, one set of politicians against another, C. succeeded, for a time, in ruling as an arbitrary monarch, and certainly kept the Scotch Presbyterians thoroughly in subjection; while the hideous imposture (1678) of a Popish Plot (q. v.) against his life kept up popular excitement in his favour. Parliament was at length aroused, and against C.'s will passed (1769) the *Habeas Corpus Act* (q. v.), and a bill excluding his brother James, Duke of York, from the throne owing to his having avowed himself a Roman Catholic. The *Rye-House Plot*, a great and somewhat mysterious conspiracy, of which his own illegitimate son, the Duke of Monmouth, was believed to be the head, and for connection with which many distinguished persons, including Lord William Russell and Algernon Sidney, were executed, caused a reaction in favour of C. and his brother. He died somewhat suddenly, February 6, 1685, avowing himself a Roman Catholic to a priest (Father Huddlestone) introduced to his chamber by his brother. The best that can be said of C. is that he was clever, good-natured, and personally courageous; but it should never be forgotten that he debauched the morals of his court, ruthlessly suppressed the liberties of Presbyterianism in the N., and secretly sold himself for lucre to the government of France. For a brilliant sketch of C.'s character and policy, see J. R. Green's *Short History of the English People*, pp. 616-619.

Charles IV. (*Le Bel*), the last of the Capetians, born in 1294, third son of Philippe le Bel, succeeded his brother Philippe V. (*Le Long*) in 1322, excluding Jeanne, Duchess of Burgundy, in virtue of the Salic law which Philippe V. had just established. C.'s second wife was his cousin-german, Maria, daughter of the Emperor Heinrich VII., and sister of King Johann of Bohemia. Although he relaxed the persecution of the lepers and the Jews, C. allowed Pope John XXII. (then at Avignon) to wreak his fury on the mendicant orders (whose vow of poverty was declared heresy) and on the sorcerers. He also helped Count Louis of Flanders to interfere by tolls with the commercial rights of his subjects. After the battle of Muhldorf C. became a candidate against Ludwig of Bavaria for the empire, which was finally divided between Austria and Bavaria. The disputes about the feudal rights in Guienne estranged C. and Edward II., and the former assisted his sister Isabella and the Lancastrians in the Harwich expedition, which placed Edward III. on the throne. C. died 31st January 1328, leaving Philippe de Valois (who succeeded him on the throne) as tutor to his daughter by his third wife, Jeanne d'Evreux.

Charles V. (*Le Sage*), born at Vincennes, 21st January 1337, son of Jean II. and Bonne of Luxembourg, practically reigned as Dauphin after his father was taken prisoner at Poitiers. 'La Jacquerie' gave great strength in the States-General to the *Tiers État* led by Bishop Robert le Coq and Etienne Marcel, Provost of the Traders of Paris, but C. played off against them the nobility and clergy and the provincial estates. After the devastating war of Charles the Bad of Navarre and Edward III. was closed by the peace of Brétigny, there was comparative quiet till the death of Jean (1364); after which the expedition of Du Guesclin against the Captal de Buch, Pedro the Cruel, the Black Prince, and his expulsion of the English, except from Calais, Bordeaux, and Bayonne, are the great features of C.'s reign. The 'Grand Companies' continued to harass the land, and the House of Burgundy rose into dangerous eminence. C. married Jeanne of Bourbon, and died 16th September 1380, leaving two sons. One of his *ordonnances* fixed the royal majority at fourteen. C. got his surname from his habits of life. 'He passed through the courses of study then known—an apt and eager scholar. Religious he was and learned, yet not a monk on the throne. To read in Latin and French, to know something of mathematics as then studied, of astrology, alchemy, theology, to gather round him well-known learned clerks and philosophers seeking science, to collect books and lay the foundations of the great library of Paris, to listen to grave moralities or noble deeds of olden history, or "divers fair tales from Holy Writ"—these were the occupations of the sickly king.' Kitchin's *History of France*, pp. 454-455.

Charles VI. (*Bien-Aimé*), the eldest son of Charles V., was born 3d December 1368, and succeeded his father in 1380. The Dukes of Berri, Bourbon, Burgundy, and Anjou shared supreme power during the minority of the boy-king. All these 'Princes of the Lilies' behaved badly. The last-named Duke abused the right of taxation to provide himself with means for his Sicilian expedition against Carlo Durazzo. The riots of *Maillotins* at Paris and Rouen, and of *Tuchins* in Languedoc, and the massacre of the Jews, showed the exasperation of the lower citizen class. In 1382, under the advice of the Duke of Burgundy, C. interfered in a struggle between Louis de Male, Count of Bruges and feudal lord of Ghent, and the popular party under Philip van Arteveld, who was utterly defeated at Rosbecque and Courtrai. This success was made the occasion of great severities against the Parisians, the patriotic Desmarets being executed and the taxes increased. The following year C. expelled from W. Flanders the English crusade in favour of Pope Urban, which was commanded by the Bishop of Norwich. The marriage of the King to Isabella of Bavaria (1385), the expeditions against England (1386) of Admiral de Vienne and Constable Clisson, and the dismissal (1388) of the King's uncles by the 'Marmouset' party, mark the next few years. This introduced comparative quiet and economy until C.'s insanity, which occurred in 1392, and which brought his brother, Louis of Orleans, into prominence as the rival of the House of Burgundy. Louis, partly maintained by the exactions of his friend, the 'false' Pope Benedict XIII. at Avignon, stirred up the expedition of Glendower, which was crushed at Shrewsbury; and so neglected the helpless King and oppressed the great towns, that his murder, in 1407, by Raoul d'Octonville, a follower of the Burgundian Duke Jean sans-Peur ('the Fearless'), was received with 'ecstasies of joy,' and publicly defended before the Dauphin and the nobles of France, met at the Hôtel St Pol, in March 1408. The Burgundian victory over the Liègois at Hasbain led to the 'paix fourrée' of Chartres, but the struggle between Burgundy and the Comte d'Armagnac, father-in-law of Orleans (in which the city of Paris took a leading part) was continued till the treaty of Pontoise (1414). The invasion by the English succeeding at Agincourt and elsewhere, the Armagnacs became unpopular, and in 1418 were massacred in Paris by the Burgundians. In revenge, Jean of Burgundy was murdered (1419) on the Bridge of Montereau by Tanneguy-Duchatel, one of the chiefs of the Orleanist party; and his son embracing the English cause, Paris was betrayed to Henry V., who by the treaty of Troyes (1420) obtained Catherine of France in marriage, and the right of succession to the throne. Charles, however, survived Henry by two months, dying 21st October 1422. 'He had reigned for forty-two years: long he had been but a name, a shadow. His voice, heard at rare intervals on some piteous occasion, was as if it came from the tomb: it usually had a plaintive gentleness, a touch of sad forgiveness in it. . . . The people called him "C. the Well-Beloved," clinging to him with a touching helplessness.' Kitchin's *History of France*, pp. 513-514.

Charles VII. (*Le Victorieux*, or *Le Bien-Servi*), born at Paris, 22d February 1403, was the fifth son of the preceding, whom he succeeded in 1422. In the same year he married Marie of Anjou, daughter of Louis, King of Sicily. He had previously, in 1418, assumed the title of Regent, and had acted with the Constable d'Armagnac against the Burgundian faction. While the latter occupied Paris, C. held a Parliament at Poitiers and Bourges. The treaty of Troyes (1420) had transferred the French crown to Henry V. of England. Accordingly C. had to fight with Bedford and other English commanders at Crevant (1423), Verneuil (1424), and on the fatal 'Day of Herrings' (1429) for his existence as a sovereign. The appearance of Joanne d'Arc at the siege of Orleans, and the dismissal of the favourite La Trémouille, changed the course of events. C. himself wakened up from the frivolous sloth in which he had been living, and detaching by the treaty of Arras (1435) the House of Burgundy from the English cause, he gained several important victories over his ancient foes, organised by his *ordonnances* the first standing army (cavalry and infantry) of France, and made an honourable truce in 1444. He also, by the Pragmatic of Bourges, resisted the Pope's fiscal claims on the national Church. When war broke out again, the English were speedily driven from Normandy, Guienne, and Gascony. In 1457 they had left the country. Suspicions of the Dauphin (afterwards Louis XI.) hastened C.'s end: he died 22d July 1461. He had twelve children, of whom one daughter, Catherine, was married to Charles of Burgundy; another, Madeleine, to Gaston de Foix. C. was much under the good influence of Agnes Sorel. In this reign Jacques Cœur founded French trade with the Levant, but was afterwards forced to flee from his country to escape the jealousy of the nobles. See Kitchin's *History of France*, b. iv. c. 6, 7; and Vallet de Viriville's *Histoire de C. VII.* (3 vols. Par. 1862-65).

Charles VIII. (*L'Affable*), born at Amboise, 30th June 1470, was the only son of Louis XI. and Charlotte of Savoy: his legitimacy has been questioned. He was declared king on his father's death in 1483. His sister, Anne of Beaujeu, became regent, and conducted a successful war against the Orleanists, among whom were the future King Louis XII. and De Comines, the battle of St Aubin (1488) deciding the final campaign in Brittany. In 1491 C., who had taken Dunois as his adviser, married Anne of Brittany, who had been already married by proxy to Maximilian. This led to a war with Germany, with whom Henry VII. sided. C., however, wished to prosecute the claim to Naples, which Charles of Anjou had bequeathed to his father; he also dreamed of conquering the Eastern Empire. He led an army of 30,000 men into Italy, drove the Medicis from Florence, obtained the Turkish Prince Zizim from Pope Alexander VI., and occupied Naples almost without striking a blow. The formation of the League of the Pope, Venice, Milan, Spain, and the Emperor caused C. to return home, winning on his way the victories of Fornovo and Novara. Gonsalvo de Cordova immediately drove the French out of Naples. C. was arranging a new Italian campaign when he died, 7th April 1498, predeceased by his son, Charles-Orland. C. was remarkable for courage and enterprise, but very sickly in body. See the *Mémoires* of Comines; Ségur's *Histoire de C. VIII.* (2 vols. 1835); and Varillas' *Histoire de C. VIII.*

Charles IX., born at St Germain-en-Laye, 27th June 1550, was the second son of Henri II. and Catherine de Médicis, and succeeded his brother François II. on his death in 1560, having previously borne the title of Duc d'Orleans. C. was quite passive in the earlier years of his reign, the Queen-mother pretending to favour the Huguenots. He was, however, brought over to the Catholic side by the interview which the French court had with the Duke of Alva (representing Philip II.) at Bayonne in 1567. The Huguenots then attacked Paris, and were defeated by Montmorency at St Denis. After the short truce of Longjumeau, Condé, who had attempted to gain possession of the King's person at Meaux, was defeated at Jarnac, and in 1570 the peace of St Germain-en-Laye was signed with Henri of Navarre, who had now become leader of the Huguenots. C. seems to have fallen under the influence of Coligny at this time: probably suspicion of the Guises and jealousy of his brother Henri contributed to this. He married Elizabeth, the daughter of Maximilian II., and betrothed his sister Marguerite to Henri of Navarre. To the assassination of Coligny, and the general massacre of 24th August 1572, C. consented under considerable moral pressure. The peace of Rochelle showed that the massacre was a great blunder. C. died 30th May 1574, leaving no legitimate children. His mistress, Marie Touchet, afterwards married François Balzac, and became the mother of Henriette d'Entragues, the mistress of Henri IV. C. wrote a book, *La Chasse Royale*, printed in 1625, and wrote verses of high merit. Singular to say, the King who consented to the Massacre of Bartholomew also authorised the famous Calvinistic version of the Psalms by Marot to be printed. See Varillas' *Histoire de C. IX.*, and Sorlin de Sainte-Foy's *Histoire de la Vie, Mœurs, et Vertus du Roi C. IX.*

Charles X., the fourth son of the Dauphin Louis and Marie Josèphe of Saxony, and grandson of Louis XV., was born at Versailles, 9th October 1757. In 1773 he married Maria Theresa of Savoy. He was then known as Charles Philippe, Comte d'Artois. His life was extremely vicious and stupid. C. supported the oppressive fiscal measures which precipitated the Revolution. Early in the struggle he emigrated with his sons, the Duc d'Angoulême and the Duc de Berri, and afterwards meeting his brother Louis, Comte de Provence, at the Conference of Pilnitz (1791), they issued the declaration which provoked from the National Assembly a decree placing their property under sequestration, and ordering them to return to France in three months. C. took part in the campaigns of the Dukes of Brunswick and York. He also accompanied Lord Moira's expedition of 1795, which was to assist the rising of Charette and Stofflet in the royalist provinces of the W. 'Monsieur,' as C. was then called, timidly withdrew without landing, went to Holyrood, and after the peace of Amiens (1802) to London, which he did not leave till 1814, when he entered Paris, and was enthusiastically received there and in the provinces. On the return of Napoleon, C. was sent to Lyons to organise resistance, but was obliged to retire with his brother to Ghent. On the second restoration, in spite of his vows to carry out the charter of the constitution, he became the head of the reactionary party against the moderate programme of the King and his ministers. After the assassination of his son, the Duc de Berri, C. succeeded in dissolving the Richelieu ministry, and bringing in that of Villèle and Peyronnet, which engaged in the inglorious war with Spain (1823). In 1824, in his sixty-seventh year, he succeeded Louis XVIII., and at once began a retrograde policy, encouraging Ultramontane pretensions, attacking the freedom of the press (the *Courier* and the *Constitutionnel* were both prosecuted), and strengthening the Royalist Chamber of Peers by numerous creations. The elections of 1828 produced the more enlightened ministry of Portalis, Royer-Collard becoming President of the Chamber of Deputies. In spite of this, and of the popular French intervention in Greece, a rupture took place on the question of Departmental administration; and the formation of the Polignac and Labourdonnaye ministry called forth the famous protest of the 221 deputies. Immediately after the successful expedition to Algiers, C. published the ordinances of 25th July 1830, which threw Paris into the revolution known as the Three Days of Barricades. The King, in alarm, made ineffectual efforts to conciliate the popular party. It was too late. He then departed for England, where he assumed the title of Comte de Ponthieu. The rest of his life was spent quietly at Holyrood, &c. He died, 6th November 1836, at Gorz. C. was the last Bourbon King of France. His intellectual weakness has descended to his grandson, but not his immoralities.

Charles the Rash (*Le Téméraire*), Duke of Burgundy, born at Dijon, 10th November 1433, was the son of Philippe le Bon and Isabella of Portugal. His passionate martial nature burst into action when Louis XI. attempted to take the Somme towns. C. formed a League of the Public Good, defeated the King at Montlhéry, and by the treaty of Conflans (1466) extended his father's hereditary possessions. When in 1467 he became Duke (he was previously known as Comte de Charolais), he suppressed with terrible severity the insurrection of the people of Dinant and Liège, and strengthened his position by marrying Margaret, the sister of Edward IV. of York. Afterwards, at the interview of Péronne, a sort of agreement was come to between the great vassal and his lord; but in 1471, C., taking some excuse from the Wars of the Roses, opened hostilities in Picardy, Normandy, &c., with an army composed partly of English and Italian mercenaries, but chiefly of the old feudal levy, which he opposed to the 'Compagnies d'Ordonnance' of Louis. In spite of his excellent artillery he was compelled to raise most of his sieges. He now thought of reviving the old kingdom of Burgundy by the addition of Lorraine, Provence, and Switzerland. These designs brought him into conflict with the Emperor Friedrich at Neuss, King René II. at Nancy, and with the Swiss Cantons, who defeated him utterly at Granson, and again, with the help of Lorraine cavalry, at Morat. With a third army C. made a final effort by laying siege to Nancy (1477), where he was killed (January 5), and his army dispersed. C. was unusually well educated for his age, attentive to religious fasts and ceremonies, fond of chivalry and ancient military custom, charitable to the poor, and energetic as a ruler, but rash in war and merciless in discipline. See De Comines' *Mémoires*; De Barante's *Histoire des Ducs de Bourgogne de la Maison de Valois* (13 vols. Par. 1824); Kirk's *History of Charles the Bold, Duke of Burgundy* (2 vols. Lond. 1863); and Freeman's *Historical Essays* (Lond. 1872).

Charles'ton, the chief city of S. Carolina, U.S., is situated on a tongue of land, having the Cooper river on the E. and the Ashley on the S.W. Both of these rivers are wide and deep, affording good accommodation for shipping, and the bay or estuary which they form extends eastward for 7 miles. There is a troublesome sandbar at the entrance, broken, however, by a navigable channel of from 16 to 22 feet of water. Approaching from the ocean the effect is fine, with the bay, its islands, forts, and shores spread out, and the spires and shipping of the city in the distance. C. has some thirty churches and a large orphan asylum, negro-schools, schools and charities for white people who have suffered in the war, and the State Medical College (1785). C. has an extensive trade in cotton and rice. In the year ending 31st March 1875, its exports amounted to $19,532,393; 371 vessels cleared from the port, of 310,139 tons; and 473 entered, of 370,771 tons. Most of its bread-stuffs and manufactured goods are imported from the N. C. was founded in 1672, and in 1685 many French Huguenots settled in it. Before the civil war it was a charming city, with beautiful villas, gardens, and promenades; and was famed for the hospitality of its citizens and the gaiety of its society. On the 12th April 1861, the civil war began by the firing of the first gun on Fort Sumter in C. harbour. In 1863 the Union forces bombarded the city, and in February 18, 1865, they occupied it again. During the war a great fire broke out, and it left for years a track of desolation across the city. Pop. (1870) 48,956.

Charlestown, a seaport of Massachusetts, U.S., is separated from Boston by the Charles river. It stands on an elevated peninsula, containing Breed's or Bunker Hill, crowned with a monument to commemorate the first battle of the Revolution, fought here June 17, 1775. C. contains the Massachusetts state prison, and an extensive U.S. navy yard. It was annexed to the city of Boston in 1873. Pop. in 1870, 28,323.

Charles' Wain or **Waggon,** otherwise called the *Plough*, a popular name for the seven conspicuous stars in the constellation Ursa Major (q. v.).

Char'let, Nicolas Toussaint, a French painter, born in Paris, 20th October 1792, was the son of a dragoon, and was familiar from childhood with barrack life. He was employed as a clerk in the Paris mayoralty till 1816, when his Bonapartism put an end to his official career, and the pressure of circumstances drove him into art, the special tendency of his mind leading him into the department of kindly and humorous caricature. His designs chiefly represent the phases of life in the barrack, the tavern, and the homes of the poor, but are always refined and genial. In his drawing, however broad the humour may be, there is always a basis of serious sentiment. By his *Épisode de la Campagne de Russie*, exhibited in 1836—a work remarkable at once for vigour of style and elevation of feeling—C. established his claim to high rank as a painter in oils. He died at Paris, 29th December 1845. See Jules Janin, *Notice Necologique sur N. T. C.* (Par. 1847).

Charleville, a town in the department of Ardennes, France, on the Meuse, nearly opposite Mézières, with which it communicates by means of a stone bridge. It lies near the base of *Mont Olympe*, has fine promenades, a valuable library, large ironworks, and an active railway and river trade in wine, coal, iron, &c. Pop. (1872) 11,410. C. was founded in 1606 by Charles, Duke of Nevers, hence its name.

Charl'ois, a village 2 miles S.S.W. of Rotterdam, on the Maas, notable as the scene of a terrible catastrophe in the year 1512, when some 8000 persons in a religious procession were drowned while crossing the frozen river.

Charlotte Am'alie, the capital of St Thomas, W. Indies. It has a spacious harbour, and is the W. Indian station for the English mail-packets. Pop. 12,560.

Charlott'enburg, a town of Prussia, province of Brandenburg, on the Spree, 4½ miles W. of Berlin, of which it may be regarded as a suburb. It has a royal palace, built in 1699, a beautiful park, in which there is a large orangery, a theatre, and a mausoleum of granite, under which rest the remains of Friedrich Wilhelm III. and Queen Luise. The principal industries are dyeing, printing, manufactures of machines, shot, porcelain, cement, wax, chocolate, soap, glass, &c. Pop. (1871) 19,518, of which 139 are soldiers.

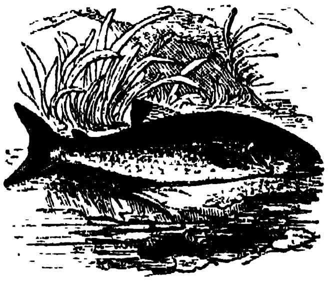
Charlotte Town, the capital of Prince Edward Island, Dominion of Canada, on Hillsborough Bay, at the confluence of three rivers, each navigable for several miles. It possesses a very commodious natural harbour, vessels being able to ascend each of the rivers to a considerable distance. C. has also an iron-foundry, a woollen factory, and considerable shipbuilding. Pop. (1871) 8807.

Charm (Fr. *charme*, Lat. *carmen*, 'a song'), a form of words in verse (hence the name), believed to possess a protective, hurtful, or healing power. For this purpose verse has always been held to be more potent than prose. Latin literature abounds with examples of the use of 'carmen' in the sense of a magic spell. The occult power dwelling in the C. exerted its mysterious influence during the 'incantation' or rhythmic recital of the words. But gradually this notion of a C. died out as the belief became confined to the more ignorant of the community, and now the word denotes any unintelligible jargon scribbled on paper by a quack and carried about by his dupes. See AMULET, INCANTATION, MAGIC.

Char'nel-House (Fr. *charnier* or *charnel*, Lat. *carnatis*, from *caro*, 'flesh'), a place in which the bones of the dead thrown up by gravediggers used to be deposited, at a time when overcrowded churchyards and other burying-grounds did not invite legislation against the nuisance they constituted. The C.-H. was sometimes a building complete in itself, having a chantry attached to it; but it was commonly a crypt under a chapel—not unfrequently, indeed, under the church itself.

Cha'ron first appears in later Greek mythology as a son of Erebus, appointed by the gods to ferry across the rivers of Hades the shades of such dead as had been buried. He exacted as toll from each an *obolus* or *danake*, and the coin was placed in the mouth of the dead previous to burial. C. is represented as a slovenly old man with squalid beard and clothes.

Charr (*Salmo salvelinus*), a species of Teleostean fishes belonging to the salmon genus, and included in the family *Salmonidæ*. The C. is a fresh-water fish, occurring in British and European lakes and rivers. The Lake of Geneva is celebrated for its C.—the *ombre chevalier* of that lake. The body of this fish is elongated, the tail forked, and the fins of small size. The back is coloured dark olive; the sides are of lighter colour, and spotted with red or white; the belly is light in colour, and may be pale or even deep orange. The colours vary with the season and reproductive periods of these fishes. Only the front part of the vomer is provided with teeth, as in the true salmon and bull-trouts. The C. feeds on crustacea, insects, &c.; and appears to live in deep water during summer, but to come to the surface and shallower waters in the autumn season. It spawns in autumn or winter, and ascends rivers for that purpose. The fish is more plentiful in the N. of England lakes than in Scotch waters; but its numbers have greatly decreased owing to the indiscriminate fishing permitted by the want of legislative measures.



Charr.

Char'ta Mag'na. See MAGNA CHARTA.

Charte (Lat. *charta*, 'a paper'). Before 1789 France had properly speaking no great written guarantee of constitutional freedom. The successive constitutions of the Revolutionary period and the First Empire will be noticed elsewhere. The first French C. is properly that of 1814. The Senate, under Talleyrand, had already, on 6th April, prepared a draft constitution, which was 'to be submitted to the acceptance of the French people, and to which Louis-Stanislas Xavier, freely called by the people, was to swear conformity.' But, in spite of the declaration of St Ouen, Louis set this aside, and submitted to a meeting of the Senate and Corps Legislatif the *C. Constitutionelle* of 4th June 1814, which is couched entirely in the language of concession, and in its preamble expressly affirms that the person of the King contains all authority. The document deals with public rights, such as equality before the law, equality of contribution to public burdens, freedom of civil and military offices, personal liberty, and liberty of conscience, freedom of discussion. The Catholic religion is declared to be the state religion, conscription is abolished, and the enjoyment of the nationalised property is guaranteed to its present owners. Then comes a chapter on the forms of government, defining the supreme executive vested in the King, the responsibility of ministers, the legislative power vested in King, Chamber of Peers, and Chamber of Deputies, the initiative of legislation, and the special initiative in taxation. The Chamber of Peers is next treated of: they sit in secret, have the sole jurisdiction in high treason, are free from arrest in matters criminal. The King has an unlimited power of creating peers, but the peer must be thirty years old before he has a deliberative voice. With regard to the Chamber of Deputies from the electoral colleges, the deputies are elected for five years; each one must be forty years old, and a ratepayer to the extent of 1000 frs. The suffrage is confined to ratepayers of 300 frs. The King may dissolve the Chamber, but must call another in three months. The persons of deputies are protected during session. The Chamber has the right of accusing ministers, who may be chosen from either House. The judges named by the King are not removable, except Juges de Paix. Juries are preserved. The whole military service is to remain in possession of its honours and pensions; the public debt is guaranteed; the ancient nobility resumes its titles. This C. is modified by the *Acte Additionnel*, drafted by Benjamin Constant, which, during the Hundred Days, Napoleon passed on 22d April 1815, and which received 1,300,000 votes. It reduces the minimum age of deputies to twenty-five, and removes the ratepaying qualification; an indemnity is given to representatives; offences of the press are appropriated to the jury; the duty is laid on ministers to give explanations when required; and the intervention of the Legislature is made necessary in loans, alienations of territory, and in the levy of forces. On the second Restoration, which had proclaimed at Cambrai the dogma of Legitimacy, Louis promised to reform fourteen articles of the C., but failed to do so. After the assassination of the Duc de Berri, a long series of retrograde measures were carried by the ministries of Villèle, Peyronnet, and Polignac; the National Guard was disbanded; new peers were indiscriminately created. Then came the address of the 221 members, 'that the policy of the Government was not consistent with the wishes of the people;' and the royal ordinances of St Cloud (25th July 1830), the object of which was the total destruction of the liberty of the press, and the restriction of electoral power to the wealthier classes. These ordinances, which dissolved the Chamber, were unconstitutional. Associations were formed in Normandy, Burgundy, Lorraine, and Paris to resist payment of taxes not voted by the Chamber; then came the Revolution, the new or revised C. of 6th August 1830, and the ministry of Laffitte, Guizot, Dupont de l'Eure, Gérard, Bignon, Casimir Périer, Duc de Broglie, Baron Louis, Molé, Sébastiani, and Dupeir. One important point in this C. was that the regulation of the franchise, or, in the French constitutional language, the organisation of the electoral colleges, was not made part of the constitution, but left to the Legislature, so that universal suffrage might have been legally introduced before 1848. A direct initiative is given to both Chambers; the deputies and the electors nominate their presidents; the sittings of the Upper Chamber are made public; the Catholic religion ceases to be the state religion in this sense that all other Christian sects are admitted to receive state aid. All the peerages created by Charles X. were annulled, and speedy legislation was promised as regards the responsibility of the executive, the organisation of primary education, the re-election of deputies receiving official posts, the franchise, the use of a jury in the trial of political and press offences. In its main features the second repeats the first C. By a subsequent law of 29th December 1831 the twenty-third article, which gave an unlimited right to create hereditary and life peerages with pensions, was limited to the nomination of life peers without pension from certain classes which are enumerated. There were three parties concerned in the preparation of this C.; the Progressists, of whom Constant was the type; the *Doctrinaires*, or 'quasi-Legitimists,' who did not wish to go beyond the principles of 1814; and the practical majority of the Chamber led by Dupin the elder, whose anxiety was to point out that Louis Philippe succeeded, not as heir, but by choice. In 1831 the franchise was lowered from 300 to 200 frs. of direct taxes, and the eligibility qualification from 1000 to 500 frs. The only other constitutional law of importance prior to 1848, when the republican constitution was introduced, was the regency law of 1842.

Char'ter, in the law of England, is the instrument conveying a royal grant. It is generally written in Latin. The grant may be of lands, houses, or honours, not already possessed; or it may be confirmatory of a grant already made; in which case it is called a C. of Confirmation. (See DEED.) In Scotch law, a C. is the written evidence of a grant of heritable (real) property, made under the condition that the grantee shall annually pay money or perform a service to the granter; and this must be in the form of a written deed. The granter is termed the superior; the grantee, the vassal. The vassal is said to *hold* the subject of the superior. The annual sum or service stipulated for is called the *Duty*. Charters are either *Blench* or *Feu*. A blench-duty is nominal, as a penny Scots or a red rose, *si petatur tantum*. A Feu-Duty (q. v.) is a consideration of value.

Char'terhouse (a corruption of the Fr. *Chartreuse*, Latinised Carthusian), originally a Carthusian monastery, founded about 1370 by Sir Walter Mauny outside of the bar of W. Smithfield.

It was surrendered to Henry VIII. June 10, 1535, and after having been possessed by several eminent personages in turn, was sold for £13,000 by the Earl of Suffolk to Sir Thomas Sutton, who founded on it a magnificent hospital, and endowed it for a master, preacher, a head schoolmaster, a second master, forty-four boys, and eighty decayed gentlemen, known as *Poor Brethren*. The poor brethren must not be under fifty years of age, and must have been housekeepers; they must also be bachelors and members of the Church of England. The boys, or scholars, are admitted between the ages of ten and fourteen; and both they and the poor brethren gain admission less because of their poverty than of the influence which they can command. The poor brethren have each an apartment, food, and about £26 a year for clothing, &c., and the scholars receive free board and education. The masters, however, are allowed to receive others either as boarders or as day-scholars, and as the C. is one of the best English schools, the number of these is always considerable. Among those C. boys who distinguished themselves in after-life are Barrow, Addison, Steele, Wesley, Thirlwall, Grote, Thackeray, Eastlake, and Havelock. A few years ago the school was removed to Godalming in Surrey.

Charter-Party, this is a contract for letting a ship or part of one to a merchant, called the freighter or charterer, for the conveyance of goods for one or more voyages. It may be under seal, or in writing only. A memorandum of agreement, or the heads of an agreement for the drawing up of a C.-P., are frequently all that passes between shipowner and freighter, and they are as binding as a formal instrument. By the C.-P. the owner or master usually undertakes that the ship shall be seaworthy, and otherwise in condition to carry the goods; that the ship will be ready on the day appointed; that after receiving her lading she shall sail on the first opportunity, and safely deliver her goods at the place of consignment. The charterer undertakes to pay the freight, and load and unload within the time agreed on. Each binds himself by a penalty to fulfil his undertaking. The freighter may underlet, or put in the goods of another, unless contrary to the contract. The responsibility of the owner of the ship begins when the merchandise is put on board. The freighter generally insures. See BILL OF LADING.

Char'tism was the articulate expression of the misery and sense of wrong felt by the working classes (both artisan and agricultural) in the long period after the Napoleonic wars, when, without education or political rights or trade organisation, they expected to counteract high prices and low wages by a redistribution of political power. The same movement is seen in the 'Friends of the People' (1793), and in the 'Manchester Blanketeers' (1819). In 1830 Lancashire and Yorkshire operatives were receiving 4d. a day for twelve hours' work, and in some parishes the whole available property was insufficient for the relief of the poor, although the weekly allowance for a labouring man (including earnings) was sometimes only 3s. 1d. per week, when the quartern loaf was 1s. Rick-burning and machine-breaking were frequent in that year. The influence of a bad poor-law and of the vexatious corn-laws was in 1835 intensified by a bad harvest; and the excitement which the Reform Act of 1832 had partially allayed broke out in the Dorchester labourers' meeting in Copenhagen Fields (1834), the Lancashire torchlight meetings of 1838, and the Birmingham National Convention (elected by Chartists) of 1839. The 'Charter,' drawn up in 1838 by six radical M.P.'s. and six members of the 'Working Men's Association,' demanded universal suffrage, ballot, annual Parliaments, payment of members, abolition of the property qualification of members, and equal electoral districts. A monster petition was presented to the Commons on 14th June 1839, but the motion to refer it to a committee was negatived by a majority of 189. This was followed by riots in Birmingham, Sheffield, Newcastle, &c., by forced contributions and the attempted suppression of religious services; but fortunately the threat of a 'sacred month,' or cessation from labour during August, was not carried out. The best Chartists, such as Hetherington, Vincent, Lovett, and even Fergus O'Connor, were 'moral force' men, and supported their principles in the *Dispatch* (London), *True Scotsman* (Edinburgh), *Journal* (Birmingham), *Chartist Circular*, the *Northern Star*, and other papers. Prominent among 'physical force' Chartists was a Methodist minister named Stephens, who countenanced torchlight meetings (after they were by proclamation declared illegal), and was tried and sentenced to eighteen months' imprisonment at Chester in 1839. The popularity of Vincent, and the report that he had been cruelly treated in prison at Newport (in Wales), occasioned the armed attack on that town under the leadership of Frost (a linendraper and magistrate), Williams (a publican), and Jones (a watchmaker). These men were tried for high treason, sentenced to death, and transported for life. In 1840–42, under O'Connor and O'Brien, C. was successfully revived, joint cause being made with the Irish Repealers. Mr Duncombe presented in Parliament the petition of the 'National Chartist Association' (which possessed 400 affiliated societies and 40,000 members); and in the N. of England there was a systematic 'turn-out' from the factories, although little violence was done to person or property. In spite of numerous prosecutions (on one of which Thomas Cooper was sent to prison for two years), the 'complete-suffrage union' of Joseph Sturge and the abortive land scheme of O'Connor (who was now supported by Ernest Jones) continued to fan the excitement. O'Connor, who had weakened his position by opposing the Anti-Corn-Law League, was nevertheless returned to Parliament in 1846, on the downfall of Sir Robert Peel's administration, but nothing of importance occurred till after the French Revolution of 1848, when a monster meeting took place on Kensington Common. The petition presented by this meeting (against the proposed procession of which to Westminster great military preparations had been made) was found to be in great measure a dishonest fabrication. This fact, the prosperity of trade, and the increase of emigration, all tended to extinguish C. O'Connor became a lunatic. The resolutions in favour of household suffrage and ballot, moved by Mr Hume in 1848, indicated that portions of Chartist principles were destined to survive. One of the 'points' has already been conceded—the ballot; others are in a fair way of being realised—*e.g.*, 'universal suffrage;' but the experience of America does not commend the principle of 'payment of members.'

Char'tres, the capital of the department Eure-et-Loire, France, lies in a hilly amphitheatre on the Eure, 47 miles S.W. of Paris by railway. It is in great part composed of picturesque old houses, and has many fine promenades. Its large cathedral of *Notre Dame*, rebuilt during the 11th, 12th, and 13th centuries, is one of the finest in France, and is almost unsurpassed for wealth of ornamental sculpture. The façade supports two elegant spires, the principal one being 400 feet high; and the windows are traced with 5000 figures, exhibiting fine artistic design and the rarest delicacy of colour. There are several other handsome churches, as those of St Pierre and St André, also an imposing episcopal palace, founded by Madame de Maintenon, a massive town-hall, a theatre, &c. C. has large manufactures of steel, woollens, leather, hoisery, &c., and an active trade in grain, wine, and cattle. Pop. (1872) 16,977. C. was the capital of the Gallic *Carnutes*, and became the *Autricum* of the Romans. In the middle ages it gave name to a country which fell to the crown of France in 1286, was raised to a duchy by François I., and became an appanage of the Orleans family, whence the eldest son of the Duc d'Orleans generally bore the title of Duc de C.

Chartres, Duc de, Robert-Philippe-Louis-Eugène-Ferdinand d'Orleans, younger son of the late Duc d'Orleans, was born in Paris, November 9, 1840, and at the Revolution of 1848 passed into exile with the rest of the family. He was educated at Eisenach, resided for some time at Richmond, and served along with his brother in the Federal army during the campaign of the Potomac (1862) in the American civil war. In 1863 he married his cousin, the eldest daughter of the Prince de Joinville, and in 1870 returned incognito to France, entering the army of General Chanzy under the name of Robert le Fort. After the German war, the National Assembly having revoked the law of banishment against the Orleans family, he was named commander of a squadron by M. Thiers, and served in Algeria in 1872.

Chartreuse', La Grande, a famous monastery in the department of Isère, France, 13 miles N. of Grenoble, picturesquely situated in the valley of the Guiers (nearly 4000 feet above the sea), enclosed by lofty mountains, and almost inaccessible. It was founded in 1084 by St Bruno, broken up at the Revolution of 1789, and reoccupied since 1816. The well-known liqueur of the same name is manufactured by the monks, and is so much in repute, that cautions are regularly advertised in the English and other newspapers against spurious imitations.

Charts are the maps used in navigation, and in which are specially noted the depth of soundings, the position of rocks and sandbanks, and the direction of currents and prevalent winds. The English Admiralty Office expends a large sum annually on the preparation of elaborate C. on a large scale, and these are sold at nominal prices, ranging from 3s. to 6d. each. At various places, as Gibraltar and Cape Town, there are depôts for the supply of C., which are now in almost universal use.

Char'tulary (Late Lat. *chartularia*), a collection of charters belonging to a church or religious house, a civil corporation, or even private individuals. Where these were numerous, the necessity of such a collection, consisting of copies of the original charters, would soon suggest itself; and hence we find that chartularies were made in France as early as the 10th c. Many of them have been printed, and contain matters of great interest and value, historical and antiquarian.

Charyb'dis. See SCYLLA.

Chase, Salmon Portland, a prominent American statesman, was born in Cornish, New Hampshire, January 13, 1808, graduated at Dartmouth College, 1828, and, after studying law, settled in Cincinnati about 1830. C. was at first a Democrat, but in 1841 he assisted in organising the Liberty party, and sought to denationalise slavery. He was elected a senator in 1849, and in 1855 was made Governor of Ohio. In 1861 President Lincoln appointed him Secretary of the Treasury, and C. signalised himself by his bold financial policy during the crisis of the war. He was the originator of the far-famed *greenbacks*. In October 12, 1864, C. was appointed Chief-Justice of the United States, which office he held till his death, May 7, 1873. C. stood very high in the esteem of his countrymen. He was unquestionably a man of noble character and great intellectual vigour, and his career must always form an important part of the history of his time.

Chas'idim (Heb. *ka-sĕ'thĕm*, 'the pious') were the Puritans among the post-Babylonian Jews. They were distinguished by their efforts after a Levitical and sacerdotal purity; for besides their leaders, who were properly the offerers of sacrifice, each individual obtained the standing of a priest by taking part in the purifications and sacrifices. They imposed upon themselves great acts of self-denial, and to a great extent had a community of goods. In process of time the association was split up, the ultra-Puritan party being the Essenes, while the moderate party, to which the Pharisees belonged, retained the name of C. A sect of C., which has survived to the present day, with doctrines drawn from the Bible, the Talmud, and especially the Cabala, was founded in Poland in the middle of the 18th c. by Rabbi Israel ben Eliezer Baal Shem.

Cha'sing, the art of chiselling or otherwise cutting out ornamental details on metallic surfaces, principally applied to the precious metals and bronze. C., indeed, in its widest signification may be said to be the artistic sculpture of metal-work. The tools used by the chaser are 'gravers' and other cutting implements, 'rifflers,' and 'mats,' for producing a soft superficial texture. Repoussé-work (q. v.), after being beaten up into form, is finished by C., as are also cast and 'struck' or stamped ornament; and C. in relief is also applied to metal in the flat.

Chass'é, David Hendrik, Baron, a Dutch general and patriot, was born at Thiel, March 18, 1765, entered the army of his country at the age of ten, and was made lieutenant in 1781, and captain in 1787, but subsequently joined the army of France. He rose to the rank of lieutenant-colonel in 1793, distinguished himself fighting against Prussia in 1796 and 1799, and was popularly called *Général Bayonnette* during the Peninsular war. In 1811 Napoleon made him a baron of the Empire. After the first restoration of the Bourbons, he returned to Holland, and was lieutenant-general of the Dutch army, fought at Waterloo, was appointed Governor of Antwerp after the peace, and defended the town for about a month in 1832 with a garrison of 6000 men against a Belgian and French force 75,000 strong. C. died at Breda, May 2, 1849.

Chasseurs' (Fr. 'huntsmen'), the name originally given to a French body of sharpshooters or skirmishers, formed in 1741, in imitation of the Tyrolese jägers (chamois-hunters) of the Austrian army. The French C. were at one time both infantry and cavalry, but the name came to be applied strictly to a celebrated foot corps organised in 1835 by the Duc d'Orleans, armed with improved rifles, and called *C. de Vincennes*, from having been quartered at Vincennes. In 1838 these troops were raised to a battalion, and they have since become known also as *Tirailleurs*. There are light troops corresponding to the C. in almost all European armies.

Chaste-Tree. See VITEX.

Chas'uble (*casula*, *casibula*, a diminutive of *casula*, used by Isidore of Seville for 'a mantle'), the principal garment of a Roman Catholic priest, and as such often called 'the vestment' in old English inventories. It is worn uppermost at the celebration of mass. Originally in the form of a circle, it was retrenched in the Western or Latin Church till it became oblong. In England it was generally adorned with Y-shaped crosses and orphreys, or with embroidered ornaments down the front and along the edges; and later with a Latin cross on the back, and an orphrey in front. The hooded C. seems to have existed in France as early as the 6th c.; it is the original of the *casula processoria*, 'processional C.,' which was formerly worn at processions, but not generally at mass. The modern-shaped Roman and French C. is the invention of the last two centuries.

Chat (*Saxicola*), the name applied to a genus of Insessorial birds, including several species, and belonging to the sub-family of the *Erythacinæ* or robins, which in turn forms a group of the larger division *Sylviadæ* or warblers. The stone-C. (*S. rubicola*), whin-C. (*S. rubetra*), and wheatear (*S. œnanthe*), are three familiar species included in this genus.

Châ'teau, or **Châtel** (Old Fr. *chastel*), a word of common occurrence in the names of French towns, and derived from the Latin *castellum*, 'a fort.'

CHÂTEAUDUN, a town of France, department of Eure-et Loire, on the Loire, 26 miles S.S.W. of Chartres. It has been almost entirely rebuilt since 1723, when it was destroyed by fire. Besides a castle, which dates from the 10th c., it has several fine churches, with the interesting ruins of Notre-Dame-de-la-Boissière. Its chief industries are tanning, and manufactures of blankets and hats; its commerce is for the most part in cattle, wine, wool, and hemp. Pop. (1872) 5564. C. was stormed in 1870 by the Germans.

CHÂTEAU-GON'TIER, a town of France, department of Mayenne, on the right bank of the river of the same name, 17 miles S.E. of Laval. Its most interesting buildings are the Church de la Trinité, erected in the 17th c., the ancient Chapel des Ursulines, remarkable for its fine stained windows, and the Church of St Jean. C. has cornmills, tanneries, potteries, and manufactures of linens, woollens, serge, &c., and in its vicinity are mineral springs. Pop. (1872) 6371.

CHÂTEAU-MARGAUX, a beautiful castle near the village of Margaux, in the department of the Gironde, E. of Castelnau de Medoc, on the left bank of the river Gironde, 14 miles below Bordeaux. It is famous for its vineyards, which yield one of the finest class of clarets.

CHÂTEAUNEUF, a village of France, department of Lozère, 14 miles N.E. of Mende, pop. (1872) 393. It is historically interesting for the touching incident connected with its surrender by the English governor in 1380 to the dead Du Guesclin, the former laying his sword and keys on the bier of the latter. Here also, on 18th November 1870, the Germans defeated a superior force of French Mobiles.

CHÂTEAUROUX, a town of France, department of Indre, on the left bank of the river Indre, and a station on the Paris and Bordeaux Railway, 145 miles S.W. of the former city. The town-hall occupies the site of the old castle, erected in the 10th c., and of which only a tower remains. C. manufactures and trades in woollens, cottons, hosiery, paper, hardware, leather, tobacco, &c., and has a considerable number of hands engaged in working lithographic stones. Pop. (1872) 14,893.

CHÂTELLERAULT, a town of France, department of Vienne, 20 miles N.N.E. of Poitiers, on the right bank of the Vienne, and connected with a suburb on the opposite bank by a stone bridge, having a castellated gateway, built by Sully, with four massive towers. Cutlery is extensively carried on, lace is manufactured, and there are bleaching-grounds for linen. The river-port gives rise to a large trade in the produce of the district.

Pop. (1872) 13,019. The Duke of Hamilton takes the title of Duke of C. from this place, the duchy having been granted to James Hamilton, Regent of Scotland, by Henri II. in 1548.

Châtillon-sur-Seine, a town of France, department of Cote-d'Or, on the Seine, 45 miles N.N.W. of Dijon, with which it is connected by railway. It has a church of the 10th c., and large manufactures of cloth, iron, paper, &c., and a trade in timber and lithographic stones. The allied sovereigns held a congress here, February 5 to March 19, 1814, to negotiate terms of peace with Napoleon. Pop. (1872) 4586.

Chateaubriand, François Auguste, Vicomte de, born at St Malo, in Bretagne, 14th September 1768, the youngest of ten children in an aristocratic family. He was first destined for the marine service, and educated at the Colleges of Dôle and Rennes; then for the Church, for which he studied at Dinan; but finally entered the army, from which, after being presented at court in 1787, he retired to his father's estate of Combourg. After witnessing the outbreak of the Revolution, C. set sail for America, with a view to discovering the N.W. Passage. He saw the Canadas and some Indian tribes, when the news of the King's disaster at Varennes recalled him to France. After marrying Mademoiselle de Lavigne, to whom he did not profess to be attached, he joined the Prussian army before Thionville, where he was left for dead in the trenches. He then came in bad health and great poverty to London. While supporting himself by teaching and translations, he allowed one of his pupils, Miss Ives, to fall in love with him. In 1797 appeared his *Essai sur les Révolutions Anciennes et Modernes*, a work written in a sceptical and pessimist spirit, and concluding against revolutions as useless, though made necessary by human passion. The deaths of his mother and sister made C. a Christian: he says, 'J'ai pleuré et j'ai cru.' In 1800 he returned to Paris under a false passport, which called him Lassaigne, and next year described his religious position in *Atala*, which had enormous success all over Europe. It was followed by *René*, the story of a youth who seeks for peace of mind among savage tribes, and the *Génie du Christianisme*, which is written to show that Christianity is the most beautiful, the most sublime, the most favourable to liberty, arts, and letters, of all religions; and that to it is due all modern civilisation, from agriculture and charity to abstract science and literary taste. This book, half-melancholy, half-enthusiastic, altogether mystical and almost irrational, found a ready audience at a time of so much sorrow and uncertainty. The love of nature, in which C. was preceded only by Rousseau and Bernardin de St Pierre, contributed to its success. The book obtained for C. two diplomatic appointments, which, however, he resigned on hearing of the judicial murder of the Duc d'Enghien. In 1806-7 he made a pilgrimage through Greece, Palestine, and Spain, of which the fruits were his chief work, *Les Martyrs*, a prose epic of the time of the Diocletian persecutions, in which he wishes to set off the new faith against the corruptions of Paganism and the shortcomings of heathen wisdom; and *Le Dernier des Abencerages*, remarkable for its beautiful word-pictures of the Alhambra, &c. C. published in 1814 a passionate pamphlet, *De Bonaparte et des Bourbons*, which Louis XVIII. said was worth an army to the Restoration. C. enjoyed the title of Minister of State; but, as an ultra-royalist, he savagely attacked the constitutional Decazes in the *Conservateur*. After attending the Congress of Verona, where the Spanish invasion question was discussed, and acting as Minister of Foreign Affairs under Villèle, C. became a Liberal writer in the *Journal des Débats*. At the Revolution of 1830, however, he showed Legitimist colours, refusing to take the oath to Louis Philippe, thus forfeiting a seat in the Chamber of Peers and a large pension. He was even prosecuted for sedition. Down to his death, 4th July 1848, C. was half-republican, half-royalist, always a man of sentiment, not of intelligible principle. He left behind him a monument of sickly egotism in *Mémoires d'outre Tombe*. His old age, though brightened by the society of Mademoiselle Récamier and Béranger, was consumed by doubts about his own reputation. C. will always remain a proof of what literary genius without strong conviction can accomplish. Of the numerous editions of his works the best is that by Sainte-Beuve (12 vols. Par. 1859-60). See Marin's *Histoire de la Vie et des Ouvrages de M. de Châteaubriand* (2 vols. Par. 1833); Desnoiresterres *Châteaubriand et son Époque* in *La Semaine* (20th and 27th August 1848), &c. Most of the great French critics and journalists have attempted to analyse and estimate C.

Chatelet-Lomont, Gabrielle Emilie, Marquise du, a celebrated French woman of letters, daughter of the Baron de Breteuil, was born at Paris, 17th December 1706. Under her father she studied Latin, English, and Italian, and at fifteen undertook a translation of Virgil. At an early age she was married to the Marquis du Châtelet-Lomont, but in 1733 she formed a *liaison* with Voltaire, which was maintained for fifteen years. The lovers retired to Cirey, where they alternately studied, quarrelled, and were reconciled, till in 1747 the marchioness was captivated by the assiduities of M. de St Lambert, a captain in the regiment of the Lorraine Guards, who was destined to be in turn the successful rival both of Voltaire and Rousseau. The result of this intimacy was the birth of a child at Lunéville, followed on the sixth day after (September 10, 1749) by the death of the mother. Of C., Carlyle says, that she was 'a woman, not merely immodest, but without the slightest fig-leaf of common decency remaining;' yet he considers it a legitimate psychological speculation how far she might still have had moral worth as a woman. She was an eager and successful student of mathematics and the physical sciences. Among her works are *Dissertations sur la Nature et la Propagation du Feu* (Par. 1744, 8vo); *Institutions de Physique* (Par. 1740); and her translation of Newton's *Principia*, not published till 1756, seven years after her death.

Chatham (Old Eng. *Ceteham* or *Cætham*, 'the village of cottages'?), a strongly fortified town in the county of Kent, and one of the chief naval arsenals of Britain, on the right bank of the Medway, 30 miles E.S.E. of London by railway. It is a meanly-built town, but is defended by a series of detached forts, which also form a flank defence of the metropolis. Among the principal buildings are Fort Pitt (a combined fort and military hospital), an extensive arsenal, large barracks for the naval and military forces and engineers, and extensive depôts and magazines. The Government shipbuilding establishment is situated at Brompton village, on the estuary of the Medwin, about half a mile below C., covers an area of some 100 acres, and includes building-slips, floating-docks, and sawmills on the largest scale. It is provided with Brunel blockmaking machinery, and also with a metal mill for preparing copper plates, bolts, &c. A captain-superintendent is in control of the dockyard, and has a salary of £700; under him there are various officers and clerks, whose salaries range from £200 to £80. In 1874 his estimates returned the number of shipwrights and other workmen in and about the dockyards at 2974, at an average weekly wage of 24s. each. Pop. (1871) 45,792. C. sends one member to Parliament. The town is a place of considerable antiquity, and from remains found on the spot the Romans appear to have had a cemetery here. The dockyard was established in the reign of Elizabeth, and in 1667 a Dutch fleet of seventeen vessels, under Van Ghent, De Ruyter's vice-admiral, sailed up the Medwin and set fire to the shipping. New buildings were erected between 1757 and 1805, and since the latter date great extensions of the marine resources of C. have been made.

Chatham Islands, or Broughton Archipelago, a group of islands in the S. Pacific, nearly 400 miles E. of the province of Canterbury in New Zealand, were discovered and named by Lieutenant Broughton in 1791. Their total area is about 180 sq. miles. The largest is C. Island or Warekauri; lesser islands are Pitt or Kangihaude, and Cornwallis or Rangiaura. The soil on the whole is fertile, and favourable to the cultivation of wheat; horses and oxen thrive, but there is no timber of any size. The natives, though a robust and vigorous race resembling the Maories, are fast dying out. An English and German mission are maintained here.

Chatham, William Pitt, Earl of, one of Britain's greatest statesmen and orators, was born November 15, 1708. His father, Robert Pitt, of Boconnoc in Cornwall, was originally a country gentleman, and both father and grandfather (the latter had been Governor of Madras) sat in the House of Commons for Old Sarum. Pitt studied at Eton and Trinity College, Oxford, and after travelling on the Continent, obtained a cornetcy in the Blues. He did not, however, find his true vocation till, on his elder brother Thomas, being returned both for Oakhampton and Old Sarum, resigning the latter, he took the vacant place. In Parliament he espoused the side of Frederick, Prince of Wales, and by his eloquence and bitterness soon obtained the position of leader of the 'Boys,' as the younger Whigs, and opponents of Sir Robert Walpole, were then called. On the fall of Walpole, Pitt, although much disliked by the King, became a subordinate member of the Broad Bottom administration, and held the post of Paymaster-General. In 1756 Pitt, who had become the head of the Opposition to the Newcastle administration that had been formed on the death of Henry Pelham, and who was so popular that he was styled 'the Great Commoner,' was made Secretary of State in November 1756, and in reality head of the Government. Driven for a time from power, he was recalled, in answer to the demand of the people, in June 1757, and although the Duke of Newcastle was Premier, Pitt, who had the management of foreign affairs, was the real force of the administration. Under him, and mainly on account of the energy he infused into every department of the state, Britain rose to a position she had never, since the time of Cromwell, held among the nations. Everywhere British arms were victorious; in Canada and India, under Wolfe and Clive, great possessions were snatched from the French, and at Minden and Quiberon, the power of France in Europe was shattered. 'We are forced,' said Horace Walpole, 'to ask every morning what victory there is, for fear of missing one.' Pitt, however, found himself compelled to resign office after the accession of George III., then under the advice of Lord Bute, and more immediately because the majority of the Cabinet refused to declare war against Spain. A pension of £3000 a year, however, was granted him, and his wife was created Baroness C. Till 1766 he remained out of office, when he was again called to form a ministry, which he did, going to the House of Lords as Earl of C. This second administration was, however, far from a success, and C., broken in health, and to appearance temporarily insane, resigned office in 1768. Although he never again was a minister, C. to the end of his life took a keen interest in the affairs of his country. He opposed the policy of the Government towards the American colonies, advocating conciliation; and yet it was after he had delivered a powerful address against a motion by the Duke of Richmond for making peace with America, then in alliance with France, that he fell back into the arms of his friends, and had to be carried dying from the House of Lords. His death took place May 11, 1778. The country honoured him with a public funeral in Westminster Abbey; the sum of £20,000 was voted to pay his debts; and a pension of £4000 a year was settled on his descendants. C. was one of the greatest of British orators, patriots, and statesmen. Besides his actual achievements, which covered his country with glory, his foresight was shown in his proposals for parliamentary reform, for the direct government of India, and in his directing his foreign policy towards the preservation of Prussia, while it has been said of him with truth, that 'Time has approved almost all his greater struggles—his defence of the liberty of the subject against arbitrary imprisonment under "general warrants," of the liberty of the press against Lord Mansfield, of the rights of the constituencies against the House of Commons, of the constitutional rights of America against England itself.' In public life C. was purity itself. As an orator, his passionate eloquence and sarcasm, aided by a commanding presence, made him more feared than any of his contemporaries. His chief faults were intense pride, pomposity, and a tendency to theatrical airs even in private life, though he was a most affectionate husband. See the *C. Papers* (4 vols. Lond. 1838-40); his Letters to his nephew, Lord Camelford (Lond. 1804); F. Thackeray's *Life of C.* (2 vols. Lond. 1827); and Macaulay's *Essays.*

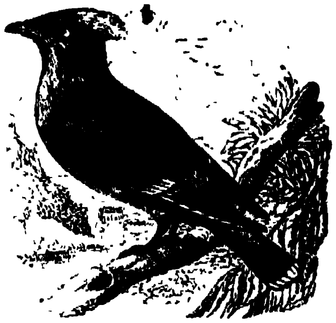
Chat Moss, a peat-bog in Lancashire between Liverpool and Manchester. It is composed entirely of decayed vegetable matter, is about 12 miles square, and varies in depth from 10 to 30 feet. A portion of it was reclaimed about the beginning of the present century by Mr Roscoe of Liverpool; but it is most celebrated in connection with the Liverpool and Manchester Railway, which the engineering skill of George Stephenson successfully carried across the yielding surface in 1829.

Chats'worth, in Derbyshire, the private seat of the Duke of Devonshire, stands on the Derwent, 20 miles N. by W. of Derby. It is a splendid palace, of quadrangular design, having a façade 720 feet long, and being surrounded by grounds 9 miles in circuit, and only inferior to those of Versailles. Its conservatory is the finest in Europe, and the mansion itself contains famous art collections. The estate was originally a grant from William the Conqueror to his natural son William Peveril, and was held in Elizabeth's time by Sir W. Cavendish, who began (1570) the erection of the mansion, in which Mary Queen of Scots was imprisoned for some years. The old pile was included in the present edifice, which was designed by Wren and Talman, and built by the first Duke of Devonshire (1687-1706), and to which the N. wing was added since 1820.

Chattahoo'chee. See APPALACHICOLA.

Chatt'els, in English law, include all property, movable or immovable, which is not freehold, copyhold, or inheritable. They are either real or personal. Real C., or chattel interests, are interests or minor estates taken out of greater, as leases for terms of years. Personal C. are all property not connected with the freehold.

Chatt'erer (*Ampelidæ*), the name of a large family of Insessorial birds belonging to the Dentirostral section of that order, and divided into a number of sub-families, including such birds as the Drongo-shrikes, caterpillar-eaters, fruit crows, true chatterers (*Ampelinæ*), manakins, &c. The Bohemian C., or common waxwing (*Ampelis garrula*), is a familiar example of the typical genus. These birds possess short, broad bills, rounded wings, short tarsi, and curved claws.



Chatterer.

Chatt'erton, Thomas, the boy-poet, was born at Bristol, November 20, 1752. His father, sexton at Redcliffe Church and master of a charity-school, died before C.'s birth. At school he was considered slow, but early manifested a taste for antiquities, which was first excited by a black-letter Bible belonging to his mother. Bound apprentice to an attorney at the age of fourteen, in this situation he endured much misery, solacing himself, however, by writing poetry and studying heraldry. In 1768, on the opening of Bristol New Bridge, he composed the *Description of the Fryars first passing over the Old Bridge, taken from an Antient Manuscript.* Before this, C. had written the celebrated *De Bergham Pedigree*, purporting to trace the descent of a tradesman called Burgham. These and other MSS., such as the *Romaunte of the Cnyghte*, and Thomas Rowley's *Sermon*, he declared were found in 'Canynge's Cofre,' an old chest taken from the muniment-room of Redcliffe Church. After this he sent to Walpole, for his *History of British Painters*, a manuscript entitled *The Ryse of Peyncteyne in England*, and also an account of noted 'carvellers and peyncters' of Bristol. Walpole, at first deceived, afterwards suspected forgery, and the correspondence was broken off. His three years of legal servitude over, C. proceeded to London, and was soon engaged in party-writing for the newspapers and magazines, taking the side of the Opposition. His industry was unceasing, and success at first made him look for a 'glorious prospect.' But this soon died away, for pasquinades, satires, burlesques, political letters, did not bring the means of life. Reduced at length to the extremity of despair and want, he sought the post of surgeon's-mate in an African ship. Even this poor chance failed him. These reverses and the pangs of poverty acting on a natural predisposition, drove this lost genius to suicide, August 25, 1770. His remains were laid in the burying-ground of Shoe-Lane Workhouse. In the tragic sadness of his fate, and the precocity of his mental power, C. is without parallel in English literature. His short span of eighteen years was wondrously rich in results. Among his works are *Ella*, a tragedy; *Ode to Ella; Battle of Hastings; The Tournament;* and *Execution of Sir Charles Bawdin.* The 'forged' poems are undoubtedly superior to the others; but such a satire as *Kew Gardens*, compared with the *Ode to Liberty* and the *Bristow Tragedy*, shows strikingly his varied powers. It is a moot point whether his maturity would have fully realised the promise of youth; but that a longer life would have developed his genius can be clearly discerned from the works he has left. It may here be noted that C.'s knowledge of Old, or even Middle English, was of the very slightest; and it seems almost incredible that anybody should have ever supposed the forgeries to be genuine. Neither metres, nor rhymes, nor words, nor spelling belong to the 15th c., or indeed to any other century. See *The Poetical Works of Thomas C., with an Essay on the Rowley Poems, by the Rev. Walter W. Skeat, M.A., and a Memoir by Edward Bell, M.A.* (2 vols. Lond. 1875).

Chau'cer, Geoffrey, the first great English poet, was born probably about 1340. His father, John C., was a London vintner. It is not known where C. was educated. In 1359 he accompanied Edward III.'s army into France, was taken prisoner, and was ransomed in 1360. About 1366 he married a certain Philippa, a lady in attendance on the Queen, and shortly afterwards obtained an annual grant of 20 marks as a valet of the King's chamber. He was sent to Genoa, in 1372, to arrange a commercial treaty, and was made comptroller of the wool customs in London in 1374. About this time his income was also increased by the custody of a minor's estate. Between 1377 and 1384 he was employed on important missions in France, Flanders, and Lombardy. In 1382 he became comptroller of the petty customs, and was sent to Parliament as a Knight of Kent in 1386. But the same year saw the downfall of his patron John of Gaunt, and the consequent dismissal of the poet from all his offices. His fortunes rose with the reviving influence of John of Gaunt in 1389. He was made clerk of the King's works; obtained, in 1394, an annuity of £20, and a pension of 40 marks on the accession of Henry IV. in 1399. He died, probably at his house in Westminster, in 1400.

Traveller, soldier, courtier, diplomatist, member of Parliament, he passed his life among the most various and splendid aspects of the society which he has so vividly and minutely portrayed.

His literary career has been divided by Mr Furnivall into four periods—1. 1367–68, *Pity;* 1369, *Death of Blaunche*, more commonly known as *The Boke of the Duchesse.* 2. 1373, *Parliament of Fowles; Compleynte of Mars; Anelida and Arcite; Troylus; Adam Scrivener;* 1384, *Hous of Fame.* 3. 1386, *Legende of Good Women;* 1388, *Prologue to Canterbury Tales.* 4. 1391, *Astrolabe; Compleynte of Venus;* 1393–99, *Envoy to Skogan; Marriage; Gentleness; Lack of Steadfastness; Fortune; Purse.* The *Canterbury Tales* were begun in 1373 with the second *Nonnes Tale*, and were left unfinished in 1400. In this list we miss the *Court of Love*, the *Flower and the Leaf*, beautiful symbolical poems, and the *Romance of the Rose*, a vivid translation of about a third of the *Roman de la Rose* of Guillaume de Lorris and Jean de Meung. Some scholars have denied these works to be C.'s because they do not agree with a somewhat arbitrary rhyme-test. But there is no other author to whom these poems can be assigned, and it is certain that James I. of Scotland attributed the *Court of Love* to C. C. was at first greatly influenced by the French *trouvères*, but in his *Canterbury Tales* struck out an original form of poetry, substituting the delineation of character and contemporary life for the relation of monotonous and extravagant adventure. He recast and recoloured a number of chivalrous, humorous, and marvellous tales woven in France, Italy, and the East, and gave us in the persons of their imaginary narrators, the Canterbury pilgrims, a representative gallery of society in the 14th c. His characters are not extinct types but sharply defined, living men and women. His verse breathes of spring, and is bright with the splendours of chivalry. His narrative skill is consummate, his tales gliding on with captivating artistic fluency and unobtrusive felicities of phrase. He unites luxuriant invention, and piercing satiric shrewdness with delicate pathos, sunny humour, grave love of truth, and refreshing delight in nature.

The English style of C. marks the beginning of the modern period in our literature. Contrasted with earlier English dialects, his language may be called uninflected, and comparatively few of his expressions have become entirely obsolete. Of modern editions of C., that of Bell (8 vols. Griffin & Co., Lond.) is meritorious for its notes and honest industry, but incomparably the best is that of Morris (6 vols. Bell & Daldy, Lond.), both as regards text, biography, and linguistic criticism. See also Minto's *English Poets*, and the publications of the *C. Society.*

Chaudes-Aigues ('hot springs'), a town of France, department of Cantal, on the Remontalou, 28 miles E.S.E. of Aurillac. Its hot mineral springs (133° to 190° F.) are much used for medicinal purposes, and for discharging grease from the fleeces of sheep. C. has important fairs for the sale of pigs, and a considerable trade in tinwares. Pop. (1872) 1100.

Chaudfontaine ('hot spring'), a village of Belgium, province of Liège, a few miles from the city of Liège, on an island in the Vesdre, and much frequented by visitors in the summer season, on account of its baths and hot springs (104° F.). Pop. (1873) 1393.

Chau'dière, a river and lake of Canada. The river, after a course of 90 miles through the province of Quebec, joins the St Lawrence 7 miles above the city of Quebec. About 2½ miles from its mouth are the Falls of the C.—**Lake C.** is merely an expansion of the river Ottawa. On its S. shore stands the capital of the Dominion of Canada.

Chaumette', Pierre Gaspard, born at Nevers, 24th May 1763, the son of a shoemaker, after a vagabond youth came to Paris in 1789, where he fell under the influence of Camille Desmoulins, and joined the Cordéliers. After haranguing and writing in the most violent journals for three years, he became in 1792 the Procureur of the Commune of Paris, and assumed the fanciful name of Anaxagoras. He established the Revolutionary Tribunal, and his rapid, sonorous eloquence made him influential in all the extreme measures of 1793. He founded the party of Hébertists, who desired to have religious honours paid to the goddess Reason, which was actually done at the *Fête de la Raison*, in which an actress named Maillard took the part of the goddess. With the assistance of Chabot, Clootz, and others, C. induced the Convention to adopt this absurdity. Danton and Robespierre now combined to crush the Hébertists, and C. was executed 13th April 1794.

Chau'mont, an ancient town in the department of Haute Marne, France, on the left bank of the Marne, 141 miles S.E. of Paris. The Church of St John the Baptist is a fine building of the 13th c. C. has manufactures of hosiery, gloves, druggets, &c., wool and cotton spinning-mills, and tanneries. The treaty concluded here against Napoleon by the Allies, March 1, 1814, formed the basis of the Holy Alliance. Pop. (1872) 7984.

Chaun'cey, Charles, the second President of Harvard College, was born in England in 1592, and educated at Westminster School and Trinity College, Cambridge. In 1627 he was made vicar of Ware, became a Puritan, and after being imprisoned and fined, emigrated to New England in 1636, and in 1654 was appointed President of Harvard. In 1659 he published twenty-six sermons on 'Justification.' He died 19th February 1672. C. is the ancestor of all the American Chaunceys, who form a pretty numerous body.—**Chauncey, Charles, D.D.**, great-grandson of the above, was born January 1, 1705. He was minister in Boston in one parish for sixty years, and is the author of various theological works which are still in repute in America. He died February 10, 1787. See *C. Memorials*, by Professor Fowler.

Chau'ny, a town of France, department of Aisne, 19 miles N.W. of Laon. A portion of it is built on the right bank of the Oise, and the remainder on an island in the river. C. has manufactures of sacking, hosiery, and chemicals; bleaching-grounds and tanneries; and a trade in grain, timber, and cattle. Pop. (1872) 8333.

Chausses (Fr., from the Lat. *calceus*, 'a shoe, or covering to the foot'), defence pieces of armour for the legs, worn in the middle ages. They were variously made of banded mail, riveted plates, chain-mail, or padded and quilted cloth, with metal studs. The C. were sometimes laced behind the leg.

Chaux de Fonds, La, a flourishing town in the canton of Neuchâtel, Switzerland, near the French frontier, in a valley 3271 feet above the sea. It is the chief seat of the watchmaking industry in the Jura, employing 12,000 hands, and producing yearly some £400,000 worth of gold and silver watches. There are also important manufactures of mathematical and musical instruments, beer, bijouterie, and lace. The town has extended very rapidly, and is still increasing. Pop. (1870) 19,930, of whom 2300 are Roman Catholics.

Chav'ica, the dried unripe fruit of *C. Roxburghii*, one of the Pepper order, and known in commerce as *long pepper.* It contains an acrid resin, a volatile oil, and an alkaloid—*piperine.* C. is used in much the same way as black pepper, which in its properties it resembles. In India dried slices of it are in repute as a stomachic. *C. officinarum* of the Malay Islands also yields a similar long pepper. C.-betel is betel-pepper. C. *Siraboa*, mixed with betel-nut and a little lime, is chewed. See BETEL.

Chay Root, Choya, or Sayan, a name applied to the root of *Oldenlandia umbellata* (one of the *Cinchonaceæ*), sometimes imported from India for the sake of the colouring matter in the bark, which is employed to dye red, purple, and orange-brown. The same name is also sometimes erroneously given to the roots of *Morinda, tinctoria*, and *citrifolia*, Indian plants of the same order. In C. R., known as Indian madder, some of the Ceylon tribes used at one time to pay their tribute.

Chead'le, a town and parish in Staffordshire, 14 miles N.N.E. of Stafford, in a hollow moorland region. The finest building is a Roman Catholic church, built in 1846 by the Earl of Shrewsbury, at a cost of £60,000. In the neighbourhood are iron-mines, collieries, copper and brass works, &c., which furnish employment to the inhabitants. Pop. (1871) 2929. The parish is mentioned in Domesday Book under the form *Cedla*. About 4 miles distant are the ruins of the Cistercian Abbey of Croxden, founded in 1176.

Check (Fr. *échec*, 'chess'), a cloth variegated with rectangular spaces like a chessboard, which are variously coloured, but are most frequently alternate black and white.

Check'y, or **Chequée** (Fr. *échiqueté*), in heraldry, describes a field divided into three or more continuous rows or small squares, tinctured alternately with a metal or fur, and a colour.

Chedd'ar, a village in Somersetshire, at the entrance of a gorge in the Mendip Hills, overhung by walls of cavernous rock, in places rising perpendicularly to the height of several hundred feet. The church has a square tower 100 feet high, and a sculptured stone pulpit. The dairies in the neighbourhood are famous for their cheese. The C. process of cheese-making has now been widely introduced into the great dairy-farms in the S.W. of Scotland. (See CHEESE.) Pop. of parish (1871) 2200.

Chedu'ba, a richly productive island, included in the division of Aracan, British Burmah, lies 20 miles from the coast, and has an area of 250 sq. miles, and a pop. of 9000. It yields large quantities of rice, sugar, tobacco, indigo, hemp, &c., and has mud volcanoes and petroleum springs.

Cheese is the compressed curd or casein of milk prepared for use as human food. In making C., the milk employed is gently heated to a temperature of about 112° F., and a sufficient quantity of rennet or of an acid substance is added to cause coagulation of the casein. Rennet, which is usually employed, is prepared from the lining membrane of the fourth stomach of the calf, which organ must be salted and dried for a year before it or its solution is used. The action of the rennet produces a complete coagulation of the casein, and the separation of the curd from a straw-coloured, clear, liquid whey takes place on 'breaking the curd' by stirring with the hand or any implement. The greater part of the whey can be drained off, and the curd rendered rather dry and crumbly in the vessel, after which it is submitted to a further draining in a linen cloth, and pressed in the C.-press. The curd is then again broken up, and mixed with the proper amount of salt, placed in a clean cloth into the C.-vat or chessart, which has the shape the C. is intended to take, and submitted to a prolonged pressure in the C.-press to expel the last traces of whey. During this pressure the C. is turned occasionally. When perfectly pressed, the cheeses are put away on shelves in a cool apartment to harden and ripen, and in C. of good quality a gradual moulding should ensue. Four kinds of C. are found in commerce :—(1) cream C.; (2) C. made of sweet milk with a proportion of cream added; (3) sweet-milk C.; and (4) skimmed-milk C. The first variety, cream C., is made in Yorkshire and Neufchatel, keeps only a short time, and, of course, is soft and very fat. The best ordinary C. belongs to the second class, and comprises Stilton, Double Gloucester, Roquefort, Gorgonzola, and Cheddar. Of the third class are Gloucester (single), Wiltshire, American, and Dunlop; and Parmesan and Dutch C. belong to the fourth class, which also includes most of the ordinary country C. made in Scotland. Gouda C. of Holland is made with curd formed by the action of hydrochloric acid on milk, and to this it owes its freedom from mites and its pungency. Parmesan C. owes its peculiar rich flavour to the sweet herbage on which the cows are fed along the banks of the Po. Swiss C. (Schapzieger and Gruyère) is flavoured with fragrant herbs, and made in cheeses of 40 to 60 lbs. The following table exhibits the composition of several varieties :—

	Chester.	Roquefort.	Dutch.	Gruyère.	Parmesan.
Water per 100 parts .	30·39	26·53	41·41	32·05	30·31
Nitrogen ,, .	5·56	5·07	4·10	5·40	5·48
Fat ,, .	25·41	32·31	25·06	28·40	21·68
Ash ,, .	4·78	4·45	6·21	4·79	7·09

C. is called on to discharge two functions in the economy of food. It is a most nutritive but somewhat indigestible article when the commoner qualities form an article of diet, as they frequently do among the labouring population. The richer varieties of C. are eaten in very small quantities after meals, and they, when ripe, are found to materially promote the process of digestion. Great improvement has taken place of late years in the manufacture of this article, especially in Scotland, where annual competitions take place among the makers. The Kilmarnock 'Cheese Show' is one of the largest in the world. The whole S.W. of Scotland is in the field, and the value of the C. exhibited is often over £20,000.

Cheese-Hopper (*Piophila casei*), the name given to the larva of a fly (belonging to the order *Diptera* and family *Muscidæ*), owing to its habit of bending the body into a loop, and of suddenly straightening it in order to spring. It exists in cheeses, the perfect fly being of minute size (1½ lines in length), of a black colour, with red feelers and forehead. The bacon-beetle (see DERMESTES) and another fly (*Musca corvina*) also deposit their eggs in cheese, and thus cause much waste in dairies.

Cheese-Mite (*Acarus domesticus*), a species of *Acaridæ*, or true mites, belonging to the class *Arachnida* (q. v.), and so named from its being mainly found in cheese and like substances. It possesses an oval-shaped body covered with prominent bristles, eight legs, and a mouth provided with mandibles or jaws. In decaying cheese the C.-M. is sometimes found in immense numbers. Reproduction is effected very quickly. No defined circulatory or respiratory organs exist in the animal, in which also the eyes are of simple character.

Chee'tah, or **Hunting Leopard** (*Felis jubata* or *Gueparda jubata*), a species of carnivorous mammalia, generally regarded as allied to the panthers and leopards, and found in India, Persia, Sumatra, Senegal, the Cape, and other parts of Africa. This animal exceeds the ordinary leopard in size. The limbs are relatively longer than in the leopard, as are also the feet; the claws are blunt, and only partially retractile. The head is small in proportion to the animal's size and height, and a short mane of stiff hairs exists on the neck. The ears are short and rounded, the muzzle being truncated and short. The hair on the front part of the body and lower edges of the jaws is rough and elongated, as is also the fur of the hinder part of the abdomen. The colours are like those of the leopard, the general hue being, however, of a deeper fawn. The fur is marked on the body and limbs by round black spots. The face is striped, and a bold black streak runs from each eye to the angle of the mouth.

The C. is trained in India and Persia to hunt such game as antelopes, deer, &c. It is kept blindfolded until within sight of the quarry, when it is let slip, and stealthily approaches the prey. It then bounds in upon the antelopes, but if unsuccessful in its first onslaught, it makes no attempt to follow, but returns to the hunter. The name *Youze* is also given to the C. which under domestication may become tame and familiar.

Cheiran'thus. See WALLFLOWER.

Cheirol'epis, a genus of extinct Ganoid fishes, generally assigned to the division *Lepidosteidæ* of that order. The fossil remains of this genus occur in the Devonian or Old Red Sandstone formations. The head was of large size, and the body covered by small ganoid scales of lozenge shape. Each fin had its first ray existing as a strong spine, and the pectoral and ventral fins were well developed and scaly.

Cheir'omancy, or **Chir'omancy** (Gr. *cheir*, 'the hand,' and *manteia*, 'divination'), palmistry, a mode of forecasting the destiny of an individual from the lines of the hand. It was known to the ancients. Traces of it are visible in Aristotle. Artemidorus, however, in his *Dream Book*, was the first to give anything like a connected or systematic view of the subject. In the middle ages it was still more developed and associated with astronomy. Cardan, Paracelsus, Porta, and other dubious savans, sought to give it a scientific basis. But with the spread of knowledge it gradually lost its hold on the human mind, and is now professed only by gipsies.

Chei'romys. See Aye-Aye.

Chei'ron, represented by Homer (Il. xi. 831) as the wisest and most humane of the Centaurs (q. v.); the instructor of Achilles, Jason, and Æsculapius; skilled in hunting, music, medicine, and prophecy; and throughout life and in his death a splendid example of self-sacrifice. The young Achilles, and sometimes the Erotes, or Loves, appear in existing representations riding on his back.

Cheironec'tes, a genus of Marsupial mammals represented by the Yapock or Yapock-opossum of Brazil (*C. Yapock*), and allied to the opossums, from which, however, it is distinguished by its semi-aquatic habits. The hind-feet are webbed, the fore-feet being hand-like in conformation, and webbed only to the first joint of the digits. The fur is of a pale grey colour, banded with sooty-black. The C. possesses cheek-pouches, the food consisting chiefly of insects and crustaceans. The average length is 2 feet.

Cheirop'tera. See Bat.

Cheiroste'mon, a genus of plants of the natural order *Sterculiaceæ*. *C. platanoides* is the hand-plant of Mexico, so named from the anthers and style of the flowers resembling in their arrangement a hand furnished with long claws. It was the *Macpalxochitlquahuitl* of the ancient Mexicans. It is found in forests near the city of Guatemala.

Cheirothe'rium ('hand-beast'), the name formerly given by Kaup to the ideal animal which was supposed to have made certain footprints seen in rocks of Triassic age in Britain and in Germany. The fossil remains of the actual animal were afterwards discovered, and the name *Labyrinthodon* (q. v.) substituted for that of C.

Cheke, Sir John, one of the ardent scholars who forwarded the revival of classical literature in England in the 16th c., was born at Cambridge, 16th June 1514, and studied at St John's College, Cambridge, where he became professor, and introduced a new method of pronouncing Greek, which, however, he was ordered to discard by Bishop Gardiner, the chancellor of the university. Among his pupils were William Cecil, afterwards Lord Burleigh, and Roger Ascham. In 1544 he became tutor to Prince Edward, and was made a canon of King's College (now Christ Church), Cambridge. When his pupil ascended the throne, C. got various grants of lands and rents, was made Provost of King's College (1548), knighted (1551), and made a secretary of state (1553). Upon Mary's accession he was committed to the Tower on a charge of treason, but soon after obtained his liberty, went abroad, and taught Greek at Strasburg; but in 1556 was seized by the orders of Philip while travelling in Belgium, conveyed to England, and again imprisoned. In an evil moment C. abjured Protestantism to escape the stake, and grief at this apostasy seems to have hastened his death, 13th September 1557. C. wrote a considerable number of works, partly scholastic, partly theological; but they have now no place in literature. For a list of these, see Cooper's *Athenæ Cantabrigienses*.

Che'læ, Chelic'eræ. The name *chelæ* is given to the largely developed 'nipping-claws' seen in such crustaceans as crabs, lobsters, &c., and also in the scorpions, in which latter forms the *chelæ* are formed by the *maxillary palpi* or appendages of the lower jaws. The *chelicerae* of the scorpions are formed by the pincer-like extremities of the mandibles or larger jaws. The *chelicerae* are, in short, the diminutives of the larger *chelæ*.

Che'lifer. See Book Scorpion.

Chelms'ford (called in Domesday Book *Celmeresforde*), the capital of Essex, on the Chelmer, near its junction with the Cann, and about the heart of the county, 29 miles N.E. of London by railway. It has tanneries, cornmills, coachworks, &c., and a considerable river trade in agricultural produce. The river, which separates here into two branches, surrounding an islet called Mesopotamia, is crossed by several bridges. C. possesses various handsome buildings, and a grammar-school founded by Edward VI. Pop. (1871) 9318.

Chelo'nia (Gr. *chelōne*, 'a tortoise'), the class of *Reptilia* or reptiles to which the tortoises and turtles belong. It is primarily distinguished by the fact that the true or endoskeleton combines with the outer or exoskeleton to form a bony case in which the body is enclosed. This case consists of a *back* or *carapace*, formed by the expanded spines of the dorsal vertebræ, and by the flattened and amalgamated ribs, generally eight in number on each side. Occasionally (as in the soft tortoises) the ribs may be imperfectly united towards their extremities, and gaps may thus be left in the otherwise solid structure. The sides of the structure are formed by *marginal plates*, which may either be bones developed by the skin (*dermal ossifications*), or be the ossified ends or cartilages of the ribs. The floor of the body or box is formed by nine pieces forming the *plastron*, which Owen thinks is a greatly developed breastbone, but other naturalists regard it as merely composed of dermal or skin ossifications; the C. in this latter view being destitute of a breastbone. The carapace and plastron are both covered by horny plates, which in the hawk's-bill turtle (*C. imbricata*) constitute the *tortoise-shell* of commerce. The dorsal vertebræ are thus immovably connected together, those of the neck and tail being alone mobile. The bones of the shoulder and pelvis, supporting the fore and hind limbs respectively, are contained *within* the ribs or carapace, instead of, as in all other vertebrata, existing *outside* the ribs. Clavicles or collar-bones are absent in Chelonians. Four limbs are developed. The bones of the skull are firmly ossified together, the halves or *rami* of the lower jaw being firmly united in front. No teeth exist, the jaws being sheathed in horn, like those of Birds (q. v.). In some (soft tortoises, &c.) fleshy lips may be present. The tongue is thick and fleshy; the heart is three-chambered, and the lungs are large and voluminous. These forms *swallow* air in breathing, like the frogs, the fixed nature of the chest rendering respiratory movements impossible of performance. A large urinary bladder exists, the anal opening or vent being circular or of longitudinal shape. These forms are cold-blooded and of slow movements; they hybernate in winter, may pass long periods without food, and will exhibit signs of vitality for a lengthened time after decapitation. They are divided into the *Cheloniidæ* or Turtles (q. v.), the *Trionycidæ* (soft tortoises and terrapins), and the *Testudinidæ* (Tortoises) (q. v.).

Fossil representatives of this group occur doubtfully first in the Permian rocks, where their footprints occur (*e.g.*, *Chelichnus Duncani* of Jardine); but in the Oolite rocks turtle remains are found, and the Eocene period is rich in Chelonian fossils. The Tertiary deposits of the Sewalik Hills of Hindostan afford the remains of a gigantic chelonian averaging from 18 to 20 feet long, and to which the appropriate name of *Colossochelys Atlas* has been given.

Chel'sea (originally *Ceoles-ige*, 'the island of ships'?) Middlesex, now a suburb of London, with a pop. in 1871 of 258,050. In the 16th c. it was the residence of Queen Catherine Parr, Sir Thomas More, the Princess Elizabeth, Sir Hans Sloane, &c. Even in the 17th and 18th centuries it was still a village 2 miles from London, the residence of many of the nobility and gentry; and was famous for its Ranelagh Gardens, the favourite resort of pleasure-seekers from the capital. C. has numerous churches and chapels; that of St Luke (1824) cost £40,000; another, a fine old brick structure near the river, is full of monuments and brasses to historic personages. It has also a training college for schoolmasters, and another for schoolmistresses; two fine suspension bridges; a Royal Military Asylum for the education of the sons of soldiers; Botanic Gardens (the gift of Sir Hans Sloane, and one of the earliest botanic gardens in England); and the somewhat notorious Cremorne Gardens; but the renown of C. is mainly due to its famous hospital.

Chelsea Hospital, for invalids or superannuated soldiers, has accommodation for about 600 men, besides officers; and attached to it there are gardens and exercise grounds, covering about 40 acres. The governing body consists of a Board of Commissioners under the Presidency of the Paymaster-General, which meets weekly. The inmates are known as *in-pensioners*, in contradistinction to *out-pensioners*, the proportion of the latter to the former being in the ratio of 100 to 1. The in-pensioners have board, lodgings, clothing, medical attendance, &c., and a graduated scale of weekly payments, according to the status each held in the army, colour-sergeants receiving 5s. 3d. and a private 7d. The out-pensioners receive payments for life at the rate of 1½d. (for West Indians) to 3s. 7½d. per day. The cost of the hospital for 1875–76 is estimated at about £28,000. Previous to the funeral of the late Duke of Wellington, November 18, 1852, the body lay in state for a few days in C, II. The building was begun in 1609 by Dr Sutcliffe, Dean of Exeter, as a theological college, and was styled in its charter, 'King James's College at Chelsea.' Charles II. built on its site the present Royal Hospital, of which the architect was Sir Christopher Wren, and the cost £150,000. There is an annual parliamentary grant for the maintenance of the hospital.

Chel'tenham, a parliamentary borough and market-town, Gloucestershire, 8 miles N.E. of Gloucester, on the river Chelt, from which it derives its name. Its prosperity originated in its mineral springs, which were accidentally discovered in 1716. In 1788, George III. having derived much benefit from their use, C. at once became a fashionable resort. It has now magnificent promenades, and numerous handsome squares, crescents, and terraces; while two suburbs have been recently formed of villas and first-class residences. To each of the spas a pump-room is attached. C. has an endowed grammar-school, a proprietary college, which holds a very high place among similar establishments, a ladies' college, and a training-college for male and female teachers. It returns one member to Parliament. Pop. (1871) 44,519.

Chemical Affinity. See AFFINITY, CHEMICAL.

Chemistry, which at present holds such an important and prominent position among the useful and exact sciences, and which has done so much for the good of mankind, and for the advancement of science generally, had for its origin the purely selfish desire for wealth.

History.—The alchemists, who were the fathers of the science, laboured to discover the philosopher's stone—a substance which, by contact with other bodies, should convert them into gold; and later they sought for the *elixir vitæ*, to give them perpetual youth, and by that means ensure an unlimited period during which to enjoy their riches. (See ALCHEMY.) Such were the chief aims of alchemy—an art (for it cannot be called a science) which was first cultivated in the East, either by the Arabs or Greeks, and gradually extended to Spain and Africa, Germany, Italy, France, and England. In thus censuring alchemy, however, it must not be forgotten that many of its devotees were not animated by selfish motives, but, on the contrary, laboured to turn their discoveries to practical account for the good of their fellows, chiefly by employing the substances which their researches had brought to light as medicines; and indeed Geber, one of the earliest of the alchemists, appears to have made this his special object. To the alchemists we are indebted for the knowledge of a great many substances which their experiments elicited, and in many cases for the discovery of the chief properties of these substances, but it cannot be said that they left us any important theories. Theory began to dawn on chemists in the 17th c., and with its light C. rapidly assumed the proportion of a science, and developed with a rapidity unsurpassed by any other branch of knowledge. Johann Joachim Beccher and Georg Ernst Stahl were the first to introduce into C. a comprehensive and rational theory of the nature and properties of matter, and to refer them to a common principle. This theory originated with Beccher, but was extended and enlarged by Stahl, to whom most of the credit of its introduction was given; so much so, indeed, that it was styled the 'Stahlian' theory, though it is now better remembered as the 'Phlogiston' theory. Its principle was, that all combustible bodies were compounds containing a common constituent which was dissipated during combustion, leaving either a *calx* or an *acid* as residue, according to the nature of the combustible. This common constituent was believed to be a material substance, and to constitute the principle of combustion. It received from Stahl the name of *phlogiston*. Incombustible bodies were at first but little considered, but subsequently they were believed to be the calces or residues of substances which had undergone the process of combustion. Phlogiston, it was believed could in many cases be made to combine with a calx or acid, and so produce the original substance. Thus, if tin be sufficiently heated it smoulders away, and is eventually converted into a dirty white earthy powder or calx. If this calx be now mixed with charcoal and strongly heated, some of the charcoal disappears (its phlogiston being yielded up to the calx), and metallic tin is reformed. Chemists of the time had excessively vague ideas, if any, concerning the nature of phlogiston, but after the discovery of hydrogen they appear to have regarded that body as isolated phlogiston, an idea which must have appeared very plausible, considering the ease with which hydrogen burns, leaving no fixed residue, and the readiness with which many metals can be reformed from their calces when the latter are heated in a stream of it.

During the greater part of the 18th c. this theory reigned supreme, and was advocated and extended by some of the ablest men that have laboured in the cause of chemical science. Pre-eminent among them were Priestly, Cavendish, Black, Scheele, and Bergman,—philosophers to whom the world is largely indebted for their discoveries. It would take up too much time to enumerate all the substances brought to light by their researches; suffice it to say, that Priestly discovered oxygen, Cavendish first prepared hydrogen, and demonstrated the composition of water. Black discovered carbonic acid gas, and explained the difference between caustic and mild alcalies. Scheele first prepared chlorine, tartaric, citric, malic, oxalic, and gallic acids, and many important mineral acids; whilst to Bergman belongs the credit of having first introduced quantitative analysis into chemical science, and by that means prepared the way for the atomic theory.

Well as the phlogiston theory explained the leading properties of most substances known at the time of its introduction, and for nearly three-quarters of a century afterwards, it was doomed to a speedy destruction at the hands of Lavoisier, a man who effected a complete revolution in C., and laid the foundation for our present ideas.

Lavoisier proved that when a metal is calcined, the calx, or residue of combustion, weighs more than the metal originally taken; and that when this calx is heated with charcoal, at the same time that the metal is regenerated, a certain quantity of gas is produced, which possesses all the properties of 'fixed air,' or carbonic acid, discovered by Black; and is, in fact, the same substance. Moreover, he showed that during calcination in a closed vessel a certain quantity of air disappears, and that the weight of the air thus disappearing is exactly equal to the increase in the weight of the metal after calcination. He thus proved that a body in burning, far from losing anything, gains in weight, and that this gain in weight is attributable to the absorption of something from the air. Lavoisier made these observations before the discovery of oxygen, but the existence of that body furnished him with the means whereby to explain his experiments, and to overturn and completely dissipate the whole doctrine of phlogiston. He eventually proved that when combustible substances are burned, they combine with oxygen contained in the air, and yield new substances. When metals are reduced from their calces by heating the latter with charcoal, the oxygen contained in the calx combines with the charcoal to form carbonic acid gas, and thus leaves the metal at liberty. The reduction of a calx by hydrogen is owing to a similar cause, but in that case water, and not carbonic acid, results. The C. of Lavoisier's day was the C. of oxygen. Substances were examined for its presence, and new bodies were obtained by combining it with various known elements or compounds. Lavoisier determined the exact composition of the air, showed that oxygen was the active ingredient, and explained the part it took in the process of Respiration (q. v.). In the course of his researches he had proved that carbonic acid was a compound of carbon and oxygen, sulphuric acid of sulphur and oxygen, phosphoric acid of phosphorus and oxygen, and nitric acid of nitrogen and oxygen. These discoveries induced him to believe that oxygen was a necessary constituent of all acids, and on this account he gave it its present name, from the Greek words ὀξὺς, *sour*; γεννάω, *I produce*. That oxygen is not a necessary constituent of acids has since been proved by the discovery of the hydracids, nevertheless it is present in by far the greater number of acids. It is impossible to over-estimate the value of the reforms introduced into C. by Lavoisier. The science received an impetus never before experienced in its history, and discoveries and speculations multiplied in all directions. Quantitative analysis became an essential part of C., and numerous investigators laboured in its cause. Amongst the most celebrated of these may be mentioned Klaproth, Vauquelin, Stromeyer, and Berzelius. The researches of these chemists not only added to the knowledge of the composition and properties of known substances, but brought to light several new and interesting elements,—as, for instance, uranium, zirconium, titanium, tellurium, chromium, cadmium, selenium, &c.

At the time these discoveries were taking place, a most important controversy was being carried on by two French chemists, Proust and Berthollet. The latter maintained that the elements combined together in variable proportions, the former that the proportions were fixed and definite. The dispute ended in Berthollet's defeat, and in the establishment of one of the most important laws in chemistry, viz., that of definite proportions. This has brought us to the commencement of the 19th c.—a memorable period for chemists, for it was at this time that Dalton introduced the Atomic Theory (q. v.). Space does not permit us to trace the development of this theory, nor to show how the quantitative experiments of Bergman, Wenzel, Richter, Lavoisier, and others were instrumental in establishing the principles upon which it depends. The atomic theory being once firmly established upon a thorough basis of experimental evidence, chemists next turned their attention to the determination of the atomic weights of the elements, and for the results we are indebted to Dalton, Gay-Lussac, Dulong and Petit, Berzelius, Gerhardt, Staas, and others. At the time that Dalton was carrying on his experiments and enunciating his ideas, another eminent British chemist was startling the world by his striking and brilliant discoveries, and opening up a new field of research and speculation. In the year 1800, Volta had published a description of the Pile (q. v.), and shortly afterwards Nicholson and Carlisle had shown that by its agency water could be decomposed into its constituents, oxygen and hydrogen. Berzelius and Hisinger, following up the idea, had performed a series of experiments on the action of a current of electricity on various salts. It was Sir Humphrey Davy, however, who enunciated the laws of voltaic chemistry, and threw an entirely new light on the composition of an important class of bodies. He found that potash, soda, lime, baryta, strontia, magnesia, and lithia were compounds of oxygen with metals. The latter he succeeded in isolating, and demonstrated their chief properties. These discoveries eventually enabled chemists to prove that the groups of compounds called *Alkalies*, *Alkaline earths*, and *Earths proper*, are simply the oxides of metals. Into Davy's electro-chemical theory space prevents us from entering; suffice it to say, that it has done excellent service for science, although not retained at present in its entirety. Mention must here be made of the beautiful experiments of Faraday on the quantitative effects of the galvanic current in decomposing salts. (See ELECTROLYSIS.) Davy also established the fact that hydrochloric acid is a compound of chlorine and hydrogen, and that chlorine is an elementary substance, and not, as had been before believed, a compound of hydrochloric acid (or, as it was then called, *muriatic acid*) with oxygen. These facts quite upset Lavoisier's doctrines respecting the nature of acids, and led eventually to the discovery of the other hydracids, viz., hydriodic, hydrobromic, and hydrocyanic acids, and to the placing of hydrofluoric acid in the same group. Berzelius was another chemist to whom science lies under the greatest obligations. His whole life was devoted to investigation, and his labours have gone far to place C. on its present footing. To him we are indebted for much of the nomenclature of chemical substances at present in use; for his representation of atoms by symbols, and of reactions (or chemical changes) by means of equations. By his analyses he contributed largely to a knowledge of the atomic weights of the elements, and by his electro-chemical theory to a correct understanding of many important facts. His experiments with the blowpipe raised that instrument to an important place amongst chemical apparatus. He first isolated the elements silicon and selenium, showed that sulphur united with certain metals to form substances having a basic character, and with certain non-metals yielding bodies possessed of acid characters, and that these sulpho-bases and sulpho-acids combined, forming sulpho-salts. In fact, he clearly demonstrated the important analogies existing between the two elements sulphur and oxygen. His great merit lies in his having systematised C.

It was at the commencement of the present century that chemists began to direct their attention to the organic world, and to attempt to manufacture in the laboratory substances which previously had only been obtained from the products of animal and vegetable life. The first synthesis of an organic substance was that of urea, a crystalline nitrogenous compound contained in considerable quantity in the urine of the carnivora. In the year 1828 Wöhler showed that this substance was produced by a molecular change in cyanate of ammonium when its aqueous solution was boiled. This discovery opened up a grand field of research and speculation. No longer were chemists held in check by the belief that organic substances were built up by the vital force —a special agency beyond their control. What Wöhler had accomplished in the case of urea, they hoped to do with other bodies, and their experiments were soon crowned with success in all directions. Numerous new and interesting groups of carbon compounds were discovered, and organic C. became the C. of the compounds of carbon (on account of the presence of that element in all organic products). From that time to the present day organic C. has largely occupied the attention of chemists, and has led to the discovery of facts of the greatest practical importance. Of the services of this department of chemical science to the arts and manufactures too much could not be said. The brilliant discoveries of Perkin and Hoffman with aniline have supplied the dyer with the most beautiful colours ever produced, whilst not only aniline, but a host of other products, obtainable from Coal Tar (q. v.), are employed in numerous manufactures. Organic C. has supplied the physician and surgeon with medicines and remedies of the greatest value, with chloroform and chloral, carbolic acid, &c.

Among the chemists who have made organic C. their great study, none deserves more credit than Liebig, who first supplied a method for determining carbon and hydrogen in an organic body. In conjunction with Wohler he discovered the compound carbon radicals, and added to our knowledge by isolating many new and important compounds. His experiments, too, into the physiological C. of plants and animals, have been of inestimable value to the farmer, and indeed have been the means of revolutionising agriculture, and of establishing it on a rational and scientific basis.

Before quitting the history of C., mention must be made of the services done for the science by the *Spectroscope* (q. v.). Fraunhofer was the first to observe in the sun's spectrum a number of black lines, which have since been found to be owing to the presence of certain metals in the state of vapour. This observation in the hands of Bunsen and Kirchoff led to the construction of the *spectroscope*, an instrument by means of which the smallest trace of many elements can be detected. By its aid, too, several new elements have been discovered—viz., cœsium, rubidium, thallium, and gallium. Not only has the spectroscope revealed the nature of the matter of which our earth is composed, but it has also demonstrated that the masses of the sun and of many planets are composed (in part at least) of the same elements.

In reviewing the position of C. at the present time, we cannot but be struck by the marvellous rapidity of its development during the present century, with the important place it holds among the sciences, and with the vast influence it exercises on almost every department of human industry.

Principles.—From the preceding sketch, it will have been seen that the object of C. is the investigation of matter with a view to the determination of its composition and properties. But to define C. in exact language is a matter of great difficulty, owing to the fact that the sister science of physics is engaged with almost the same problems: and indeed it is urged that C. is simply a branch of physical science. We must leave the reader to form his own definition from a statement of the leading facts and doctrines of the science.

Composition of Matter.—All investigations into the nature of matter have led to the conclusion that whereas certain substances can be decomposed or split into new bodies, others resist all efforts to decompose them. Substances of the first kind are called compounds, those of the second, elements. Up to the present time science has revealed the existence of sixty-four elementary bodies (if we include the new metal gallium, discovered quite recently). These elements differ from one another in appearance and properties. They are divided into two classes, which are called respectively *metals* and *non-metals*. Of the former, with the exception of quicksilver or mercury, all are solid at ordinary temperatures. Of the latter, four are gaseous (oxygen, hydrogen, chlorine, and nitrogen), one liquid (bromine), and the remainder solid at ordinary temperatures. Compounds are formed of the elements, united in various proportions; but the same compound always contains the same elements, and the same proportions of these. The majority of compounds contain but two, three, or four elements, but sometimes the number is greater.

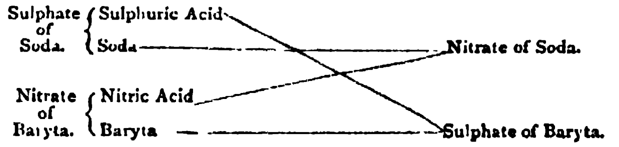
Differences between Compounds and Mixtures.—A problem of repeated occurrence to the chemist is to decide whether he is dealing with a mixture of substances, or with a true chemical compound. This is not always an easy matter, but there are certain well-marked distinctions between the two, with which the reader should be made acquainted. Compounds, as we have said, are characterised by a definite composition: if solid, they very often crystallise, and the crystals have a definite and characteristic shape; if liquid, and volatile without decomposition, they boil at a definite temperature. Moreover, and most important of all, if we produce a compound from its elements, the union of the latter is attended with a disengagement of heat. A mixture, on the other hand, may contain substances in varying quantities. In a mixture, each of the ingredients retains its own properties, and the properties of the mixture are simply the mean of these. In making a mixture, no rise of temperature occurs; and finally, it is often possible, by purely mechanical means, to separate the ingredients of a mixture, and to obtain each in an isolated condition. (For an illustration of these arguments see article ATMOSPHERE.)

The investigation of compound substances constitutes by far the most important part of C., for it is with compounds that the chemist has chiefly to deal. There are two methods by which an insight can be gained into the composition and constitution of these bodies. The one consists in separating them into their elements or into compounds of a simpler nature than themselves: the other in building them up, it may be directly, it may be by several stages, from their elements, or from compounds the nature of which is already known. The first is the analytical, the second the synthetical method.

Analysis.—In certain cases it is easy to demonstrate the composition of bodies not only qualitatively but also quantitatively; but more frequently the task is one of considerable difficulty, and demands all the skill and patience of the chemist. No better example of analysis can be chosen than that of water—one of the most abundant and well-known of all chemical compounds. If we take water and acidulate it with a few drops of sulphuric acid (to make it conduct), and then plunge into it two platinum plates connected respectively with the positive and negative poles of a galvanic battery, we observe at once a disengagement of gas from both of the plates. If we collect the gases in separate vessels, we find that they possess very different properties, the one collected from the platinum plate attached to the negative pole being combustible, whilst the other is not inflammable, but capable of supporting combustion with great brilliancy. The two gases are, in fact, hydrogen and oxygen—the two constituents of water. Another important point in this experiment is, that the volume of the hydrogen is exactly double that of the oxygen. But if the gases be weighed, as well as measured, it is found that for every one part of hydrogen, eight parts of oxygen are disengaged. The experiment proves then that water is a compound substance, containing oxygen and hydrogen in the properties of two *volumes* of the latter to one of the former, but of one part by *weight* of the latter to eight parts by weight of the former.

Many other compounds can be decomposed into their elements by the electric current, and, indeed, it is one of the most valuable decomposing agencies which the chemist possesses. We have already mentioned the fact that by its aid Sir Humphrey Davy was enabled to demonstrate the true nature of an important series of bodies.

Heat, like electricity, is a decomposing agent, and one of almost as much importance to the chemist. Its action is, however, frequently of a more complex nature; nevertheless, there are many simple analyses which may be accomplished by its aid. Thus, if red oxide of mercury be heated, it is resolved into its elements, mercury and oxygen; but in the case of many substances only partial decomposition ensues. For instance, chalk, which is a compound of carbon, oxygen, and the metal calcium, when strongly heated, splits up into two new substances—lime and carbonic acid, each of which is itself a compound. The carbonic acid contains the whole of the carbon and part of the oxygen: the lime, the whole of the calcium and the remainder of the oxygen. The action of heat on many organic substances is totally to destroy them and to produce other and often highly complex compounds. (See DISTILLATION, DESTRUCTIVE.) We see, then, that there are two very powerful physical decomposing agents, both of which, at various times, have done good service for C. But we have not spoken of decompositions brought about by chemical agents, although, from a chemist's point of view, these are the most important. All chemical decompositions are brought about by the operation of affinity, or the force which causes bodies to combine. This statement may appear contradictory, for how, it will be asked, can a force which causes union also cause disunion? The answer is, that the affinity existing between various substances differs in degree. For instance, the affinity of a body, A, for another, B, may be greater than that of A for a third, C. If, then, we have the compound A C, and place B in contact with it, A will leave C at liberty, and will go to B to form a new compound, A B. Thus, if we take gaseous hydriodic acid (a compound of hydrogen and iodine), and heat some sodium in contact with it, the iodine will unite with the sodium, forming iodide of sodium, and hydrogen will be set at liberty. We can isolate the iodine, now combined with the sodium, by passing a stream of chlorine through the aqueous solution of the iodide of sodium, for, owing to the greater affinity of chlorine for sodium, the iodine is set at liberty, and chloride of sodium, or common salt, formed. *Double decomposition* results when certain compounds are brought together under suitable conditions. For instance, if a solution of nitrate of baryta (a compound of nitric acid and baryta) is mixed with one of sulphate of soda (a compound of sulphuric acid and soda), a dense white precipitate is produced, which eventually settles down, leaving a clear solution. The precipitate consists of sulphate of baryta (a compound of sulphuric acid and baryta), whilst the solution contains nitrate of soda (a compound of nitric acid and soda). Here, then, a mutual exchange of constituents has taken place. The sulphuric acid, before combined with the soda, has left it to combine with the baryta, whereas the nitric acid, before combined with the baryta, has now gone to the soda. Thus—



Double decompositions are of frequent occurrence, and are perhaps the most important of chemical reactions.

Synthesis is the reverse of analysis, for whereas by analysis a substance is *split up* into its constituents, by synthesis it is *built up* from these. Synthesis, like analysis, serves to determine the composition of bodies, and many complex problems in this direction have been solved by its aid alone. It was by synthesis that Cavendish discovered the composition of water. In like manner, Wohler by its aid demonstrated the composition of urea, and showed for the first time that a substance of organic origin could be formed by artificial means. The synthesis of water is readily effected by mixing the two gases, oxygen and hydrogen, in the proper proportions, and kindling the mixture, either by the electric spark or by the application of a flame. If the experiment be made in a closed vessel of sufficient thickness, a flash of light is observed, and the sides of the vessel become covered with dew. But if the experiment be made in an open vessel, a very loud explosion takes place. Water is a product of nearly all ordinary combustions, for most combustible substances contain hydrogen, and the air supplies the oxygen. Thus it can be seen that in the combustion of a candle, of wood, gas, or coal, water is produced. In order to effect the synthesis of a body, it is frequently necessary to proceed in an indirect manner, for in the majority of cases, the elements of which a substance is composed do not unite directly to form the substance.

Affinity.—We have already spoken of affinity as being the force which causes chemical union, and have stated that it differs in degree, being in certain cases very intense, in others very weak. At the present time chemists and physicists are undecided in their opinions as to the nature of this force, but that it is intimately connected with heat and electricity cannot be doubted. Faraday, indeed, stated that 'the forces called electricity and chemical affinity are one and the same.' The degree of affinity existing between two bodies is measured by the amount of heat given out during their combination. A rough estimate of the affinity can also be formed by observing the stability of the compound when formed: unstable bodies—or such as are readily decomposed—containing elements with a weak affinity for one another. Thus the affinity of hydrogen for iodine is so slight that their compound, hydriodic acid, decomposes spontaneously when exposed to the light. Chemical attraction or affinity is a force of enormous power, but is only exercised at minute and inappreciable distances. Thus a piece of iron is completely dissolved when acted upon by hydrochloric acid; the affinity of chlorine for iron being so great that the particles of the latter are torn from one another, the cohesion which formerly kept them together being completely overcome. But actual contact of the iron and hydrochloric acid is necessary, no action whatever ensuing if the acid be simply approached to the iron. Affinity differs, then, from gravity in its mode of action. The difference in the amount of affinity existing between different bodies is well illustrated by the replacement of metals from their solutions. If some mercury be placed in a solution of nitrate of silver (a compound of the radical of nitric acid and silver), the whole of the silver is gradually deposited in beautiful crystals, and the solution eventually contains nothing but nitrate of mercury. If copper be placed in the solution of nitrate of mercury, the mercury in its turn is deposited, and nitrate of copper is formed; and in a similar manner the copper may be replaced by lead, and the lead by zinc. These replacements are entirely due to the difference in the affinity of the nitric acid radical for the various metals, the affinity being strongest in the case of zinc, and weakest in the case of silver.

Laws of Chemical Combination.—These laws are of the greatest theoretical and practical importance, and deserve our special attention. The first law is that of *definite proportions*, and may be thus stated:—*Two substances in combining, do so in definite proportions. The same compound, no matter what its source or origin may be, always contains the same constituents, and the same proportions of them.* Thus water, obtained from the clouds, from the sea, from a spring, or from a burning candle, invariably contains 88·89 per cent. of oxygen, and 11·11 per cent. of hydrogen. The second law is that of *multiple proportions*, and is as follows:—*If two substances combine in more than one proportion, then, taking in the compounds so formed the same quantity of one of the substances, the quantities of the other vary in a simple manner.* Thus nitrogen forms five compounds with oxygen, in which, taking the proportion of nitrogen as constant, and as being 28 parts by weight, the quantities of oxygen are respectively 16, 32, 48, 64, and 80. In other words, the proportion of oxygen increases in the ratio of 1, 2, 3, 4, and 5. The facts relating to the replacement of substances by one another, and their *equivalence*, are also of great importance, and belong to this branch of the subject. We have pointed out how the difference in the affinity of substances was proved by the replacement of metals by one another in their solution. Now, if we determine the quantities of the different metals replacing one another, we find that for every 108 parts of silver deposited, 100 parts of mercury are dissolved; that 31·7 parts of copper precipitate 100 parts of mercury; that 103·5 parts of lead precipitate 31·7 of copper; and finally, that 32·7 parts of zinc precipitate 103·5 parts of lead. These quantities of the different metals are said to be equivalent to one another, because they combine with the same quantity of the nitric acid radical, and thus play the same part. Not only do they combine with the same quantity of the nitric acid radical, but also with the same quantities of chlorine, oxygen, sulphur, &c. Again, in the case of acids and bases, we find that different quantities of the latter are required to saturate (or completely neutralise) the same quantities of the latter. Thus, in order to saturate 49 parts of sulphuric acid, 56 parts of caustic potash, 40 of caustic soda, 17 of gaseous ammonia, and 37 of slaked lime are required, and the same quantities of these bases saturate 63 parts of nitric acid and 36·5 of hydrochloric acid. The numbers expressing these quantities of acids and bases are said to be their *equivalents*.

Atomic Theory.—The laws of combination and the facts of equivalence are beautifully explained by means of the Atomic Theory (q. v.), which asserts that all matter is composed of ultimate particles or atoms, which by no means in our power can be further subdivided. The atoms of which an element is composed are of the same kind, and possess the same weight and properties; but the atoms of different elements differ from one another in these respects. As up to the present time sixty-four elements have been discovered, it follows that we are acquainted with but sixty-four kinds of atoms. The atoms of each element are characterised by their weight (atomic weight), by their attraction for other atoms (affinity), and by the proportion in which other atoms combine with them (atomicity). With regard to the size and shape of the atoms nothing is known, neither are we acquainted with their *absolute* weight; but it has been found possible to determine their relative weights, *i.e.*, their weights as compared with one another. For this purpose the atom of hydrogen is chosen as representing unity, and the atomic weight of an element is defined as the weight of its atom (or smallest particle capable of existence), compared with the weight of the atom of hydrogen. For information respecting the methods by which the atomic weights have been determined, the reader is referred to article ATOMIC THEORY. A curious point in connection with the atoms is, that in the majority of cases a single atom cannot exist in the free state, but immediately combines with others of its own kind. Thus a single atom of hydrogen is only known in combination: as soon as it becomes free it seizes upon a neighbour, and forms a group of two atoms. To designate this group—or indeed the smallest particle of any body, whether simple or compound, capable of existing in the free state—the term *molecule* is employed. The molecule of hydrogen therefore contains two atoms. Compounds are formed by the juxtaposition or union of the atoms of elements in various proportions; but the molecule of the same compound always contains the same number and kind of atoms, arranged in the same manner. A drop of water, for instance, is composed of myriads of particles or molecules, each of which contain one atom of the element oxygen and two atoms of the element hydrogen. The explanation of the law of definite proportions is at once clear after this statement. Let us take the example of water to illustrate this. A molecule of water contains one atom of oxygen with the atomic weight 16, and two atoms of hydrogen with an atomic weight of 1. The proportions of oxygen and hydrogen present in water are therefore—

16 . 2 or 88·89 : 11·11,

and these proportions cannot vary. The law of multiple proportions also admits of a ready explanation; for as the difference between the various compounds which two elements form depends upon the number of atoms present in the molecules of each, it follows that the proportions of the two elements will vary directly as these numbers. Thus the oxides of nitrogen contain in their molecule respectively 1, 2, 3, 4, and 5 atoms of oxygen, combined with 2 atoms of nitrogen, each of which has an atomic weight of 14. As the atom of oxygen weighs 16, the first compound will contain 28 parts of nitrogen and 16 of oxygen, the second 28 parts of nitrogen and 32 of oxygen, and so on. The facts of equivalence are also explained by the atomic theory. Let us take the case of the replacement of metals. We saw that 108 parts of silver were replaced by 100 of mercury, the mercury by 31·7 of copper, the copper by 103·5 of lead, and the lead by 32·5 of zinc. Now it will be found on an inspection of the table of atomic weights (see ATOMIC THEORY) that, with the exception of 108, these numbers represent *half* the atomic weights of the different metals, and that 108 is the atomic weight of silver. As atoms cannot be halved, it is clear that 2 atoms of silver are replaced by 1 atom of mercury, the mercury by 1 atom of copper, the copper by 1 atom of lead, and the lead by 1 atom of zinc.

Molecular Weights.—By the molecular weight of a body, simple or compound, is understood the weight of its smallest particle capable of existence in the free state, compared with the weight of the atom of hydrogen. The determination of the molecular weights of compound substances is of great importance, because by simple analysis we cannot determine the actual number of the different atoms present, but only their ratio. Thus the analysis of benzol shows that it contains in every 13 parts, 12 parts of carbon and 1 part of hydrogen; and as the atomic weight of carbon is 12, we should be inclined to admit that benzol is a compound of 1 atom of carbon and 1 atom of hydrogen, and therefore that its molecular weight was 13. But a direct determination of the molecular weight of benzol shows it to be 78, *i.e.*, exactly six times 13. From this we conclude that the molecule of benzol contains 6 atoms of carbon combined with 6 atoms of hydrogen. The direct determination of molecular weights can only be accomplished in the case of volatile bodies. In other cases these weights can only be deduced either from the steps taken in the synthesis of the bodies, from a consideration of their reactions, or from the different products yielded by their decomposition.

Avogadro and Ampère enunciated the law that *in equal volumes of all gases and vapours, under the same conditions of temperature and pressure, the same number of molecules is contained.* Thus, in a litre of hydrogen and benzol vapour, at a temperature, let us say, of 100° C., and a pressure of 760 mm., the same number of molecules is contained. Now the specific gravity of a gas or vapour is defined as the weight of a given volume, compared with the weight of the same volume of hydrogen under the same conditions of temperature and pressure.

$$\text{Sp. gr.} = \frac{\text{Weight of a given volume of gas or vapour at T. and P.}}{\text{Weight of same volume of hydrogen at T. and P.}}$$

But what does the weight of a given volume of the gas or vapour depend upon? First, upon the weight of each molecule; next, upon the number of molecules present. Let M represent the former, and x the latter. Then the weight of a given volume of gas or vapour at T and P = M × x. In the same manner the weight of the equal volume of hydrogen depends upon the weight of its molecules, and upon their number. By Avogadro's law the latter is x, and we have seen that the former is 2 (the molecule of hydrogen containing 2 atoms).

We have then:—Weight of equal volume of hydrogen at T and P = 2 × x, and therefore—

$$\text{Sp. gr.} = \frac{M \times x}{2 \times x} = \frac{M}{2};$$

from which it follows that

$$M = 2 \times \text{sp. gr.}$$

In other words, the molecular weight of a body is determined by multiplying the specific gravity of its vapour by 2.

Chemical Notation.—Berzelius was the first to introduce the present system of symbols and formulæ as a means of briefly stating the composition of chemical substances. The most important points in connection with this subject are as follows:—An atom of an element is represented by means of the first letter or letters of its Latin name. Thus 'Hg' represents an atom of mercury (hydrargyrum), 'Na' an atom of sodium (natrium), 'K' an atom of potassium (kalium), &c. The composition of a molecule of an elementary substance is expressed by writing the symbol or symbols of the atoms of which it is composed side by side, and affixing small figures to the right hand, and a little below each symbol, to indicate how many atoms of the element in question are contained in the molecule. Thus P_4 represents a molecule of phosphorus, and shows that it consists of a group of 4 atoms of the element; $C_{12}H_{22}O_{11}$, a molecule of cane-sugar, containing 12 atoms of carbon, 22 of hydrogen, and 11 of oxygen. To represent several molecules a number is prefixed to the formula of the molecule, with or without a bracket. Thus $2P_4$ represents two molecules of phosphorus, $6(C_{12}H_{22}O_{11})$ six molecules of cane-sugar. A chemical equation represents by means of symbols or formulæ a chemical reaction. Thus—

$$2H_2 + O_2 = 2H_2O$$

represents the reaction which takes place when hydrogen combines with oxygen, and shows that two molecules of hydrogen (each containing two atoms) and one molecule of oxygen (also containing two atoms) give two molecules of water (each of which contains two atoms of hydrogen and one of oxygen). The sign + is equivalent to 'together with' or 'and;' the sign = to 'gives.' Such an expression is called an equation, because the quantity of matter represented on the left hand is equal to the quantity on the right. A chemical equation is *a qualitative and quantitative expression of a chemical reaction.* Qualitative, as it shows by means of symbols the composition of the different molecules, reacting and produced. Quantitative, for several reasons:—(1.) It represents the atomic composition of the different molecules. (2.) It also represents the relative *weights* of the different substances taking part in the reaction. For in the above equation $2H_2$ represents 4 atoms of hydrogen (the weight of each of which is taken as unity), and therefore 4 parts by weight; O_2, 2 atoms of oxygen (each of which weighs 16 times as much as the atom of hydrogen), and therefore 32 parts by weight; $2H_2O$, twice the combined weight of 2 atoms of hydrogen = 2 and 1 atom of oxygen = 16, and therefore 36 parts by weight. It follows that 4 parts by weight of hydrogen and 32 parts by weight of oxygen give 36 parts by weight of water; or, what is the same thing, 1 part by weight of hydrogen and 8 parts by weight of oxygen give 9 parts by weight of water. (3.) An equation also represents, in the case of gases or vapours, the relative volumes of them taking part in the reaction; for by Avogadro's law the same number of molecules is contained in equal volumes of all gases and vapours, providing they be at the same temperature and pressure, and therefore *the indices to the number of molecules are also the indices to the relative volumes.* Providing, therefore, that oxygen and hydrogen be at 100° C., and that the pressure is constant, 2 volumes of the latter and 1 volume of the former will give 2 volumes of steam.

Atomicity.—We have said that the atoms are characterised by their weight, their affinity, and by the proportions in which they combine with other atoms, or their *atomicity.* The theory of atomicity, although for many reasons unsatisfactory, has nevertheless done good service for chemistry, by explaining the constitution of bodies and the existence of isomers, and by enabling the chemist to foresee the existence of new compounds. Starting with the fact that a certain number of elementary substances combine in a single proportion—that of atom to atom—it has been conjectured that the atoms of these elements each possess a certain something—a point of attraction, arm, or link—which, for want of a better name, has been called an 'atomicity.' The nature of an atomicity remains in obscurity, but it is believed to be by its means that the atoms become attached to one another. Atoms possessing but a single atomicity may be likened to men possessed of but one arm, who are therefore capable of holding by the hand a single individual. An atomicity is represented graphically by affixing to the symbol of the element a stroke or dash: thus—

$$\text{H}' \qquad \text{Na}' \qquad \text{Cl}' \qquad \text{Br}'$$

$$\text{or} \quad \underbrace{\text{H—}}_{\text{Hydrogen.}} \qquad \underbrace{\text{Na—}}_{\text{Sodium.}} \qquad \underbrace{\text{Cl—}}_{\text{Chlorine.}} \qquad \underbrace{\text{Br—}}_{\text{Bromine.}}$$

and the compounds of these elements with one another thus—

$$\underbrace{\text{H—Cl}}_{\substack{\text{Hydrochloric}\\ \text{acid.}}} \qquad \underbrace{\text{Na—Br}}_{\substack{\text{Bromide of}\\ \text{sodium.}}}$$

where the straight line between the two symbols is supposed to represent the coalesced atomicity of both atoms. The elements of this class are said to be *monatomic* or *monovalent*, or are simply called *monads*. The atoms of a second class of elements combine with two atoms of a monad, and are therefore supposed to possess two atomicities. These elements are called *dyads*. Oxygen, barium, strontium, and calcium belong to the group. To represent their diatomic properties two dashes are affixed to their symbols: thus—

$$\text{O}'' \qquad \text{Ba}'' \qquad \text{Sr}'' \qquad \text{Ca}''$$

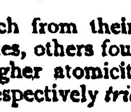
$$\text{or} \quad \underbrace{\text{—O—}}_{\text{Oxygen.}} \qquad \underbrace{\text{—Ba—}}_{\text{Barium.}} \qquad \underbrace{\text{—Sr—}}_{\text{Strontium.}} \qquad \underbrace{\text{—Ca—}}_{\text{Calcium.}}$$

A dyad combines at maximum with two atoms of a monad. Water and chloride of calcium are typical of such compounds—

$$\underbrace{\text{H—O—H}}_{\text{Water.}} \qquad \underbrace{\text{Cl—Ca—Cl}}_{\substack{\text{Chloride of}\\ \text{calcium.}}}$$

But dyads can combine together in more than one proportion. Thus barium forms two oxides, BaO and BaO_2, the constitution of which is supposed to be

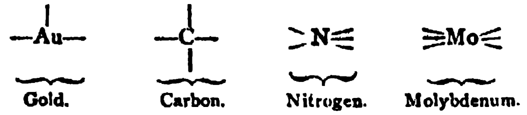
Ba=O and



There are other elements which from their properties are believed to possess three atomicities, others four, five, and six; but no element exists having a higher atomicity. These different classes of elements are called respectively *triads*, *tetrads*, *pentads*, and *hexads*, and their atomistic properties are represented by affixing to their symbols the corresponding figure or number of dashes, thus :—

$$\mathrm{Au}^{\mathrm{III.}}\qquad \mathrm{C}^{\mathrm{IV.}}\qquad \mathrm{N}^{\mathrm{V.}}\qquad \mathrm{Mo}^{\mathrm{VI.}}$$

or



The atomicity of an element can only be determined from its compounds with monads, or with monatomic groups.

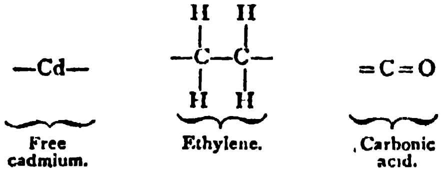
An important point in the theory of atomicity is that, with one or two exceptions, no molecules exist containing an atom having a single atomicity unoccupied. Such a group (which is said to be *unevenly unsaturated*), on being set at liberty, at once combines with a neighbour of its own kind, and forms a double group. It is supposed to be for this reason that the molecules of hydrogen, chlorine, and bromine each contain two atoms—

$$\underbrace{\mathrm{H—H}}_{\text{Free hydrogen.}}\qquad \underbrace{\mathrm{Cl—Cl}}_{\text{Free chlorine.}}\qquad \underbrace{\mathrm{Br—Br}}_{\text{Free bromine.}}$$

Again, the group hydroxyl —O—H, although existing in caustic potash, K—(O—H), and water, H—(O—H), becomes doubled when set at liberty, forming peroxide of hydrogen—

$$\mathrm{H—O} \vdots \mathrm{O—H}$$

and many other instances can be quoted. *Evenly unsaturated* molecules do exist; for instance, cadmium, ethylene, carbonic oxide.

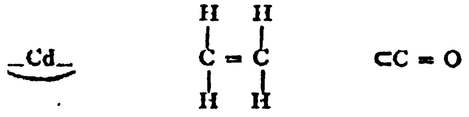


$$\underbrace{\mathrm{—Cd—}}_{\text{Free cadmium.}}\qquad \underbrace{\begin{matrix}\mathrm{H} & \mathrm{H}\\ | & |\\ \mathrm{—C} & \mathrm{—C—}\\ | & |\\ \mathrm{H} & \mathrm{H}\end{matrix}}_{\text{Ethylene.}}\qquad \underbrace{\mathrm{=C=O}}_{\text{Carbonic acid.}}$$

But others become doubled ; thus oxygen—

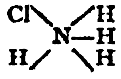
$$\underbrace{\mathrm{O=O}}_{\text{Free oxygen.}}$$

Here we see the atomicities of two atoms of the same element coalescing. It has been thought possible that in the case of evenly unsaturated bodies, the two atomicities also coalesce. The molecule of cadmium, ethylene, and carbonic oxide are represented on this view thus—

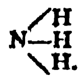


$$\underbrace{\mathrm{\_Cd\_}}\qquad \begin{matrix}\mathrm{H} & \mathrm{H}\\ | & |\\ \mathrm{C} = & \mathrm{C}\\ | & |\\ \mathrm{H} & \mathrm{H}\end{matrix}\qquad \mathrm{C}\!\!\subset\!\mathrm{C=O}$$

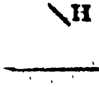
Many elements of an atomicity greater than two have a varying atomicity; thus nitrogen, which is pentatomic in some compounds—chloride of ammonium, for instance ($\mathrm{NH_4\,Cl}$)—



is triad in most of its compounds; for instance, ammonia—

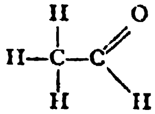


The other arms becoming occluded or inactive. As the atomicity of such bodies always varies by *two*, it has been supposed that the two atomicities coalesce, as in the formula just given for carbonic oxide. Thus,

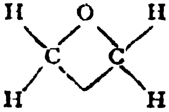


Constitution.—We have said that the nature of a compound depends upon the number and kind of atoms composing it, and also upon the manner in which the atoms are *arranged* or grouped. The last is an important point, for we very frequently find (more especially in the case of the compounds of carbon) that the molecules of two or more bodies contain the same number and kind of atoms, and yet possess very different properties. Thus acetic aldehyde and oxide of ethylene both have the formula $\mathrm{C_2H_4O}$. The difference between such bodies can only be explained by assuming that the atoms composing their molecules are differently grouped ; in other words, that they have a different *constitution*. The investigation of the constitution of compounds forms one of the principal aims of modern C., and has already advanced considerably. Substances which, like aldehyde and oxide of ethylene, have a similar atomic composition but a different constitution, are said to be *isomeric* (see ISOMERISM). Substances the molecular weights of which are multiples of one another, are said to be *polymeric*. Thus acetylene, $\mathrm{C_2H_2}$, and benzol, $\mathrm{C_6H_6}$, are polymers. The theory of atomicity has lead to the introduction of *graphic formulæ* for representing the arrangement of the atoms in a molecule. Subjoined are the graphic formulæ of the two isomeric substances we have mentioned to illustrate the manner in which the difference in their constitution is accounted for by the theory of atomicity.

Aldehyde.



Oxide of ethylene.



Chemists and Druggists, Laws Relating to. The Pharmaceutical Society of Great Britain was incorporated by royal charter on 18th February 1843. The charter provides that the society shall have the right to examine candidates for admission, and to confer on those qualified the title of 'Pharmaceutical Chemist.' To assume the title without licence is punishable by fine; but the practice of a chemist and druggist is open to all. The Council of the Society is required to appoint examiners for Scotland, who have the same powers as the examiners in England. No member of the medical profession, or who is practising under the right of a degree of any university, or diploma or licence of a medical body, is entitled to be registered; and if any one who is registered become a member of the medical profession, he is disqualified from remaining on the register. See APOTHECARY.

Chem'nitz, the first manufacturing and second trading town of Saxony, on a river of the same name, in a wide valley, at the foot of the Erzgebirge, 36 miles S.W. of Dresden by railway. It has 80 cotton and spinning mills, 450 machines and 3000 handlooms, 50 machine-works, supplying locomotive and other engines to all parts of Europe, over 50 large dye-works, besides manufactures of silk, gloves, lace, musical instruments, embroideries, &c. In 1874 the export of woollen, cotton, and other manufactured goods to America alone amounted to £420,776. There are various technical schools, several good public buildings, an exchange, a large theatre, and fine promenades formed on the site of the old walls. Pop. (1871) 68,229. The first Christian church was built here in 938 by Otto I., and C. became an imperial city under Rudolf of Hapsburg in the 13th c. It was ruined by the Thirty Years' War, and only began to prosper again on the introduction of cotton-weaving in the end of the 17th c.

Chem'nitz, Martin, one of the most distinguished theologians of the Lutheran Church in the 16th c., was born at Treuenbrietzen, in Brandenburg, 9th November 1522, and studied under Melancthon at Wittenberg. In 1547 he was appointed rector of the cathedral school at Königsberg, where he engaged in a controversy with Osiander in defence of the Lutheran doctrine of justification. Returning to Wittenberg in 1553, he lectured on Melancthon's *Loci Communes*—the origin of his own *Loci Theologici*, reckoned the best book of systematic theology produced in that age. In 1554 he settled in Brunswick, where he first became pastor, then superintendent, and died 8th April 1586. He is most distinguished for his treatises against the Jesuits (*Theologia Jesuitarum præcipua capita*, Leips. 1562) and the Decrees of the Council of Trent (*Examen Concilii Tridentini*, 4 vols. Leips. 1565); but probably the greatest ecclesiastico-political work of his life was inducing the Churches of Saxony, Franconia, and Swabia, to adopt the *Concordienformel* as their confession of faith.—**Martin C.**, son of the preceding (born 1561, died 1627), became privy councillor and chancellor to the Duke of Holstein-Gottorp.—**Philipp Bogislav von C.**, son of the younger Martin (born 1605, died 1678), entered the service of Sweden, was made royal historiographer, and raised to the order of nobility.

Chemnit'zia, a genus of Gasteropodous mollusca, the shell of which is of slender, elongated shape—the aperture being oval and the operculum horny. This genus is included in the family *Pyramidellidæ*, and its fossil representatives first appear in the Permian rocks, more than 150 fossil species being known.

Chenab', the largest of the rivers from which the Punjab ('five rivers') takes its name. Its source is in the Paralasa range of the Himalayas. After a course of about 600 miles it receives the Jhelum on its right; somewhat lower down, the Ravee on its left; and 110 miles still lower, on the same side, the united stream of the Beas and Sutlej. The entire body of waters before joining the Indus bears the name of the Punjnud. At Waizerabad the railway crosses C. by one of the longest iron bridges in the world, having a length of 1¼ miles, and consisting of 64 spans of 1426 feet each. This bridge was opened by the Prince of Wales, 22d January 1876.

Chén'ier, André-Marie de, a French poet and political writer, was born October 29, 1763, at Constantinople, where his father was consul-general for France. He came to France at an early age, and studied at the Collége de Navarre, in Paris, there evincing poetic talent and acquiring a passion for ancient literature. In 1784 he travelled on account of his health in Switzerland, Italy, and Greece, and in 1787 he visited England as secretary to the embassy of M. Luzerne. Returning to Paris in 1790, while the Revolution was raging, he joined the brilliant 'Society of '89,' and volunteered to assist the infirm Malesherbes in the defence of Louis XVI. C. stood as far apart from despotism as from anarchy, and in prose and verse proclaimed at once his love of liberty and his detestation of violence. He was at last brought before the Revolutionary Tribunal, was condemned, along with forty-five others, and was guillotined, July 25, 1794. When in prison C. burst forth in a beautiful ode. *La Jeune Captive*, of which the subject was his fellow-prisoner, the celebrated Comtesse de Coigny. His *Elégies* are exquisite in their mingling of classical spirit with an original boldness and vivacity. Only a tithe of his projected poems were finished, still the influence of C. is clearly visible in the early works of Chateaubriand, Barthelémy, Lamartine, and Victor Hugo. Of the many editions of his *Poésies*, the best are those of Delatouche (Par. 1840), and Becq de Fougières (1862); and of his *Œuvres en Prose*, there is a selection by Hugo (1840).—**Marie-Joseph de C.**, brother of the former, was born at Constantinople, August 28, 1764, and became famous as the principal dramatist of the Revolution, and as a member of the Legislative Assembly from 1792 to 1802. He is also the author of the *Chant du Départ* and other songs. His dramas, of which the chief are *Charles IX.* (1790), *Jean Calas* (1792), *Henri VIII.* (1793), and *Timoléon* (1795), are full of republican declamation, and of the wild sentiments of the time. C. died January 10, 1811. His *Œuvres Complètes* were published in 8 vols., with a memoir by Daunou (1823-26).

Chenopodia'ceæ, the Goosefoot or Spinach order, a natural order of Dicotyledonous plants, herbs, or small shrubs very generally distributed over the world, but chiefly found in temperate or ex-tropical countries. There are about 500 species, and among the best-known of the seventy-four genera are *Salicornia*, *Atriplex*, *Beta*, *Chenopodium*, and *Salsola*. From the ashes of several species—*Salsola*, *Salicornia*, &c.—which grow in salt marshes, *barilla*, used for obtaining carbonate of soda in former times, is obtained; but on account of soda being now much more easily obtained from other sources, the demand has of late fallen off. Among the other species are beet and mangold-wurzel (see BETA), spinach, &c. The seeds of several of them contain volatile oil or are nutritive—*e.g.*, Quinoa (q. v.). Some are anthelmintic, antispasmodic, aromatic, carminative, and stimulant. The fruit of the strawberry Blite (*Blitum capitatum* and *B. virgatum*) of the S. of Europe has a sweetish, insipid taste.

Chenopod'ium, a genus of *Chenopodiaceæ* (q. v.), some of the British species of which are weeds, known under the name of *Goosefoot*. *C. ambrosioides*, the Mexican tea, is, owing to the essential oil which it contains, tonic and antispasmodic. *C. anthelminticum* yields 'wormwood oil,' so popular in the United States as a vermifuge. *C. Quinoa*, of the Pacific slopes of the Andes, is remarkable in so far that its seeds are extensively used as food by being ground and eaten as a gruel after the preparation has been seasoned with Chili pepper and other condiments, or by the seeds being roasted and boiled in water, which, after being seasoned, is supped. This last mixture, called *carapulque*, is a favourite Peruvian dish, and though unpalatable to those unaccustomed to it, is said to be very nutritious. The young leaves and shoots of the Good Henry, wild spinage, or Thesavy (*C. Bonus-Henricus*), a common British wayside weed, are, as well as those of *C. intermedium*, *C. album*, used as substitutes for spinach. The stinking goosefoot (*C. olidum*) is an antispasmodic and emmenagogue. *C. Botrys*, the 'Jerusalem oak,' of the S. of Europe, is expectorant and anthelmintic.

Chep'stow (Old Eng. *Ceapstow*, 'a place of trade'), a town of Monmouthshire, on the Wye, is a station on the S. Wales and Union Railway, 17 miles E. by N. of Newport, and has a river and coast trade in coal, iron, millstones, bark, cider, &c. It lies in a rocky gorge, where the river is crossed by a fine bridge, and is exposed to some danger from the tide, which frequently rises to the height of 50 feet, and even higher. Pop. (1871) 3347. About 5 miles off are the ruins of Tintern Abbey.

Cheque is a draft or order on a banker. It is subject to a stamp-duty of one penny, adhesive or impressed. A C. must be payable on demand to the bearer, and be drawn on a banker under fifteen miles of the place of issue. A *crossed C.* has the name of a banker written across the face of it, to whom for security it is payable, or it may be crossed simply '—— & Co.' leaving the holder to insert the name of the banker. In this case it is only paid through that banker. If presented by any other person, it is not paid without inquiry. By statute the crossing is to be held a *material part of the C.* Any one obliterating or altering a C., with intent to defraud, is guilty of felony. A banker is personally liable if he pay a C. to which the signature of the drawer is forged; but if the signature of the payee only be forged, and that of the drawer genuine, the bank or banker is not liable to the drawer. In *Smith* v. *The Union Bank of London*, it has recently been decided that a banker paying a C. to a party other than the bank whose name was written across, was entitled to do so. This decision has caused surprise and dissatisfaction in commercial circles, and will probably occasion further legislation.

Cher, one of the most central departments of France, in the basin of the Loire, has an area of 2800 sq. miles, and a pop. (1872) of 335,392. It is in great part an unbroken plain, bounded on the E. by the Loire, and intersected by the C. and Sauldre with their affluents, forming fertile valleys, in which are cultivated cereals, hemp, and vines. There are many fine forests, as those of Vierzon, Soudrain, Bornac, Chœurs, &c., and in the S.E., where rises a low range of hills, there occur extensive marshes. The climate is cold but healthy. Among the chief industries are cattle-rearing and iron-mining, while there are also extensive manufactures of cloth, porcelain, lace, glass, leather, &c., and a large export trade in agricultural produce, iron, and timber. C. is traversed by several canals, and by the Orleans and Lyons Railway. The capital is Bourges. The department was chiefly formed out of the provinces of Haute-Berri and the Bourbonnais.—The *river C.* rises in Creuse, near Crocq, flows N.W. through the department to which it gives name, and waters Loire-et-Cher and Indre-et-Loire, entering the Loire below Tours after a course of over 200 miles.

Cheras'co, a fortified town in the province of Turin, N. Italy, at the confluence of the Tanaro and Stura, 30 miles S.E. of Turin, has some wine and silk industries. The beautiful church of Madonna del Popolo, with a remarkable sanctuary, is much visited by foreigners. The town was taken by the French, April 28, 1796, and three days later the armistice of C. was concluded here, by which the troops of France were allowed free passage through the states of Sardinia. Pop. 10,000.

Cher'bourg, a strongly fortified seaport, and the most important town in the department of Manche, France, near the mouth of the Divette, 16 miles E.S.E. of Cape la Hogue, and 214 W.N.W. of Paris, with which it is connected by railway. It is one of the first arsenals of France, and the chief station of the marines. The town has a church of the 15th c., an hospital founded by Napoleon, a valuable fine-art collection, and a library of 61,000 volumes. The extensive fortifications of C. were begun by Vauban, and were only completed in 1858, at the enormous cost of £8,000,000. To the N. the roadstead is commanded by a detached breakwater, which is nearly parallel to the shore, is 2¼ miles long, encloses an area of 2000 acres, and supports six strong batteries. Round each end of this breakwater or *digue* vessels enter the harbour, and these channels are further protected by a series of island and mainland redoubts. The two main strongholds of C. are the extensive *Roches des Flamands* and *Roches du Homet*, and the town itself is overlooked by two forts, placed on the heights of Roule. The defences of C. make up a total of thirty forts of all kinds. The military port includes an outer harbour, having an area of 18 acres, and a floating dock of 15, and an inner floating dock of 21 acres, together admitting forty vessels of the first rank. There are also extensive shipbuilding slips and graving-docks. At the mouth of the Divette is the commercial harbour, connected with the sea by a channel 2270 feet in length, and protected by a granite mole. Besides the naval industries, there are manufactures of lace, hoisery, chemicals, leather, &c., and an export trade chiefly in cattle, salt, and wine. Pop. (1872) 46,000, exclusive of the garrison and naval force. C., under the name *Carusburg*, is first authentically known in the 11th c., when a certain Comte Gerbert de C. appears in the ranks of the Normans at Hastings. In 1418 it was taken by the English, in 1450 retaken by Charles VII., and in 1758 again captured by the English, who destroyed its defences. A grand fête was given at C. on the opening of the inner floating dock by Napoleon III., at which the Queen of England and court were present by invitation, August 1858.

Cher'ibon, or Sheribon, the capital of a Dutch residency of the same name, in Java, on the N. coast of the island, has a trade in teak-wood, coffee, and indigo. Pop. of town, 12,000, of residency, 550,000.

Cherimoy'er (*Anona Cherimolia*), a delicious Peruvian and Brazilian species of custard-apple, now naturalised in the E. Indies and other tropical countries, and reckoned inferior only to the mangosteen. It belongs to the order *Anonaceæ*. See CUSTARD-APPLE.

Cherkask'. See TCHERKASK.

Cherr'y (*Cerasus*), a genus of shrubs or trees belonging to the natural order *Rosaceæ*. It might be regarded as a sub-genus of *Prunus* or Plum (q. v.). There are many species scattered all over the temperate portions of the world, *C. avium* (the gean), and *C. vulgaris*, both natives of Britain (though according to some the latter is a native of Syria and Western Asia generally, and only naturalised in Europe), and believed to be the progenitor of all the varieties of cultivated cherries. Their wood is highly valued by cabinetmakers and musical instrument makers. From the fruits of *C. avium* a spirit called *Kirschwasser* (q. v., and also *Maraschino*) is distilled in Germany, and the fruits are also extensively used in France, Germany, and Scandinavia for making soups. Among the other species are *C. Padus*, the Bird Cherry (q. v.) or hogberry, *C. Mahaleb*, of the middle and S. of Europe, *C. Virginiana* of America, *C. Capollim* of Mexico, *C. capreida* of Natal, *C. occidentalis*, *C. Lusitanica*, and *C. Laurocerasus*, the Cherry Laurel (q. v.), both of which have evergreen leaves, &c. The wood of most of them is valued. Some have astringent bark, also esteemed as a febrifuge, while the leaves and kernels of nearly all contain hydrocyanic (Prussic) acid. There are very many cultivated varieties of C. esteemed for their fruit and the liqueurs prepared from it. In addition to Maraschino and Kirschwasser, the Ratafia of Grenoble is prepared from pounded cherries to which brandy, spices, and sugar are added. A gum not unlike gum-arabic exudes from the bark of many species of the genus.

Cherry Laurel, Common Laurel, Bay Laurel, Laurel Cherry, or Laurel Bay, a name which should properly be limited to *P. Laurocerasus*, but which is often vaguely applied to the species of *Cerasus* which have evergreen leaves. From the amount of hydrocyanic acid contained in it, nearly every part of the shrub is poisonous. The vapour of the bruised leaves will kill small insects. Hence, though custards, &c., are sometimes flavoured with C. L. water, great care should be exercised in its use.

Cher'so, an Austrian island in the Adriatic, government of Trieste, 12 miles S.S.W. of Fiume: area 105 sq. miles; pop. 7590. The surface is rugged, and towards the N. there are forests. There is a town of the same name on the W. coast, with a pop. of 3500.

Cher'son. See KHERSON.

Chersone'sus, a Greek word denoting literally a land-island, *i.e.*, a peninsula. Pausanias applies it even to an island united to the mainland by a bridge. Several places were so named by the ancients :—the *Tauric C.* (the Crimea), the *Thracian C.* (the peninsula of Gallipoli), the *Cimbric C.* (Jutland), and the *Golden C.* (Farther India or Malacca).

Chert'sey (Old Eng. *Ceortes-ig*, 'Ceort's Island,' so called because situated on a spit of land between the Thames and a brook), a town in Surrey, 21 miles S.W. of London by railway, on the right bank of the Thames, which is here crossed by a handsome bridge. It has several almshouses, one founded by Cowley the poet, who died here, and a school founded in 1725 by Sir William Perkins for clothing and educating fifty children. The principal trade is in malt, flour, tiles, and bricks, and vegetables for the London market. C. is a very old place. Bede (*Hist. Eccl.* lib. iv. cap. 6) says that Earconwald, Bishop of the E. Saxons in London, built a monastery here (*circa* 666 A.D.), but the town plays no part in history. Pop. (1871) 3146.

Cher'ub (pl. *Cherubs*, Heb. *Cherubim*), in the theology of the Hebrews was a creature of composite form, variously described in the sacred books. It is represented as having the human form (Ezek. i. 5), hands (Gen. iii. 24), two wings and one face (Exod. xxv. 20), four wings, four faces—of a man, a lion, an ox, and an eagle—four hands, the soles of the feet like a calf's, and the whole body full of eyes (Ezek. i.). The four beasts of the Apocalypse (iv. 6–8) had six wings, and each a different form—of a lion, a calf, (the face of) a man, and an eagle. The attributes thus assigned to cherubs indicate the power of looking and moving swiftly in any direction without turning. As to the idea attached to the cherubs, everything points to this, that their proper task was to guard the unapproachable. The parallel to them is found in the winged bulls and lions of Nineveh (from which, it has been conjectured, they were borrowed, as recent discoveries show a strikingly close connection between Hebrew and Babylonian theology), the sphinx of Egypt, the chimæra, and griffin. Now the part ascribed to the griffin (Gr. *gryps*, the same word as the Heb. C.) is that of guardian of treasure, and that this was just the office of the C. is manifest from Gen. iii. 24, and Ezek. xxviii. 13–16: hence their post on the top of the Ark (q. v.), and over it in Solomon's temple (1 Kings viii. 6–7), and their multitude of eyes (Ezek. i. and Rev. iv. 6). See Kuenen's *Religion of Israel* (Eng. transl. 1875).

Cherubi'ni, Maria Luigi Carlo Zenobio Salvatore, the last of the great Italian composers, was born 8th September 1760 at Florence. He was educated in Italy, but went to Paris as a young man, and remained there, where he was unboundedly popular, for the rest of his life. Of his very numerous compositions, which include twenty-eight operas, eighteen masses, and numerous smaller works, a few overtures are still heard, and at least two operas, 'Medea' and 'Les Deux Journées.' C. was Director of the Paris Conservatoire, where Auber and Boildieu were his pupils. He died in Paris, 15th March 1842. See Piechianti, *Notizie sulla Vita e sulle Opere di C.* (Mil. 1843).

Cherus'ci, a German tribe, separated from the Suevi by the Silva Bacenis, or Harz Forest, which formed the southern boundary. Under their chief Arminius (Hermann), they totally routed the Romans, commanded by Varus, in the Teutoburg Forest, A.D. 9. Germanicus failed in his attempt to wipe out this stain on the Roman arms, but weakened by internal dissensions, the C. were subdued by the Chatti. About the beginning of the 4th c. they appear among the Frankish confederacy against Constantine, and, still later, Claudian alludes to them in his panegyric on the fourth consulship of Honorius.

Cher'vil (*Anthriscus cerefolium* or *Chærophyllum sativum*), an umbelliferous plant, cultivated for the purpose of using it as an ingredient in soups. It is a native of the continent of Europe, but naturalised in Britain. The pleasantly aromatic odour of its leaves distinguishes it from *A. vulgaris*—a poisonous weed, the leaves of which have a disagreeable odour. The great C., anise C., sweet C., sweet Cicely or myrrh, is *Myrrhis odorata;* the needle C., Venus' comb or shepherd's needle, is *Scandix Pectenveneris;* the parsnip C., *Chærophyllum bulbosum* or *Anthriscus bulbosus;* and the wild C., *Chærophyllum sylvestre.* All the species of *Chærophyllum* are also called C.

Ches'apeake Bay, a deep indentation on the Atlantic coast of the United States, nearly 200 miles in length, with a breadth of from 10 to 30 miles, and an average depth of 9 fathoms. At its mouth are the two capes Henry and Charles, facing each other. Its coast-line is very irregular, and forms numerous lesser bays. The eastern side has a flat and swampy shore; the western is a little higher. Besides a number of smaller streams, it receives the Potomac, Susquehannah, Rappahannock, York, and James rivers, all navigable; and by means of canals it is connected with other great water systems in the United States.

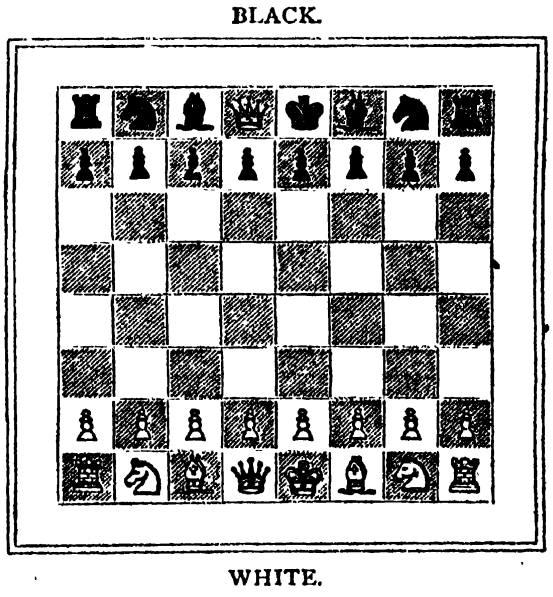
Ches'elden, William, surgeon and anatomist, was born 19th October 1688, at Barrow-on-the-Hill, Leicestershire. He began to lecture on anatomy at twenty-two, and was elected a Fellow of the Royal Society in 1711, and a corresponding member of the Academy of Sciences at Paris in 1729, being the first foreigner honoured with that distinction. As surgeon to the St Thomas's and St George's Hospitals and to Westminster Infirmary, he acquired a brilliant reputation as an operator. He died 10th April 1752. His chief works are *Anatomy of the Human Body* (1713); *Treatise on the High Operation for the Stone* (1723); and *Osteography, or Anatomy of the Bones* (1733).

Chesh'ire, a western and maritime county of England, lies between the rivers Mersey and Dee, and has an area of 705,493 acres, and a pop. (1871) of 561,131. It forms, towards the Irish Sea, a flat peninsula, the Wirral, between the estuaries of the great rivers, and inland a plain separating the mountains of Wales from those of Derbyshire. Near the centre it is intersected by an elevated ridge, running from the mouth of the Weaver in the N., to Beeston Castle rock (366 feet high) in the S.W., and in the W. also the county is slightly hilly, besides being bounded in great part by the Mersey on the E. and N., and by the Dee on the W. C. is watered by the Weaver and other navigable affluents of the Mersey. It has a moist climate and a soil fertile and loamy. There is excellent pasturage, and the agriculturists mainly devote their attention to dairy-farming, and especially to cheese-making. In 1875 there were 116,667 acres under all crops, and 347,461 acres of permanent pasture, while there were also 162,466 head of cattle, a higher proportion to the number of acres than in any other English county. As much as 20,000 tons of cheese are produced yearly. C. is almost entirely formed of new red sandstone, containing an inexhaustible quantity of rock-salt, which is extensively mined near Northwich. When illumined by torchlight, the mines, some of them of vast extent, form a splendid spectacle. The other mineral products are coal, copper, lead, cobalt, and limestone. Chester is the capital, and among the other towns are Birkenhead, Stockport, Macclesfield, Staley Bridge, and Crewe. C. is connected with all parts of the kingdom by the London and Liverpool Railway, and by the Crewe, Chester, and Holyhead Railway, and is traversed by the Grand Trunk and Bridgewater Canals. It returns six members to Parliament.

The original British inhabitants were the *Cornavii* or *Cornabii.* Under the Romans the district formed part of the province *Flavia Cæsariensis.* It first became permanently English in 828, when Ecgberht of Wessex compelled the submission of the N. Welsh, and then received the name *Ceastre-scyre* ('shire of Chester'), of which the present form is a corruption. It was an earldom in the reign of Canute, was made a county palatine by William the Conqueror, having eight barons and a Parliament of its own. Henry VIII. abolished (1539) its separate Parliament, and compelled it to send representatives to the national assembly, but its independent jurisdiction did not finally cease till 1831.

Chest'nut, or Chestnut (*Castanea*), a genus of Dicotyledonous trees or large shrubs, belonging to the order *Cupuliferæ.* The common sweet or Spanish C. (*C. vesca*) is believed to have been originally introduced into Sardinia from Sardis in Asia Minor, and from thence to have spread all over the S. of Europe, where it forms in places large forests. A celebrated specimen at Mount Etna measures 204 feet in circumference. In Britain the C. is widely distributed, and attains a good size, but there is evidence for believing that it was introduced by the Romans. It is now one of our trees most valued for its beauty, the excellence of its timber and its fruit, which when roasted is very nutritive and not unpalatable. Among the species of C. may be mentioned the American C. (*C. Americana*), the silvery C. of Java (*C. argentea*), the Tungurrut (*C. Tungurrut*), the fruits of which are eaten boiled or roasted. (See also CHINQUAPIN.) The term *C.* is also given to various trees and shrubs which have no connection with the genus C.—*e.g.*, the horse-C. (q. v.) is *Æsculus Hippocastanum;* the Moreton Bay C., the seeds of *Castanospermum* (q. v.) *australe;* the Tahiti C., *Inocarpus edulis;* the water-C., *Trapa natans;* wild C. of the Cape of Good Hope, the seeds of *Brabejum;* the yellow C. or C.-oak, *Quercus castanea;* the latter name is also sometimes applied to the timber of *Quercus sessiflora*, of which the woodwork of the roof of Westminster Abbey and various other old buildings is composed, and not, as long believed, of C.

Chess. The origin of this game is lost in antiquity. There seems to be little doubt that a game radically the same as the modern C. was played in the East some thousands of years ago. From Arabia it passed into Spain. In England it seems to have been known before the Norman conquest; but the game as now played may probably rather be said to have grown than to have been invented at any precise period. An elementary knowledge of C. is so generally diffused, and can be so much more effectually given *viva voce* than in a book, that, in the following observations, we will assume the reader to know the power of the various pieces and the object of the game. Any one who has not this knowledge, may acquire it in a few minutes from one who has. He may then enter on the study of this wonderful game, in which perfection lies beyond the reach of the human intellect; yet it is not the intellect alone which is concerned in C.-playing. Its results are largely affected by temperament, and by some of the moral qualities. The man of phlegmatic temperament may prevail over the deeper thinker, if the latter be of an excitable temperament, because to be excited is almost certainly to make an oversight, or some other kind of blunder; besides, in losing the game, the excitable man not unfrequently suffers at the same time a more painful loss in the loss of his temper. In losing at whist, or in any game whose immediate issue is largely



The names of the pieces are King, K.'s Bishop, K.'s Knight, K.'s Castle or Rook; Queen, Q.'s Bishop, Q.'s Knight, Q.'s Castle. Each piece has its respective Pawn.

affected by chance, the player may blame his bad luck, but in C. there is no such refuge for human self-love.

The annexed diagram shows the names and position of the pieces, with their pawns in front, before opening the game. He will thus be able, by himself, or with a fellow-student, to play over printed games, which, making a good selection, affords the best nourishment to reflection that we know of.

We give a few hints to beginners. The novice who may enter the lists with one a little more advanced than himself will probably find himself defeated in a few moves by what is called *scholar's mate*. Thus white and black move as follows:—White, king's pawn two; Black, king's pawn two; W. king's bishop to queen's bishop's fourth; B. king's bishop to queen's bishop's fourth; W. queen to king's rook's fifth; B. king's knight to king's bishop's third; W. queen takes king's bishop's pawn, and gives checkmate.

Now this mode of attack by queen and bishop is easily defeated, and, when defeated, it puts him who made it to great disadvantage by obliging his queen to retreat, and so causing loss of moves. Supposing W.'s two first moves to have been as before, let B. move his queen's pawn one square, so as to support the king. W. then, as formerly, plays his queen to the king's rook's fifth; B. king's knight's pawn one; thus giving check to the W. queen, who must retreat with very little choice of move. The novice should keep in view that it is not the force which he possesses on which his power for attack or defence depends, but that this depends on his *available* force. This being so, his first endeavour should be to play out his pieces early, to play them in support of one another, and to *castle* in good time. By the latter move, you probably place your king in a better position, and bring the powerful piece, the castle, into play. It is well to endeavour to have the attack; besides the strategical advantage of being the assailant, the position is more inspiriting than that of being on the defence. At the same time, a premature attack, that is, with a large part of your force at home, can hardly succeed. Play as much as you can with those who are more skilful than yourself. Never accept any indulgence when you have made a blunder, nor give any; otherwise, when the situation becomes critical, disputes are sure to arise; consequently, never take nor give back a move. In pursuing your own object, do not forget that your adversary is pursuing his at the same time; do not therefore play until you have, if possible, fathomed the motive of your adversary in making his last move.

The following are the leading laws of the game:—1. If you touch a piece you must play it; but, so long as you retain your hold, you can make any move consistent with its power. 2. If you touch a piece that cannot move, your adversary may compel you to move your king, if it be possible to do so. 3. If you make a false move, your adversary may make you retract it, and move your king, or he may oblige you to make any lawful move he chooses with the piece falsely moved. 4. On the king being checked, notice must be given, or the player whose king is attacked is not bound to notice the check. 5. When, towards the end of a game, one player has just sufficent force to win, he may be called on to win within fifty moves on each side. If he fail to do so, the game is held to be drawn. It sometimes happens that one player has the greater skill when there are many pieces on the board, and that the other again has more skill, when the board is nearly cleared, in manœuvring the pawns into queens, or otherwise. In this case the latter may, to the disgust of his adversary, choose to change queens and minor pieces early in the game. Now every player is entitled to play his own style of game, and to take every lawful advantage. If you do not like another man's style, therefore, the only alternative is not to play with him. Among the numerous books on this fine game we may mention Forbes' *History of C.* (Lond. 1860); Staunton's *C.-Praxis* (1860); Morphy's *Games at C.*; Staunton's *C., Theory and Practice*, edited by R. B. Wormald (1876); and *English C. Problems*, collected and edited by James and W. T. Pierce (1876).

Chest, the part of the trunk known as the thorax, composed of the dorsal vertebræ, the sternum, the ribs, and the costal cartilages. For anatomical description see SKELETON and THORAX.

Chest, Military, is the term used to denote the money and negotiable securities at the command of the commissariat department to meet the expenses of an army in motion.

Chest at Chatham, a fund established during the reign of Queen Elizabeth for the support of maimed and superannuated seamen. It dates from 1590, when all seafaring men in Her Majesty's service consented to a stoppage of from 2d. to 6d. a month out of their pay for this purpose, and as the money was kept in a chest, hence the name of the fund. When the managing office was removed to Greenwich in 1803, it retained the name, and became the *C. at Greenwich*. The monthly payment from the wages of the seamen was abolished in the reign of William IV. From the C. disabled sailors may receive a sum of money in hand, if they can still earn a living; if not, they may receive a pension for one year, for several years, or for life, as the case may be.

Ches'ter, an ancient city and bishop's see, a municipal and parliamentary borough, a county in itself, and the capital of Cheshire, on a rocky height on the right bank of the Dee (here crossed by a splendid stone bridge with a span of 200 feet), 16 miles S.E. of Liverpool. It is a great railway centre, and has one of the finest stations in the kingdom. By the Ellesmere Canal it is also connected with the Mersey. C. is surrounded by a wall 7 or 8 feet thick, now used as a promenade, and affording a wide prospect over a pleasant land. There were once seven towers in the walls, of which only two, Phœnix Tower and Water Tower, now remain. The two principal streets, which cross each other at right angles, are cut into the red sandstone rock to a depth of 10 feet, and the footways are within piazzas called the 'rows,' in front of the shops on the second stories, which are carried back about 16 feet. These 'rows' represent the original level. Flights of steps, at suitable distances, connect the rows with the street below, while beneath are ranges of shops of an inferior description on a level with the street. Numerous ancient houses with timber-framed gables, some of them curiously carved, give the city a peculiarly picturesque character. The cathedral, a massive Gothic structure of red sandstone, is of great antiquity. It grew out of the Abbey Church of St Werburgh, founded early in the 10th c., but has recently been repaired in a style that has marred its former venerable appearance. The *diocese* of C., it may be noted, was not created till after the dissolution of monasteries by Henry VIII. Other churches are St Bridget's, St John the Baptist's, St Michael's, and St Peter's. C. has a grammar-school (King's School), founded by Henry VIII., and under the dean and chapter of the cathedral. St John's Church is said to have been founded by Ethelred in 698. There is in the neighbourhood a fine public cemetery, and in 1867 a public park was opened, the gift of the Marquis of Westminster. The city has manufactures of paint, shot, and lead pipes; iron foundries, and a shipbuilding yard. The chief exports are cheese, lead, copper plates, cast-iron, and coal. C. returns two members to Parliament. Pop. (1871) 35,257.

C. was the *Devana Castra* of the Romans, so called from being half-encircled by the *Deva* or Dee,—the *Caerleon vawr*, 'City of the Great Legion,' of the Cymri. In 828-830 Ecgberht wrested it from the N. Welsh. The Danes captured it in 894, but it was recovered in 904. After the Norman conquest, the Earls of Chester held their courts here. Charles I., it is said, witnessed from the Phœnix Tower the defeat of his troops by the Parliamentary forces on Rowton Heath.

Ches'terfield, Philip Dormer Stanhope, Earl of, an English statesman, man of the world, and author, was born in London, September 22, 1694. In early life he travelled, was appointed gentleman of the bedchamber to the Prince of Wales (1715), and sat in the House of Commons as member for St Germains, in Cornwall, for upwards of ten years. In 1726 his father died, and he entered the House of Lords, where he was noted for his eloquence, and the keenness of his opposition to Sir Robert Walpole, who was then in power. C. was a member of the Broad-Bottom administration, formed in 1744, and was even made a chief secretary of state; but ill-health and deafness compelled him to retire from public life. C. wrote a good deal for some of the periodicals of the times, and was intimate with Bolingbroke, Swift, Pope, &c., and more celebrated for his wit and refined manners than for his statesmanship. His treatment of Johnson, however, provoked from the great lexicographer an outburst of honest, though surly and even exaggerated indignation, which is now chiefly interesting as marking the revolt of literature against the slavery of patronage. C. died March 24, 1773. His most notable work is his *Letters to his Son* (2 vols. 1774), which may be considered even yet the best English compendium of the so-called 'ethics' of fashionable life. The best edition of his letters and miscellaneous literature is that by Lord Mahon (5 vols. Lond. 1845-53).

Chesterfield, a town of Derbyshire, 21 miles N. of Derby, and 156½ from London by railway. It has a fine church (All Saints), and a grammar-school of the 16th c. There are manufactures of lace, merino, silk, cotton, earthenware, and hardware; and the neighbourhood is rich in coal, iron, lead, clay, &c. The trade of the place greatly increased after 1776, when Brindley constructed the *C. Canal*, joining the Trent near Stockwith. C. was the residence of the great engineers, the Stephensons, in their later days. In October 1877 the Marquis of Hartington laid the foundation of a Stephenson Memorial Hall, which is designed to serve all the purposes of a scientific and literary institute, embracing a public hall, a free library, and lecture-rooms for science and art classes. Pop. (1871) 11,427.

Chesterfield Inlet penetrates from the N.W. corner of Hudson's Bay 250 miles inwards. Its greatest breadth does not exceed 25 miles, and it is thickly studded with islets.

Chevalier' (Fr. 'a horseman or knight'), in heraldry, signifies a horseman armed at all points. The term is used generally also in the sense of a knight.

Cheval'ier, Michel, one of the greatest of French political economists and free-traders, was born at Limoges, January 13, 1806. After studying at the Polytechnic School and the School of Mines, he became an engineer in the department of the Nord. He was, however, soon attracted by the speculations first of St Simon and subsequently of Enfantin, and for some writings in the *Globe* journal, which were considered an outrage against Christianity and morals, he was imprisoned for six months. Retracting what he had written, he was sent by M. Thiers on a special mission to the United States, to inquire into the systems of water and railway communication there. The brilliant letters which he wrote to the *Journal des Débats* when on the journey, and which were republished under the title *Lettres sur l'Amerique du Nord* (2 vols. 1836), dispelled many French delusions regarding America, and may be said to have made C.'s fortune. Various posts and dignities were bestowed upon him on his return to France, and in 1840 he was appointed Professor of Political Economy in the College of France. He was for a short time (1845-46) a member of the Chamber of Deputies. Writing vigorously against his former friends the Socialists, C. lost his various appointments on the Republic being proclaimed, but after the *coup d'état* they were restored to him, and since then he has been known chiefly as one of the ablest French advocates of free trade. In 1860 he assisted Mr Cobden in negotiating the important commercial treaty between England and France. In England, which he has visited frequently, C. is very much respected. His latest visit was paid in 1875, when he received a warm reception in the leading commercial centres of the country. Among his works, his *Cours d'Économie Politique* (3 vols. 1842-50), *De la Baisse Probable de l'Or* (1859, translated into English by Cobden), and *Le Mexique, Ancien et Moderne* (1863), are especially admired.

Chevaux'-de-Frise (Fr. *cheval*, 'a horse;' *de Frise*, 'of Friesland'), in defensive fortifications, large and strong pieces—centres or barrels—of timber, traversed with wooden spikes, pointed at each end, and shod with iron, which are used as an obstacle to impede the progress of an advancing enemy.

Che'viot Hills, a range of hills partly in Northumberland and partly in Roxburgh, and thus on the confines of England and Scotland. The highest points are Cheviot Hill in Northumberland, 2684 feet high, and Carter Fell, 2020 feet. The C. H. are in general smooth, and covered with a close sward. Numerous small streams, the Kale, Liddel, Tyne, Till, and Coquet, rise in the green recesses of this pastoral region, which Border ballads and tales have invested with an imperishable romance.

Cheviot Sheep.—A breed which occupies chiefly the Cheviot Mountains, but which has extended itself to the Lothians and to the Ochils. It is easily fed, and yields a large carcass of mutton. Cheviots are well woolled all over the body and the legs. They have white faces, open countenances, and bright, full, sparkling eyes; the lenses are large and very contractile, and the head is stylishly set upon the shoulders, which are rather light; the back is long and straight, and the quarters full. See SHEEP.

Chevreul', Michel-Eugène, a distinguished French chemist, was born 31st August 1786, at Angers (Maine-et-Loire). He was appointed in succession Professor of the Sciences at the Charlemagne College (1813), Director of the dyeing department in the Gobelins manufactory (1824), Professor of Applied Chemistry in the Museum of Natural History (1830), and Director of the Museum for the two quinquennial periods 1864 and 1869. C.'s principal works are *Recherches Chimiques sur les Corps Gras d'Origine Animale* (Par. 1823), and *Considérations Generales sur l'Analyse Organique et sur ses Applications* (1824). Besides these, numerous memoirs on colours and various chemical subjects are to be found in the *Annales de Chimie* and the *Mémoires* of the Academy of Sciences.

Chev'ron (Fr. 'a rafter'), in heraldry, one of the nine honourable ordinaries, which resembles the supports of a roof formed by two rafters leaning against one another. It is otherwise defined as the lower half of a Saltire (q. v.) brought to a point on the upper side. The C. is supposed to betoken the accomplishment by the bearer of something important, such as the founding of a family. A shield divided by a line in the form of a C. is said to be *per C.*, or *party per C.* The diminutive of the C. —half its size, or sometimes rather less—is called a *chevronel*.

In *architecture*, the term *C.* is used to denote the zigzag moulding characteristic of Norman architecture, and also found in the pointed arch of the transition period between the Norman and the Early English styles.

Chevrons, stripes worn on the arm by non-commissioned officers in the army. A lance-corporal or bombardier wears one, a corporal two, a sergeant three, and a staff-sergeant four.

Chev'y Chase, a celebrated ballad in English folklore. It appears in two forms, an ancient and more modern, both of which are given by Bishop Percy in his *Reliques*. The earlier and more rudely constructed, whose original title was *The Hunting a' the Cheviat*, may have been written in the reign of Henry VI. (1422-1461); the later probably dates from the time of Elizabeth. The combat described in the ballad of C.C. is really imaginary, but was probably suggested by the historic battle of Otterbourne, fought between the rival Border nobles Percy (Hotspur) and Douglas in 1388, which is also the subject of a fine ballad. Both forms of C. C. are of English origin, but there is such knightly magnanimity in the narrative, that it became equally popular N. and S. of the Border. High and low alike rejoiced in the valiant strain. 'I never heard,' says Sir Philip Sydney, 'the old song of Percy and Douglas, that I found not my heart moved more than with a trumpet; and yet is sung but by some blind crowder, with no rougher voice than rude style.' The later and more familiar version has been extravagantly criticised by Addison in papers 70 and 74 of the *Spectator*.

Cheyne, George, a Scotch physician and mathematician, born of good family in Aberdeenshire in 1671. He practised at London from 1700 almost till his death, which took place at Bath, April 12, 1743. C. strongly recommended milk and vegetable diet, having found such very beneficial in reducing his own corpulency. His work on *Fluxions* (1703) procured him admission to the Royal Society. Some of his other works are *A New Theory of Fevers* (1702), *Observations on Gout* (1722), *An Essay on Health and Long Life* (1725), and an *Essay on Regimen* (1739).

Chiabre'ra, Gabriell'o, born at Savona, 8th June 1552, was the first Italian lyric poet of his time. Educated at Rome by an uncle, he afterwards took service with Cardinal Cornaro, but owing to an affray in which he avenged his quarrel with his own hand, he was obliged to leave the capital and retire into privacy. Honours were heaped upon him by Pope Urban VIII., by the Dukes of Savoy, Mantua, &c. C. died at Savona, 14th October 1637. His lyrics are considered the best in the style of Pindar and Anacreon that have been produced in Italy in modern times. He also wrote several epic, dramatic, bucolic, and epistolary poems. His *Rime* (best ed. 3 vols. Rome, 1718; 4 vols. Ven. 1731) and *Pœsie Liriche* (3 vols. Livorno, 1781), together with his epics, *Delle Guerre de' Goti* (Ven. 1582) and *Amadeida* (Gen. 1620), are contained in the collection of his *Opere* (3 vols. Ven. 1768; 5 vols. 1782).

Chia'na, the name of two small rivers of Tuscany,—one (the anc. *Clanis*) a tributary of the Arno, the other an affluent of the Paglia,—which water the wide expanse of the Val di Chiana, and have been the means of converting it into one of the most fertile districts of Italy, although prior to the time of Ferdinand III. their unrestricted inundations had rendered it a malarious and marshy wilderness.

Chiaramonté, a town in the province of Catania, Sicily, 33 miles W.S.W. of Syracuse, has a trade in corn and wine. Pop. 9000.

Chia'ri, a town of N. Italy, province of Brescia, on the river Oglio, 14 miles W. of Brescia by railway. It was a walled town till the beginning of the present c., and has a church dating from 1431–80, and important silk manufactures. Pop. 9339. Here, on September 1, 1701, Prince Eugene defeated the Franco-Spanish army commanded by Marshal Villeroi.

Chiaroscu'ro (Ital. *chiaro*, Lat. *clarus*, 'bright, clear;' Ital. *oscuro*, Lat. *obscurus*, 'obscure, dark') is the Italian term for what is generally spoken of as 'light and shade' in painting. It may be described as the art of disposing the lights and shadows of a picture so as to realise the highest picturesque effect. The simplest and crudest form of C. is the violent contrast of light and shade; but the refinements of this quality of painting embrace the light in light, the dark in dark, and all those variations in the use of colours which produce the effects of reflected light, or light tempered by shadow. The first painter who reduced C. to a system was Leonardo da Vinci, and, though the quality is a main constituent of every successful work of art, it has been most effectively used, and may be most profitably studied, in the works of Correggio, Rembrandt, Titian, and Rubens.

Chiava'ri, a seaport of N. Italy, province of Genoa, at the mouth of the Sturla, 21 miles E.S.E. of Genoa. Of its churches, the finest is the *Madonna del' Orto*. C. has manufactures of lace and silk, and important anchovy fisheries; in the neighbourhood are extensive slate quarries. Pop. 10,457.

Chiavenn'a (Ger. *Kläfen*), a town of N. Italy, province of Sondrio, 38 miles N.N.W. of Bergamo. It is situated on the Splügen road, and is the point of junction for the roads to Milan by Lake Como, to the Engadine, and the Swiss canton of the Grisons. C. has manufactures of silk and cotton. Pop. 3845.

Chibon, or Cachobon Resin. See BURSERA.

Chica, a red substance obtained by boiling the leaves of *Bignonia Chica*, a native of the banks of the Orinoco and other parts of S. America. It is used by the Indians for painting their bodies, and in the arts for giving an orange-red colour to cotton fabrics. The name *C.* is also applied to *Sterculia Chicha*, the seeds of which are eaten by the Brazilians. C. is also another name for Pito, Poso, or maize-beer—a fermented liquor made from Indian-corn by many tribes of the S. American Indians by fermenting the *chewed* maize. A very superior quality is made by pouring the liquor into an earthen jar containing several pounds of beef, and burying the whole underground for several years. When a child is born such a jar is buried, and only disinterred for the contents to be drunk at the same child's marriage. Vinegar and a spirituous liquor can be also made from it.

Chicacole', the chief town of Ganjam district, in the province of Madras, British India, 415 miles S.W. of Calcutta, and not far from the coast. It is noted for its beautiful muslins. Pop (1871) 15,587.

Chica'go (pron. *Shekawgo*), in Illinois, one of the chief cities of the Union, is situated on the S.W. shore of Lake Michigan at the mouth of a river of the same name. The name is Indian, meaning 'wild onion.' C. stands on the great E. and W. route, and is the centre of an immense traffic. It is perhaps the most wonderful city in the world for its rapid growth and great energy. Living men remember when its site was a swamp, and could have been bought for a trifle. Fort Dearborn was erected in 1803 at the mouth of the river, and the place was a mere frontier post till 1831, when a settlement was made. The town was organised in 1833, and received a charter March 4, 1837. The population in 1835 was 1000; 1837, 4470; 1845, 12,080; 1850, 28,269; 1855, 83,509; 1860, 110,973; 1865, 187,446; 1870, 298,977; 1875, 410,000. The C. river, having two branches, separates the city into three parts, the business portion being on the S. side. The Illinois and Michigan Canal connects the C. river with the Illinois, which enters the Mississippi, thus uniting the navigation of the great lakes with the Gulf of Mexico. The river is bridged and tunnelled, and has some 18 miles of wharfage, and there is a tunnel for 2 miles under the lake, by which the city is supplied with 57,000,000 gallons of water daily. For the better drainage of C. entire streets, with their buildings, were about twenty years ago raised from 4 to 10 feet higher. A terrible fire broke out 7th October 1871, and lasted three days, destroying 17,450 houses, and consuming $196,000,000 of property. A fund amounting to $3,500,000 was subscribed in aid of the sufferers from all parts of the world, and the city was completely rebuilt in about two years. The finest buildings are the court-house, observatory, the colleges, the Douglas monument, and some of the largest hotels in America. C. is the greatest depôt for grain in the world, having an annual export of some 15,000,000 bushels of wheat, 27,000,000 of maize, besides large quantities of corn, rye, and barley. The business of pork-packing rivals that of Cincinnati. There are besides extensive manufactures of machinery, carriages, &c. C. is one of the great railway centres in the Union, about thirty lines meeting there. In 1875 the taxable value of property in the city was $303,705,140. C. has thirty-six public schools, where education is free; two colleges; Baptist, Presbyterian, and Congregational theological seminaries; a law school, several medical institutions, and five daily and thirty-eight weekly newspapers.

Chichen', a town in Yucatan, Central America, about 30 miles W. by S. of Valladolid, and chiefly interesting for the ruins of an ancient city, attesting in its builders a considerable degree of civilisation. It is impossible to conjecture the purpose for which many of the structures were erected. There is a spacious parallelogram formed by rows of small pillars, and a truncated pyramidal mound, 75 feet high, each side of the base measuring about 200 feet, and crowned with a ruined building, of which the sides measure 43 feet by 49.

Chi'chester, a municipal and parliamentary borough, and bishop's see in Sussex, 62 miles S.W. of London by road, and 79 by railway. It consists of two principal streets, with smaller streets at right angles to them, having an elaborately carved octagonal cross at their intersection. The city is surrounded by an ancient wall, a mile and a half in circuit, now lined with elms, and forming a pleasant promenade. The cathedral, an imposing structure, exhibiting almost every variety of Gothic, was built in the 12th and 13th centuries, and has undergone 'restoration' since 1830. It is rich in 'portraits' of English kings and bishops, and contains many interesting monuments; among others, one to Collins the poet, who was a native of the place, and another to Chillingworth. C. has extensive corn and cattle markets, but almost no manufactures. The harbour, 2 miles to the S.W., is connected with the city by a canal. C. returns one member to Parliament. Pop. of parliamentary borough (1871) 9054. C. is considered the *Regnum* of the Romans—the headquarters of Vespasian, who built the walls; and the coins and temple fragments found here favour the conjecture. But it derives its name from Cissa, a king of the S. Saxons, and appears in the *Chronicle* as *Cissa-ceaster*. Its oldest charter dates from the reign of Stephen.

Chicken-Pox (*Varicella*), an infectious disease almost always confined to children. It seldom lasts more than a week, and is never fatal. There is first an eruption of pimples, which become vesicles on the second day (hence called crystal-pox). On the fourth day these vesicles become scabs, and fall off about the end of a week from the commencement of the disease. A little opening medicine is all the treatment required. C.-P. generally occurs only once in a lifetime, and is essentially a disease distinct from *Small-Pox* (q. v.).

Chick-Pea (*Cicer*), a genus of plants of the natural order *Leguminosæ* (sub-order *Papilionaceæ*). About twelve or fifteen species are known, natives of Southern or Eastern Europe, W. Africa, and Abyssinia. *C. arietinum*, the C.-P. or Egyptian, pea (*Cece* of the Italians, *Garbanzos* of the Spaniards, the *Gram* of India), is a native of the S. of Europe and of India. The leaves of them are covered with glandular hairs excreting oxalic acid—or, according to some, a mixture of oxalic, malic, and acetic acids—which hangs in drops which afterwards crystallise. The seeds are ground into meal and made into cakes, which form a large portion of the food of the natives of the countries in which the C.-P. is a native, and are also parched and boiled. In Paris they are greatly used in soups. The acid crystals are collected by the natives in India, and considered an infallible cure in cases of indigestion. The herbage is well adapted for feeding cattle.

Chickweed, or **Chickenweed** (*Stellaria*), a genus of plants of the natural order *Caryophyllaceæ*, but generally applied to *S. media*, one of the Stitchworts (q. v.). It is a troublesome weed, gathered to make poultices or to feed birds. The mouse-ear is a species of *Cerastium*. The term *C.* is also sometimes given to *Roccella tinctoria*.

Chicla'na, a town of Spain, province of Cadiz, about 12 miles S.E. of Cadiz. It is built on a hill, and has a fine appearance. C. has a good hospital, manufactures of linen, earthenware, &c., and mineral baths of great repute in the W. of Andalusia. Pop. about 5000.

Chic'opee, a town of Massachusetts, U.S., at the confluence of the rivers C. and Connecticut, 85 miles W.S.W. of Boston by railway. It has some twelve churches, several newspapers, and large manufactures of cottons, woollens, paper, arms, &c. Pop. (1870) 10,500, including the village of C. Falls. C. was formerly called Cabotville.

Chic'ory, or **Succ'ory** (*Cichorium*), a genus of plants belonging to the order *Compositæ*, sub-order *Cichoraceæ*, comprising few species. *Cichorium Intybus*, the common C., is a plant with bright blue flowers, common on waysides and similar localities in some parts of England and most parts of Europe. The leaves are used for feeding cattle, and the blanched leaves as a salad. The roots when roasted form a substitute for coffee, and, indeed, in the opinion of many, if mixed with the latter improve its flavour. They also deepen the colour of the coffee, though when largely used they tend to give diarrhœa. This adulteration is itself adulterated with roasted beans, parsnips, carrots, acorns, logwood, and mahogany, dust, &c., and even, it is said, with the dried and ground bones of horses and bulls, &c. The Endive (q. v.) also belongs to this genus.

Chief (Fr. *chef*, 'head'), in heraldry, one of the nine honourable ordinaries, is the uppermost third, or less than a third, of the field of a shield, bounded by a horizontal line. The C. may be borne with any other of the nine ordinaries except the Fesse (q. v.); it may also be charged with other heraldic figures or devices, which are then said to be *on a C. In C.* means borne on the uppermost part of the shield, even though the horizontal bounding-line is not drawn.

Chief-Justice. See JUSTICE COURTS.

Chiem-See, the largest lake in Upper Bavaria, 42 miles S.E. of Munich, is 10 miles long, 7 broad, and lies 1500 feet above the sea. It receives the Achen and Prien, and is drained by the Alz, an affluent of the Inn. It is rich in trout, salmon, pike, and carp, and is adorned with three fine islands, Herrenwörth, Frauenwörth, and Krautinsel. The Bairisch-Salzburg Railway runs along its southern shore. There is a steamer on the lake.

Chie'ri (the *Carea* of the Romans), an old town in the province of Turin, N. Italy, 9 miles S.E. of Turin, has manufactures of fustians, cottons, linens, silks, &c. It is rich in churches, cloisters, educational and benevolent institutions. Its finest buildings are the Church of St Dominico (1260), and that of Santa Maria della Scala (1405), a large Gothic edifice. Pop. 15,474. C. is frequently mentioned in Italian history. See Cibrario *Delle Storie de C.* (Tur. 2 vols. 1827; 3d ed. 1855).

Chie'ti, the capital of a province of the same name, Central Italy, 78 miles E.N.E. of Rome. It is the seat of an archbishop, and has a cathedral, several churches and convents, a college, a theatre, and remains of antiquity. Its industries in woollen and silk fabrics are unimportant, but its vicinity is extremely productive, and gives rise to a considerable trade. Pop. 20,000. C. partly occupies the site of the *Teate Marrucinorum*, of which traces are still seen. In 1524 St Gaetano established the Theatine order here. The province of C. has an area of 1104 sq. miles, and a pop. (1872) of 339,986.

Chignec'to Bay, the westerly of the two terminal branches of Fundy Bay, N. America, separated from Northumberland Strait, in the Gulf of St Lawrence, by an isthmus, bearing the same name, 14 miles in breadth.

Chig'oe, or **Jigg'er** (*Pulex penetrans*), a species of *Aphaniptera* or fleas, found in the W. Indies and S. America, and noted for its habit of selecting the skin of the foot or under the toe-nails as a residence. If the eggs are allowed to be developed in the skin, the parturient female flea acquires a relatively enormous size, her abdomen being greatly distended with eggs; whilst the irritation produces a troublesome ulcer, amidst which the young larvæ appear. The remedy consists in extracting the C., and in applying tobacco-juice lotion to the affected part,—an operation in performing which the W. Indian negroes are said to be very expert.

Chihua'hua, capital of the Mexican state of the same name, lies on a tableland 4500 feet above the sea. It is a well-built town, with regular streets, a large cathedral, several convents, and an aqueduct 3 miles in length. It was founded in 1700, but has been falling into decay since the overthrow of Spanish authority. Pop. 12,000. S. of the town lie the famous silver mines of St Eulalia.—The *State of C.*, separated from Texas, U S., by the Rio Grande del Norte, has numerous mines, but the soil being dry, only the river-bottoms are cultivated, and a strip along the slope of the Sierra Madre. Near the base of this are extensive ruins, known as Casas Grandes. Area, 104,013 sq. miles; pop. (1871) 171,971, mostly Indians.

Chil'blains, blains or boils caused by a chill or cold. The proper treatment consists in keeping the affected parts warm and dry, and applying iodine ointment to them. In strumous children, codliver oil and iron should be given.

Chil'dermas, or **Holy Innocents' Day** (28th December), is held as a festival by the Church of Rome, to commemorate the massacre of the Innocents by Herod. It is said to have been customary to whip the children upon this day, to enforce Herod's crime on their memory. It was thought unlucky to marry or commence any work on this day.

Child-Killing. See INFANTICIDE.

Children, Legal Capacity of. See AGE, CAPACITY, LEGAL, CURATOR, MINOR, PUPIL, GUARDIAN, TUTOR.

Child-Stealing. See ABDUCTION.

Chi-li, or **Pe-chi-li**, a province of the Chinese empire, bounded on the N. by the Great Wall, has an area of 57,283 sq. miles, and a pop. of 38,879,838. It is watered throughout its length by the Pei-ho and its numerous affluents. The Hoang-ho also passes through its southern border. Pekin, the capital of the empire, lies near the Pei-ho in the northern part of the province.

Chil'i, or **Chile**, a republic on the W. coast of S. America, bounded W. and S. by the Pacific Ocean, E. by the Andes, and N. by Bolivia: lat. 25° 30'-43° 20' S.; long. 69°-74° W. It has a coast-line of 1500 miles, and includes several islands, of which by far the largest is Chiloe (q. v.). The divisions, areas, and populations, according to an official census for 1875, are as follows:—

Provinces.	Area in sq. miles.	Pop. 1875.	Capitals.
Chiloe	2,399	64,536	San Carlos
Llanquihue	8,334	48,492	Osorno
Valdivia	10,715	37,481	Valdivia
Arauco	13,873	140,896	Arauco
Concepcion	3,589	151,365	Concepcion
Nuble	3,666	136,880	Chillan
Maule	3,686	118,457	Parral
Linares		118,880	Linares
Talca	3,595	110,359	Talca
Curico	2,946	92,110	Curico
Colchagua	3,857	146,889	S. Fernando
Santiago	7,777	362,712	Santiago
Valparaiso	1,665	176,682	Valparaiso
Aconcagua	7,938	132,799	San Felipe
Coquimbo	13,330	157,463	La Serena
Atacama	37,934	71,302	Copiapo
Colonies of Magallanes	...	1,144	...
	128,004	2,068,447	

The province of Linares was separated from that of Maule by a law of December 11, 1873. Araucania (q. v.) is excluded from the above table.

Physical Aspect, &c.—The country, stretching N. and S. in a long narrow strip, is cut off from the rest of the continent by the Andes, which here form a single magnificent ridge. It consists of numerous offsets of the great range, and of intervening valleys of great fertility and beauty, which open upon the sea. In the N. is the barren and rainless waste of Atacama, while over the rich central region the snow-covered peak of Aconcagua (q. v), the giant of the Chilian Andes, towers to a height of 22,422 feet. There are sixteen active volcanoes, such as Chillan and Villarica, both of which are 16,000 feet high; and the coast-line has been greatly extended of late years by the gradual upheaval which the country is undergoing. Among the rivers are the Biobio (q. v.), the Maule, Calacalla, Noble, Cauthen, and innumerable smaller streams. The climate in the N. is hot and dry, but in the rest of the country is delightfully tempered by prevailing sea-breezes. On the whole, C. is singularly healthy, although the temperature often rises to 95° in the shade. January and February are the hottest months, and the rainy season, by which Atacama is almost unaffected, lasts from April till August intermittently.

Natural Products, &c.—The base and slopes of the Andes are clad with forests of fine timber trees, and wild apple and pear trees grow in abundance. Agriculture is rapidly improving, the principal crops under cultivation being maize, wheat, barley, and other European grains. The only hemp grown on the W. side of S. America is in C., which is also the original home of the potato. In the dry region of the N. there is a luxuriant yield of grapes, olives, figs, pomegranates, oranges, peaches, melons, &c. C. is plentifully stocked with cattle and goats, while its principal animals of prey are the puma or American lion, and the condor, a splendid Andian species of the vulture.

Geology and Mineralogy.—The upper portion of the Chilian mountains consists mainly of schistose rocks, the lower offsets of granitic, covered with tuff and lava in the vicinity of the volcanoes. Everywhere are seen hornblende, mica-schists, clay slates, and basaltic and felspathic porphyrites of deep red and brown tints, while limestone rocks occur in numerous places. Quartz is usually found in conjunction with veins of the metals, which exist in great abundance, and constitute the chief wealth of the country. The principal minerals are gold, silver, copper, lead, iron, tin, coal, and precious stones, such as agate, jasper, rock-crystal, &c. Atacama with its vast mineral resources has been brought within the reach of mining enterprise since the recent introduction of railways.

Means of Traffic, Commerce, &c.—C. is now placed in direct communication with Europe by means of a telegraph line from Buenos Ayres, which crosses the Andes by the Paso de la Cumbre, 12,178 feet high. In 1875 the various railway lines throughout the country had a total length of 616 miles, and a project was on foot to extend the Copiapo line across the Andes, and unite it with that from Cordova in the Argentine Republic. The estimated cost of the scheme is £6250 a mile, and the distance is 400 miles. C. has considerable foreign commerce, chiefly with Britain, and the principal articles of export are copper and silver ore, wheat, flour, raw cotton, guano, tallow, and hides. In 1874 the exports by land and sea amounted to £7,268,000, and the imports to £7,762,000; the number of ships that entered the various ports being 5827, of 3,790,000 tons. The value in 1873 of the minerals (chiefly copper) exported was £3,313,000, and of agricultural produce and cattle, £3,187,000. C. has manufactures of linens, brandy, earthen and copper wares, &c.; and the chief towns are Santiago (the capital), Valparaiso, Copiapo, Caldera, Chanaral, Chillan, Concepcion and Talca. A great international exhibition was held at Santiago in the end of 1875.

People, Government, &c.—In the N. and central provinces the inhabitants are mostly whites or Chileños, of Spanish origin, distinguished by their enterprise and industry. The S. is almost wholly occupied by Indians. According to the constitution of 1833 the government is a republic, and the legislature consists of two houses. The public debt, which is chiefly contracted on account of railways, amounted at the end of 1873 to £10,779,404. In 1874 the army comprised 2000 infantry, 712 cavalry, and 804 artillery; while the navy numbered two powerful ironclads and ten small vessels. The prevailing religion is the Roman Catholic, but other churches are protected by a law of 1865.

History.—The country was overrun by Diego Almagro after the conquest of Peru in 1535, and later was made a general-captaincy, with an extended dominion stretching to Cape Horn. In 1810 began the revolt against Spain, which continued till 1818, when the decisive battle of Maypo gave C. her independence. The republic has since, in spite of repeated internal dissensions, firmly established its position as the most stable and enlightened of the S. American governments. In 1864, after Spain had wrested the Chincha Islands from Peru, it declared war against C. for having preserved a strict neutrality. Several of the ports were bombarded, the whole coast was blockaded for several months, and the attempt to regain possession of C. was only abandoned after much useless destruction of property. See *Geographical, Natural, and Civil History of C.* (2 vols. Middletown, 1808), and Gay, *Historica Fisica y Politica de C* (vols. i.-xviii., Par. 1844-61).

Chili Nettle. See LOASACEÆ.

Chili Pine. See ARAUCARIA.

Chillianwall'a, a village of the Punjab, 5 miles from the left bank of the Jhelum, and 85 miles N.W. of Lahore. Here, on 13th January 1849, Lord Gough defeated the Sikhs, after an obstinate engagement. An obelisk has also been erected at C. to the memory of those who were slain in the two wars with the Sikhs.

Chill'icothe, the capital of Ross county, Ohio, U.S., on the Scioto river, 96 miles N.E. of Cincinnatti by railway. It has large manufactures of machinery, and is the trading centre for the rich farming country bordering on the river. Formerly capital of the State, C. is finely built and wealthy. Pop. (1870) 8920.

Chill'ies. See CAPSICUM.

Chill'ingworth, William, a famous divine, called 'the immortal C.,' born in October 1602 at Oxford, and had Laud for his godfather. While studying at the university of his native city he became a Roman Catholic, and went to Douay, but afterwards returned to the English Church, mainly through the persuasions of Laud, and in 1637 published his chief work, *The Religion of Protestants a Safe Way to Salvation*, in reply to the treatise of a Jesuit called Knott. He accompanied the King's troops during the civil war, was taken prisoner at the siege of Arundel, and died January 30, 1644. C. was an able controversialist, but his clear, close reasoning is weakened by an immoderate dread of fallacy. He denounced persecution, and maintained that Scripture, and not Church authority, was the basis of Protestant faith. *The Religion of Protestants* is remarkably bold and tolerant, the first clear-ringing defence in the English tongue of the liberty of private judgment. In later times C. was a favourite with latitudinarians like Locke and Tillotson. A complete edition of his works was published by Birch (3 vols. Clarendon Press, 1838). See *Masters in English Theology* (Lond. 1877).

Chillon, a famous fortress, in the canton of Vaud, Switzerland, at the E. end of the Lake of Geneva, 6½ miles S.E. of Vevay. It stands on an isolated rock, at a distance of 62 feet from the shore with which it is connected by a drawbridge. It is mentioned in documents of the 12th c., but the date of its foundation is not exactly known. Pietro of Savoy (Charlemagne the Little) converted it into a fortress in 1248. Bonnivard, prior of St Victor, Geneva, was imprisoned here from 1530 to 1536. Byron's *Prisoner of C.* has invested the castle with an undying interest. It is now an arsenal. See Vulliemin, *C., Étude historique* (Lausanne, 1851).

Chiloë, an island forming a province of Chili, is situated in the Gulf of Ancud, is 120 miles long from N. to S., about 60 broad, and has an area of 2399 sq. miles, and a pop. (1875) of 64,536. It is a huge mass of volcanic rock, rising in no part higher than 2600 feet, and possesses a rich soil, which is almost entirely clad with forests, chiefly of a bastard cedar. The coast-land is cultivated, and yields wheat, barley, potatoes, and fruits. There is a considerable export of grain and timber. San Carlos and Castro are the principal towns, the former being the capital, and having an excellent harbour.—The *Archipelago of C.* includes sixty other small islands, only half of which have inhabitants. The principal of these islets are Lemuy, Calbuco, Llaicha and Quinchao.

Chilognath'a and **Chilop'oda**, the orders of the class *Myriapoda* (q. v.).

Chil'tern Hills, a chalky ridge across England, from Wilts, through Berks, Oxford, and Bucks, to the border of Suffolk. The range is in great part from 15 to 20 miles in breadth, and its greatest height is Wendover, with 905 feet of an altitude.

Chiltern Hundreds.—The office of 'Steward of the C. H.' was established under the crown for the purpose originally of suppressing the bands of depredators who infested the forests of the Chiltern Hills. It began, however, to serve its singular modern political purpose about 1750. A member of the House of Commons is unable to resign his seat unless through his acceptance of a place under the crown, but the now nominal appointment to the stewardship in question continues to be regarded as such an office, and thus affords a means of resigning. This office is almost invariably granted when applied for; no salary attaches to it; and it is usually resigned immediately after acceptance. It is the only office of which the Chancellor of the Exchequer has the patronage.

Chimæ'ra, a fire-breathing monster of Greek mythology. Homer represents it as of divine origin, and as having the front of a lion, the tail of a dragon, and the body of a goat. It was killed by Bellerophon. In works of art it is represented as a lion with a goat's head springing from its back. The myth of its breathing fire is sought to be explained by a reference to the volcano of C. in Lycia, mentioned by Pliny and Mela. The name has since been given to any irrational product of a disordered fancy.

Chimæra, a genus of Elasmobranchiate fishes, forming the type of the sub-order *Holocephali.* These forms, represented by the *C. monstrosa* or 'King of the Herrings,' and by the *Callorhynchus Australis* of the S. Seas, possess a persistent notochord in place of the spine. The jaws are bony, and the scales are of the placoid kind. The mouth exists at the extremity of the head, and a single gill aperture only exists. The ventral fins are situated posteriorly, and the tail is heterocercal. Fossil species allied to the C. (genera *Elasmodus*, *Ischiodus*, &c.), occur in Mesozoic and Tertiary rocks.

Chiman'go (*Milvus C.*), a species of Raptorial birds, belonging to the *Polyborinæ* or *Caracaras* (q. v.), found in S. America, and, according to Darwin, commonly associated in its habits of feeding on garbage with the Carrancha (*Polyborus Brasiliensis*). It possesses all the distinctive characters of the *Polyborinæ*, and by Darwin is said to be 'generally the last bird that leaves the skeleton' of its prey. He adds, that it 'may often be seen within the ribs of a (skeleton) cow or horse like a bird in a cage.'

Chimaph'ila. See WINTER GREEN.

Chimbora'zo, the loftiest summit in the Andes of Quito, is 21,424 feet above the sea, and was once believed to be the highest mountain in the world. It is an extinct volcano, and has a trachyte peak, covered with perpetual snow. Humboldt (23d June 1802) ascended C. to within 2138 feet of its top, and Boussingault and Hall (15th and 16th December 1831) to within 1729 feet. The assertion of the French traveller Remy that he reached the summit (3d November 1856) in a mist 'without knowing it' is not generally credited.

Chimere', the black satin robe worn by a bishop, on which the lawn sleeves, or the sleeves of a rochet, are sewn. In the time of Henry VIII. and Edward VI. it was scarlet, and was probably the sleeveless habit of a D.D. Objections were taken to this colour by Dr Hooker, and the colour was changed to black.

Chimes, a set of bells in a church (or other) tower, also music performed upon such bells. See BELLS.

Chim'ney (Fr. *cheminée*, Ital. *camminata*, from Lat. *caminata*, der. of *caminus*, used by Vitruvius for a chimney). In the dwelling-houses of the ancients, the smoke and heated gases from the fireplace were, in general, left to find their way out of a room by openings in the roof or walls, and it is very doubtful whether either the Greeks or the Romans used any more satisfactory method than this. Modern chimneys were not known in this country until about the 12th c., and it is not until nearly four hundred years later that they appear to have been thought essential to every fireplace in a house.

The business of a C. is twofold—first, to carry off the smoke, and prevent its disagreeable presence in the room; and, second, to create a draught through the fuel, so as to consume it the more quickly and effectually. This latter function of the C. depends on the fact that hot air is bulk for bulk lighter than cold, so that when any column of heated air is allowed to communicate freely with the atmosphere at top and bottom, the cooler air continually pushes the hot air upwards, and thus keeps up a circulation.

If a C. be well designed in the first place, by having an opening as nearly as possible over the fire, a somewhat contracted neck, and a tolerably straight flue, it should never give any trouble by smoking. But if these points have been neglected, it is often very difficult so to alter the defectively formed C. as to prevent smoking. This nuisance is caused by down-draughts, which most frequently result from the position of the top of the C. being such as to expose it to side currents and eddies of air. The most simple means of neutralising the effect of these is the fitting of revolving cowls upon the C.-pot, these cowls being so arranged that their openings always point away from the direction from which the wind is blowing. It is only in some few cases that the alteration of the flue or fireplace becomes absolutely necessary.

The chimneys of large factories are sometimes of extraordinary height, and their construction presents difficulties of no mean order; that belonging to Messrs Tennant & Co. of St Rollox near Glasgow, for instance, is amongst the highest structures in the world. It is 454 feet above the ground, and 14 feet more from its foundation. It is 32 feet in diameter at the bottom, and 2 feet 8 inches thick, and tapers to 12 feet 8 inches diameter at top, by 1 foot 2 inches thick.

The chimneys of steamers are commonly made, for convenience and lightness, of wrought iron, as also are those of locomotives. For factory chimneys, however, this material is not nearly so well adapted as the brick or masonry almost invariably used in their construction.

Chimpanzee.

Chim'panzee, one of the highest or Anthropoid apes, included in the *Catarhine* section of the order Quadrumana (q. v.). The C. is the *Troglodytes niger* of naturalists; the Gorilla (q. v.) being the *Troglodytes gorilla.* This ape occurs chiefly in Western Africa, and inhabits much the same territory as the last-mentioned animal. The hair is nearly black in colour—hence the specific name *Niger;* but age is said to tint it with grey. The hair of the chest and abdomen is thinner than that of the limbs; and the hairs of the arm and forearm meet in opposition at the elbow to form a tuft, as in the gorilla. The nostrils are flat and oblique, and the muzzle projects. The C. approaches the human type of structure most nearly in the character of the skull, in its dentition, and in the relative size of the arms. It attains a height somewhat greater than that of the orang, which rarely exceeds 4½ feet in height. The arms in this species measure half as much again as the height of the body. The hand is equal to, or may be a little larger, than the foot; and as the sole can be placed flat on the ground, the C. can stand erect and run. Like the gorilla and orang, it often rests itself by leaning forward on the knuckles of the hand. It appears to be gregarious in habits, and its food consists chiefly of vegetable matter.

China. See CHINESE EMPIRE.

China Bark, a common name for Cinchona Bark (q. v.), especially in Germany.

China Grass. See BŒHMERIA, CORCHORUS, and SIDA. C.-G. cloth is now used to some extent in Europe, being valued for its transparency and glossy appearance.

Chinande'ga, a town of Nicaragua, Central America, on a small river of the same name, 10 miles inland from the Pacific, is scattered over a wide area, and has a trade in cotton, sugar, maize, hides, &c. Pop. 10,000.

China Root, the tuber of *Smilax China*, a kind of Sarsaparilla (q. v.), a native of China, Japan, and E. Indies. C. R. is possessed of diaphoretic properties, and has been recommended in Syphilis (q. v.).

China Ware. See PORCELAIN.

Chin'cha Islands, three in number, belonging to Peru, and situated about 12 miles from the coast, in Piseo Bay, lat. 13° to 14° S. They have since 1840 been famous in Europe for their great guano deposits, which, since 1836, have formed the principal source of Peruvian wealth; but which are now becoming rapidly exhausted. They are named respectively N., Middle, and S. Islands, have an aggregate area of about 400 acres, are rocky and precipitous on the landward side, destitute of water, and without a trace of vegetation. From time immemorial they have been the resort of vast flocks of penguins and other seafowl, the droppings from which, covering the surfaces and filling the crevices of the rocks, have formed immensely valuable stores of guano. The first cargo of guano was shipped to England in 1840, and it is calculated that the deposits will last till about 1880.

Chinchill'a (*C. laniger*), a genus of Rodent (q. v.) quadrupeds, usually included in the family of the *Cavidæ* (Guinea-pigs, &c.), and found in mountainous districts of Peru and Chili. The average length of the C. is 14 or 15 inches including the tail, which makes up one-third of the measurement. The hind limbs are much larger than the fore, and the tail is clothed towards its tip with long hairs. The fur is of a light-grey on the upper, and whitish-grey on the under parts, and is of very fine texture. The food consists of roots, which it digs out by means of its powerful paws. When feeding, it sits on its hind limbs, and conveys the food to its mouth with the fore paws. There are five toes on the front, and four on the hind feet The ears are large and prominent. The fur is manufactured into muffs, mantles, cloak-trimmings, and other articles.

Chinchilla.

Chinchilla, a walled town in the province of Albacete, Spain, 10 miles S.E. of Albacete; has manufactures of woollens, linens, leather, glass, &c., and an old church in which there are several fine pictures. Pop. 7500.

Chin-Chin, a gummy varnish used in China and Japan, and believed to be derived from *Ilocaria tenax*.

Chinchon', a town in the province of Madrid, Spain, 25 miles E.S.E. of the metropolis, overlooks the Tagus, and has slight industries of linen, leather, and earthenware. Pop. 5400.

Chincho'na. See CINCHONA.

Chindwar'a, chief town of an executive district of the same name, Nerbudda division, Central Province, British India, is situated at an elevation of 2100 feet, has a clear, healthy climate, and attracts many invalids. Pop. (1872) 9185.

Chinese Empire, the oldest, most populous, and, after the Russian and British empires, the greatest in territorial extent in the world, may be said to occupy the whole of the eastern division of the Asiatic continent S. of Asiatic Russia and E. of British Burmah. Besides *China Proper*, it includes Manchuria (q. v.), Mongolia (q. v.), and Thibet (q. v.). *Eastern Turkestan* (see CASHGAR) has for the present thrown off the Chinese yoke and achieved independence; but the suzerainty of the Chinese emperor is acknowledged by the tributary kingdoms of Corea, Burmah—which in 1875 resorted to its former custom of paying tribute to the imperial treasury, and thus reassumed the duties and obligations of a Chinese feudatory—Siam, and the minor states of the Indo-Chinese peninsula, though in Cambodja and Cochin-China Chinese influence is being gradually superseded by that of France. Thibet and the *extra-mural* states of the empire—that is, those lying to the N. of the Great Wall of China, viz., Manchuria and Mongolia, as well as the kingdoms and states which pay tribute, but over which China exercises no direct administrative control—are each treated separately, and attention is here directed exclusively to the central and sovereign state of the empire, China Proper.

China, *Tsin*, or *Shih-pā-sang*, 'the eighteen provinces,' was called *Chin* by the inhabitants of India, from whom the Spanish and Portuguese adventurers of the 16th c. (the first Europeans to open up the Indian Seas to commerce) obtained some knowledge of the country, the Indian name of which they altered into the Latinised form of *China*. The Tartar tribes in the N. gave to the country the name of Katai or Cathay, by which it was vaguely known in Europe during the middle ages. It is also called the 'Middle Kingdom,' a name which is appropriately applied to the central and principal state of an extensive empire. China Proper is divided into eighteen provinces, exclusive of the frontier province of Shing-king (q. v.) between the province of Chi-li and the Corea, and of the islands of Hainan and Formosa. In configuration it is singularly compact; it is of nearly uniform length and breadth; its coast-line is regular, with no deep indentations, and with only two notable peninsulas, Quang-tung or Lien-chow peninsula between the Gulf of Tonquin and the China Sea, and the Shan-tung peninsula between the Gulf of Pe-chi-li and the Yellow Sea. But though there are few deep indentations, there are numerous inlets, and the excellent harbours on these and on the mouths of the rivers are almost countless. The almost numberless islets that stud the E. coast lie as a rule close to the shore, while of the two great islands, Hainan, in the extreme S., is separated only by a narrow strait from Quang-tung peninsula, of which it doubtless at one time formed a part, while Formosa, in the E. Sea, is separated from the mainland by Fu-kien Channel, about 100 miles broad.

Boundaries, Area, Population.—China Proper is bounded on the N. by Manchuria, Mongolia, and the dependent parts of Chinese Tartary; on the W. by Thibet and Burmah; on the S. by Cochin-China or Anam and the China Sea; and on the E. by the Gulf of Pe-chi-li and Yellow and Eastern Seas—arms of the N. Pacific Ocean. Its area has been usually stated at about 1,300,000 sq. miles, and Williams estimates it at nearly 2,000,000. The following is a list of the provinces, with their areas and populations, according to the last estimate (1842):—

Provinces.	Areas in sq. miles.	Populations.
Pe-chi-li	57,283	38 879,838
Shan-tung	53,779	29,529,877
Shan si	65,969	17,056,925
Ho-nan	66,933	29,069,771
Kiang-si	40,140	39,646,924
Ngan-hoi	54,001	36,596,988
Kiang-si	68,596	26,513,889
Fu-kien	45,761	22,799,556
Chi-kiang	35,071	8,100,000
Hu-pé	69,480	28,584,564
Hu nan	83,229	20,048,969
Shen-si	81,216	10,309 769
Kan-su	260,599	19,512,716
Sze-chuen	185,053	35,000,000
Quang-tung	90,246	20,152,603
Quang-si	77,857	8,121,327
Yun-nan	122,461	5,823,670
Quei-chu	66,759	5,679,128
Island of Hainan	13,976	2,500,000
Island of Formosa	14,982	3,020,000
	1,533,991	404,946,514

Mountains, Rivers, Surface.—The physical geography of no country of equal extent is less complex than that of China. The gradually lowering spurs of the vast mountain system of the Himalaya enter the country from Thibet on the W., and traverse it in two main ridges, the general trend of which is from W. to E., but which throw out a number of lateral branches. Of these two main ridges, the *Nan-ling* ('Southern Range') extends in broken chains over the province of Yun-nan and Kuei-chow, exhibiting rugged mountains and fertile and abundantly-watered valleys. From the eastern border of Quei-chu the Nan-ling extends E. and N.E., forming the frontier line between the provinces of Quang-tung and Kiang-si on the S. and those of Hu-nan and Hu-pe on the N., and finally bending E. and forming the southern boundary of the basin of the lower Yang-tse. Another branch of the Nan-ling stretches E.S.E. from the southern border of the province of Hu-nan, forming the northern limit of the wide valley of the Si-kiang river, which ultimately becomes the Chu-kiang or Canton river. The *Pe-ling* ('Northern Range') enters the province of Sze-chuen from the W. In this province the mountains are irregular, and numerous peaks, especially in the sub-range known as the Snowy Mountains, rise above the line of perpetual snow. From Sze-chuen the main chain traverses the province of Kan-su, where there are several subsidiary ranges, and where the valleys are numerous but small in extent. The chain crosses Shen-si into Shan-si, through the S. part of which it is continued into Hu-nan. The range seems again to cross upon the eastern bank of the Hoang-ho, and occupies the greater part of the province of Shan-si. The generally eastward trend of these mountain ranges determines the courses of the great rivers. The principal are the Si-kiang or Chu-kiang, flowing eastward S. of the Nan-ling range, through the southern provinces to Canton; the Yang-tse, flowing E. through the great central valley of the country between the Nan-ling and the Pe-ling mountains; and the Hoang-ho, flowing, in its lower course, through the valley to the N. of the main branch of the Pe-ling range. The other important streams of the country are either tributaries of these great rivers, or, like them, they flow eastward into the China, Eastern, or Yellow Sea, or into the Gulf of Pe-chi-li. The surface of the country presents every variety, from Alpine regions, where loftier peaks than those of Switzerland tower high above the line of perpetual snow, to far-extending tracts, flat, alluvial, and fertile as the Netherlands, but infinitely more extensive. From the western frontier of China (about 100° E. long.) eastward to the middle of the country, or to about the meridian of 112° E., the surface is mountainous. In the N., especially in the province of Shan-si, the mountainous region extends 100 miles farther E., or to about the meridian of 114° E. In this western half of the entire area, immemorial forests clothe the mountains, and immense beds of coal occur. E. of this mountain region, the middle of the country is occupied by the great alluvial plain of the Yang-tse and Hoang-ho, extending northward from lat. 30° to 40° N. The Great Plain of the basin of the lower Yang-tse is about 700 miles in length, and varies in breadth from 150 to 500 miles. Its area (210,000 sq. miles), though greater than that of France, forms only a sixth part of China, yet it contains nearly one-half of the entire population, and is the most densely inhabited portion of the earth's surface. In the six fertile provinces that lie either wholly or in great part within it, 180,000,000 persons are supported. The remainder of the country is hilly or undulating. The lakes of China are numerous, the chief being the Tong-ting Lake in the N. of Hu-nan, about 250 miles in circumference, Lake Po-yang in Kiang-si, 180 miles in circumference, and the Tai-hu, or Great Lake, near Shanghai, 150 miles in circumference, and from 10 to 15 feet deep. All the lakes and rivers are abundantly stored with fish, and multitudes of families living on their banks, or in junks or floating houses on their waters, are maintained by the fisheries.

Geology and Mineralogy.—Owing to the exclusive policy of the Chinese Government, and to the deep-seated dislike of the officials to foreigners, the geological character of the country has remained almost wholly unknown down to our own day. Within recent years, however, missionaries and merchants have penetrated the empire in various directions, and the more salient facts of the geology of the country are becoming gradually known. The Rev. A. Williamson, in his *Journeys in N. China*, 1870, R. Pumpelly, and Baron Reithofin, have recently made valuable contributions towards a view of the geology of the country. The mountain system of China, the outline of which has already been given, consists for the most part of granitic and metamorphic rocks, and to this bold and broken formation the rugged and picturesque character of so much of the scenery of China is due. In the valley of the Yang-tse cretaceous rocks and Tertiary beds occur. All classes of rocks containing metalliferous veins are largely present in this country. The whole of Northern China, embracing the greater portions of the provinces of Shan-tung and Chi-li, and the whole of the provinces of Shan-si, Shen-si, and Kan-su, may be described as one vast and inexhaustible coal-field, while smaller fields occur in almost every other province. These strata are associated with varieties of iron ore, among which there are great fields of black oxide, the finest ore in the world. Fine limestone occurs in all directions, and gold—especially abundant in Yun-nan, in the S.W.—silver, tin, and copper are found in all the 'hill' provinces. In the province of Shan-tung there are four great coal-fields; and coke, which is manufactured in immense quantities, is used for smelting silver, and for other processes requiring great heat: iron, gold, and galena abound in numerous localities. Tertiary deposits cover the plain of Chi-li, and among the hills limestone, granite, and metamorphic rocks prevail. There are numerous coal-mines, very inefficiently worked, and gold, silver, iron, and tin exist in many localities. In Shan-si, in which the mineral resources are great and varied, coal—bituminous, anthracite, and lignite—and silver, copper, and iron are plentiful. In Shen-si, Kan-su, and Ho-nan, all the minerals and metals named, together with quicksilver, exist in large quantities. Gold is common in the majority of the streams, and jade, agates, amber, iron pyrites, sulphur, and petroleum are obtained in many places. Gold and the other valuable metals are also pretty generally distributed on the alluvial flats and slopes of the western mountains trending N. and S., as well as in the southern province of Quang-tung. As a mineral product of China, porcelain is of the first importance in beauty and utility. The porcelain manufactories of the country are few in number, but are upon a large scale. The largest is named King-tu-ching, in Kiang-si, near Lake Po-yang, where there is an inexhaustible supply of the peculiar clay and silica from which the best porcelain is made, together with extensive coal-mines, whence fuel is obtained for the furnaces. The curious loam-terraces in the northern provinces, everywhere excavated into houses and villages, mark, according to Pumpelly and Williamson, the sites of former lakes and the channels of streams, and especially of the great river-system of the Hoang-ho or Yellow River, the course of which has suffered deflection from natural causes within our own time, and which appears to have been subject to similar vicissitudes prior to as well as during the historic period.

Climate, Soil, and Agriculture.—Extending in lat. from 18° to 44° N., and from long. about 98° to about 125° E., it is only natural to expect that the climate of China should vary in the different quarters of the country. The climate of the coast districts is widely different from that of the remote interior, and even among the coast districts themselves the climate varies, the meteorological conditions being quite different at Canton in the S. and at Pekin in the N. A peculiarity of the climate in general is the low average of the temperature, taken in connection with the fact that a part of China is within the tropics, and that the latitude even of Pekin, in the extreme N., is a degree to the S. of that of Naples. The mean annual temperature of Canton and Macao, which are within the tropics, is no higher than what is usually registered in places on the 30th parallel; while the mean annual temperature of Pekin is ten degrees lower than that of Naples. In winter severe cold is experienced in the northern provinces, though in midsummer the heat is oppressive. The average rainfall is 70 inches in the extreme S. There the N.E. monsoon commences in September and continues till February. The S. monsoon, which brings with it the annual rains from the heated ocean to the S., commences in March or April. The hottest months are July, August, and September. In these months the heat is oppressive and exhausting, and it is at this season, when the air is in a condition of extreme rarefaction, that the dreaded typhoons occur. China is a perfect hotbed for virulent and endemic diseases. This is accounted for by the extreme heat and humidity of the climate in summer, the absence of proper sanitary arrangements in the crowded houses of the swarming rivers, and the thronged villages and towns. Famine, arising from the frequent droughts and inundations, too frequently accompanies disease, and fearful destruction is often caused among the people who live afloat by the typhoons that annually visit the southern coasts. The estuary of Canton river is especially subject to these hurricanes; and in August 1862 it was calculated by the Chinese authorities that not less than 60,000 inhabitants were drowned or killed by falling houses during a typhoon of fourteen hours. These tempests, though most frequent in the S., ravage the harbours all along the E. coast as far N. as Shanghai. In the northern and inland provinces of China the climate is pleasant, and in many localities delightful. The *soil* of the country is as various as its climate. There are tracts of champaign country like France and Belgium, swampy districts like Holland, and barren mountain regions. The richest soil is formed by the detritus of the innumerable rivers, and is found occupying immense tracts in the basins of Hoang-ho and Yang-tse, and composing the substance of their deltas.—*Agriculture*, the chief industrial pursuit of the Chinese, is considered a choice occupation, not only by the people but by the nobles and learned men, while even the Emperor himself condescends to plough a furrow on the occasion of the great annual festival of husbandry. All the land is vested in the Emperor as universal landholder. For the best land in the rich district near Canton a tax amounting to ten or twelve shillings an acre (including the collector's illegal levies) is paid, but in the inferior districts the tax amounts to only two or three shillings an acre; while those who undertake to till waste lands are free to do so without payment, and are even assisted by Government in cases where expense is involved in bringing the land to a condition of productiveness. The great proportion of the farms are of from 5 to 10 acres. Holding directly of the Emperor, the peasant of China is subject to no compulsion, exaction (except in the case of the collector above mentioned), or control. There are no game-laws, and the fisheries on the rivers and lakes are open to all. 'In no part of Europe,' says Mossman, 'is the agriculturist so independent as in China, and as a class they will compare favourably with the most advanced peasantry in England for intelligence and good conduct.' The implements and methods of agriculture among the Chinese are very rude and imperfect. Their plough makes a furrow only 4 inches in depth, and the hoe is used for almost every operation in farming and gardening; but owing to the immense number of the labourers, and the enthusiasm with which the pursuit is followed, the system is effective—all available lands are cultivated, and the greatest ingenuity and economy is everywhere observable. The land is abundantly supplied with streams, and by a universal system of irrigation the whole land is efficiently watered. In China the sewage of the cities and all available refuse is made use of as manure with the most profitable results; though to a foreigner residing in a Chinese town the method of removing the night-soil from the town by carrying it through the streets in great vessels supported on poles, and carried by porters like a sedan-chair, is surprising and not pleasant. There are four great tracts in which the soil is fertile, and the agriculture specially efficient:—(1) The maritime provinces S. of the Nan-ling, in which the climate and productions are tropical, and the land cultivated like a garden up to the slopes of the forest-clad mountains. (2) The N. and E. slopes of the Nan-ling, in which the tea-shrub and the camphor and varnish-tree (*Dryandra cordata*) are indigenous. (3) The great plain of the Yang-tse, with mild climate and its immense cotton and woollen culture, its vast paddy-fields and tracts of sugar-cane; and (4) The grain-farming land between the Hoang-ho and the mountains in the N.

Vegetable Productions and Animals.—The vegetable productions of China embrace all the fruits, vegetables, and grain grown in temperate as well as in tropical climes: in the tropical provinces of the S., mangoes, grapes, pine-apples, pomegranates, the lichi, the varieties of orange. The tea-shrub is universally cultivated in the warm and sheltered districts; and rice, the staple food of the Chinese, is raised in immense quantities both upon wet, or rather muddy fields, and on dry soils, where its cultivation is carried on like that of ordinary grain. In the N. maize, barley and wheat are extensively grown. Floriculture is universal. Waterlilies float on every sheet of still water. Artificial islands, constructed on the lakes, are all so many floating gardens; and the care with which the gardeners' azaleas, viburnums, and the host of brilliant flowers are carefully reared in the gardens and nurseries of China justify the application to that country of the name 'Flowery Land.' The tobacco plant and the poppy are also cultivated, and opium is an important article of manufacture. *Animals.*—The zoology of a country so densely peopled and so generally cultivated is not rich in the larger wild animals. The Bengal tiger, however, occurs in Yun-nan, and the bear infests the woods and rocky ravines of the mountains. Wild cats are common in the forests of the S., and are caught and fattened in cages for the table. Other animals, which do not usually come within the scope of the European *cuisine*, among them the rat and the puppy, are used as food. Muck and moose deer are found, and the buffalo is used to a limited extent in agriculture. Human labour, however, is so cheap in China, that beasts of burden are not so numerous as in most other countries. The sturgeon, sole, flat fish, rock-cod, and the golden carp are very abundant. Locusts visit the southern districts in numbers inconceivable. The air is at times darkened with their flight as with a thunder-cloud, and the ground is sometimes seen covered with these animals—which are from 3 to 5 inches long—two or three deep.

Industries and Arts.—The cultivation of rice, tea, cotton, hemp, sugar, and grain, and the manufacture of silk, opium, paper, porcelain, and lacquerware, are the principal industries. Curious carvings in ivory and mother-of-pearl are among the most interesting of the minor industrial products. The art-productions in drawing and painting betray an entire want of knowledge of perspective and of light and shade. The musical instruments of the Chinese embrace primitive and crude types of most of the European instruments, but no improvements have been made upon them for ages. The native music is shrill, harsh, and aimless to a European ear; yet many of the national songs are plaintive airs in the minor key, like the old national melodies of Scotland, Ireland, and Wales. The artistic genius of the country, however, is best displayed in its admirable pottery enamelled-work, engraving on wood and stone, its carvings and antique vessels in bronze, its filigree-work in gold and silver, and its fine lacquerware. The vigour of the inventive and artistic genius of the country in earlier ages, while intellectual life was a living and growing principle among the Chinese, and before the slavish and indiscriminate conservation which their religion inculcates had put a stop to progress, and unalterably stereotyped all ancient forms, however crude, as unsurpassed and unsurpassable, is attested by the fact that China anticipated Europe in many of the most important discoveries of modern times. It is certain that the art of printing was practised in China in the 10th c. Gunpowder was known and used (in the manufacture of fireworks) from a very remote period. The property of loadstone to communicate polarity to iron was understood during the 1st c. of our era, and a Chinese Encyclopædia of the date 121 A.D. describes loadstone as 'a stone with which direction can be given to the needle.' In a work written a hundred years later, the use of the compass is explained. To the Chinese also is due the discovery of the methods of manufacturing silk, paper, and porcelain, which they have carried to higher perfection than any nation in the world.

National Works, Monuments, &c.—The most renowned of the great national works of China is the Great Wall, which, from long. about 98° 30′, is carried eastwards over twenty degrees of long. along the N. frontier of China, over mountains and through valleys, and on bridges across rivers, to the Gulf of Leao-tong,—a distance of 1400 miles. It was built 200 years before the Christian era, as a protection against the inroads of nomadic Tartar tribes. Constructed mainly of earth and rubbish, it is bound in on each side by a coating of brick, and fortified at intervals by towers, which still in many instances have an imposing appearance. The Great Wall is from 15 to 30 feet high, rests on a basis of stone 2 feet thick, is 25 feet thick at the base, and from 15 to 20 feet at the top or platform. The towers are 40 feet square at the base, taper towards the top, and are about 37 feet high. The wall has long been entirely useless as a defence; it has consequently been neglected, and about one half of it has fallen to ruin, and is now little better than a shapeless mound of rubbish. The Grand or Imperial Canal extends from the town of Hang-chow (lat. 30°), in the province of Chi-kiang, N.W. through the maritime provinces of Kiang-su and Shan-tung to the town of Ling-ching (lat. 37°) on the river En-ho,—length about 700 miles. From Ling-ching the river En-ho is available as a continuation to Tien-tsin at its mouth. This great canal was constructed not merely to afford means of communication, but also to drain the plains that lie around the lower courses of the Yang-tse and Hoang-ho. With this view its breadth is unusually great. It is led across numerous rivers, including the two great rivers of China; and owing to the continual action and reaction of the waters of these streams, there are very few reaches of the canal which are without a distinctly noticeable current. At several points it is cut through rocks; it traverses lakes, and drains numerous swamps. The number of the flood-gates that regulate it, the bridges that span it, and of the cities and provinces between which it forms (with its many branches and the innumerable rivers with which it is connected) a vast, easy, and cheap system of communication, constitute it one of the greatest national works in the world. The part of the canal extending southward from the former bed of the Hoang-ho (q. v.) was constructed during the 7th, or early in the 8th c. The remainder, extending N. through Shan-tung and Chi-li, was the work of Kublai Khan (in the 13th c.) and his successors. Prior to 1853, when the lower course of the Hoang-ho was deflected from E.S.E. to N.E., the rice-fleet, bearing about 430,000 tons annually, passed northward by the canal from the southern part of the great plain of the Yan-tse to the neighbourhood of Pekin, and thus avoided the delay, and the liability to storms and the attacks of pirates, to which the sea-voyage along the winding coast exposed it. The deflection of the great river, however, and the consequent withdrawal of the water-supply from an important reach of the canal, have rendered it impassable for junks. Williamson, one of the latest travellers on the Grand Canal, describes its condition as he saw it in 1869. The 'summit-level' of the canal is at the junction with it of the

Ta-wan-ho (from the middle of Shan-tung province), about 30 miles S. of the point at which the canal enters the Hoang-ho. The greater part of the volume of the Ta-wan-ho runs S.E. through the canal, but a portion runs N.E., rendering the canal navigable for small boats to the Hoang-ho. From the Hoang-ho northward to Tien-tsin the canal is unnavigable, but from this town it is navigable to its practical termination,—the treaty-port of Tien-tsin. From the Pei-ho at Tien-tsin north-eastward to the river Pei-hang, a new branch of the canal, the object of which was to prevent the recurrence of the disastrous inundation of the plains of Tien-tsin in 1872, was completed in 1875. From Tsi-ning-chow, about 20 miles below the junction of the Ta-wan-ho, already named, the canal is navigable for good-sized junks at all seasons to Chin-kiang. Another great national work, the Mei-ling Pass, across the Nan-ling or southern mountain range, at the height of 8000 feet above sea-level, is a feat of labour and engineering which will compare with any of the Alpine passes. Across this pass nearly all the tea shipped at Canton, prior to the opening of the treaty-ports in the E. and N., was carried on the backs of porters, 200,000 of whom are said to have been engaged in its transport. After the opening of the treaty-ports, which were found to be nearer the great tea-districts than the port of Canton, the traffic over the Mei-ling Pass dwindled away. The empire is also traversed in all directions by great roads, usually from 70 to 80 feet broad in the plains, lined with trees, and carried across rivers by great bridges, which are often built of marble and adorned with innumerable fantastic figures of lions, tigers, dogs, and monkeys. Good cart-roads, also, connect all towns and villages of any importance. 'Few things,' says Williamson, 'impress the traveller more with the large-mindedness, ability, vigilance, and vigour of the former emperors, and the greatness of the empire, than these roads.' The monuments and gigantic idols and carved images of China are a special feature of the country. There are numberless statues in wood and clay of famous emperors and eminent men, mostly of colossal size and gilded. The statue of Confucius, which may be seen standing alone in all the numberless temples dedicated to the memory of the great sage, is never gilded, but is remarkable for its placid expression of features and sombre drapery. Before the tombs of the emperors of the Ming dynasty, in the neighbourhood of Pekin and Nankin, are ranged processions of gigantic figures, —men, horses, camels, elephants,—in stone.

Trade and Commerce.—The trade of China Proper, consisting of an interchange of commodities between its inland provinces and the Russian, Tartar, and Indo-Chinese states on its borders, is very active and extensive, but no official statement of its extent is available to foreign officials. Of the foreign trade or commerce of the country, however, the British consuls at the different ports are in a position to furnish annual returns. Of the ports of China, twenty-one have been thrown open to foreign commerce. Of these, eleven are primary or consular ports; but the consuls resident in them are also furnished with statistics of the chief, at least, of the secondary ports, and thus in the consular returns a fairly accurate statement of the whole of the foreign trade is given. Full statements of the whole trade of the Chinese ports are given under their names. (See CANTON, SHANGHAI, &c.) The whole of the foreign trade of China—with the exception of one-seventh, which is carried on with the United States and other foreign nations—consists of commerce with Great Britain and its Indian Empire, and with the British possession of the island of Hong-Kong (q. v.). The following is a statement of the trade of China (including Hong-Kong and Macao) in the years 1870-74 inclusive, with the quantities and values of the chief articles of import and export:—

TOTAL BRITISH IMPORTS FROM CHINA (INCLUDING HONG-KONG AND MACAO).

	Total Imports.	Tea.		Raw Silk.	
		Quantity.	Value.	Quantity.	Value.
	£	lbs.	£	lbs.	£
1870	9,905,716	125,593,898	8,787,894	578,441	681,277
1871	12,297,165	151,636,036	9,999,819	1,754,981	1,809,793
1872	14,395,248	160,520,882	10,879,038	2,096,329	2,147,746
1873	13,303,917	137,246,372	9,261,937	3,132,949	3,172,636
1874	11,938,194	133,452,693	9,110,669	2,656,764	1,996,203

TOTAL BRITISH EXPORTS TO CHINA (INCLUDING HONG-KONG AND MACAO).

	Total Exports.	Cotton Goods.		Woollen Goods.	
		Quantity.	Value.	Quantity.	Value.
	£	yds.	£	yds.	£
1870	9,547,563	396,975,526	6,183,016	19,130,018	1,183,700
1871	9,415,950	469,080,335	6,511,994	17,581,467	950,533
1872	9,497,184	402,077,775	6,373,049	18,565,519	1,178,567
1873	8,294,669	349,744,270	5,294,360	17,657,780	1,146,679
1874	8,402,066	393,316,000	5,304,659	13,872,770	871,542

From the above statement it appears that the Chinese trade with Britain during the years 1870-74 has been steady, with a slight tendency to decline in the last of the years named. This is accounted for partly from the circumstance that cotton, which is extensively grown in Chi-li and other provinces, chiefly in the N., became temporarily an export to Britain during a few years subsequent to the period of the cotton-famine in England. But the export of this article from the northern ports of China gradually and naturally declined as the wonted activity was resumed in the cotton-fields of America, and in 1874 it disappeared altogether. But this falling off in the export of cotton told doubly against British trade in 1874; for while in that year cotton was not exported to Britain, it was diverted to the southern Chinese ports, which being thus supplied with native cotton, were no longer under the necessity, as they had been previously, of purchasing that article from British India. The diversion of the cotton grown in the N. of China to the ports in the S. accounts for the fact that in Canton in 1874 there was a decrease in the export of foreign raw cotton of 161,256 piculs (the picul = 134 lbs.). Other causes for the decrease in our exports of textile fabrics to China are that China manufactures the cheaper kinds of goods more profitably than Manchester, and also that the import trade in these goods has, within the last few years, passed almost exclusively into the hands of guilds of native dealers at the different ports, who form commercial 'unions' for the purpose of excluding the foreigner. At Ning-po there was a decrease of 54,641 'pieces' of cotton goods, and of 9460 pieces of woollen goods, in 1874; and this decrease is due to the fact that here, as at other ports, the trade in cottons and woollens is passing bodily into the hands of Chinese dealers. The practices of the 'piece-goods guilds' of Ning-po may here be explained, as they are representative of the new commercial policy of the native officials at all the ports—a policy which threatens the very existence of foreign commercial enterprise among the 'Celestials.' The guild named pays to the Taotai (a local official, one of whose functions is the collection of customs-duties) two sums annually, one of 15,450,000 cash (equal to 14,500 dols.), and a further sum of 2000 taels (3 taels = £1), towards barrier expenses, in consideration of which they are allowed to impose a tax of from 12 to 50 cash (1d. to 5d.) per piece on piece-goods. This sum is imposed in addition to the half-duty duly paid to the Imperial Maritime Customs. A certificate, granted by the guild when the goods go into the interior, clears them of all further taxes. But this guild declines to have dealings of any kind with foreigners or their native agents. They refuse certificates to all goods of non-Chinese importers, and should such goods find their way into the interior, they are no sooner delivered to a purchaser than local officials, acting on instructions from the guild of the port, compel the purchaser to pay a tax on the goods of more than double the amount of the tax levied by the guild on goods bearing their own certificate. In default of payment of this tax, which is one of the various forms of the 'squeeze' upon the foreigner, which is a universal institution in China, the goods are seized. At Shanghai in 1874, the piece-goods trade was fairly prosperous; but even here, where European influence is distinctly felt, a powerful combination among the Chinese merchants enables them to 'bear' or 'bull' prices in a manner which is disastrous to foreign importers; while the same obstructiveness on the part of Chinese officials to the free transit of foreign goods in the interior hampers the operations of British importers in the same manner as at the other treaty ports.

Government.—The present Emperor of China, Tsai-tien, succeeded to the throne in 1875 on the death of Tong-che, who was nominated to the throne by his father, Hien-fung (died

22d August 1861). In the Chinese constitution (which is written in the Ta-tsing-whei-tien, or *Collected Regulations of the Great Pure Dynasty*), the Emperor, or Whang-ti, is supreme legislator, administrator, commander-in-chief, criminal judge, owner of the soil, and arch-priest. He is called Tien-tse, or Son of Heaven, and theoretically rules over Tien-hin, or all under the skies. The only qualifications of the prerogative are that the Whang-ti must govern according to the classics, and that he is disqualified by incapacity or wickedness, the people having a right to rebel in cases of 'prolonged famine, pestilence, or hordes of robbers.' They have no voice in the election of magistrates, the making of laws, the imposition of taxes. The Whang-ti is visited every morning by the Keun-ki-chu, or Cabinet Council, and on invitation by the Ne-kö, Inner Council, or Great Secretariat. The Li-fan-yuen, or Colonial Office, has charge of Mongolia and Thibet. It includes a Chamber of Compassion for 'fan,' or foreigners, a term which does not extend to outer barbarians, such as English. The Han-lin, Great College of Learned Men, literally Pencil Forest Hall, includes the various Ta-hyo-si, or ministers of state, who see that the constitution and the maxims of Confucius are obeyed, and who collectively control the six Boards of Offices, Revenue, Ceremonies, Military Affairs, Punishment, and Works. This last includes the Chambers of Architecture, Government Stores, Hydraulics, and Mausoleums. The Han-lin is properly a senate to test literary attainments, on which office depends. The Board of Ceremonies is subdivided into the Chamber of Etiquette (which regulates marriage, funerals, public rejoicings, &c.), the Chamber for Regulating Sacrifices, the Chamber for Mutual Intercourse (which provides a reception for illustrious strangers), a Chamber for Arranging Festivities or Imperial Banquets, and the Board of Music. Quite apart from the executive, but represented at the meetings of all the boards, and having a general power of direct remonstrance or petition to the throne, is the Tu-chah-yuen, or Board of Censors, whose business is to watch the proceedings of mandarins. In each province is a Swuin-fu, or governor, who has the sole power of addressing the throne or council, has the power of life and death, and is the military commander. His office is generally forfeited by the occurrence of a rebellion. Beneath him in each province are the Pie-chung-si, or superintendent of provincial taxes, which he receives from the magistrates and accounts for to the governor; the Ngan-cha-si, or provincial criminal judge, who receives and reports on persons sentenced by the district magistrates to death or banishment; and the Hioh-tai, or educational examiner, who corresponds with the Han-lin, and conducts along with the prefect the primary examinations for the literary degree in the departmental cities. Several departments, grouped together within a province, are placed under a Tau-tai, or intendant of circuit, who has charge of the customs, corresponds with foreign consuls, and hears appeals from the court of the prefect. One species of Tau-tai, the Ping-pac-tau, has a military command, and draws money from the treasury for troops which have often no real existence; another, the Yeu-yun-tau, is sometimes called the salt commissioner. The single department, or 'fu,' is presided over by a Chi-fu, who hears appeals from the lower courts. The 'fu' is divided into several 'liens,' about the size of English counties, in which the Chi-lien or chief mandarin is the sheriff, police superintendent, coroner, receiver of taxes, and literary examiner. Under him are the assistant district-magistrate, inspectors, masters of prisons, writers, tax-gatherers, constables, &c. It may be useful in connection with these names to add the meanings of some terminations constantly used in Chinese:—*Shau*, a hill; *Chung* or *Cheng*, a city; *Chwang*, a large village; *Tsun* or *Tun*, a village; *Kwan*, a fortified pass; *Mun* or *Men*, a gate; *Kow*, a port; *Kiai*, a market street; *Ho*, a river or canal; *Kiang*, a great river; *Hu*, a lake; *Yamun*, a mandarin's office; *Wang*, a prince. Little is accurately known as to the public revenue of China, which has been stated at £100,000,000. It would be unsafe to infer anything from the amount of the customs-duties, which in 1873 amounted to 10,977,082 taels or £3,659,027, of which imports contributed £1,268,285, and exports £2,045,706. The other sources of revenue are a land-tax and trade licences, which are probably made to bear the heavy deficits frequently occurring. In 1874 China for the first time contracted foreign debt, viz., £627,675, issued at 95, bearing 8 per cent., and secured on the customs-duties. It may be explained that the Chinese tael = 10 mace = 100 caudareens = 1000 cash = 6s. 8d. sterling. It is part of the duty of the mandarins to read periodically to the people from the *Book of Sacred Instructions*. Besides this, the penal laws are printed and circulated among the people (nearly all of whom can read and write), so that no one may plead ignorance of the law for which he is punished. There is in criminal justice a vicarious principle; parents being occasionally punished for the crimes of children, and districts for those of individuals. The Government reserve a power of punishing cases of 'improper conduct' not defined in the penal code. The enormous patronage of the court and the extensive system of espionage contribute to the stability of the empire. See Archdeacon Gray's *History of C.* (2 vols. Lond. 1878).

Religion.—Like the Babylonians, the ancient Chinese erected large square altars and high terraces of earth, stone, and brick. The sacred altars in Peking, on which imperial sacrifices are offered every winter solstice to Shan-ti, are square earthen terraces about 60 yards in circuit, and from 4 to 6 feet in height. There was before Confucius a singular numerical philosophy, which is said to have been received by Ta-yu, B.C. 2200, as a reward for his success in subduing the inundations of the rivers. It contains nine categories—(1) Five elemental energies; (2) five human actions; (3) eight departments of government; (4) five registers of time; (5) the Emperor's perfection in virtue, or himself attaining the summit of virtue; (6) the three virtues; (7) investigation of doubts by the tortoise and diviner's grass; (8) five natural indications; (9) five kinds of happiness and six of misery. This numerical scheme is also seen in the Pa-kwa, or eight diagrams of Fo-hi, a system of whole and broken strokes arranged octangularly, the basis of the 'Book of Changes,' and used on the Chinese mariner's compass. The number eight curiously survives in the number of meats allowed at the imperial dinner, which are bears' paws, deers' tail, ducks' tongues, torpedoes' roe, camels' hump, monkeys' lips, carps' tails, and beef-marrow. Combinations of the five primitive elements are constantly used as the basis of calculation in fortune-telling with the joss-stick, which is largely practised according to printed rules and for fixed charges, chiefly by unsuccessful candidates at the public examinations. This gambling spirit appears everywhere. Tradespeople have bamboo-tubes full of sticks, with numbers burnt into the concealed end, from which the customer draws his price; some even use dice. In the temples, two plane-convex bits of bamboo are tossed by the worshipper, and the omen is good or bad according as they fall. It is in his commentaries on the *Ye-king*, the Book of Changes, that the famous Chu-tsze explains the principle of Tae-keih, represented by a circle, on one semi-diameter of which a semicircle is described, and on the other semi-diameter, but in the lower half of the great circle, another semicircle is described. The curved divisions thus obtained represent the *yang* and *yin*, the masculine and feminine, the celestial and terrestrial, the sun and moon. This materialistic theory, resembling the Egyptian fable of the mundane egg and the Brahmanic legends of creation, was applied vigorously to all nature, the whole vegetable and inorganic world being endowed with sex, and numbers themselves having a gender.

There are many minor religions in China, such as Mohammedanism, which is diminishing, but still extensively spread; the Vegetarians of Ningpo, who profess the 'Religion of the White Lily' and the 'No-Hypocrisy Religion,' and distinguish themselves by holding the breath until the face becomes livid and the body stiff; the simple creed of the Pepohoans of Formosa, that the world has existed and will exist for ever, together with its present occupants, who are punished in their next stage of existence for their misdeeds in the present; then the Feng-shui, or Wind-water, *i.e.*, Incomprehensible system, which determines the proper sites of tombs, houses, or cities from the configuration of rivers, trees, and hills. This singular superstition assumes that all evil comes from the S., and that evil travels in straight lines. Hence curved lines are introduced as much as possible; a pagoda or a heap of stones will divert the lines, and protect a considerable district from famine and plague, and most of the temple doors have wooden screens inside, which intercept the evil spirits from proceeding to the altar. Perhaps the strongest among the practical religious feelings of the Chinese is that of predestination. It is well illustrated in a popular almanac of the present day, in which a woodcut represents a fly, a spider, a bird, a sportsman, and a tiger. Each of these animals successively kills his prey, and then they all fall into a well. So also in the great cities it is the custom, if a coolie laden with wine or oil slip and fall when the streets are slippery with ice or snow, that he shall be held liable for the damage done; if on a fine day, when the streets are dry, the owner of the goods bears the loss, for, like the burning of the icehouse, this unlikely accident is taken to be clearly the will of Heaven. All this is mixed up with the grossest superstitions. Even the intelligent and liberal viceroy, Li-hung-chang, who lately established the Nanking arsenal under Dr Macartney, armed the Peiho forts with Krupp guns, and introduced foreign drill to the army, expected that by self-prostration before a small water-snake he might persuade the god of floods to stop those in Chihli. The chief faith of China has for the last ten centuries undoubtedly been Confucianism, which is not a religion in the sense of having any account of the invisible world, but is a system of self-culture with two great objects—the proper government of one's own family and of the state. It exhorts men to love virtue for itself, without hope of reward or fear of punishment, and it is extremely obnoxious to the Christian missionaries, as laying down the principle that 'man's nature is originally good.' It resembles Christianity, on the other hand, in the importance it attaches in theory to purity of secret thoughts. Practically, however, what distinguishes Confucianism is the sanctity it throws round the existing social relations of dependence and subordination, both public and private. It establishes a power of life and death in the head of the family (*Penal Code*, s. 293), and a despotism (assumed to be benevolent) in the head of the state. The conservative method of Confucius is revealed in the *Li-king*, or Book of Rites, which contains 3000 ceremonial usages, and is administered by one of the public departments. Confucius said: 'I do not know life: how can I understand death?' Hence the state-worship by sacrifices, before referred to, is strictly positivist. The Jesuits, who at first got on very well with the Confucians, said that this worship (which includes the burning of a bullock in a large furnace of green-glazed bricks, with the professed object 'of attracting the attention of the Heavenly Spirit') really related to an intelligent moral creator, Tien or Shan-ti; to a primitive monotheism which existed before the worship of the saints (Shing-jin), of the lofty good and evil spirits (Shen and Kwei), before the Sabean worship of the heavenly bodies, or the worship of ancestors by means of tablets. It is true that the Emperor Kang-hi assured the Pope that his worship was not addressed to the visible system of things; but after allowing much for the fetichism of the uneducated masses (who are singularly isolated from the literary and governing class), it remains true that Chinese religion, in so far as consciously Confucian, is not, indeed, atheistic but agnostic. Buddhism, the creed of the Tartar dynasty, began to appear in China about 217 B.C.; and in 120 B.C. a Chinese general, after defeating the barbarians to the N. of Gobi, brought back a golden statue of Buddha as a trophy. In A.D. 65 it was officially recognised by the Emperor Ming-ti as a third state religion. Soon after, the life of Buddha, *Lalita Vistara*, was translated into Chinese under imperial auspices, and three centuries after this began the great stream of Chinese Buddhist pilgrims—Fahian (A.D. 390), Hœi-seng, Song-yun (A.D. 518), Hiouen-thsang (A.D. 648), Khi-nie (A.D. 964), whose travels, along with the *Itineraries* of the fifty-six monks (A.D. 730), are all extant, and some of them translated into European languages. The story of Hiouen-thsang, translated by Stanislas Julien, is a graphic romance and an invaluable history. He returned in honour to China with a great number of Sanskrit works on Buddhism, which he afterwards translated in 1335 volumes. There are now in the Peking temple wooden blocks for printing upwards of 6000 Buddhist volumes. In Chinese, Brahma became Fan-lon-mo, and Buddha became Fo-to, which was vulgarly shortened to Fo. Buddhism is a creed of ideal purity; its Pentalogue enjoins not only moral duties, but abstinence from marriage and wine. But even these fundamental precepts are disregarded by the mendicant priests of China, whom the best authority has called 'a lying, shameless, debauched class.' They extort money from the poor not merely by begging on false pretences, but by impostures in the temples. Thus, at the shrine of Kuan-yin, goddess of mercy, at Hong-Kong, the goddess prescribes certain drugs, which are sold by an apothecary who has an understanding with the priests; and the priests themselves sell worthless bits of paper as counterfeits for money, which are then burned at the altar—a proof of the Chinese reverence for the 'written word' in whatever form it may appear; even a pawnticket or a newspaper is regarded as something sacred. The centre of Buddhism is the island of Put in the Chusan Archipelago, where since A.D. 550 there have been sixty temples governed by an abbot or Tae-hoshang. These are supported by the rent of Church lands, the contributions of pilgrims, and the labour of the priests. Here and there are monasteries of devout and clean men. The great Hall of Saints, Lo Han T'ang, contains 500 gilded images of Buddhist saints, one of whom is supposed to be that good Catholic, Marco Polo, the traveller. The Buddhist pagodas are circular towers, 200 feet in height, containing seven stories, reached by a spiral staircase, each floor having an outside terrace, surrounded by a massive stone balustrading resting on ornamental brackets. They are chiefly found in S. China, and are not known outside China. They were probably built as beacons and watch-towers, and as places of strength in which to guard the relics of Gautama. The tonsure, celibacy, fasting, prayers for the dead at fixed money rates, the baptism in water, the rosaries and chaplets, and the Franciscan dress of the Shamans or Buddhist priests, suggested to Père Gerbillon that they must have been subject to Christian influences from Syria and Armenia. The third great faith is Taouism, which was first taught by Taou or Laou-tsze, a contemporary of Confucius, in the 6th c. B.C. He taught contempt of worldly riches and honour, and thought true happiness was to be found in starving all troublesome wants and living apart in slothful tranquillity. His followers believed that life might be indefinitely prolonged by an elixir, and therefore became alchemists. The mysteries of the Taouist, 'Three Pure Ones,' were announced to man through the 'great barefooted angel,' and are written in the Scripture, Taou-te-king, a copy of which is possessed by the Royal Society. Under the Sûng and Tang dynasties this sect became very influential, the title of Tien-sze, or celestial teachers, being given to its professors. Three Taouists, named Chang, excited the rebellion of Yellow-Caps, which put an end to the Han dynasty. But the religion is now represented chiefly by professional jugglers, who traffic in all the grossest superstitions of the people. To the Confucian student the theoretical asceticism of the Buddhist and indifference of the Taouist are both equally culpable; but practically there is very little bigotry shown between the members of the different persuasions. The three faiths agree, however, in detesting Christianity. This is shown in a poem published in 1874 in the tea-market at Hankow, which, after sarcastically referring to the 'stillness and cleanliness' of Buddhism, and the 'abstruseness and hollow mockery' of Taouism, attacks the gospel *with its secret confusion of sexes*. This spirit is partly political or patriotic, but the spiritual and moral difficulties in the way of the missionaries are enormous. Thus, the Chinese work seven days in the week; there is no restriction on the sale of spirituous liquors, and no drunkenness except from opium; there is no charity, except in the customary support of parents and other relatives and friends; and the result is, that nearly everybody works, although wages are barely sufficient for comfortable subsistence. Accordingly the social evils to be attacked in China are different from those most prominent at home. It is not true that the Chinese are specially prone to thieving, but they lie systematically; and suicide, especially among women, is very common, and is in many cases applauded. They have been unjustly accused of unusual cruelty, especially in judicial punishment. 'The lingering death,' described by Meadows, is quite obsolete; the heavy bamboo is also abolished; and the light flogging, and the *kea* or Cangue (q. v.), or wooden collar, are imposed under rules which would gratify Beccaria himself. A more serious matter is that thefts and sometimes homicides are compromised by money payments in court. See Edkin's *Religion in China* (2d ed. Lond. 1878).

History.—The fabulous part of Chinese history begins with the Three Emperors, Fo-hi, who invented numbers, music, &c.; Shin-nung, the divine husbandman; and Hoang-ti, who divided the land into groups of nine equal squares, of which the centre was owned by the state, and who introduced the cycle of sixty years. Then follow the Five Sovereigns, of whom Shun is connected with the tradition of the Deluge (the overflowing of the Yellow River), and also the first choice by a reigning emperor of his successor, which is still the rule. After two periods, named *Hea* and *Shang*, a martial king, Wu-wong, about 1100 B.C., revolts and founds the dynasty of Chow, which endured till 240 B.C. It was about the middle of Chow that a partial consolidation of the independent states or dukedoms in Northern China took place.

The first true Emperor, Chi-hoang-ti, built the Great Wall, and burned nearly the whole of the classic literature. During the Han period (B.C. 200–A.D. 200), the Tartar becomes troublesome on the N.W. frontier. After an interval of Sankuo, or 'Three States,' the Duke of Wei established the supremacy of the Tsin dynasty on the Salic principle (afterwards disregarded), that 'queens should not reign, nor assist in public matters.' From A.D. 416–585 the cities Nanking and Hünnan appear as the capitals of separate kingdoms, which are afterwards united, and the dynasty of Tang (A.D. 622–897) appears with the wise and just Tae-tsung, whose virtues are soon forgotten in the wicked tyranny of the eunuchs. A chaos of half a century, called the How-woo-tae, or 'Latter Five Successions,' follows, in which Davis thinks he sees the features of a feudal land system surviving in the tax of 10 per cent., to which the Emperor is still entitled out of all lands. To this period belong the accounts of the early Arabian travellers, who describe the taxes on salt and tea, the use of the bamboo, and the excessive issue of paper money. Under the feeble and vacillating Sûng dynasty (A.D. 950–1281) a great impetus was given to the production and multiplication by printing of books, and the manufacture of porcelain was begun at King-teh-chin; but the attitude of the Eastern Tartars grew constantly more threatening, until China had to call for help to the Mongol chief Peyen (Hundred-eyes), with the usual result of introducing a foreign dynasty, that of Yuen, whose first monarch was Kublai Khan. He, a Buddhist, tried to suppress Taouism, surrounded Peking with the Grand Canal, and founded the medical college, where the doctrine of the pulse, the diseases of children, and the therapeutics of counter-irritation have ever since been expounded. The narrative of Marco Polo belongs to this time, which is also marked by the establishment of Mohammedanism as the religion of a considerable part of the people. The Mongols rapidly degenerated, and in 1366 Hung-wu, a Chinese bonze, founded the Ming dynasty, and removed the capital to Nanking. Under this line, which enriched the world with many magnificent metal vases and tripods, gave Macao to the Portuguese, and saw the first of the Jesuit missions (Fathers Ruggino and Ricci, worthily followed by Fathers Schaal and Verbiest), a war gradually sprang up between China and the Bogdoi Khans or Manchu princes; and in 1644, after promising freedom from taxation, Tien-ming (or Heaven's Decree) founded at Peking the Manchu Tartar dynasty, which still rules. To them belong the present uncouth pigtail and costume of China. Their empire was not assured until the long and brilliant reign of Kang-hi, who had friendly negotiations with the Pope and with Peter the Great, and who inflicted a decisive defeat upon the Kalmucks. In 1662 he expelled the Dutch from Formosa, and in 1692 he published a decree permitting the exercise of Christianity, which was forfeited by a foolish claim of jurisdiction on the part of the Pope. The Supreme Emperor, Kien-lung (1735–95), received in 1793 Lord Macartney, the first British ambassador to China, who was followed by Lord Amherst in 1816. Kien-lung (who persuaded the banished tribe of Tourgouths to return from Russian rule in 1772) deserves the highest credit for relieving the East India Company (established with a concession of the right to trade at Canton since 1637) from some of the grievous customs and port duties; but Macartney failed in opening the ports of Ningpo and Tientsin. Amherst's mission, intended as a protest against the avowed Chinese policy of 'treating the barbarians as beasts and not as citizens,' was equally unsuccessful. Taou-kuang, 'the Glory of Reason' (1820–50), murdered the Mohammedan Tartar Prince Jehanghir, and made a successful campaign on the Cashgar frontier. In 1834 the charter of the East India Company, which had hitherto regulated trade at Canton, came to an end, and Lord Napier went out as commissioner. The Chinese wished to have a *taepan*, or commercial superintendent without representative character, in order to assist them in dealing with the illicit trade in opium, which had now begun, and against which the Chinese commissioner Lin distinguished himself by his energy and duplicity. This question led to the war of 1840, in which Amoy, Ningpo, and Shanghai were taken, and after which, in 1842, the Treaty of Nanking was signed, abolishing the Hong monopoly, opening five ports with a moderate tariff, and ceding the island of Hong-Kong. Another military expedition was rendered necessary by outrages committed in 1847. But the Chinese Government was now seriously shaken by the great Tae-ping rebellion, led by Hung Sew Tseuen, a peasant of the Canton district, against Hien-fung, the Manchu Emperor who succeeded in 1850. Hung was at first mistaken for a Christian: he was in reality an immoral impostor who arrogated divine honours to himself. His political object was to restore the Ming dynasty, and therefore he established himself at Nanking, the ancient Ming capital. The course of this great insurrection has been traced by Mr Meadows and Commander Brine; and its inner spirit will best be seen in the autobiography of Hung or Chung-wang, the Heavenly Chief, published at Shanghai in 1865. The Taeping publications were translated by Medhurst in the *North China Herald*. Meantime, in spite of the prudent action of Sir J. Bowring, Governor of Hong-Kong, the treatment of the English merchants at the ports, especially by Commissioner Yeh, became again intolerable. At last (1856) the *Arrow*, a small British colonial vessel, was violently seized. This led to the first mission of Lord Elgin, described by Mr Oliphant, and the expedition of the allied French and English forces, which resulted in the important commercial Treaty of Tientsin (26th June 1858), fixing the right of British subjects to travel with passports, throwing open five additional ports, and adjusting a general rate of transit dues. The treaty was not carried out, and this made necessary Lord Elgin's second mission of 1860, described by Mr Loch. There was more fighting, which began with the repulse of Admiral Hope at the Taku forts, but was afterwards better managed by Sir Hope Grant. The palace of Yuen-ming-yuen was burned to the ground as an appropriate punishment of the treachery of certain mandarins. After this, British officers served in suppressing the Taeping rebellion (which lasted till 1864), and British civilians held important posts in the departments. After the failure of the expeditions of Major Gordon and Major Sherard Osborn, and the massacre of 30,000 rebels at Foo-chow, the Palmerstonian policy of permitting British subjects to serve in China was abandoned. In 1873 the Chinese brought to a successful close a war which had lasted for seventeen years with the Panthays, a Mohammedan race in the district of Yünnan. At last Talifu, the capital of the Sultan Soleiman, and Momien, were taken with great slaughter by an army of 200,000 under Li-ssa-ta-ye, the general who nearly destroyed Major Sladen's exploring party from Burmah in 1868. In June 1873 the young Emperor Tsai-shun gave the first public reception to the ministers of the Great Powers. (This Emperor, who died 12th January 1875, was known as Tong-che, in accordance with the singular custom that the true imperial name, being sacred, may not be profaned by use.) In 1874 the murder of fifty Japanese sailors led to the expedition under General Saigo to the island of Formosa. The result was a treaty on 31st October 1874, acknowledging China's sovereign rights in Formosa, but giving to Japan a sum of 500,000 taels, partly in compensation to the families of the murdered sailors, and partly in payment for roads and buildings constructed by the Japanese. In January 1875 the foulest of all Chinese murders was perpetrated on Mr Margary, of the consular service, at Manwyne. Margary belonged to the party of Colonel Browne and Dr Anderson, sent out by Lord Salisbury to discover a through trade route from Burmah by the entrepôt Bhamo to Yünnan. Sir T. Wade, British Minister at Pekin, by threatening to break off diplomatic relations, got the Emperor to send Li-han-chang as a commissioner to investigate the matter. The English Government had already sent Messrs Grosvenor, Davenport, and Baker for the same purpose. Sir T. Wade has also taken this opportunity of securing a general inquiry into the taxation of foreign trade; an edict enjoining that all foreigners with passports are to be unmolested, or, if wrong-doers, to be given over to the consulate; an undertaking that all foreign treaties shall be published in the *Peking Gazette*, the proper rank being given to the foreign ministers, and that there shall be regular intercourse between the foreign legations, and not merely the Tsung-li-yamen, a commission of cabinet ministers organised in 1859, but all the departments as well. In these negotiations, however, Prince Kung has distinctly laid down the principle that his Government 'have never sanctioned trade carried on within the limits of a subject state.' This principle is not acted on on the Mongolian borders or in Turkestan, where facilities for inland trade have been given to Russia. Britain is entitled to similar facilities on the frontiers of Thibet, Nepaul, and Burmah. But until the *lekin* and other provincial sur-taxes—levied with great official corruption—on inland trade are abolished, or transferred to the transit duty collected at the consular ports, mere freedom of passage will remain of little value. The new Semipalatinsk route to the Kiayu Pass, and the impending fall of Yacoob Beg, the Mohammedan ruler of Yarkand, will give great commercial advantages to Russia. The present Emperor is Tsai-tien. See section on *Government.*

Language and Literature.—In Chinese no word is allowed more than one consonant and one vowel—the vowels including diphthongs and nasal vowels. The possible number of words is therefore very small, and it is said there are only 450 significative sounds. But each word is made to vary its meaning according to accent and intonation; so that the total number of words in this sense is 43,496. This being the structure of the spoken sounds, a graphic representation of sounds was impossible, and therefore hieroglyphical writing, enlarged by the introduction of determinative signs, was used. Twenty-nine thirtieths of the language consist of combined signs, one part indicating the general sound, the other indicating the special meaning. Hence the omission of a stroke or a dot entirely alters the idea. But these signs only supply the idea; the number, gender, case, person, tense, mood, any special determination or qualification of the idea, must be expressed by an additional word. Inflection is unknown, and the syntactical relations of the words in a sentence are therefore expressed by position. The earliest Chinese alphabet consisted in the use of a knotted cord; then came Fu-hi's octangular figures; then the 'tadpole' character, consisting of waving lines and blotted heads, seen in old inscriptions, and supposed to survive in the 608 simple hieroglyphic signs for the more familiar natural objects; then the 'seal' character, still used in titles of books, inscriptions, &c. The Li and Kiai characters, now generally used, are not older than the beginning of the Christian era; and the more stiff and modern Sung character is also sometimes used in printing, the wooden types being cut out from the copy pasted on to the block. Some abstract ideas are expressed by the combination of hieroglyphs; and by processes resembling those of metonymy and synechdoche in poetry, the meaning of one hieroglyph is gradually extended by association. But from the constant use of abbreviations, and of the 'grass hand,' to which fancy lends some ornament, the old hieroglyphs themselves need interpretation. The paper used is made of the second skin of the bark of bamboo, soaked in water with lime till the woody parts are separated from the pulp. The rice-straw paper is not largely used. As in Japan, brushes, not pens or pencils, are used. Writing and printing are in perpendicular columns. While the book language remains the same, there are 200 or 300 spoken dialects, which are often unintelligible beyond their native province. The *Kwan-hwa* or Mandarin dialect is, however, used by two-thirds of the Chinese. The Canton and Amoy dialects occupy towards Mandarin the position of Latin towards French. On the Amur, and in the military garrisons all over China, in Pekin for the formal ceremonies of court, and also generally for documentary purposes, use is made of the Manchu language, the alphabet of which, representing one thousand syllables, is said to have come from the Syriac through the Nestorian communities of W. Asia, who gave it to the Mongols. Chinese largely enters into Japanese, and one-fifth of Mongol words are Chinese. The language undoubtedly presents great difficulties to strangers, not merely from the novelty of some combinations, but also from the distinction of even and inflected tones, the latter consisting of the 'rising, departing, and entering tones.' The tones are further subdivided by reference to the heavy or light initial of the syllable. There is in Chinese a great deal of what we should call slang. Thus, 'how are your venerable teeth,' is the expression for 'how old are you?' There are also many singular euphemisms: 'The guitar string is broken' means 'his wife is dead.' The Emperor never dies, he 'becomes a guest on high.' Affection for a child is expressed by the endearment of '1000 ounces of silver.' There are also many excellent proverbs in the collection called *Ming-sin-paou-kien*, and elsewhere. The most cynical is: 'There are two good men, the one dead, the other not yet born.' The singular jargon of Pidgin-English or sing-song has been made the subject of a book by Mr C. G. Leland (1876). Besides the Five King and the Four Shu (described in the article CONFUCIUS), and their numerous annotations, there is an immense mass of Chinese literature, much of it of no value. In Wylie's *Notes on Chinese Literature*, five pages are devoted to the enumeration of thirty well-known and voluminous catalogues of ancient and modern works. An acute observer (Mr H. A. Giles, in *Chinese Sketches*, 1876) says: 'More works on topography have been written in Chinese than in probably any other language, but to say that even these are read is quite another matter.' Hence from the existence of the *Ta-tsing Ye-tung-chi*, or Complete Account of the Ta-tsing Empire, in 240 volumes, and from the existence of separate statistical histories in all the provinces, we must not infer that the Chinese know much about their own country: they are on principle ignorant of all other countries. The educational books on such subjects as zoology, ethnology, botany, &c., are full of childish nonsense. The missionaries, from Father Ricci (who translated *Euclid's Elements* into Chinese) to Mr Wylie, have given the Chinese opportunities of progress in mathematics and astronomy; but although there is at present at the imperial college a distinguished mathematician, Le-sheu-lau, the author of *Tae-su-hea*, or Treatise on Algebra, nothing of importance seems to have been done. Similarly, while the medical missionaries, such as Lockhart, Dudgeon, and Maxwell, have done much to extend medical knowledge, and there is now an English Professor of Anatomy (as of other subjects) at Peking, it is doubtful whether the Chinese have advanced far since Kublai Khan founded his Medical College. A strong prejudice exists against Christian works. The continuity of Chinese historical literature was broken by the burning of books, commanded about 200 B.C. by the first Tien Emperor; but this has not prevented a large manufacture of native histories from the beginning down to the close of the Ming dynasty in 1643 A.D. Of this, the only interesting portion is the *Sai-kuo-chn*, or History of the Three States. The history of the Manchu Tartar line, named *Tong-hua-lo*, is not yet published. Among biographies, the taste for which was set by the *Yun-lu*, or Discourses of Confucius, may be mentioned the *Sing-pu*, in 120 volumes. The dramatic literature is large, and is well represented by the *Heir in Old Age*, translated by Davis from the Collection of One Hundred Plays; and in the *Chalk Circle*, translated by Julien. Several specimens of the Chinese novel have also been translated: *The Two Cousins*, by Rémusat; *The Lasting Resentment of Miss Keaon Lwau Wang*, by Thom; *The Fortunate Union;* and *The Two Young Bluestockings*, by Julien. The earliest monument of Chinese poetry is the *Shi-King*, the First Canonical Work, or Book of Sacred Songs. It describes the manners of different states and the great deeds of heroes and sages, and also contains hymns for state ceremonies. Much of this is in lines of four words, the monotony of the prevailing monosyllable being varied by its occasional repetition, so as to produce a foot. Rhymed quatrains and a cæsural pause are also used, and much of the poetry is marked by a parallelism or antithetical balance of expression. The golden age of Chinese poetry was in the 8th Christian century.

Chi'nese Green Indigo, or *Lo-Kao* of the Chinese, a green dye now much used in Europe, prepared from two species of buckthorn, viz., *Rhamnus chlorophorus* (*globosus*) and *Rhamnus utilis.*

Chi'nese Hemp. See CORCHORUS.

Chi'nese Ink. See INDIAN INK.

Chi'nese or **Chi'na Sea**, an inlet of the Pacific Ocean, enclosed on the N. by the mainland of China and Formosa, S. by Borneo, W. by Further India, and E. by the Philippines. It contains the Gulfs of Siam and Tonquin, is some 2100 miles long from the island of Formosa to Singapore, and has a maximum breadth of 900 miles.

Chi'nese Tall'ow, a white sebaceous substance covering the seeds of *Stillingia sebifera* (natural order *Euphorbiaceæ*), made into candles, &c. It is now acclimatised in Algeria.

Chi'nese Wax, a substance produced by an insect (*Coccus Pe-la*) which feeds on the Chinese ash (*Fraxinus chinensis*).

Chingleput (*Chengalpatu*, 'the brick town'), the chief town of the district of the same name, Madras, British India, 36 miles S.W. of Madras by rail. It is meanly built, but has a fortress and a large tank, which in the dry season gives off malaria. C. is in general, however, a healthy place. Pop. (1871) 7979. The French took the place in 1751, and retained it till the following year, when it was captured by Clive.—The *district* of C., which lies on the Bay of Bengal, and is poor in soil, has an area of 2619 sq. miles, and a pop. (1872) of 940,747.

Chini', a village of the Punjab, in the Himalayas, on the right bank of the Sutlej, about 80 miles N.W. of Simla, at an elevation of 8770 feet above the level of the sea. The climate is pleasant and salubrious, and eighteen varieties of the grape are said to be cultivated successfully in the district.

Chin-Kiang-Fu ('River-Guard City'), a city of China, on the Yang-tse, where it is joined by the Grand Canal, 150 miles from the sea. It was a great commercial centre till about 1853, when the Grand Canal was partly destroyed by the Tae-ping rebels, in consequence of which it has lost its importance. The pop. is said to have dwindled from 500,000 to some 500. The port was opened to foreign trade in 1858 by the Tien-tsin treaty, and in 1864 the English formed a settlement here.

Chi'non (the *Castrum Caino* of the middle ages), a town in the department of Indre-et-Loire, France, on the right bank of the Vienne, 26 miles W.S.W. of Tours. It was once fortified. From the tower, in which Jacques Molay, the last grand-master of the Knights Templars, was imprisoned, a fine view of the neighbouring country is obtained. C. has manufactures of druggets, serges, earthenware, and saltpetre, and a trade in grain, wine, brandy, honey, and prunes. In the Castle of C. Jeanne d'Arc was first presented to Charles VII. C. is also the birthplace of Rabelais. Pop. (1872) 4625.

Chin'quapin, a name applied in the Eastern States of N. America to *Quercus prinoides*, as well as to *Castanea pumila*, and in the N. Pacific region to *Castanopsis chrysophylla* of California and Oregon.

Chinsu'ra, a town on the right bank of the Hoogly, 20 miles N. of Calcutta. It is built in the Dutch style, having been a Dutch settlement till 1824, when it was ceded to Britain in exchange for possessions in Sumatra. The Hoogly College is situated here. C. is famed for its cheroots. Separate pop. about 14,000; along with Hooghly (1872) 34,761.

Chintz (Hind. *chhint*, 'spotted cotton cloth;' *chhintâ*, 'spot,' *chhintna*, 'to sprinkle'), a highly-glazed cotton fabric, the ground of which is usually light, while the pattern, brought out in flowers, foliage, birds, &c., often in four or five gaudy colours, has a spotty appearance. Owing to the glazed facing of the cloth, dust does not readily adhere to it, and therefore it is much used for bed-hangings, furniture coverings, &c.

Chiococo'a, a genus of plants of the natural order *Cinchonaceæ*, chiefly belonging to the tropical and sub-tropical regions, and consisting of small shrubs. The roots of all of them are violently emetic and cathartic, and in Brazil are used as remedies for snake-bites, though, according to Martius, it is a doubtful remedy, owing to the action of the drug being almost as dangerous as the snake-poison itself. The species chiefly used are *C. anguifuga* and *C. densifolia*. At one time it was used in Europe as a diuretic and purgative, but owing to its violent action precluding its use unless in extreme cases, it is now rarely seen in legitimate medical practice.

Chioggia, or **Chiozza**, a seaport, N. Italy, province of Venice, 15 miles S.S.W. of Venice, built on piles on an island of the same name, and connected with the isthmus of Brondolo by a bridge of forty-three arches. The harbour is protected by two forts. C. has manufactures of cordage and lace, some shipbuilding establishments, a good coasting trade, and an active fishery. Pop. 26,732.

Chio'nis and **Chio'nidæ**. See SHEATH-BILL.

Chi'os, Chi'o. See SCIO.

Chip Hats. See BRAZILIAN GRASS.

Chipp'enham (Old Eng. *Cyppenhamme*, a 'market-place'), is a parliamentary and municipal borough, Wiltshire, on the left bank of the Bristol Avon, here crossed by a handsome old stone bridge of twenty-one arches, and a station on the Great Western line, 13 miles N.E. of Bath. It has some silk and woollen manufactures; tanning and malting are carried on extensively, and there is a large flourmill. C. has a monthly market for cattle, and its cheese-market is one of the most important in the empire. Its parish church was restored (1878) at a cost of £6000. It returns one member to Parliament. Pop. (1871) of the municipal borough, 1387. C. is the place where the Danish army wintered in 878, when Alfred was in hiding in Athelney.

Chipp'eways. See INDIANS, AMERICAN.

Chiq'uichiqui Palm (*Attaleafunifera*), a palm of the N. of Brazil, which yields the Piassaba Fibre (q. v.). It is an inhabitant of swampy or flooded lands on the banks of the Rio Negro and other Venezuelan and Brazilian rivers. The leaves are used in thatching. The fibre, which is twisted into cordage, is obtained from the fibres which hang from the leaf-stalks and cover the stem. It is now exported to Britain from Pará. According to some writers, *Leopoldinia Piassaba* is the source of this fibre.

Chiquimu'la, the name of an isthmus on the eastern confines of Guatemala, Central America. Its breadth from the Caribbean Sea to the Pacific is 150 miles, no part of which exceeds an elevation of 2000 feet.

Chira'ta, or **Chirett'a**, the *Ophelia Chirata*, a plant used in medicine, belonging to the natural order *Gentianaceæ*. It is about 3 feet long, has the thickness of a goosequill, and the opposite branches flower in panicles. C. is pulled up by the root and dried. It is an excellent bitter tonic, without astringency.

Chiriqui', the name of a river in Costa Rica, Central America, which flows in a northerly direction, and is received by a deep spacious lagoon of the same name, which is separated from the Caribbean Sea by an archipelago, also called C. A mountain peak in the same state is likewise known by this appellation.

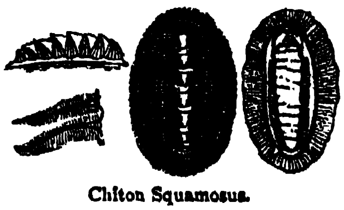
Chirr'a Pun'ji, a town on the Khasi Hills, Assam, British India, about 30 miles S. of Shillong, at an elevation of 588 feet above the sea. It is the headquarters of the Welsh Calvinistic mission. Stone is extensively quarried, and oranges and potatoes are grown for export to Calcutta. C. P. is said to be the rainiest spot in the world.

Chir'u (*Pantholops* or *Antilope Hodgsonii*), a species of Antelopes (q. v.) found in Thibet and on the Himalayan plateaux. It averages about 2½ feet in height and 5 feet in length, and possesses long annulated horns. A curious soft protuberance exists above each nostril. The C. is gregarious in its habits, and exceedingly wary and shy.

Chis'wick, a thriving village of Middlesex, on the left bank of the Thames, 7½ miles S.W. of St Paul's (London), and a station on the loop-line of the South-Western Railway. The Church of St Nicholas has monuments to Hogarth, Holland the actor, Lord Macartney, the Duchesses of Cleveland and Somerset, the Countess of Falconberg (Cromwell's third daughter), Sharp the engraver, Ugo Foscolo, and many other eminent persons. C. has breweries, coal-wharves, and many handsome villas. Here also are the nursery gardens of the Horticultural Society of London, and close by is Chiswick House, a residence of the Duke of Devonshire. Pop. (1872) 8508.

Chitine'. The solid parts of insects and other articulate animals, corresponding to the skeleton of the vertebrata, are mainly composed of this substance, which derives its name from *chiton* (Gr. 'mantle'). It may be obtained by boiling the wing-cases of beetles (best those of the cockchafer) with water, alcohol, ether, acetic acid, and solution of caustic potash in succession. Thus obtained, C. is a white horny substance, retaining the form of the texture from which it has been obtained. C. appears to belong to the group of bodies called *Glucosides* (q. v.); when boiled with dilute acids, it takes up the elements of water and splits into glucose or grape-sugar and other products. It has the composition represented by the formula $C_9H_{15}NO_6$.

Chi'ton, a genus of Gasteropodous mollusca, forming the type of the family *Chitonidæ*. These animals are distinguished from all other gasteropods by the possession of a *multivalve* shell, or one consisting of eight transverse plates which overlap each other. By means of the broad ventral foot, the chitons adhere to stones and rocks at low-water mark, after the fashion of the more familiar lampets. The gills form a series of lamellar or plate-like organs, situated posteriorly, and between the foot and the 'mantle' which lines the shell. *C. squamosus* is a familiar species, and *C. magnificus* is also well-known. Chitons of large size are met with on tropical shores.



Chiton Squamosus.

Chitt'agong, chief town of a district of the same name in the province of Bengal, British India, in the N.E. corner of the Bay of Bengal, on the Kurnafuli river. It is built on the extremity of a spur of hills, separating the Kurnafuli valley from that of the Brahmaputra. On the higher ground are situated the residences of the Europeans, while the native quarter occupies the low lands along the banks of the river. C., formerly called *Islamabad*, was selected by the Portuguese early in the 16th c. as one of their first settlements in this region, and was named by them *Xatigam* or *Porto Grande*. Their energy fostered among the natives a liking for a seafaring life, and to this day C. owns a great many of the native craft that trade about the Indian seas, and supplies a large proportion of the native seamen employed in the Indian marine and merchant service under the name of 'Lascars.' After C. passed into the hands of the English (1760) its prosperity gradually declined, as the produce of the country found its way to Calcutta through the Sunderbunds, though it still continued to build and own a fleet of native vessels, generally styled *Parriahs*. But in 1864 some European merchants began to settle in the place, and its former prosperity is again reviving. In 1873 it exported 104,565 tons of rice. During the past three years (1876-79) a portion of the jute crop of lower Bengal has been sent here for shipment instead of to Calcutta, and this trade is likely to increase. The tea-plant also flourishes, and there is now a considerable tea trade. The wood used in the construction of native vessels is called *jarool*, which, in water, is quite as durable as teak. Pop. (1872) 20,604, among whom are some descendants of the original Portuguese families.—The *district* of C. is flat for about 20 or 30 miles inland, and almost every foot of soil is cultivated. Round the villages are some fruit-trees, but there is no jungle till you reach the hills where the tea estates lie. Area 2498 sq. miles; pop. (1872) 1,127,402.

Chittagong Wood, the timber of several Indian trees, especially *Cedrela Toona* and *Chickrassia tabularis*. C. W. is valued in India for nearly all the purposes to which mahogany is applied in Britain, more especially when veined and mottled. Furniture made from it is light and beautiful, but apt to warp in dry weather.

Chittor', two strong towns in India are so named.—1. C. in the district of N. Arcot, province of Madras, 80 miles W. of Madras, on the right bank of the Puni, a feeder of the Palar, came into the possession of the British in 1801. Some remarkable ancient tombs were discovered in the neighbourhood, not unlike the Druidical remains in Britain. In the hot season (sometimes 140° in the sun) the river and tanks are dried up, and fever, ague, and dysentery prevail.—2. C., formerly the capital of the state of Odeypore, is about 270 miles S.W. of Agra, with numerous temples and buildings of note, including two richly carved towers of white marble dedicated to Siva. The fort stands on a steep isolated rock overlooking the town, and was once among the strongest in India.

Chiu'sa is the name of several small places in Italy, of which the most important are—1. **C. de Pesio**, a town in the province of Cuneo, N. Italy, 8 miles S.E. of Cuneo, with manufactures of silk and glass. Pop. 5900.—2. **C. San-Michele**, a village in the province of Turin, N. Italy, on the Dorea Ripense, at the foot of Mount Picheriano, on which stands the once famous Benedictine abbey of San-Michele, now a hospice for travellers, and the place of burial of the Sardinian kings.—3. **C. Sclafani**, a town of Sicily, province of Palermo, 33 miles S.S.W. of Palermo, with a pop. (1872) of 6840.—4. **C.**, a village of N. Italy, province of Udine, at the southern base of the Carnic Alps, on the Fella, and on the highway from Villach to Venice.

Chiu'si, a town of Central Italy, province of Siena, 37 miles S.E. of Siena, known in antiquity under the name of *Clusium*, one of the twelve Etrurian republics. It is historically famous as the residence of Lars Porsena. On the fall of the Roman Empire it was utterly destroyed. The whole valley in which it lies (*Val di Chiana*) was depopulated, and the place became a pestilential swamp. But in modern times, with improved drainage, C. is again thriving. The excavations of the last forty years have resulted in the recovery of a vast number of Etruscan remains, which are to be seen in the town's museum and also in Florence.

Chiv'alry (Fr. *chevalerie*, from *chevalier*, and hence literally meaning cavalry, in which sense the word is still occasionally used in romantic poetry) was a development under the auspices of the Christian Church of the ancient Teutonic custom, by which, after preparatory exercises, and ordeals of skill and courage, the youthful warrior was ceremoniously presented to the tribal assembly, and devoted to the public service. It must not be supposed, however, that the Church took advantage of an existing institution, and adapted it to the defence of the faith against the heathens of the middle ages. The fascination of adventure, the excitement of travel and combat, the passionate, if somewhat blind, veneration for woman, even the devotion to religion, then universally symbolised for Europe in one Church of splendid ceremonial and splendid piety; these were all strong, natural feelings, which the white dress, the fast and confession, the purification by water of the neophyte in C., his blessing by the priest, and his oath to defend the Church, served in some measure to express. Of necessity the knights were not free from the superstitious intolerance of their age; their patron saints and the Virgin Mary inspired them to acts of great cruelty and injustice. So also, as is seen in the degradation of the phrase '*par amour*,' the love of woman in the abstract, and the defence of widows and orphans, often lapsed into guilty intrigue, although the *Dame des Belles Cousines* had proved to *Jean de Saintré* that it was only true devotion to, and secret service of, one lady that could keep him free from the seven deadly sins. Even when this did not occur, the extravagant fancy of the lady sometimes imposed useless dangers on the knight, as in the combat against odds, the combat without arms, &c., while the absurd discussions of the Courts of Love (*e.g.*, on the question whether the most meritorious love was founded on report or on eyesight) readily degenerated into false notions of morality, married women being frequently chosen by the knights. This immorality increased after the Crusades, and grossly stains the *fabliaux* of Barbazan and Legrand and *Tirante le Blanc* (Valencia, 1480); while even the higher-class chronicles of *Amadis de Gaul* and Sir Thomas Malory's *Mort d'Arthur* (1470) are not free from bad morals. Much of the literature of C., however, belongs to the decline of the institution, and may have been written more for amusement than for history. The general tournaments, whether *à l'outrance* or with blunted weapons (the wooden spear-heads were called *rochets*), the special *pas d'armes*, and the judicial combats (in which the *preux chevalier* might always appear for the party without champion) no doubt fostered military skill, and gave the sanction of public renown to the duties of C. One of the most notable of these *pas*, mentioned by Froissart, in whose history is the best contemporary account of military C., was the Just of St Inglebert, or Sandzing Fields, at which three French knights withstood all comers. The custom of tournaments was shaken by the death in the lists of Henri II. of France (1559). The course of education in C. began when the *page* (about the age of twelve) was placed in the household of some knight or at the royal court, where he learned the use of horses and of arms, the art of hunting, and the duty of serving at table. There was a gentleman-page in the family of Buccleuch so late as the beginning of the 18th c. The page became a squire (Old Fr. *escuyer*, from Lat. *scutarius*, the *scutum* or 'shield'-bearer), who acted as groom and personal attendant on the knight, was entitled himself to carry a shield, and from whom the social accomplishments of the time were expected. If an esquire took a prisoner, the ransom belonged to his master. Later on, there arose a class of independent esquires, who, though never entitled to wear gilded spurs or a complete hauberk, had their own armorial bearings, and led their followers to battle under a pennoncele, or small triangular banner. At the age of twenty-one the squire received the *accolade*, or stroke of knighthood, generally from the knight he had served. This ceremony, performed sometimes on field of battle, often in church, or at a *cour plénière*, consisted in the squire, who had laid aside his brown coat and put on armour, receiving helmet, sword, and spurs, and being dubbed 'Sir' or 'Messire,' 'in the name of God and St Michael,' or with some other religious formula. Knighthood was a military rank, and conferred the right of assembling, and leading under a swallow-tailed pennon, at least 1000 men. Hence the power of conferring it was latterly monopolised by sovereigns; the knighting of Francis I. by Bayard being altogether exceptional. The surcoat, and the triangular *heater* or buckler shield (both of which bore the scutcheon of the knight), the dagger of mercy, the crest and device (which, like the scutcheon, became hereditary), were characteristic parts of the knight's equipment. When the knights-bachelor had in many cases become poor adventurers, living on the spoils of war or of the tourney, the order of knight-banneret was instituted. This was chiefly a military distinction, confined to knights of wealth and position who could bring to the field fifty men-at-arms with corresponding archers and crossbowmen. It was conferred by the commander-in-chief, who ordered the forked tails of the pennon to be cut off, thus converting it into a rectangular banner. In England a 'banneret' was one who had received knighthood on a field where the royal standard was displayed. The English order of the Garter was instituted by Edward III. after the jealousy of Philippe VI. had destroyed his project of a Round Table at Windsor. The courts of Europe introduced many ornamental titles, which were conferred on royal or noble infants by right of blood as well as on capable knights; and the degree of baronet, invented by James I. ostensibly to encourage the settlements in Nova Scotia and Ulster, being hereditary, was quite opposed to the principles of C. Disgrace of knights occurred on conviction of a heinous crime, or on defeat in the appeal to the judgment of God by single combat. Besides the loss of spurs and swords, peculiar bearings, called abatements, were given by the heralds to disgraced knights. C. first came into definite shape at the end of the 10th c.; its most brilliant period was in the 14th c., and it speedily declined before the introduction of regular mercenary troops, a movement initiated by Charles VII. of France (1445). See Sir Walter Scott's *Essay on C.* in *C., Romance, and the Drama*; St Palaye's *Chevalerie, considérée comme un Établissement Politique et Militaire* (Par. 1759–81); and Büsching's *Ritterzeit una Ritterwesen* (2 vols. Leips. 1823).

Chiv'alry, Court of, a court of which the Earl Marshal and Lord High Constable were judges. When it was merely a court of honour, the Earl Marshal presided alone, but both judges sat when it was a criminal court. This jurisdiction was established by Edward III., but when it was found to encroach on the common law, its sphere was defined by Richard II. It gave relief in matters of honour to such of the nobility and gentry as proved that they had been oppressed, and it guarded the distinctions of degrees and of quality. It is now quite a thing of the past.

Chivass'o, a town in the province of Turin, N. Italy, on the left bank of the Po, 15 miles N.E. of Turin by railway, has manufactures of earthenware, soap, and bricks, and is noted for its lampreys. The French razed the fortifications of C. in 1804. Pop. (1871) 7841.

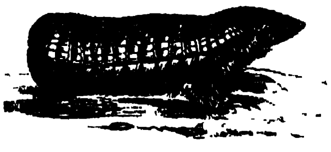
Chive, or **Cive** (*Allium Schœnoprasum*), a plant of the natural order *Liliaceæ*, and a cogener of the leek and onion. See ALLIUM. It is a native of marshy or flooded places in Europe and Asia, and is a rare plant of Britain. It is, however, a common garden vegetable, used for flavouring soups and dishes, in much the same way that onions are.

Chiz'erot, or **Bu'rin,** a name applied to several communities scattered over Sermoyer, Arbigny, Boz, and Ozan, communes of the department of Ain, and the arrondissement of Bourg-en-Bresse, canton Pont de Vaux. Like the Marans of Auvergne and the Lyzelards of St Omer, they do not intermarry with their neighbours, who hold them in contempt. They are chiefly labourers, cattle-breeders, and butchers, and are both industrious and rich. The women are fair, pretty, with quick black eyes, and form rather inclined to roundness. An incredible legend gives them a Saracenic origin. The Sermoyers, in particular, have come into collision with their neighbours about the pastures of the Saône.

Chlad'ni, Ernst Florenz Friedrich, the founder of the true theory of acoustics and music, was born, November 30, 1756, at Wittenberg. He travelled for many years through Germany, Holland, France, Italy, Russia, and Denmark, expounding his discoveries in popular lectures, and died, April 3, 1827, at Breslau. His principal works are—*Entdeckungen über die Theorie des Klanges* (1787); *Akustik* (1802, 2d ed. 1830); *Neue Beiträge für Akustik* (1817); *Beiträge zur prakt. Akustik und zur Lehre vom Instrumentenbau* (1822). See Bernhardt's *Dr Ernst C., der Akustiker* (Wittenb. 1856).

Chlæna'ceæ, a small order of Dicotyledonous trees and shrubs, containing only eight species, all natives of Madagascar. *Sarcolæna* and *Leptolæna* are examples of the genera, of which there are four described, but the properties or uses of none of the species are known. They are closely allied to *Sterculiaceæ.*

Chlamyph'orus, a genus of Edentate (q. v.) mammals (see also ARMADILLO) allied to the *Dasypodidæ* or armadilloes of S. America, and represented by the species *C. truncatus* of Chili, the average length of which is about 6 inches. The C. is sometimes known as the 'pichiciago.' As in other armadilloes, the integument secretes bony plates, and these are disposed in C. in the form of an armour-casing of square plates, investing the top of the head, back, and hind quarters, the plates terminating abruptly at the hind quarters. The other parts of the body are covered with a silky fur. The feet are provided with strong claws adapted for digging. The tail is scaly, and is generally applied closely to the belly; but it has been suggested that it may be used for throwing out the earth behind the animal as it burrows forwards.



Chlamyphorus truncatus.

Chlo'picki, Joseph, a Polish soldier and patriot, was born in Galicia in 1772, and fought under Kosciusko in 1787. He subsequently served under Bonaparte, commanding the Polish legion at Eylau and Friedland during the Russian campaign. In 1814, on his return to Poland, he was well received by the Czar Alexander; but when the Polish insurrection of 1830 broke out, he was called upon by his countrymen, and made Dictator. The following year he resigned the office, on account of differences with colleagues of more extreme views. After the insurrection was crushed, he retired into private life. He died at Cracow, 30th September 1854.

Chlo'ral is a substance which of late years has become of great importance on account of its narcotic properties. It was discovered by Liebig in 1832, but was first employed in medicine many years later by Liebreich. To prepare C. dry chlorine gas is passed into absolute alcohol as long as it is absorbed. The resulting liquid is then mixed with three times its volume of sulphuric acid, and allowed to remain for some time at rest, when it separates into two layers. The upper of these is C.; it is siphoned off and purified by rectification. C. is a colourless liquid, possessing a peculiar and disagreeable odour and taste. Its specific gravity is 1·802, and it boils at 99·6°. Its composition is represented by the formula C_2Cl_3OH. C. is *Aldehyde* (C_2H_3OH) (q. v.), in which three atoms of hydrogen are replaced by chlorine. C. unites with water to form a crystalline hydrate ($C_2Cl_3OHH_2O$). This hydrate is the preparation of C. used in medicine. Administered internally or by subcutaneous injection in doses of about 30 grains, it speedily procures sleep. Treated with alkalies, C. splits into formic acid and chloroform—a decomposition which by many has been supposed to occur in the body, thus explaining the therapeutic action of C. On account of the high price of alcohol in this country (owing to the duty), C. is chiefly manufactured on the Continent.

Chlorantha'ceæ, a natural order of Dicotyledonous plants, natives of tropical regions. There are about fifteen species, which possess aromatic stimulant properties. The roots of *Chloranthus officinalis* and *C. brachystachys* are used in Java as stimulants in malignant fevers, &c., and as anti-spasmodics. The flowers of *C. inconspicuus* (the 'chu-lan' of the Chinese) are used in China to give the 'cowslip flavour' to tea. Species of *Hedyosmum* are used in the W. Indies for much the same medical purposes as *Chloranthus.*

Chlo'rate of Potash is the potassium salt of chloric acid ($HClO_3$), and has become of importance in the manufacture of fireworks, of oxygen gas for the Lime Light (q. v.), and of Safety Matches (q. v.). Its composition is represented by the formula $KClO_3$. It is prepared commercially by acting upon a warm solution of chloride of potassium, in which slaked lime is suspended, with chlorine gas, when in addition to C. of P., chloride of calcium is produced—

$$\underbrace{KCl}_{\text{Chloride of potassium.}} + \underbrace{3Cl_2}_{\text{Chlorine.}} + \underbrace{3CaH_2O_2}_{\text{Slaked lime.}} = \underbrace{KClO_3}_{\text{Chlorate of potash.}} + \underbrace{3CaCl_2}_{\text{Chloride of calcium.}} + \underbrace{3H_2O.}_{\text{Water.}}$$

The solution containing the two salts is evaporated, and when sufficiently concentrated, allowed to cool. C. of P. being far less soluble than chloride of calcium, crystallises out and leaves the latter salt in solution. C. of P. gives up the whole of its oxygen when heated, a reaction which is turned to account in the preparation of that gas.

$$\underbrace{2KClO_3}_{\text{Chlorate of potash.}} = \underbrace{2KCl}_{\text{Chloride of potassium.}} + \underbrace{3O_2}_{\text{Oxygen.}}$$

Mixed with charcoal, sulphur, or other oxidisable substances, it forms explosive or combustible mixtures, largely used in pyrotechny. C. of P. is also employed in medicine.

Chlorim'etry is the process by which the available chlorine in *bleaching powder* or *chloride of lime* is determined. By available chlorine is understood the chlorine which is set free when the bleaching powder is treated with an acid. The following is one of the many chlorimetric methods which are in use : it depends upon the oxidising properties of chlorine in presence of water. When arsenious acid is added to a solution of chloride of lime, the chlorine in the latter by removing hydrogen from the water sets free oxygen, which in the nascent state converts the arsenious acid (As_2O_3) into arsenic acid (As_2O_5). Thus

$$\underbrace{As_2O_3}_{\text{Arsenious acid.}} + \underbrace{2H_2O}_{\text{Water.}} + \underbrace{2Cl_2}_{\text{Chlorine.}} = \underbrace{4HCl}_{\text{Hydrochloric acid.}} + \underbrace{As_2O_5}_{\text{Arsenic acid.}}$$

From the amount of arsenious acid which can thus be converted into arsenic acid by a given weight of chloride of lime, the quantity of available chlorine in the latter can be determined. The actual process is as follows :—10 grammes of the bleaching powder to be tested are rubbed in a mortar with water, the mixture decanted into a flask, and the mortar rinsed out with water, which is also put into the flask. The contents of the flask are then diluted till they occupy 1 litre. Next a standard solution of arsenious acid is prepared by warming 6·972 grammes of the acid with a solution of 10 grammes of dry carbonate of soda, till it is dissolved. The solution when cold is diluted to 1 litre. The solutions having been thus prepared, 50 cubic centimetres of the chloride of lime solution (equivalent to 0·5 grammes by weight) are placed in a flask or beaker, and the solution of arsenious acid gradually added from a burette, till a drop of the mixture ceases to strike a blue colour, when placed on a slip of paper which has been soaked in starch paste to which a little iodide of potassium has been added. When this point has been reached, all the available chlorine in the bleaching powder has been used up to oxidise the arsenious acid. With the above quantities every cubic centimetre of the arsenious acid solution is equivalent to 1 per cent. of available chlorine, hence the number of cubic centimetres added to the chloride of lime also represents the percentage of available chlorine in the latter.

Chlo'rine is one of the non-metallic elements, and under ordinary conditions is gaseous. It was discovered in 1774 by Scheele, and was called by him *dephlogisticated muriatic acid.* Sir Humphrey Davy first recognised its true nature, and gave it the name of chlorine from the Greek word *chloros*, signifying pale green.

C. occurs in nature in combination with metals : chloride of sodium or common salt being its most abundant compound. C. may be obtained by heating hydrochloric acid with binoxide of manganese, water and chloride of manganese being the other products of the reaction—

$$\underbrace{4HCl}_{\text{Hydrochloric acid.}} + \underbrace{MnO_2}_{\text{Binoxide of manganese.}} = \underbrace{MnCl_2}_{\text{Chloride of manganese.}} + \underbrace{2H_2O}_{\text{Water.}} + \underbrace{Cl_2}_{\text{Chlorine.}}$$

also, and more economically, by heating a mixture of common salt, sulphuric acid, and binoxide of manganese—

$$\underbrace{2NaCl}_{\text{Chloride of sodium.}} + \underbrace{2H_2SO_4}_{\text{Sulphuric acid.}} + \underbrace{MnO_2}_{\text{Binoxide of manganese.}} = \underbrace{MnSO_4}_{\text{Sulphate of manganese.}} + \underbrace{Na_2SO_4}_{\text{Sulphate of soda.}} + \underbrace{2H_2O}_{\text{Water.}} + \underbrace{Cl_2}_{\text{Chlorine.}}$$

C. at ordinary temperature is a greenish-yellow gas, highly irritating to the lungs and mucous membranes, and exerting a corrosive action on all organised tissues. It is soluble to a considerable extent in water, and forms with that liquid, at a temperature of 0° C., a crystalline compound ($Cl_2 10H_2O$). Under a pressure of four atmospheres C. condenses to a yellow liquid, but this liquid has never been frozen. C. is not itself combustible, but is a supporter of combustion. A candle burns with a smoky flame when plunged into it. Copper and antimony, in a state of fine division, ignite spontaneously when introduced into the gas. C. has a very strong affinity for hydrogen, and forms with it an important compound called hydrochloric acid. A mixture of C. and hydrogen may be made in the dark without combination taking place, but if this mixture be ignited, an electric spark passed through it, or even be brought into sunlight, the two gases combine with a powerful explosion. The bleaching properties of C. are entirely due to its strong affinity for hydrogen. Moistened coloured fabrics at once lose their colour if plunged into C., but unless they be moist no effect is produced. The reason for this is, that the C. seizes on the hydrogen of the water to form hydrochloric acid, whilst oxygen (the other constituent of water) in the nascent state combines with the colouring matters, forming colourless compounds. C. is employed in immense quantities in the manufacture of *Bleaching Powder* (q. v.). Diffused in small quantities in the air, it is an admirable disinfectant. C. forms important compounds with the other elements, which will be considered elsewhere. Its compounds with oxygen are for the greater part unstable and readily explosive. C. has an atomic weight of 35·5, and the symbol for its atom is Cl.

Chloroc'odon, a genus of Natal climbing plants belonging to the natural order *Asclepiadaceæ.* The roots, *C. Whitei,* are used by the native tribes under the name of 'mundi' or 'mindi' as a stomachic.

Chlor'oform is a substance of immense value to the surgeon as an anæsthetic. It was discovered almost simultaneously by Soubeiran in France and by Liebig in Germany in 1831. The latter chemist, believing it to be a compound of carbon and chlorine, gave it the name of *perchloride* or *terchloride of carbon* ; but in 1835 Dumas discovered its true composition, and observing that when treated with caustic potash, formic acid and chloride of potassium resulted, gave it its present name of C. Its anæsthetic properties were first recognised by Simpson and Bell.

C. is obtained by distilling a mixture of water, lime, chloride of lime (bleaching powder), and alcohol, when it passes over along with water, and is caught in the receiver. Being much heavier than water, C. is readily separated from it by decantation ; it is next washed with water to remove alcohol, and later with a solution of carbonate of potash ; afterwards it is dried with chloride of calcium and rectified. C. is a colourless mobile liquid of sp. gr. 1·48, and boils at 60·8° C. ; it has a pleasant odour and sweet taste. It is an excellent solvent of caoutchouc, phosphorus, iodine, fats, many alkaloids, &c. Good C. is known by the following characters :—It should produce no colour when agitated with oil of vitriol, and no turbidity when mixed with a little water ; a few drops evaporated on the hand should leave no unpleasant odour. C. contains carbon, hydrogen, and chlorine, and has the composition expressed by the formula $CHCl_3$.

For the use of C. as a medicine, see ANÆSTHESIA.

Chlor'ophyll, literally leaf-green (Gr. *chlorôs*, green ; *phyllon*, leaf), the substance in the cells of Plants (q. v.) which gives the green colour to the leaves, stems, &c., of plants. In the higher plants C. occurs in grains, each grain consisting of a plastic material and the colouring matter. According to Sachs, starch is formed by the C. granules ; but this view, like many others of the same botanist, rests more upon imagination than fact. Withdrawn from the action of light the plant develops no C., and it has also been found that the presence of iron is essential to its formation. At one time it was believed to be only present in plants, but it is now known to give the green colour to *Hydra viridis*, *Stentor*, &c. The very various and often contradictory views which are held regarding it may be found stated in Brown's *Manual*, pp. 23-33, 219, and in Sachs' *Lehrbuch*, and in other recent works.

Chlo'rops. See CORN-FLY and WHEAT-FLY.

Chloro'sis, 'green sickness,' 'pallor of virgins,' is a peculiar form of Anæmia (q. v.), common in young girls about the age of puberty, characterised by excess of serum in the blood, and diminution of the red blood corpuscles. The countenance is of a pale waxy hue, the appetite is depraved, and there is irregular menstruation. The proper treatment consists in restoring the functions of the body by good food, plenty of fresh air, and the use of iron tonics.

Chloro'sis, in botany, a disease of plants, consisting of a pallid condition, 'in which the tissues are weak and unable to contend against severe changes, and the cells are more or less destitute of chlorophyll.' It may exist in plants exposed to direct light, and often the best culture will not restore the health of the plant. It is often beyond cure, but the best remedy, according to Mr Berkley, is to water the plant with a very weak solution of sulphate of iron.

Chlorosper'meæ, one of three divisions of *Algæ* or sea-weeds, comprising three species, which have green spores; most of them have also green fronds.

Cho'card, or **Choquard**, the name given to a genus of *Corvidæ* or crows, allied to the choughs, but possessing a shorter bill than the last-named genus. The Alpine crow (*Pyrrhocorax Alpinus*) is the typical species of this genus.

Cho'co, a name given in the U. S. of Colombia, S. America, to a province and a bay. The first lies on the coast of the Pacific, in the state of Cauca, and has for its principal town Novita. The second forms the S. part of the Gulf of Darien.

Cho'colate (Sp. *chocolate*, from Mexican *chocolatl; choco*, 'cocoa,' and *latl*, 'water'), the ground seeds of *Theobroma Cacao* (see COCOA) made into a paste and mixed with sugar and various spices, and then formed into moulds and allowed to harden. It is eaten either solid, or dissolved in hot water, and taken like tea or cocoa. It is extensively used, especially on the Continent, and its nourishing qualities were proved during the siege of Paris in 1870-71, when it formed a great portion of the food of the inhabitants. It is adulterated with rice, meal, oatmeal, flour, starch, &c., and with benzoin, storax, &c., in place of vanilla and the other spices used to flavour it.

Chocolate Tree.

Cho'colate Root. See GEUM.

Choir (Fr. *chœur*, Lat. *chorus*, see CHORUS), that part of a cathedral extending eastward from the nave to the altar, and including the whole area set apart for the celebration of the services of the church. It is generally raised, at least, one step above the nave, and around its sides are rows of seats or stalls. The term is also applied to the staff of choristers or singers of a cathedral or church.

Choir-screen, a partition of open work in wood or stone surrounding the C., and separating it from the nave and side aisles. It is often encircled with niches, statues, &c., which are sometimes coloured and gilt.

Choi'seul, an ancient French family, which takes its name from the lands of C. in Champagne. According to Viguier, its founder was a certain Comte de Bassigny and de Boulogne-sur-Mer, who flourished in the 10th c.; but le Laboureur, whose opinion is more weighty, considers the family an offshoot of the old Comtes de Langres. It was in time divided into four great branches—C.-Beaupré, C.-Gouffier, C.-Praslin, and C.-Stainville—all of which are historically conspicuous, and furnished soldiers, prelates, and statesmen to their country. The last, however, which originated in the marriage of a C.-Beaupré (d. 1711) with his cousin-german Nicole de Stainville, may be regarded as the most illustrious. To it belongs **Etienne François, Duc de C.**, the ablest and most patriotic French statesman in the latter half of the 18th c. He was born 28th June 1719. After serving as Comte de Stainville with credit in the wars with Austria, he obtained the favour of the reigning mistress of Louis XV., Madame de Pompadour, and, through her, was appointed ambassador to Rome and Vienna (1756), and raised to the dignity of Duc de C. (1758). Under her he became in reality Prime Minister of France, and made himself very popular by a series of able diplomatic measures. He arranged the 'Family Compact' of the Bourbon sovereigns, secured for his country at the disastrous close of the war in 1763 better terms than had been expected, extended French commerce and influence especially in the W. Indies, where Domingo, Martinique, and Guadeloupe rose into importance, expelled the Jesuits (1764), and almost succeeded in freeing the Church of France from papal authority. For some years after the death of Madame de Pompadour, his influence in France and Europe continued great, and he was nicknamed by the Empress of Russia *Le Cocher de l'Europe* ('The Driver of Europe'). The rise of Madame Dubarry proved fatal to C.'s power, however, and he was compelled (1770) to retire to his estate at Chanteloup. His advice in political matters was frequently taken in the early part of the reign of Louis XVI. He died May 7, 1785. See the *Mémoires de M. le Duc E. F. de C., écrits par lui-même*, and Soulavie's *Mémoire de M. le Duc E. F. de C.*

Choke-damp remains in coal mines after an explosion of *fire-damp*, and consists of Carbonic Acid (q. v.).

Cho'king, in the human subject, may be caused by any substance, as a piece of meat, being arrested in its passage downwards, before it reaches the stomach, and producing suffocation by pressing on the Trachea (q. v.) or Larynx (q. v.), or by spasm of the muscles of those parts. Unless the obstruction be removed it may speedily produce death. The patient should be made to vomit by tickling the back part of his throat, or should try to force the substance down into the stomach by drinking water.

Chol'era, most probably from *cholas*, the bowels, and *rheo*, to flow, is one of the most fatal diseases known to man. The suddenness of the attack, the severity of the symptoms, and the great mortality of those affected, all tend to render it one of the most dreaded of diseases. The most prominent symptoms of C. are vertigo, a feeling of oppression in the præcordial region, nausea, vomiting, griping pains in the abdomen, frequent watery purging (the stools resembling rice-water), suppression of urine, and profuse perspiration. As the disease advances, there is coldness of the extremities; the skin of the hands and feet becomes shrivelled and dusky; the eyes sunken, the features pinched, cramps are felt in the limbs; there is oppressed breathing, intense thirst, rapid and small pulse, and sepulchral voice; the skin becomes cold and clammy, and a peculiar sickly odour is exhaled from the body, breath, and ejections. Reaction may supervene, or the disease may terminate within a few hours in fatal collapse. The early Sanskrit writers describe a disease called 'Vishuka,' the symptoms of which are identical with those of C. Hippocrates and Galen describe a similar disease in Europe, and Whang-shooho in China. Gaspar Correa, a Portuguese, was the first European who described an epidemic outbreak in Hindustan in 1503, and Sydenham states that C. morbus was raging in London in 1676. C. is endemic in the valley of the Ganges, and in all the large towns along the seaboard of British India, including Chittagong, and part of the Pegu division; but it frequently passes out of the endemic area, and becomes epidemic. C. has visited almost every country, the exceptions being remote islands and isolated populations. Great Britain has been visited four times within the present century (1831-32, 1848-49, 1853-54, and 1865-66). The first and second epidemics were the most fatal, and they were followed by many important sanitary improvements. The second epidemic cost England and Wales 55,181 lives; the third, 24,516; and the fourth, 15,669.

In 1866 there were 1170 deaths from C. in Scotland; several counties escaped, and in many the cases of C. were sterile. Aberdeen, Forfar, Fife, and Edinburgh were those most severely visited. The ravages of C. had been so destructive in Europe, that an international sanitary conference was held at Constantinople in 1866, and a second at Vienna in 1874, to determine regarding the origin, transmissibility, and prophylaxis of the disease. The late conference was attended by delegates from every European state, and also from Egypt and Persia. C. is propagated along the highways of human intercourse, and its dissemination bears definite relations to that intercourse. The morbific agent contained in the *fomes* of C. patients, produces the same disease in others: it is probably less active when newly evacuated; so that excreta should be removed at once, and tainted clothing should be washed before the matter is allowed to become dry. The poison may enter the system by the respiratory passage from its being held in suspension, in connection with gaseous emanations, from C. dejecta in a confined atmosphere; or as an impalpable dust from dried excreta, and in this form it may be carried for a short distance by air currents; or it may enter by the digestive passages in connection with food or drink. The poison has the property of imparting its infective power to large volumes of water, and the danger to which a community is exposed is in exact proportion to the liability of its water supply being contaminated with C. excreta. A solitary case may be sterile, or may give rise to a general epidemic, according as the conditions for propagation are present or absent. The dejecta of a C. patient, gaining access by leakage or soakage to wells or reservoirs of drinking water, may thus give rise to a local or a general epidemic, and the mortality may be comprised within a few days, or extended over weeks or months. At Mecca, in 1865, where the pilgrims used a *single* or common water supply, there were 10,000 deaths in about six days; and in Zanzibar, in 1869, where there were many wells liable to contamination, there were 10,000 deaths within six weeks. C. is propagated to distant localities in a few days by those suffering from the disease during the period of incubation; or by means of contaminated clothing, the morbific matter being capable of producing its effects after fifteen or more days; but there is every reason to suppose that excrement-tainted water and air are the essential conditions of its local spread. Sanitary and hygienic measures, necessary for the maintenance of the general good health of a community, are sufficient to secure it against the ravages of C., and powers to enforce such measures are vested in local authorities. There is no disinfectant known which has the power of destroying the germs of the disease, but several are of great value, and should be used freely, such as chloride of lime, cupralum, ferralum, terebine, &c. There is no known antidote to the disease, but the administration of carbolic acid, on the first accession of symptoms, has been attended with favourable results. The treatment varies according to the stage of the disease, and, as it often runs a rapidly fatal course, no definite rule can be laid down applicable to all cases. C. being a filth disease, will disappear when communities are sufficiently enlightened to prosecute sanitary improvements. See Macnamara's *Treatise on Asiatic C.* (Lond. 1870); *Supplementary Report for* 1875 *of the Medical Officer of the Privy Council and Local Government Board; Papers concerning the European Relations of Asiatic C.;* and Christie's *C. Epidemics in East Africa* (Lond. 1876).

Choles'terine (*kolē*, bile, and *steros*, solid) is a crystalline substance, which was discovered by Conradi in 1775 in human gall-stones. It occurs also as a normal constituent of bile; in the brain, spinal marrow, and yolk of egg, and in various morbid growths. It has also been found in plants, in peas, maize, olives, &c. C. is readily obtained by boiling crushed biliary calculi with alcohol and a little caustic potash, the solution when filtered and evaporated depositing it in nacreous laminæ. C. possesses the properties of an Alcohol (q. v.), and is usually regarded as such. Its composition is expressed by the formula $C_{26}H_{43}(OH)$.

Chol'et, a town in the department of Maine-et-Loire, France, on the Maine, 32 miles S.S.W. of Angers by railway, has large manufactures of cambric, calicoes, flannels, &c., and an active trade in corn, cattle, and wine. The republicans gained two decisive victories at C. during the Vendean war in 1793. Pop. (1872) 11,328.

Cholu'la, an ancient town of Mexico, state of Puebla, 60 miles E.S.E. of the city of Mexico, on the tableland of Anahuac, and 6912 feet above the sea. It was the second largest city of the Aztecs, and at the time of the Spanish invasion had 20,000 houses and 400 temples. It is now rich in remains, the principal of which is the pyramidal temple of the Quetzalcoatl, 177 feet high, now surmounted by a Catholic church. Pop. 5000.

Chon'da, a village in the protected state of Gwalior, India, 18 miles N.W. of the town of Gwalior, and notable as the place where Sir Hugh Gough signally defeated the Mahrattas, December 29, 1843.

Chon'drin, a substance obtained by boiling the cartilages of the ribs, larynx, or joints in water for forty-eight hours, allowing the fluid to gelatinise, and treating the residue with ether to free it from fat. When dry, C. is a hard, horny, translucent substance, dissolving in hot water, but insoluble in alcohol or ether. It is precipitated by all acids, as well as by alum, sulphate of alumina, acetate of lead, sulphate of copper, ferric and ferrous sulphates, and mercuric nitrates. It cannot be supposed to exist as C. in the body, but is the chemical result of certain substances after prolonged boiling in water.

Chondroden'drum, a genus of climbing shrubs belonging to the order *Menispermaceæ*. *C. convolvulaceum* is the wild grape of the Peruvians, so called on account of the form and flavour of its fruits being not unlike that of the vine. The bark is used as a febrifuge.

Chon'etes, an important genus of extinct Brachiopodous shellfish, belonging to the family *Productidæ*. They occur in Silurian and Devonian, but especially in Carboniferous rocks. The shell is concavo-convex, of oblong shape, and with a straight hinge-line. A row of tubular spines exists at the hinge-area of the ventral valve.

Cho'nos Archipelago consists of two large and about thirty small islands, which lie along a part of the W. coast off Patagonia, and to the S. of the Chilian island of Chiloe. They are extremely barren, and are inhabited only by a few tribes of Chonos, who live by fishing.

Cho'pin, Frederic Francis, a Polish musician, was born 1st March 1809, near Warsaw, where he studied music under Elsner. Exiled after the revolution of 1830, he took up his abode in Paris. There he was personally very popular; his music also was much admired, but his health was bad, and he suffered much from depression of spirits. He visited England in 1848, and was most cordially received, but the journey seems to have been too much for his strength. He died in Paris, 17th October 1849. He wrote largely for the pianoforte, chiefly in the form of nocturnes, polonaises, waltzes, &c.; his compositions are full of poetry and imagination. A monument was erected to him at Warsaw in 1869. See the sketches of Liszt (1852), Barbadette (2d ed. 1869), and Karasowski (1877).

Chop'in, a liquid measure in use before the present system of weights and measures was sanctioned by Act of Parliament. It contained in England ½ pint. In Scotland (under the form *Chapin* or *Chappin*) the name is still applied to a measure, used especially for milk, which is equal to a wine quart.

Chora'gic Monuments. The Choregus was the Athenian citizen appointed by his tribe to provide the various choruses that took part in the festive and religious celebrations. The Choregus who was thought to have best discharged this duty received a tripod as a prize. He had, however, to pay the cost not only of the prize itself, but also of erecting a chapel in which it was dedicated. A street in Athens contained so many of these monuments that it was called the Street of the Tripods. The names of the Choregus and his tribe were inscribed on the monument.

Chora'le, the psalm or hymn tune of the Protestant churches of Germany. It has generally a simple diatonic melody, which is sung in unison by the congregation, the harmonies being supplied by the organ, and sometimes by a choir and orchestra. The C. appears frequently in the works of the great German composers, and notably in those of Johann Sebastian Bach (q. v.). Bach's harmonies to many of the old Church melodies, while retaining an ancient form and ancient strict adherence to rule, remain unsurpassed and unsurpassable in intrinsic beauty, and give to the bare melody wonderful richness and loftiness.

Cho'ral Music, a term applied generally to all music written for a choir or chorus having a number of voices in each part. It includes, therefore, oratorios, cantatas, masses, motetts, and most anthems, as well as part songs, madrigals, &c., although it is not often used for the latter. See CHORUS.

Choral Service, the service of the Church of England as generally performed in cathedrals, with intoned responses and psalms, and the use of music throughout wherever it is authorised.

Chord, in music, a combination of notes performed simultaneously. Chords may be consonant or dissonant (see CONSONANCE), according to whether the intervals between each one of the notes of the C. and every other are concords or not. The consonant chords are those known as 'common' chords, and consist of a note with a third and fifth above it, or their octaves. When the combination is so made that either the third or the fifth are below the fundamental note itself, the C. is said to be inverted. Common chords may be built upon all the notes of the scale, but the C. of the Mediant (Si or Me) is seldom required, and that of Sub-tonic (Mi or Te) has an imperfect fifth, and on this account has often been excluded from the list of consonant chords. It is so very similar in effect to the much commoner common C. of the dominant with the seventh added ('dominant seventh' C.), that it is in any case unimportant. Common chords are called major or minor, according to the nature of their third. A seventh, a ninth, and so on, may be added to the common chords, and dissonant chords thus constructed. All these chords have their inversions like the common chords, and by this means they have immense variety in construction and effect. The ear can take pleasure in dissonance as well as consonance, but it cannot dwell upon the former as it can upon the latter, and for this reason the rules of Harmony (q. v.) prescribe certain *resolutions* of the sevenths, ninths, &c., which require to be attended to in all cases except those in which some special effect can be gained by disregarding them. One of the most useful dissonant chords found in modern music is known as the C. of the *diminished seventh*, and consists of three minor thirds, one above the other, as, for example, the G♯BDF. Besides its own peculiar effects, which vary very much with the notes of the key of which it is composed, it offers specially great facilities for modulation.

Chord, in geometry, is the straight line joining the extremities of an arc. Tables of chords, so common in old trigonometrical tables, are now superseded by tables of sines, which are much more convenient for calculating purposes. *C. of Curvature* is any C. of the circle of curvature drawn from the point whose curvature is represented by this circle.

Chor'dadorsa'lis, a name given to a delicate semi-transparent thread, at first cellular, but afterwards cartilaginous, which appears beneath the primitive groove in the early embryo. It is seen in the chick as early as three to eighteen hours after incubation. It ultimately contributes to the formation of the bodies of the vertebræ, part of it remaining persistent in the form of the intervertebral discs. It remains persistent in its cartilaginous condition in the lowest or Myxenoid fishes, such as in the lancelet or *Amphioxus lanceolatus*, the lamprey, the sharks, rays, and the *Chimæra*. See EMBRYO.

Chor'dæ Voca'les are the true vocal chords found in the larynx or organ of voice. They are the superior *thyro-arytenoid* ligaments. Attached by one border to the side of the larynx, the other border is free, and by its vibrations, caused by the current of air forced upwards through the trachea by the lungs, voice is produced. See LARYNX, VOICE.

Chore'a (Gr. *choreia*, a dancing or jumping), St Vitus' Dance, is an affection of the nervous system, characterised by peculiar tremulous movements of certain of the voluntary muscles especially of the face and limbs. It generally occurs in children from six to sixteen years of age, and is more common in girls than boys. C. may be caused by worms, fright, blows, teething, &c. It may be regarded as a form of bad health, and the proper treatment is to try to remove the cause by the use of good nourishing food, with iron tonics. Special attention should be paid to the bowels.

Cho'rion. At an early period of development of the mammalian ovum, the surface is found clothed with a covering having numerous villi or shaggy tufts upon it. This is the C. A description of its further development will be found under EMBRYO and PLACENTA.

Choris'ia is a genus of small prickly-stemmed trees of S. America, belonging to the natural order *Sterculiaceæ*. The silky hairs which cover the seeds of *C. speciosa* are used in Brazil (where it is known as *Arvore de Paina*) for stuffing cushions, pillows, &c. The tough bark of *C. crispiflora* is used in the same country for making cordage.

Chor'ley, a flourishing town of Lancashire, on the Chor, 25 miles N.E. of Liverpool by railway, with manufactures of muslins, calicoes, cotton yarn, ginghams, and jaconets. There are also numerous bleachfields and dye-works, and near the town are several coal, lead, and iron mines, and quarries of millstones and slates. Pop. (1871) 16,864.

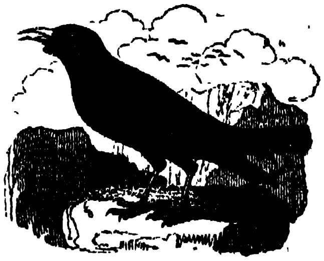
Chor'oid, a term applied in anatomy to various textures characterised by a shaggy appearance and a rich supply of blood-vessels. There is the C. plexus (see CEREBRUM) and the C. coat of the eye (see EYE).

Cho'rus, in music, signifies both a composition for numerous voices and the singers who perform the composition. Choruses are commonly parts of some large work, such as an opera or oratorio. In the former they are generally simple in construction, and often in three parts only, and have therefore come to be almost contemptible, while in the latter they play a most important part, and are correspondingly elaborate. The oratorio C. is generally in four parts (soprano, alto, tenor, and bass), but in some cases—notably in Bach's Matthew-Passion and Handel's Israel in Egypt—a double C. is employed.

Chose in Action, a term of English law denoting a thing of which no one has actual possession, and to which a right can only be constituted by legal decree.

Chou'ans, the name given to the insurgent royalists of Bretagne, from their first leader, Jean Cottereau, a smuggler and clogmaker, who inherited the sobriquet of Chouan (*chat-huant*, *i.e.*, screech-owl) from his grandfather, so designated from his sad and silent humour. Another explanation of the name refers it to the signal of danger among the smugglers—an imitation of the cry of the screech-owl—which was adopted by the insurgents. In 1792 an insurrection was planned by the marquis de la Rouarie in conjunction with the brothers of Louis XVI., and communications were opened up with Cottereau, who had organised a band of smugglers. The arrest of the marquis transferred the chief control of the movement to Cottereau, and the insurrection was henceforth named the *Chouanerie*. After some short-lived successes Cottereau was mortally wounded, 28th July 1794, near the wood of Misdon, having proved himself an intrepid soldier and a leader of considerable capacity. The movement, however, was not suppressed by the death of Cottereau, but under George Cadoudal (q. v.) and Charette assumed threatening proportions. The events of the 18th Brumaire dashed the hopes of the insurgents, but they were not finally suppressed till 1803, some time after the Vendeans had submitted to the First Consul. Occasional outbursts of an insurrectionary spirit exhibited themselves as late as 1830, following on the insurrection of July.

Chough, a genus of *Corvidæ* or crows, included in the subfamily *Pyrrhocoracinæ*. The C. differs from the true crows in having the bill notched slightly at its tip. The wings are also long and pointed, and the bill slender, long, and of curved shape. The tarsi are either scaly or covered with a single long plate. The choughs are gregarious in habits, and build their nests in rocks, steeples, and like situations. The Cornish C. (*Fregilus graculus*) is the best-known species. This bird is not now peculiar to Cornwall, but may be met with elsewhere, and usually near the sea-coast. It possesses red legs and bill, and is hence sometimes named the Red-legged C. or crow. The Chocard (q. v.), or Alpine crow, is the only other European species of C. The Cornish C. also occurs on the Continent, in N. Africa, Persia, and India. The food consists of grain, berries, and insects.



Chough.

Choya. See CHAY ROOT.

Chrism (Gr. *chrisma*, an 'ointment'), the unguent consecrated by the bishops in the Roman Catholic and Greek Churches for use in the sacraments of baptism, confirmation, orders, and extreme unction; being composed for the first three of oil and balsam (or in the Greek Church forty different spices), for the last, simply of oil.

Chris'ome was a white cloth, which used to be laid on a newly-baptized child after it was anointed with Chrism (q. v.), doubtless a relic of the white robe with which baptized persons were clothed in the early Church. See CANDIDATE.

Christ is the literal Greek translation (*Christos*, anointed) of the Hebrew word Messiah, and as applied to Jesus it means that he was the Messiah expected by the Jews. See MESSIAH, JESUS, and CHRISTOLOGY.

Christ, Orders of. An order of this name was instituted in 1205 by Albrecht, Bishop of Riga, to guard the Christians of Livonia against the heathens. Another was founded by Pope John XXII. in 1322, and reformed by Paul V. in 1615 as the Order of Jesus and Mary. The Portuguese Order of C. was formed in 1317 by Denis, or Dionysius, King of Portugal, from the Knights Templars (q. v.), whom Philippe le Bel expelled from France. The headquarters of the order were first at Castromarino, and afterwards at Tomar, whence they could more easily assail the Moorish kingdom of Granada. They shared in the wars with the Moors, and in the Portuguese expeditions to India. At first they held the lands they conquered, but these were afterwards handed over to the Portuguese crown. They still exist, and are said to possess twenty-six villages. Entrance to the order is granted only to Catholics of high birth.

Christ, Pictures of. In the records left to us of the life of C. there is not a single hint from which we could form the faintest conception of his personal appearance. But very soon attempts were made to satisfy the natural craving which the early Christians must have felt to know the personal appearance of one who was so dear to them. Two apparently contradictory views as to what his appearance ought to have been prevailed at different periods, the one being chiefly prevalent as it happened in the Eastern Church, the other in the Western, but without any contemporary controversy, as is sometimes asserted. The idea most consonant with the feelings of the humble and persecuted Christians of the second and third centuries, was that expressed in the words of Isaiah liii. 2, 'He hath no form nor comeliness, and when we shall see him, there is no beauty that we should desire him,' and the Christians of this period were ridiculed by Celsus for representing their God as of 'a mean aspect.' But the triumph of Christianity in the 4th c. brought a reaction, and the tendency then arose to represent him according to the words of the Psalm (xlv.), 'Thou art fairer than the sons of men.'

The first definite conceptions of C.'s appearance were portrayed by fictitious descriptions, of which two especially survive: the first in the letter of Publius Lentulus, a fabrication of the 3d c.,'(?) in which C. is described as 'a man of lofty stature and handsome, with wavy glossy hair, the colour of wine, and golden at the root, flowing down on his shoulders, and parted in the middle; his forehead smooth, his countenance beautiful, with a slight blush, and his eyes bright and sparkling; his beard abundant and reddish, not long, but forked.' Another description occurs in the writings of Joannes Damascenus (8th c.), according to which C. was 'stately, with eyebrows joined together, beautiful eyes, curly hair, black beard, and yellow complexion.' The descriptions, of which these two were doubtless but specimens, were followed by pictures attempting to embody them, for the faithfulness of which various evidence was found, as, *e.g.*, that Luke, as well as Pilate, took C.'s likeness, and that Peter drew it from memory.

There were various legends also regarding P. of C. said to have been impressed upon cloths. One of these was possessed by Abgarus, King of Edessa, who, being afflicted with an incurable disease, and having heard of the miracles of C., sent a letter to him, asking him to come and heal him, on which he received a letter from C. and his portrait impressed on a cloth. According to another legend, a similar portrait came into the possession of Veronica or Bernice, the woman cured by touching C.'s garment (Mark v.) [otherwise merely a woman of Jerusalem, who offered him her veil to wipe his face on the way to Calvary], who greatly desired to have his portrait, and found it impressed on the cloth with which he dried his face on washing when he came to visit her. The woman is manifestly a second invention to help out the first, her name being merely a corruption of *vera icon*, true image, the name given to the picture.

As to the physiognomy given to C. in his portraits, the type of features with which we are now most familiar—oval face, straight nose, and long curling hair parted in the middle—was not invariably adhered to, but was confined to the Byzantine school of art, and even in it was not constant. The fact is, that so long as C. was represented like other men, the type of his head was, generally speaking, the characteristic head of the different nations. He was left with a character of his own only when the Italian masters of the Renaissance, headed by Fra Angelico, gave a personal individuality to those about him, and then the characteristic expression which above all was given to him was *sympathy*. Perhaps the noblest conception of the Son of Man which art attained to was that of Leonardo da Vinci, in his picture of 'the Last Supper.' But the attention of the great painters was devoted to depicting the features of C. when dead or glorified rather than when alive; the Madonna and Child being also a favourite subject. See Lord Lindsay's *History of Christian Art* (Lond. 1847), *The History of Our Lord, &c.* (1864), by Mrs Jameson and Lady Eastlake, and a series of articles in the *Art Journal* for 1861.

Christ or Chris Cross Row, the alphabet arranged in the form of a cross, with the letter A at the top and Z at the foot.

Christ'church, a municipal and parliamentary borough and seaport in Hampshire, at the confluence of the Avon and the Stour (hence its old English name *Tweon-ea*, 'between the rivers'), 24 miles S.W. of Southampton. The priory church (restored 1861) dates from the reign of William Rufus, and contains an old sculptured altar-piece said to be one of the finest in England. There is also a free grammar-school and commodious barracks. C. has breweries and some manufactures of watch-springs and hosiery. Pop. (1871) 15,415. Roman remains have been found in the neighbourhood.—*C. Bay* is a spacious harbour, with a double tide every twelve hours, but is obstructed by a moving sand-bar, so that vessels drawing 5 or 6 feet can only enter at high tide. C. returns one member to Parliament.

Christ-Church, one of the chief towns of New Zealand, and capital of the province of Canterbury, is situated on the E. coast of Middle Island, on Pegasus Bay, to the N. of Banks' Peninsula. It lies on the river Avon, 9 miles from the port of Littleton by railway, and is also the point where two coast lines of railway, from N. and S. respectively, converge. There is an extensive export trade, chiefly in wool and timber. Pop. (1871) 6747.

Christ-Church, The Cathedral of. The foundation at Oxford of C.-C. was projected on a scale of great magnificence by Cardinal Wolsey, who in 1526 obtained from Pope Clement VII. a bull for the suppression of twenty-two monasteries, the site of one of which he selected for the erection of a college, to be called in honour of himself Cardinal College. On his disgrace in 1529, Henry VIII. took possession of it, and three years later refounded it as King Henry VIII.'s College, a title exchanged in 1546-47 for that of C.-C., which it still bears. The foundation consisted of a dean, eight canons, one hundred students (to which one was added in 1664, by a benefaction from William Thurstone, Esq.), eight chaplains, a schoolmaster and organist, eight clerks and eight choristers. The canonries, which at first had no duties assigned to them, have been from time to time annexed to professorships in the university, and no canonry can now be held except by a professor, the archdeacon, or the sub-dean. By 30 and 31 Vict. cap. 76, the number of canons is reduced to six; of students to eighty, twenty-eight of which are senior students with permanent tenure, and fifty-two junior students; twenty-one of these fifty-two must be elected from Westminster School, three each year on the Wednesday before Ascension Day, with a tenure of seven years. The election to the remaining thirty-one open junior studentships, which are tenable for five years, is held on the second Saturday in Lent. In 1875 there were 1146 members on the books, not including unmatriculated members of the choir. The college has the patronage of ninety benefices.

Chris'tening, as a synonym for Baptism, properly conveys the notion that a person is made a Christian in, or by, that rite; and is used in this sense by those who believe in baptismal regeneration, but is also used without any such reference.

Christian, the name of nine Kings of Denmark, of whom the following are the most notable:—**Christian I.**, son of Dietrich, the Lucky, Count of Oldenburg and Delmenhorst, born in 1426, became King of Denmark in 1448, and was King of Sweden from 1457 to 1467. He founded the University of Copenhagen in 1478, and died 22d May 1481.—**Christian II.**, King of Denmark and Norway, and Duke of Slesvig-Holstein, surnamed the Wicked, was born at Nyborg, Fünen, 2d July 1481. He was elected heir-apparent to the throne of Sweden in 1499, and became King of Denmark and Norway in 1513. To ally himself to the most powerful house in Europe, he married Isabella, sister of Karl V., at Copenhagen, 12th August 1515, but he continued his intercourse with his mistress, Düveke, a beautiful peasant girl of Dutch origin with whom he had become acquainted at Bergen. Meanwhile he sought to develop the trade of Denmark, and raise the status of the burgher class, after the model of the Netherlands, thereby exciting at once the jealousy both of the Hanse towns and of the nobility. His war against Sweden (1518–20) was marked by a horrible massacre known as the 'Stockholm Blood-bath,' which roused the Swedes to assert their independence under Gustavus Vasa (q. v.). Attacked by the Hanse towns, and abandoned by his Danish nobles, C. fled for safety and help to Holland (1523), returned and landed in the S. of Norway 1531, but was defeated, and taken prisoner at Aggerhuus in 1532. He died 25th January 1559, a captive in the castle of Kallundborg in Seeland.—**Christian IV.**, King of Denmark and Norway, and Duke of Slesvig-Holstein, was born at Fredricksburg, Seeland, 12th April 1577. After the death of his father he was elected by the States to the throne, 4th April 1588, and undertook the government of the kingdom himself in 1596. Though bold and enterprising, his foreign policy was unsuccessful, with the exception of his war against Sweden (1611–13). Fortune favoured him neither in the Thirty Years' War nor in his second Swedish war (1643-45); but he was, notwithstanding, the most popular sovereign of the Oldenburg stock. His legislative and administrative reforms were highly beneficial to his country; he did much for the development of trade and commerce, and acquired Tranquebar, the first Danish colony in the E. Indies. He died 28th February 1648.—**Christian VII.**, King of Denmark and Duke of Slesvig-Holstein, was born at Copenhagen, 29th January 1749, and succeeded his father, Fredrick V., 14th January 1766, marrying the Princess Caroline Matilda of England on November 8th of the same year. Soon after he exhibited symptoms of mental aberration, and the possession of supreme authority became the subject of factious strife. For some time Count Bernstorff and the ministers of the late king administered the state, but in 1770 they fell before the influence of Struensee (q. v.), who in turn succumbed to the superior energy and sagacity of the queen-mother, aided by her son Prince Fredrick. Henceforth C. was king only in name. His son, Fredrick VI., April 14, 1784, displaced his uncle, the crown-prince, and the queen-dowager, and assumed the government himself, assisted by the advice of the young Andreas Peter Bernstorff. C. died 13th March 1808.—**Christian VIII.**, King of Denmark and Duke of Slesvig-Holstein and Lauenburg, was born 18th September 1786. He was acting as Stadtholder in Norway when his father, Fredrick, by the treaty of Kiel (14th January 1814), was compelled to cede that country to Sweden. C. tried to maintain himself in the country by the force of popular feeling, but an English fleet and a Swedish army were too much for him, and he was compelled to withdraw. Succeeding his father as King of Denmark in 1839, the remainder of his life was devoted to the purpose of thoroughly incorporating the Slesvig-Holstein duchies with the Danish monarchy. He died 20th January 1848, in the midst of a work that led to the gravest European complications, but the issue of which has been very different from what C. anticipated.

Christian Burial. See BURIAL, FELO DE SE.

Christian Charity, Knights of, a French order founded by King Henri III. for the support of meritorious officers and soldiers who had been maimed in warfare, the revenues of which were drawn from all the hospitals in the kingdom. Henri IV. gave solidity to the institution by placing it under the charge of the marshals and colonels of France. It was the germ of *Les Invalides*, founded by Louis XIV., on the model of which the British hospitals of Chelsea and Greenwich were founded.

Christian Connection, in the United States, is a sect formed from offshoots of the Methodist, Baptist, and Presbyterian Churches in the early years of the present century. Its members regard the Bible as their only rule of faith and practice, and 'Christian' as their only name, but they deny Christ's divinity. They practise immersion and encourage revivals. The body has 3578 churches, two colleges, two academies, and several periodicals.

Christian Knowledge, Society for Promoting, under the patronage of the Queen, and the presidency of the Archbishop of Canterbury, is the oldest association of the kind in connection with the Church of England. Set agoing in 1698, under the name of 'The Society for the Propagation of the Gospel,' chiefly by the exertions of Thomas Bray, who afterwards distinguished himself as a missionary in Maryland, and wrote *Proposals for the Encouragement and Promoting of Religion in the Foreign Plantations*, it was incorporated under its present name in 1701. Its object is chiefly the establishment of churches, schools, and libraries, and the circulation of Bibles and other religious literature in the colonies, where its income is chiefly expended.

Christian'ia (Norw. *Kristiania*), the capital of Norway, romantically situated on the innermost bay of the C. Fiord, which stretches 70 miles N. from Skager Rack. It lies in a fine valley, at the base of the Egeberg, a wooded mass of gneiss, and is the residence of the king, and the seat of the government, of a bishop, and of the superior courts. Its chief buildings are the old feudal castle of Aggerhuus, a fine modern cathedral, a university (since 1811) with twenty-two professors, over 700 students, and a library of 150,000 books, a royal villa (Oscar's Hall) of Gothic architecture, an exchange, and a theatre. The town is now lighted with gas, and supplied with water from the beautiful Maridall Lake. There are large manufactures of cottons, woollens, paper, oil, soap, brandy, beer, tobacco, &c., and an export trade chiefly in timber, skins, iron, herrings, anchovies, and game. C. has regular steamboat communication with various ports of Germany and Britain, and is the key to the railway system of Scandinavia. A fleet of 180 vessels belongs to the port, which is free of ice for eight months of the year. In the fiord, near C., are many picturesque islands, on one of which (Hovedö) stands the ruins of a convent founded by Cistercian monks from Lincoln in 1147. The vicinity is rich in the wild scenery of fiord, and fell, and rushing river. Pop. (1876) 77,041, and including suburbs 97,000. C. occupies the site of the old royal town of Opslo, which was burned by Christian IV. in 1624 to make way for the present city.—The *stift* or *province* of C. has an area of 10,053 sq. miles, and a pop. (1865) 448,374. See *Norway: an Illustrated Handbook for Travellers* (edited by Christian Tönsberg, Christiania: Lond. Trübner & Co. 1875).

Christian'ity is the religion founded by Jesus Christ (q. v.), by whom, its professors maintain, the highest manifestation of God to man was made. As compared with other systems of religion—Polytheistic, Dualistic, Pantheistic—C. is to be considered Monotheistic. Here, however, a distinction is made by some between the C. of Christ and that of the Church, which latter is charged with running into Ditheism (see CHRISTOLOGY), a charge, however, always strenuously repelled by the Church. The C. of Christ had for its essential features the 'fatherhood of God and the brotherhood of man; the necessity and the value of the feelings of repentance, and assurance of pardon; a faith in the unseen and eternal, in the ultimate triumph of good and subjugation of evil, and in a retribution which shall render to every man according to his deeds.' The sum of this religion was a divine life springing from faith in God; or, as the apostles preferred to conceive it, from faith in Christ as the Revealer of God. No other religion depends so much on the person of its founder as C.; other religions rest exclusively on the teaching of their founders, but it, on what Christ was and did. The earliest Christian writers soon began to maintain that moral transgressions were of less importance than errors in doctrine, and the C. of the Church by-and-by came to be identified with a belief in the elaborate system of doctrine which was gradually developed during the first six centuries.

The central doctrine of C. is that of the Atonement (q. v.), but it again is based on another. The fundamental doctrine is that of human depravity or Original Sin (q. v.), the state into which mankind were brought by the Fall (q. v.). All men being sinners, they cannot be saved by any effort or resource of their own. Hence arises the necessity for the atonement of Jesus Christ, which was the satisfaction made by the eternal Son of God in his death upon the cross, to God the Father for the sins of men. Upon this now hinges the doctrine regarding the Incarnation of Christ, the Trinity, and Justification (q. v.). Another distinctive doctrine of C. is the existence of, or rather the prominence assigned to, Satan, the Prince of Darkness, by whom our first parents were tempted to sin, and into whose power the damned are finally and eternally consigned. Regarding a future life, C. holds that at the resurrection at the last day all who have benefited by the atonement of Christ will go to spend an eternity of bliss in heaven, those who have not, to an eternity of torment in Hell (q. v.), the domain of Satan.

As it may be seen under Christology how much of the language of pagan philosophy was employed to express the Church's doctrine of the Son of God, it is also interesting and instructive to notice how far her ceremonial in honour of Christ corresponds with the pagan Sun-worship, and even how far incidents in the life of Christ coincide with the same. In the worship of Hercules, Adonis, Apollo, Bacchus, Mithra, Krishna, &c., the sun was adored as incarnate in human form, born of a virgin, underground (the birthplace of Christ is now shown in an underground grotto), in his infancy subjected to perils, and afterwards killed through the serpent or principle of evil, but by his death redeeming mankind, rising again and ascending into heaven, to become the arbiter of life and death. The birthday of the sun-god was at the winter solstice, at which time falls also the Christian festival of Christmas; and he rose again from the dead at the spring equinox, at which time is the festival of Easter (q. v.). Similar coincidences exist in connection with the Virgin Mary (q. v.). Even the sacrament of the Eucharist or the Lord's Supper has a remarkable coincidence with the Eleusinian mysteries, from which the name of Holy Mysteries, as well as some of its rites and symbols, were borrowed, including the monogram IHS surrounded by (the sun's) rays of glory. These Greek letters, representing Iakchos Emōn Sōtēr (Bacchus our Saviour), are made to represent the Latin words Jesus Hominum Salvator (Jesus the Saviour of men), although the Greek character H is E, not H. It is not, however, to be supposed that these coincidences in any way invalidate the claim of C. to be considered a religion of divine origin. The life of Christ was not an artificial, imaginary, or non-natural life; on the contrary, it was profoundly real and human. What else, then, could be expected, but that in its great outlines it would exhibit striking resemblances to the lives of heroes and demigods in all the legends of religious history? A divine life must have innumerable 'imitations.' Men everywhere, but most conspicuously in the higher forms of ethnic religion, are ever striving after that ideal which was revealed in the Son of God. Moreover, it should not be forgotten that when C. came into the world it did not find the religious sentiment a blank, or religious rites and usages unknown. The earth was full of these. C. appropriated them wherever this could be done without hurt to its divine character. Half the ritual of the Church has its root in Roman or Teutonic paganism; but it is puerile to argue on this ground that C. has a pagan element. It drew to itself, baptized and purged of all impure or discordant associations, the numberless usages of an overthrown worship, but it did this in obedience to a wise instinct, and by doing so, consciously or unconsciously, testified to the sincerity of its pretensions as a universal religion.

The evidences for the truth of C. have usually been divided into external and internal. I. The external include—1. The testimony (1) of the original witnesses—*i.e.*, the New Testament writers; and (2) of subsequent witnesses—*i.e.*, the Christian fathers. 2. The miracles wrought in attestation of it, both by Christ and his apostles, and especially the crowning miracle of the Resurrection. 3. Prophecy (1) in the Old Testament regarding Christ, and (2) in the New Testament regarding events—*e.g.*, the destruction of Jerusalem—to happen after the time of Christ. II. The internal include—1. The consistency of the New Testament with itself, seen, *e.g.*, in undesigned coincidences and the candour of the writers, and with contemporary literature. 2. The purity of its morality as compared with that of any other known system of religion. 3. The mean condition of the men in whose writings this superior system appears. 4. The correspondence between the doctrines of C. and the facts of our own nature. 5. The identity and originality of Christ's character, as well as that of the apostles. 6. The impossibility of accounting for it (1) by the state of the world at its birth, or (2) by any of the motives which instigate men to the fabrication of religions. Less importance is now attached than formerly to some of these arguments. Thus, it used to be considered a strong argument that at the time of the origin of C. there was nothing human to account for it—that 'the incongruity between this religion and all the circumstances amidst which it grew up was so remarkable as to render it necessary to look beyond and above this world for its explanation.' But a better acquaintance with contemporary literature has shown this position to be untenable, and to be particularly weak as an argument for the supernatural origin of C. As to Judaism, were not our ideas regarding the relation between it and C. greatly confused, it would never have been supposed that the New Testament, which was written 'among Jews, by Jews, for Jews,' did not speak the language of the time. The period when C. arose was that of the Mishnic development of the Talmud, and such terms as redemption, baptism, grace, faith, salvation, regeneration, Son of Man, Son of God, kingdom of heaven, were household words of Talmudic Judaism. The ethics, also, of the Talmud and of C. are, in their broad outlines, identical, including the golden rule, which was quoted as a well-known saying, 'comprising the whole law,' by Rabbi Hillel, who died when Jesus was ten years old. The glory of C. is not to have invented these ideas, but, as has been said, 'to have carried those golden germs, hidden in the schools and among the silent community of the learned, into the market of humanity' C. was also affected by pagan philosophy, chiefly through the Alexandrian Philo, whose theology was 'in great measure founded on his peculiar combination of the Jewish, the Platonic, and the Neo-Platonic conception of God.' The teaching of the Jerusalem rabbis—*e.g.*, Hillel and Gamaliel—was tinged with Philonism, and the Apostle Paul, the disciple of the latter, was undoubtedly imbued with these Alexandrine ideas, which he introduced into C. But although it is thus seen that an argument for the supernatural origin of C. cannot be founded on the incongruity between it and the circumstances amidst which it grew up, it need be no argument against it that so many contemporary ideas were incorporated with it. For although C. is something communicated to nature and reason from a higher source, it stands in necessary connection with these powers and with their mode of development. Otherwise it would not be fitted to raise them to higher perfection, or be able to exercise any influence upon them at all.

It ought to be remembered that C. cannot be identified with the creed of any particular section of the Church. Its fundamental essence lies, not in speculations regarding the being and constitution of God, but in living a pure and godly life, in catching the spirit and obeying the teaching of Christ. Every one who has studied Church history knows how liquid the doctrine of the Church has been; the one unchangeable element of it being the historical person of Christ. And as Jesus said, 'The words that I speak unto you, they are spirit, and they are life,' these words, which are the primal indefeasible truths of C., will never pass away. See Neander's *Kirchengeschichte*; Parker's *Discourse of Religion*; Paley, Chalmers, &c., on the *Evidences*; Greg's *Creed of Christendom* (3d ed. 1874); E. Deutsch on the *Talmud* (*Quart. Rev.* October 1867, or *Lit. Rems.* 1874); Philo's Works (cf. Jones's *Ecclesiastical Researches*); Milman's *Hist. of C.*; Keim's *Der geschichtliche Christus* (3d ed. 1866; Eng. 1873).

Chris'tiansand (Norw. *Kristiansand*), the harbour and chief town of a province of the same name, Norway, in the *amt* or *bailivik* of Mandal, at the mouth of the Torredalselv (*Otteraa*), on the Christiansandfjord, is the seat of a bishop and of the provincial courts, and is also a naval station, with a growing trade in wood, copper, iron, dried fish, salmon, &c. It is also a naval arsenal, and forms the central point of the Scandinavian steam navigation. There are manufactures of leather, tobacco, cotton, and beer, besides extensive dyeworks and shipbuilding yards. The cathedral is the principal building. Pop. (1876) 12,137. C. was founded by Christian IV. in 1641, after whom it is named. The province or *stift* of C. lies in the S.W. of Norway, includes the bailiviks of Nedenäs, Lister, Mandal, and Stavanger, with part of Bratsberg, and has an area of 14,870 sq. miles, and a pop. (1872) of 330,000.

Chris'tianstad (Swed. *Kristianstad*), a fortified town of Sweden, and capital of a province of the same name, on the estuary of the Helge, in the Baltic, 270 miles S.W. of Stockholm by railway. It has an arsenal, a fine church, a senate-house, several high-class schools, and its manufactures are chiefly woollens, leather, gloves, and tobacco. Pop. (1872) 6222. C. was founded in 1614 by Christian IV., from whom it takes its name. The *län*, or province, has an area of 2457 sq. miles, and a pop. (1875) of 228,498.

Chris'tiansted, the capital of the Danish island of Santa Cruz, W. Indies, lies on the N.E. coast of the island, and is defended by a battery. It is the residence of the Danish governor of the W. Indies, and has a good harbour and some trade. Pop. about 6000.

Chris'tianssund (Norw. *Kristiansund*), a town frequently confounded with Christiansand, is situated in the amt or bailivik of Romsdal, in the N. of Norway, and has an export trade in wood and fish. It was a flourishing place of trade in the 17th c., and bore the name Lille-Fosen till 1742. Pop. (1876) 7489.

Christi'na, Queen of Sweden, the only child of Gustav Adolf and of Maria Eleonora, Princess of Brandenburg, was born 6th December 1626. She succeeded her father in 1632, assumed the reins of government in 1644, and in 1650 was crowned *king*. The originally masculine character of her mind was intensified by a too robust education. She hated to be dressed like a woman, often clothing herself in male attire, and was keenly fond of riding and hunting. Yet for some years she ruled with vigour and intelligence, patronising scientific and learned men. Indeed, so long as the great chancellor Oxenstierna lived she did well. But eccentricity, if not insanity, began to develop itself in her, and in 1654 she abdicated the crown in favour of her cousin, Karl Gustav, reserving to herself sufficient revenues to maintain her in royal state. C. next went to Rome, and embraced Roman Catholicism under the name of Alessandra. For a time she resided in France, where she incurred great odium by the execution for treason of her equerry, the Marquis Monaldeschi. Attempts subsequently made on the crowns both of Sweden and Poland failing, she spent the remainder of her life in Rome in artistic and scientific studies. She died April 19, 1689. C. left behind her some small works, which may be found in Archenholz's *Memoiren der Königin C.* (4 vols. Berl. 1751–60). The genuineness of the 'Letters' which appeared under her name in 1762 is undoubted. See Grauert's *C., Königin von Schweden und ihr Hof* (2 vols. Bonn, 1838–42).

Chris'tison, Sir Robert, D.C.L., born July 18, 1797, at Edinburgh, where his father, the late Alexander Christison, was Professor of Humanity in the University. After graduating here in 1819 as M.D., C. spent some time in London and Paris, applying himself to the study of toxicology, in connection with which his name is deservedly famous. After his return to Edinburgh, he was appointed Professor of Medical Jurisprudence in 1822, and ten years later Professor of Materia Medica, which chair he holds at present. His *Treatise on Poisons* (1829) has a world-wide reputation, and is the standard work on the subject. *A Biographical Sketch of Edward Turner, M.D.* (1837), *On Granular Degeneration of the Kidneys* (1839), and *The Dispensatory* (1842), may be mentioned among his other works. C. is Ordinary Physician to the Queen in Scotland, has been twice President of the Royal College of Physicians, was created a baronet in 1871, was President of the Royal Society of Edinburgh (1868–73), and is President-elect of the British Association for 1876.

Chris'tmas is the anniversary of the birth of Jesus Christ, observed on the 25th December. The Western Church, in which it appears as generally celebrated after the middle of the 4th c., has always kept to this day; the Eastern observed it first on the 20th April or 20th May, then, along with the Feast of the Epiphany (q. v.), on the 6th January; but at the close of the 4th c. altered its practice to suit Western usage. St Chrysostom, in advocating this change in the East to the true day, which, formerly uncertain, had been made known by some coming from the West, indicates the existence of a tradition in the West that the angel appeared to Zacharias to announce the birth of John the Baptist on the great day of atonement—September 23d, from which C. was reckoned. Nine months from this date gives June 24th, John Baptist's Day; and six months more (cf. Luke i. 26 and 36) gives December 25th. This was the date of the great heathen festival of midwinter, and it may be that the tradition was moulded to suit that circumstance. The winter solstice was the birthtime of the sun about to return towards the earth, which was celebrated with all manner of rejoicing and revelry. At Rome this was the Saturnalia (q. v.), which included the Sigillaria or *festival of the infants*. The Church was probably unable to abolish the pagan revelry, but it could at least surround it with other and more sacred associations, and thus gradually wean its converts from all memories or attachments incompatible with their new faith.

Christmas-Box, a gift in money which it was formerly a prevailing custom in England to give on the day after Christmas—Boxing-Day—to domestic servants, apprentices, and other persons of inferior social condition. Tradesmen used to be expected to give a C.-B. to the male and female servants of their customers; even messengers and other underling Government servants looked for it from their superiors. The usage led to so much abuse, the recipients becoming clamorous for it as a right, that tradesmen in London and elsewhere put notices in their windows that the payment of a C.-B. had been discontinued; and Government backed them in putting an end to it by discontinuing, at Christmas 1836, the customary gifts. Since then the practice has been on the decrease, but postmen still expect (not in vain) their C.-B.

Christmas Carols, festal chorals or part-songs, still sung in many rural districts of England in celebration of Christmas. (The word 'carol' is the French *carole*, Ital. *carola*, 'a round dance;' probably from Lat. *corolla*.) These songs, while mainly religious, were also at times quite secular in their feeling, as one may see from the 'Wassailers,' 'Boar's Head,' and 'Holly and Ivy' C. C.; but those most popular now are either legendary and narrative, as 'God rest you, merry gentleman,' or filled with a jubilant religious spirit, as the '*In Excelsis Gloria*' (supposed to have been written about 1500), 'Christ was born on Christmas-Day,' 'Hark! all around the welkin rings,' &c. Regarded strictly as songs of joyous thanksgiving and praise commemorative of the birth of the Saviour, the antiquity of the C. C. must reach back to an early period in the history of Christian nations. The most ancient known, however, date from the middle ages, and consist generally of portions of miracle-plays, mysteries, and legends. The earliest English C. C. date from the 15th c.; and they continued to be commonly sung down to the reign of Charles I. The Puritans suppressed them, and all other old Christmas customs, by Act of Parliament; but they came into favour again at the Restoration, after which period a number of free and noisy carols were composed. Since then C. C. have gradually fallen into disuse, except in the remoter country districts. The C. C. belong distinctly to the ballad form of poetry. The 'Carol for St Stephen's Day' is identical in tone and poetical structure with the earliest English and Scotch ballads; and a similar license of incident and expression was claimed by the writers of carols and the contemporary writers of ballads. For example, a number of C. C. have sprung out of a miracle-play, in which Adam, Eve, Herod, and the Duke of Marlborough figure among the *dramatis personæ*. Again, in the carol 'I saw three ships,' the author says, 'O they sailed into Bethlehem,' thus performing a geographical feat equal to Shakespeare's anchoring his fleet in Bohemia. Many of the old C. C., however, are of high merit, and give expression to pure religious feeling in language at once simple and picturesque. Collections of C. C. have been published by Davies Gilbert, Mr Sandys, Dr Rimbault, and Mr Thomas Wright; but the latest and fullest collection is a *A Garland of C. C., Ancient and Modern*, edited by Joshua Sylvester (Lond. J. C. Hotten, 1861).

Christmas Rose. See HELLEBORE.

Christol'ogy is the doctrine of the Church regarding Christ. The two influences which were at work in the Church in the 1st and 2d centuries—the Hebrew and the Greek—gave rise at once to two antagonistic systems of C., that of the Ebionites (q. v.), and that of the Docetæ (q. v.) and Gnostics (q. v.). According to the former, Jesus was a mere man; according to the latter, his body was a mere phantom possessed by a divine being; and the history of C. till the beginning of the middle ages is simply a history of the continual tendency of popular piety to exalt the divine element in his nature.

Before the time of Christ the notion of one supreme deity had undergone some modification. The primal deity had been removed entirely beyond the sphere of human sense, and his intercourse with man was supposed to be carried on, and even the creation of the world to have been effected, by an intermediate *inferior* being. This doctrine prevailed from Greece to China. It was the basis of the Indian religion and philosophy, of Zoroastrianism, Platonism, and the Platonic Judaism of Alexandria. According to the Jewish rabbis, the ordinary medium of intercourse between God and the prophets was the Memra or Divine Word, a name which occurs in the Indian, Persian, Platonic, and Alexandrian systems. The great master of the art of allegorising Scripture was Philo of Alexandria, who, in entire ignorance of Jesus, described the Word (Gr. *logos*) as 'the Son of God the Father,' 'the first-begotten of God,' 'the image and likeness of God,' 'the instrument by whom the world was made,' 'the light of the world,' 'alone able to see God,' 'the shepherd of God's flock,' 'the physician that heals all evil,' &c. In the Epistles of Paul and John, and that to the Hebrews, in the Fourth Gospel, and in the Apologies of Justin Martyr, the same ideas regarding the Word are applied to Jesus of Nazareth. By the middle of the 3d c. this doctrine of the Word, variously understood—the expression 'Son of God' being adopted by Origen—was generally accepted both in the East and in the West; although not without protest from some, hence called Alogists, to whom it appeared that this doctrine of a God of secondary rank incarnate in Jesus was closely akin to Ditheism. To avoid this, therefore, the theory, first propounded by the Shepherd of Hermas (q. v.), that the Son was simply the man Jesus possessed by the Spirit of God, was extended and completed by Sabellius (q. v.), according to whom the three names of Father, Son, and Holy Spirit signified merely three modes of the deity. Another form of the Unitarian protest was typified in the theory of Paul of Samosata, according to whom the Word was, in God and man alike, the principle of thought, by the action of which Jesus became perfectly united to God, and in him God revealed himself to save the human race.

The orthodox doctrine of the Church at the end of the 3d c. was expressed by the Council of Antioch (269), which condemned Paul of Samosata, when, seeking to avoid both Sabellianism and Ditheism, it decreed that the Son was not consubstantial with the Father. But the tendency was still further to glorify Christ. For logically stating the subordination of the Son implied in the decree of the Council of Antioch, Arius was condemned as a heretic by the Council of Nice (325), which at the same time decreed that the Son was consubstantial (Gr. *homoousios*) with the Father, and perfect God. A middle party between the Arians and the orthodox, hence called Semi-Arians, charged the latter with Sabellianism, and adopted themselves the term *homoiousia* (Gr., similarity of substance); but that party triumphed which most exalted Christ, because they were moving with the current of popular sentiment, while the others were striving against it.

But now arose the difficulty of how to adjust the humanity of Jesus to his perfect deity. Apollinaris did not hesitate to say that a god-man was a logical monster, comparable to a minotaur, and held that the *soul* and *body* in Jesus alone were human, while the Word supplied in him the place of the *mind* in other men, and that he had thus in reality only one nature. Apollinaris was condemned by the Council of Constantinople (384), but his ideas survived under the name of Monophysism (q. v). To avoid annihilating either the one nature or the other, theologians were driven now to speak of the two natures as separate. Consequently Nestorius (q. v.) refused to call the Virgin Mary *Mother of God*, because, he said, she could only be the mother of the human nature assumed by the Logos. But popular piety demanded this also; Nestorius was condemned by the Council of Ephesus (431), and with the materials now collected the *Athanasian Creed* (q. v.) was constructed, which contains in its essential points the C. which is held both in the Roman Catholic and Protestant Churches.

At the Reformation the C. of the reformers turned on their theories regarding the Lord's Supper. Luther adopted the view called Communion of Attributes, which amounts to this, that the human nature of Jesus had become a participator in the proper attributes of deity. Calvinism greatly toned down the harshness of the notion of personality as applied to the Trinity, the persons being simply divine attributes, which is very like Sabellianism, and denied that worship should be paid to Christ. The scattered Unitarianism of the 16th c. took the name of Socinianism, and maintained that the doctrine of the Trinity is a patent and crying contradiction in itself, and is besides opposed to the idea of the divine perfection. Arminianism taught what very closely resembled the Arianism of the 3d c. In more recent times there has arisen a feeling of reluctance to pursue C. as a branch of theological speculation. Experience has convinced religious men that it is not a fit subject for precise and dogmatic expression. Yet it cannot be said that there is any visible leaning towards the old Arian or Unitarian view; there seems rather to root itself deeper and deeper in the Christian conscience an indestructible sense of the unique grandeur of Christ's nature, which better accords with the mysterious teaching of the Church than with the Rationalistic protest. See Hagenbach's *Hist. of Doctrine*, Reville's *Deity of Christ*, and Dorner's *History of the Development of the Doctrine of the Person of Christ*.

Chris'tophe, Henri, King of Hayti, born in Grenada, October 6, 1767, of negro parents, and for some time a slave, became in 1793 one of the leaders of the black insurgents against the French, and in 1797 was raised to the rank of brigadier-general by Toussaint-l'Ouverture. In 1802 he defended Cape Town against General Leclerc, who had conducted an expedition from France to regain St Domingo from the blacks. On the death of Dessalines, C. intrigued to succeed him, but Petion, a man of colour, proclaimed a republic at Port-au-Prince. C., however, contrived to have himself proclaimed President of Hayti for life (17th February 1807), and in 1811 he took the title of King as Henri I. He next created a nobility, established a code of laws, encouraged education, and imitated as far as practicable the proceedings of Napoleon. On the death of Petion in 1818, he attempted to unite the S. and W. of the island with the N., but was defeated by General Boyer, the successor of Petion. An insurrection broke out in 1820, and C., deserted by his bodyguard, shot himself, 24th October 1820. He was a man of courage, energy, and considerable accomplishments.

Chris'topher, St (Gr. 'bearer of Christ'), in the tradition of the Church a saint, reputed to be a native of Syria or Palestine, and a martyr, under Decius, in the 3d c. A.D. He is represented as a man of huge size and strength, who did penance for his early sins and personal attendance on the devil by carrying pilgrims across a river. Once, says the legend, he carried over Christ in the form of a little child, who, when he was sinking under his burden, bade him push his staff into the ground, where it changed before the next day into a fruit-bearing palm. This miracle led to numerous conversions. Relics of C. are especially abundant in Spain. Carved and painted representations of him were very common in mediæval churches. He was invoked during plagues, and to drive away the spirits guarding hidden treasures, was assigned tutelage over fishing, and was very popular among the lower classes, who held a figure of St C. to be a preventive of secret dangers. Thus Chaucer's yeoman carried 'a Cristofre on his brest of silver schene.' An Order of St C. was founded in Austria in 1517. The Greek Church holds his festival on the 9th of May; the Roman Catholic, on the 25th of July.

Christopher's, St, or **St Kitt's,** one of the Leeward Islands, called by the natives 'the fertile isle,' was discovered in 1493 by Columbus, who gave it his own Christian name, and colonised in 1623 by the English, who were confirmed in their possession of it by the Treaty of Utrecht (1713). It lies N.W. and S.E., and is about 20 miles in length, with a very unequal breadth. Area, 68 sq. miles; pop. (1871) 28,169. Rugged, sterile mountains of volcanic origin, containing brackish hot springs, traverse the island, culminating in Mount Misery, an exhausted volcano, with a height of 3711 feet. Sugar, rum, and molasses are the staple exports. The revenue of St C. in 1871 was £31,458; expenditure, £26,721; value of total imports, £196,051; exports, £274,080; value of the sugar exported, £219,272. In 1871 there was a public debt of £92,000. The capital is Basseterre (q. v.). In 1866 St George's Church was built here at an expense of £15,000; and on July 31, 1865, a terrific fire took place, in which 1000 houses were destroyed, but fortunately only one life was lost.

Christ's College, Cambridge, into which was merged an earlier college founded by Henry VI., was founded in 1505 by the Lady Margaret, mother of King Henry VII., and enriched by Edward VI., Sir John Finch, Sir Thomas Baines, Mr Christopher Tancred, and others. Its scholarships and fellowships have frequently been increased in value. Among the most celebrated students at C. C. have been Bishop Latimer, Milton, Henry More, Ralph Cudworth, and Archdeacon Paley. The college has the presentation to eighteen livings. The society in 1875 consisted of a master, fifteen fellows, and twenty-nine scholars, twelve of these receiving their title from the founders; the number of undergraduates was 108, and of members on the boards 447.

Christ's Hospital, popularly known as the Blue-Coat School, and situated in Newgate Street, London, is one of the five great hospitals of the metropolis, and was founded on the solicitation of a number of citizens by Edward VI. a few days before his death, for orphans and foundlings, the site of the building being the Old Greyfriars Monastery. Frequent reforms, the chief of which were made by the governors in 1856, have practically converted C. H. from an hospital into a public school for the sons of London freemen and Anglican clergymen; but the picturesque dress—a blue tunic and petticoat, yellow breeches and stockings, red waistband, and a worsted cap, more conspicuous by its absence than its presence—has remained to the present time. Various changes have been introduced into the curriculum and conduct of the school. Although still essentially a classical seminary, the 'modern side'—in the shape of modern languages, literature, &c.—is not neglected. At one time the boys were somewhat harshly dealt with (a graphic account of this is given by Charles Lamb), now they are treated much as other public schoolboys, the only duty savouring of the old charity days being, we believe, the making of their own beds by the boys. The income of C. H. amounts to between £50,000 and £60,000, the original foundation having been enriched by various subsequent ones, particularly that of King Charles II. of £7000. In 1683 a preparatory school was founded for both girls and boys at Hertford, the former, however, remaining there permanently, while the boys go to London when they are old enough. The age of entrance is nine, and of leaving fifteen, although 'King's Boys' (those who attend the mathematical school, founded by Charles II.) and 'Grecians,' *i.e.*, the highest class, eight of whom are sent on scholarships either to Oxford or to Cambridge, remain longer. The building of C. H. has had numerous vicissitudes; it was destroyed in the Great Fire of 1666, and has been twice rebuilt, first by Sir Christopher Wren, and secondly, in 1825, by Mr Shaw. The governors, who have the right of nominating pupils, and are also the patrons of several livings, are at present Her Majesty, the Prince of Wales, the Duke of Edinburgh, the Duke of Connaught, the Mayor and Aldermen of London, twelve members of the Court of Common Council, and about 400 noblemen and gentlemen, who have contributed to the extent of £400 to the benefit of the hospital. In 1875 the average attendance of pupils at C. H. and Hertford schools, including girls, was 1075. There is accommodation at the former for about 800, and at the latter for about 400. The number of masters at the two schools, including lecturers, is about forty. Some very eminent men have received the earlier part of their education at C. H.; among others, Camden, Stillingfleet, Richardson, Coleridge, Charles Lamb, and Leigh Hunt. For interesting accounts of the school, see, among other books, *Annal of C. H. by a Blue* (1867), and *Staunton's Great Schools of England* (1869).

Christ's Thorn. See JUJUBE and PALIURUS.

Chromat'ic passages, in music, are passages proceeding by or containing intervals differing (by a semitone in tempered instruments) from those of the ordinary or diatonic scale of the key in which the passages are written. They are used for the sake of variety or piquancy, or to attain some special effect, and under these circumstances are agreeable; but if employed too often, the ear tires of them, and the music (as is so often the case with Spohr's compositions) loses strength and vigour. The expression *C. scale* is often (incorrectly) applied to a series of consecutive semitones like the notes of the pianoforte.

Chromatic, in optics, opposed to Achromatic (q. v.).

Chromatics, that part of optics which treats of colour. A pencil of sunlight, when passed through a prism, decomposes into a beautiful series of various coloured tints, passing by continuous gradation into each other. Newton believed this series to be composed of seven primary colours, the intermediate shades being produced by the intermixture of two of the primary ones. It was Brewster's opinion, and in this he is supported by Clerk-Maxwell, that there are only three primary colours—red, yellow, and blue. See SPECTRUM ANALYSIS.

The colours of natural bodies are dependent upon their power of absorption for the different coloured rays. Every body, if thin enough, is transparent; hence, if a pencil of light fall upon a body, it penetrates to a certain distance, and naturally a portion of the radiant energy of the light is absorbed and transformed into another kind of energy, probably heat. If blue be absorbed in this way, the body will appear orange; if green, red; and so on. The varied tints of mother-of-pearl are due to reflection from a corrugated surface. See INTERFERENCE, LIGHT, REFLECTION, REFRACTION.

Chrome Alum is the double sulphate of chromium and potassium, analogous in composition to the double sulphate of aluminum and potassium, or alum.

Chrome alum, $Cr_2(SO_4)_3K_2SO_4,24H_2O$
Ordinary alum, $Al_2(SO_4)_3K_2SO_4,24H_2O$

It may be obtained in large violet octahedra by the spontaneous evaporation of its solution, prepared by boiling a solution of bichromate of potash to which oil of vitriol has been added with alcohol, as long as the smell of aldehyde is perceptible. Solution of C. A., if prepared in the cold, is violet coloured, but when heated becomes green, and from this green solution no crystals separate; on standing for some weeks, however, the green solution becomes violet, and deposits the salt.

Chrome Green (the sesquioxide of chromium) is a beautiful dark-green pigment used in painting porcelain and as an ingredient in green glass and enamel.

Chrome Red (a basic chromate of lead), of various shades of red and orange, is used in calico-printing and the arts generally.

Chrome Yellow (chromate of lead) is most useful in the arts, and exhibits distinct shades according to the mode of its preparation, known as *lemon yellow*, *Paris yellow*, *Leipsic yellow*, &c.

Chro'mium is a metal, and was discovered in 1797 by Vauquelin in a Siberian mineral, called by mineralogists *red-lead*,—a compound of C. with lead and oxygen. C. derives its name from the fact that its compounds are coloured (Gr. *chroma*, 'colour'). Its most abundant ore is *chrome iron*, a compound of its oxide with oxide of iron. The colours of *emerald*, *olivine*, *serpentine*, *spinelle*, &c., are due to its presence. Metallic C. may be obtained by subjecting a mixture of its oxide and charcoal to an intense white heat. It is steel-grey in colour, brittle, and after having been fused, is so hard that it will scratch glass. Its atomic weight is 52·4, and the symbol for its atom Cr. Bichromate of potash is the most important compound of C., and from it all other derivatives of the metal are prepared. It is manufactured for commercial purposes by strongly heating chrome iron (previously reduced to a fine powder) with a mixture of carbonate of potash and nitre, in a reverberatory furnace. After a sufficiently long fusion the resulting mass is broken up and treated with boiling water, when chromate of potash (K_2CrO_4) is dissolved out. In order to convert the chromate into bichromate, the solution of the former is mixed with acetic acid, and the whole evaporated to the crystallising point, when the bichromate separates in large prisms, having a beautiful orange-red colour, whilst acetate of potash remains in solution.

$$\underbrace{2K_2CrO_4}_{\text{Chromate of potash.}} + \underbrace{2C_2H_3O(OH)}_{\text{Acetic acid.}} = \underbrace{K_2Cr_2O_7}_{\text{Bichromate of potash.}} + \underbrace{2C_2H_3O(OK)}_{\text{Acetate of potash.}} + \underbrace{H_2O}_{\text{Water.}}$$

Chro'motism, or Chromism, a disease of plants consisting of an unnatural colouring of leaves, such as when they become red, variegated, &c.

Chro'motype. Under this name Mr Robert Hunt published in 1843 a photographic process, in which a solution of sulphate of copper and bichromate of potash is employed to prepare a sensitive surface, nitrate of silver to develop the picture, and washing in water to fix it. The process never had any great success, but it is recommended as yielding excellent results in copying botanical specimens and engravings.

Chron'icle (Fr. *chronique*, Lat. *chronica*, from Gr. *chronos*, 'time'), a form of history in which events are narrated simply according to their sequence in time. Chronicles exist both in prose and rhyme. Much of early European history is preserved in this shape. For our own country, the most valuable record of this kind is the old English *C.*, commencing with the Christian era, or rather with the invasion of Britain by Julius Cæsar, and reaching down to the accession of Henry II.

Chron'ogram, or Chron'ograph (Gr. *chronos*, 'time,' and *gramma*, 'a letter,' or *graphein*, 'to write'), a device by which a date is expressed by certain letters of an inscription being printed in a larger type than the others. In the C.—

GEORGIVS DVX BVCKINGAMIÆ,

from the name of George, Duke of Buckingham, the date, MDCXVVVIII. (1628), is that of the year of his assassination by Felton. The close of the Seven Years' War is thus finely expressed—

Aspera beLLa sILent: reDIIt bona gratIa paCIs ;
O sI parta foret seMper In orbe qVIes,

which gives the year 1763. An anagram was sometimes united with a C., as in this on General Monk—

GeorgiVs MonCe DVx de AumarLe,

which is intended to be read thus—

Ego Regem reduxi, Ano. Sa. MDCLVV.

Chron'ograph, an instrument for registering very small intervals of time. The principle upon which all such instruments depend is that of uniform motion. A graduated dial-plate or cylinder is made to rotate uniformly under the action of clock-work, and a mark or dot is made at the instant of occurrence of any phenomenon. The permanent mark is made either by the observer himself, as in Benson's race-C. and in Strange's astronomical C., or by the action of electric currents and electro-magnets. To this latter class belong the chronographs of Navez, Boulengé, Leurs, Noble, and Bashforth, whose work on the *Motion of Projectiles* gives descriptions of two of his instruments, and accounts of interesting experiments upon the velocities of bullets. See also Owen's *Modern Artillery* (1871).

Chronol'ogy is the science of the measurement of time. That part of it which treats of the units of time as regulated by the heavenly bodies is properly Theoretical or Mathematical C.; that which treats of the methods adopted by different nations of dividing these units into smaller, and uniting them into longer periods of time is Technical or Applied C., and that which treats of the lapse of time in the history of nations is Historical C. The principal parts of the first two of these divisions will be found discussed under HOUR, DAY, WEEK, MONTH, YEAR, &c.; only the last can be briefly noticed here.

To fix the *date* of an event is to tell how long ago it happened. This is done by counting the time, measured by years, &c., from some *epoch*, that is, a point of time marked by some very striking event. A long period of time, which is measured by events in it being reckoned from a certain epoch, is called an *era*. Thus all Christendom reckons its time from the birth of Christ, and the period from that epoch to the present time is the Christian era. The Greeks reckoned from the first Olympiad at which the victor's name was recorded, *i.e.*, 776 B.C.; the Romans from the foundation of Rome, 753 B.C.; the Mohammedans from the flight of Mohammed, 622 A.D. The Egyptians, Hindus, Chinese, Assyrians, Babylonians, Persians, &c., all had their systems of C. The Hebrew system has always been regarded by Christians, who hold the Hebrew Scriptures to be inspired, as the most important, because by it the age of the world and of mankind is supposed to be fixed. According to Hebrew C., which is counted almost entirely by lives of men, from the Creation to the Deluge (q. v.) was 1656 years, from the Deluge to the birth of Christ, 2348. In modern times the science of geology has shown this 6000 years to be too short for the age of the world and of man; and authentic records of the Egyptians and Assyrians have shown the time allowed from the Deluge to be too short. Accordingly various plans have been adopted for allowing more time, without imperilling the infallibility of Scripture. The latest chronologers, on this principle, taking into account the variations of the LXX., &c., fix the Deluge at B.C. 3099, or 3159, and the creation of Adam about B.C. 5361, or 5421.

Chronom'eter (Gr. *chronos*, 'time,' and *metron*, 'a measure'), the name usually given to an instrument, constructed upon the same principle as a watch, but much more delicate and trustworthy, the irregularities arising from changes of temperature and other external influences being as far as possible compensated for. The C. is indispensable for the determination of longitude at sea. See HOROLOGY.

Chron'oscope (Gr. *chronos*, 'time,' and *scopos*, a 'mark'), one of the many inventions of Sir Charles Wheatstone, is an instrument which is capable of measuring the duration of short-lived flames, and of showing discontinuities in certain luminous streaks. A mirror is made to move rapidly in such a manner that the reflection of a continuous flame would be a complete circle, that of a flame of short duration a greater or less arc, that of an instantaneous flash a point, and that of a discontinuous flame a succession of points. The electric spark is found by this means to be instantaneous.

Chru'dim, a walled town of Bohemia, on the Chrudimka, about 62 miles S.E. of Prague, with a splendid collegiate church, a Capuchin convent, and a high school. Cloth is manufactured, and there are great horse markets. Pop. (1870) 9446.

Chrys'alis (Gr. *chrysallis*, 'the gold-coloured sheath of butterflies'), the name popularly applied to the second or pupa stage in the metamorphosis of insects, and more notably to those pupæ which exhibited golden spots or lustres. There are infinite variations, not only in the coloration, but in the general form and attachments of chrysalids, and for fuller information the reader may consult the articles INSECT, TRANSFORMATION, METAMORPHOSIS, BUTTERFLY, MOTH, &c.

Chrysan'themum (Gr *chrysos*, 'gold,' and *anthemon* = *anthos*, 'a flower'), a genus of Herbaceous or somewhat shrubby plants, belonging to the natural order *Compositæ*, chiefly natives of the temperate parts of the Old World. There are only two native species in Britain, *C. leucanthemum*, the ox-eye daisy, and *C. segetum*, the corn-marigold, the former having a white flower with a yellow disc, the latter a bright yellow flower, often very common in corn-fields. Many foreign species have been long cultivated in our gardens, but the flower popularly known as the C. is *Pyrethrum Sinense*.

Chryselephan'tine. See STATUARY.

Chrysipp'us, an ancient Greek philosopher, born in Cilicia B.C. 280. After losing his property, he attached himself to the Stoic lecturer Cleanthes, became the head of the Porch, and attacked with great spirit and a keen logic Epicureans, Academicians and Aristotelians. It is said that he was for a time converted to scepticism by Arcesilaus, and then composed his work on Custom. Undoubtedly C. was more accurate than his predecessors, tracing the Cataleptic Phantasm (or true perception) to repeated and intense modifications of the soul, and taking as the principle of duty the nature of man, and not of the universe. The latter view he carried into great detail, insisting on the duty of preserving health and of acquiring riches, while still condemning most of the emotions to eradication. C., who was said to have written 700 books, discoursed on the education of children. In logic his name is connected with the elaboration of the *Sorites*. In physics he adopted the usual optimist theory of the Stoics based on a passive matter and an active reason. Only fragments of his numerous writings remain. See Petersen's *Philosophiæ Chrysippeæ Fundamenta* (Hamb. 1827).

Chrys'is (Gr. 'golden'), a genus of Hymenopterous insects, including those forms popularly known as 'ruby-tailed' flies. The *C. ignita*, or 'ruby-tail' of this country, is the most familiar species. These insects belong to the tribe *Tubulifera* of the Hymenopterous order, and are generally found on walls, palings, sandbanks, and like situations. The larvæ of C. attack bees in their hives.

Chrysobalana'ceæ, a family of Dicotyledons allied to the order *Rosaceæ*, of which order, indeed, it is sometimes looked upon as only a subdivision. There are nearly 100 species—all trees or shrubs—natives of the tropics of the Old and New Worlds, though more abundant in the latter. Of the twelve genera described, *Chrysobalanus*, *Couepia*, *Prinsepia*, and *Hirtella* may be taken as examples of the best known.

Chrysobalanus, a genus of plants of the natural order *Chrysobalanaceæ* containing four species, natives of the tropical parts of Africa and of America. One of the most common species is the cocoa-plum (*C. Icaco*), which in the W. Indies forms a favourite conserve with the Spanish colonists, especially in Cuba. The kernels yield a fixed oil, and when made into an emulsion they are said to be useful in dysentery. An astringent bath, useful in leucorrhœa and blennorrhœa, is prepared from the leaves and roots.

Chrys'oberyl (Gr. *chrysos*, 'gold,' and *beryllos*, a 'gem'), a transparent or translucent gem of great hardness, composed of alumina and glucina, coloured various tints of pale green by protoxide of iron, and sometimes with a bluish-white opalescence internally. When cut in facets, it exhibits a resplendent lustre almost equal to the yellow diamond. The opalescent variety shows best *en cabochon*, that is, with a convex surface. The C. is chiefly found in alluvial deposits of rivers of Brazil and Ceylon; it also occurs in granite of the Mourne Mountains, in Ireland, and a variety called *Alexandrite*, after Czar Alexander I., is obtained from mica-schist in the Ural Mountains.

Chrysochlo'ris, a genus of Insectivorous mammalia represented by the *C. holosericea* or *aureus*, or golden mole of S. Africa. The C. resembles the Common Mole (q. v.) in form, but is somewhat less in size. Its peculiarity consists in the iridescence of its fur; the beautiful play of metallic tints and lustres exhibited by this form procuring for it its names of golden, changeable, or shining mole. The *setæ* or bristles of the *Aphrodite* or sea-mouse amongst the worms or *Annelida* (q. v.) exhibit the same iridescent lines. The front feet have four toes, and the hinder ones are five-toed. No outer ears or tail are developed. The teeth of both jaws fit exactly into each other, and the food consists of insects and worms.

Chrysocoll'a, an impure hydrous silicate of copper of a green or bluish-green colour, found associated with copper ores. C. means 'golden glue,' an allusion to its resinous lustre and transparent edges.

Chrys'olite (Gr. *chrysos*, 'gold,' and *lithos*, 'a stone'). Transparent greenish-yellow crystals of olivine are so called. They are seldom an inch long, and are little used in jewellery on account of their brittleness. The best stones are brought from the Levant. *Peridot*, which, like the C., is a silicate of magnesia coloured by protoxide of iron, is sometimes used synonymously with it; but peridot is much softer, and of a yellowish-green colour.

Chrysolo'ras, Manuel, one of the scholars who promoted the great revival of learning, was born of noble family, at Byzantium, about 1350. He was sent, probably in 1389, by Joannes Palæologus, the Byzantine emperor, to France, Italy, and England to solicit aid against the Turks. Though his embassy was not successful, C. made many friends in the W., and in 1397 he settled, as teacher of Greek literature, at Florence, where he attracted numerous audiences, and had among his pupils Aretino, Guarini, Leonardo Bruni, Poggio, and Filelfo. He taught also at Milan, Pavia, and Rome, where he won the esteem of the Pope, who intrusted him with a mission to the Emperor Sigismund. He died 15th April 1415 at Constance, whither he had gone in 1413 to represent the Greek Church at the Council held there. C. is the author of numerous works which exist in MS. in the different libraries of Italy. Only two have been printed, the *Erotemata* (1488), a Greek grammar, 'the first, and long the only channel to a knowledge of that language, save oral instruction' (Hallam's *Intr. to Lit. of Europe*, ch. i.); and *Epistolæ tres de Comparatione veteris et novæ Romæ* (Par. 1655). See Van der Hardt's *Memoria Chrysoloræ* (Helmst. 1718).

Chrysomelæ. See GOLDEN BEETLE.

Chrysophyll'um. See SAPOTACEÆ, MONESIA BARK, and STAR APPLE.

Chrys'oprase (Gr. *chrysos*, 'gold,' and *prasinos*, 'leek-green'), a variety of chalcedony, of an apple or leek-green colour, due to the presence of oxide of nickel. It is found in Lower Silesia, and in different localities in the U.S., and although made into brooches, bracelets, seals, &c., it is not held in great esteem by jewellers. The chrysoberyl of the ancients is supposed to have been C.

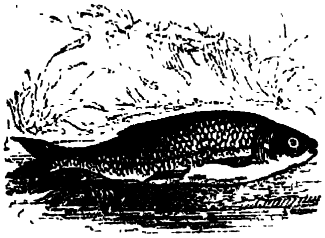
Chrys'ops. See CLEG.

Chrysosple'nium, a genus of Saxifrages. *C. oppositifolum* and *alternifolum* are two common British species, the former being, however, rather more generally distributed than the latter. There are various other species scattered over the world, but none of any great beauty. In the Vosges they are used as a salad under the name of *cresson de roche* (rock cress).

Chrys'ostom, Joannes, Archbishop of Constantinople, and the most eloquent of the Christian Fathers (hence his name, Gr. *Chrysostomos*, 'golden-mouthed'), was born at Antioch in 347. His father Secundus, imperial general in Syria, died shortly after C.'s birth, but his pious mother Anthusa, who had been left a widow at the age of twenty, procured for him the best teachers in all the branches of learning. At first intended for the law, he studied rhetoric under the great pagan Libanius, who said, with bitterness on his deathbed, 'I would have left the care of my school to Joannes, but the Christians have snatched him from me.' After remaining three years with Bishop Meletius, he was induced to receive Christian baptism, abandon his profession, and enter the Church. He then spent six years of ascetic seclusion in the mountains of Antioch, engaged in a profound study of the Scriptures under the abbot Diodorus (afterwards Bishop of Tarsus), and having for companions Basil (St), Gregory (Nazianzen), and Theodore (of Mopsuestia). Worn out with austerities, he returned to Antioch, and was ordained a deacon by Meletius in 381, and a priest by Flavianus in 386. For twelve years he preached at Antioch, delivering an immense number of sermons, orations, and homilies. Eutropius, the minister of the Emperor Arcadius, had heard the great preacher, and now inveigled him to Constantinople, much against his will, to fill the vacant archbishopric. But his life was too austere, his discipline too strict, and his denunciation of every kind of profligacy and error too faithful for that corrupt metropolis: the lax clergy (headed by Theophilus, Patriarch of Alexandria), many courtiers, and the Empress Eudoxia, combined against him, got him condemned by a packed synod (403). The charges brought against him were clandestine intercourse with females, secret intemperance, inhospitality, violence towards his own clergy to the extent of striking them, reckless dissipation of the wealth of his church, impious and arbitrary acts, infractions of canonical laws, toleration of pagans (whom he too easily admitted to baptism), and an attachment to the doctrines of Origen. That C. indignantly repelled such of these accusations as were dishonourable mattered nothing. The forty-five bishops were bent on his ruin, and they succeeded. C. was banished. When the populace of Constantinople heard the news they were stirred with fierce indignation. It was thought prudent to bring the great preacher back from his exile at Prinetos, in the Gulf of Nicomedia. But only a few months later he burst forth in church with a stern denunciation of the excesses that had marked the games held in honour of the empress. Eudoxia was furious. A council was again held at Constantinople, and the previous condemnation was confirmed. It was in vain that C. appealed to the Pope. Rome was helpless. The Goth was almost at her gates. On the 20th of June C. was carried off from his see by an armed force. His residence was fixed at Cucusus, in Armenia; but when his indefatigable pen, and the fame of his apostolic virtues, made him as powerful in adversity as on his episcopal throne, Arcadius ordered him to be transported to the remotest limits of the empire, under the shadow of Caucasus. On the way thither he sank under the fatigue of the journey made on foot, the heat, and rough treatment from his guard; and died at Comanum, in Pontus, 14th September 407. C. is one of the heroes of the Church. His virtues are noble and exalted. It is easy to understand why mean, worldly, and vicious natures hated him. His character was a living and perpetual reproach to them. It is no less easy to understand why he fell before his enemies. He was outspoken, unguarded, perhaps we may even say ungovernable, in his speech. In his transports of Christian indignation he was reckless of consequences, and uttered words that Pride and Vice could never forgive. But this sacred passion for reforming the manners of his age has given an immortal vitality to his writings. No father of the Eastern Church has thrown so much genius, so much humanity, so much of his own age into his works, which form a part of Byzantine history during one of its most momentous transitions. They embrace homilies, sermons, commentaries, and epistles. Of the complete editions we may note that of H. Savile (8 vols. Eton, 1612); and of Montfaucon and the Benedictines (13 vols. 1718-38). See also the splendid *Apologia* of Villemain in his book, *Sur l'Elo-*

quence Chrétienne au quatrième Siècle (2d ed. 1849). See also Neander's *Kirchengeschichte* (Bohn's transl. vol. iv. pp. 466–477), and also his monograph, *Johann C.* (3d ed. 2 vols. Berl. 1848).

Chrys'otype (Gr. *chrysos*, 'gold,' and *typos*, 'impression'), a photographic process invented by Sir J. F. Herschel, and one among the many modes of directly receiving the impression upon paper. The paper is prepared by immersion in a ferric salt, which is reduced by the action of light to a ferrous salt. Upon the reduced portions metallic gold is then precipitated, and the picture fixed by several washings in water and in a weak solution of potassic iodide.



Chub.

Chub (*Leuciscus cephalus*), a Teleostean fish, included in the family *Cyprinidæ*, or Carps, and found in most English and southern Scotch rivers. The average weight is about five pounds. It is coloured of a bluish-black on the upper parts, and silvery-white beneath. The sides of the head and gill-covers are yellow. It also occurs in European rivers, and spawns in April and May. The flesh is somewhat coarse, and hence the C. is not esteemed as a table-fish. The food consists of worms and insects; and the C. may be caught by means of insect-bait—real or artificial. The flesh is most seasonable in June or July. The scales used to be employed, like those of the dace and bleak, in inlaying-work, and in manufacturing artificial pearls.

Chubb, Thomas, one of the English Deists of the first half of the 18th c., was born at East Harnham, near Salisbury, 29th September 1679. First a glover, then a chandler in Salisbury, he was essentially an illiterate man, but had a mind which was fascinated by the theological controversy then raging, and he acquired facility in writing by making notes and observations on the deistical writings which were eagerly read by him. He produced a multitude of tracts similar to the writings of the time on the same side. C. died at Salisbury, 8th February 1747. His posthumous works were published in 2 vols. 1748.

Chuck-Will's-Widow (*Caprimulgus* or *Antrostomus Carolinensis*), a Fissirostral bird, belonging to the order *Insessores*, and to the family *Caprimulgidæ* or Goatsuckers. This name is applied to it from its peculiar cry. It inhabits the southern regions of the U.S. of America, and is allied to the Whip-poor-will (q. v.).

Chucui'to, a town of Peru, province of Puno, on the W. shore of Lake Titicaaca, 15 miles S.E. of Puno, was a flourishing place till the 18th c., when it is said to have had a pop. of 300,000, which has now dwindled to 5000.

Chumbul', a river of India, rises in the Vindhya range, and in the Malwa agency, flows N. and N.E. through a region of wild beauty, and joins the Jumna 90 miles S.E. of Agra, after a course of 570 miles. It has a rapid current, and receives many affluents, of which the chief are the Kally Sind, Parbutti, and Bunnass.

Chu'nam, the Indian name for lime obtained by calcining sea-shells, as well as for mortar or plaster prepared from it. The walls of houses in Madras usually receive three coats of plaster, the two first being composed of lime and fine river-sand, and the third of lime mixed with 'jaggery' (palm-sugar), and moistened with a strong infusion of cocoa-nut husks. When polished with rock-crystal rubbers, and stained, the plaster resembles the finest marble, and indeed almost equals it in durability.

Chunar', or **Chunargurh**, a town in the district of Mirzapore, N.W. Provinces, British India, on the Ganges, 16 miles S.W. of Benares. It has a strong fortress, overlooking the native town, and containing an old palace, an excavated well, a hospital, a prison, &c. C. is accessible to vessels of 60 tons. Pop. (1872) 10,125.

Chuquisa'ca, also **Sucré**, formerly **Charcas** or **La Plata**, the capital of Bolivia, S. America, on the Chachimayo, in a sheltered plain 9000 feet above the sea. It is the seat of the government and of an archbishop, has a cathedral and twenty-six other churches, a palace, the University of St Xavier, a hospital, and a military academy. Pop. (1858) 23,979. C. was founded by the Spaniards in 1538, on the site of the native *Choqua Chaka* (*i.e.*, 'Bridge of Gold'), and received the name of La Plata from being near to the silver mines of Porco. Sucré, its latest name, was that of a general in the war of Bolivian independence. The *province* of C. contains rich silver mines and splendid antiquities, and has an area of 30,135 sq. miles, and a pop. (1858) of 223,668.

Church. It has been suggested that the word C., in Old Eng. *circ*, *cyrc*, or *cyrice*, is the Latin *circus*, and that it was first applied to the stone circle or Druidical temple of the Britons, and afterwards transferred to the Christian building. But this would leave unexplained the occurrence of the word in the other Teutonic tongues—*e.g.*, Dutch *kerk*; Ger. *kirche*. It is therefore more probable that the origin of the word is the Gr. *kuriake*, 'the Lord's house;' though it is still sufficiently perplexing to understand how a nation like the English, who got their religion from Rome, should not have adopted the Roman name for a C. Perhaps Theodore of Tarsus, Archbishop of Canterbury, himself an Eastern by birth, may have had something to do with it. Its use among the other Teutonic races is more easily explained through the influence of Ulfilas (q. v.) and the Mœso-Goths. C. is the word used in the English version of the New Testament to translate the Greek *ekklēsia*, except when the latter occurs in its original civil sense (a number of people called together from among others), in which case 'assembly' is employed (Acts xix. 32). It was applied to the Jews, as the worshippers of Jehovah called from among the heathen (Acts vii. 38), and also, among them, to a congregation of worshippers (Ps. xxii. 22; *cf.* Heb. ii. 12). As used by Christians, it has several shades of meaning:—1. An assembly of Christians who meet for worship in a particular place (Rom. xvi. 5). 2. The collective Christians in a certain place, or as it were a national C. (Acts xi. 22, 26). 3. The whole body of Christian people, of all times and of all places, understood as called out from the whole body of mankind. 4. The idea of C., as a building, which is not found in the New Testament, unless it be in Matt. xvi. 18, but in the 4th c. the word had come to be generally used in that sense.

1. The C. in its widest sense (3, above) is divided into the Visible C. and the Invisible C., but there are different theories as to what is meant by these terms respectively. (1.) Thus according to Romanists and High Churchmen the Visible C. is a theocracy or an externally organised society, all born within its pale being *ipso facto* its members, 'professing the same faith, united in the communion of the same sacraments, subject to lawful pastors.' The Invisible C., according to this theory, is the body of Christians who have at any time departed out of this world in the faith and love of God, all saints being included, however, who lived in the world even before the coming of Christ, 'so believing that he would come,' but all persons being excluded who have died in a state of unforgiven sin, that is, not in communion with the C. (2.) The common Protestant theory is that the C., as such, is not an external organisation, but a body the members of which are all true believers, no matter to what ecclesiastical organisation they may belong; the one condition of membership in which is faith in Jesus Christ; and the attributes, prerogatives, and promises of which, therefore, belong to the true people of God collectively considered. (3.) According to certain Puritan sects the Visible C. consists of the regenerate, and it is its prerogative and duty to sit in judgment on the question, whether the applicant for admission is truly born of God. According to both the last two theories the Invisible C. consists of the elect.

2. C., like the Gr. *kyriakē*, and Lat. *dominicum*, has also the meaning of the Lord's house, or the building in which Christians meet for worship. Originally they were oblong, standing E. and W., with chambers for the clergy on both sides, and two doors in the W. end as separate entrances for men and women. They afterwards came to be built in various shapes—round, square, and especially in the form of a cross, sometimes with the eastern division inclined off the straight line towards the S., to indicate, it is said, the drooping of the Saviour's head upon the cross. All had an Apse (q. v.) borrowed from the Roman *basilica*. The threefold division lengthwise, of nave, choir, and sanctuary, is derived from the Jewish temple, with its court of the Gentiles, holy place, and holy of holies. There is also properly a threefold division latterly, formed by the nave and the

aisles, and a triple elevation, the base-arcade, triforium, and clerestory. Churches are distinguished into various grades:—*Cathedral*, which contain a bishop's cathedra or throne; *collegiate*, served by a dean and chapter; *conventual* or minster, if connected with a convent or monastery; *abbey* or *priory*, if governed by an abbot or prior; *parochial*, if furnished with a font. See Walcott's *Sacred Archæology* (1868), and Hodge's *Systematic Theology* (1873).

Church Dis'cipline. From the earliest times the principle was maintained in the Church that those who had violated their baptismal vows by scandalous transgressions should be excluded from participating in the Communion, and should not be again admitted to it till they had given satisfactory proofs of repentance. When this was done they were again admitted to the standing of Catechumens (q. v.), being divided into the same classes. Their penitence having thus been satisfactorily proved, they received absolution and benediction before the congregation, and were restored to the fellowship of the Church. This was the first form of Penance (q. v.) which the Church of Rome systematised, in connection with the Confession (q. v.) for all kinds of sins, even the most secret. But nowhere was C. D. more consistently and rigorously carried out than at Geneva under Calvin, and nowhere has it lingered longer, in anything like its original form, than in the Calvinistic Churches of Scotland. See EXCOMMUNICATION.

Church Gov'ernment. All Christians are agreed that there are certain rules for the organisation of the Church laid down in the Scriptures which are of universal and perpetual obligation; but at the same time all Churches have exercised a certain discretion in modifying their organisation to suit varying emergencies. The chief systems of C. G. are the Episcopalian (q. v.), the Presbyterian (q. v.), and the Independent (q. v.). The first is that in which various grades among the clergy are held to be of divine institution because existing from apostolic times, and which is carried to its utmost limit in the Roman Catholic Church. In the second, all the clergy are held to be on an equality, the Church being ruled by certain courts. The Independents hold that there ought to be no such organised unity among congregations as to interfere with their perfect independence of each other.

Church History is usually divided into *external* and *internal*. The former, which is C. H. proper, would at first be synonymous with a history of the propagation of Christianity, and would always be concerned chiefly with the relation of Christianity to the civil and religious state of the countries in which it was propagated, on which the fate of the Church would depend. The latter, which is properly the history of the Christian religion, is concerned chiefly with the doctrine and government of the Church. The first Church historian was Eusebius (261–340, q. v.), who wrote a history of the Church, 'from the very origin of the dispensation of our Lord,' to the accession of Constantine as sole emperor (324). It is generally supposed that he had sufficient materials in previous writings to enable him to give an authentic account of the Church during the period between apostolic times, and his own, for which he is the sole authority. He himself seems to have relied upon something like inspiration, for he acknowledges that his materials were next to none. In the preface to his work he says, 'Looking up with prayer to God as our guide, we trust indeed that we shall have the power of Christ as our aid, though we are utterly unable to find the bare vestiges of those who may have travelled the way before us.' His work was continued by Theodoret (q. v.) down to 429. The next who wrote was Socrates (q. v.), whose C. H. extended from the accession of Constantine (306) to 439. Sozomen (5th c.) wrote a history of the same period as the last two. Next Philostorgius (born 358), an Arian, wrote a history of Arianism from about 300 to 425. Evagrius wrote a C. H. of the period from 431 to 594. Sulpicius Severus (end of the 4th c.) wrote a sacred history from the Creation to 400 A.D. These are the chief writers of C. H. proper near the fountain-head, from whom the legion of later writers must all derive their materials. For a history of doctrines, which is a branch of C. H., of rites and ceremonies, and of some other matters connected with it, much information is also to be found in the numerous and voluminous writings of the early Christian Fathers. On the rise of separate states in Western Europe, after the dismemberment of the Roman Empire, each country in due time produced its roll of Church historians, of whom the most interesting and important for Englishmen is the Venerable Bede (q. v.). Since the Reformation C. H. has been written from the Roman Catholic and Protestant points of view by many erudite and able scholars. Others, again, like Neander in Germany and Milman in England, have sought to exhibit the historical development of the Christian Church without any polemical bias. A full account of all the writers of C. H. up to the middle of the 18th c. will be found in Walch's *Bibliotheca Theologica Selecta*; of more recent ones in Lowndes' *British Librarian*.

Church Rates, in England, constitutes a tax on the parishioners to defray the expense of upholding and repairing a church and its appurtenances. The rate was imposed by the parishioners, convened by the Churchwardens (q. v.), and the vote of the majority was binding on the whole. There is no law which obliges the parishioners to provide C. R., consequently when Dissent is in a majority, or even possesses a strong minority, there is often no fund to repair churches—many have consequently become ruinous. The levying of C. R., and questions in connection with so doing, was long a source of animosity in England; but by the Act of 1868 compulsory payment has been abolished. Voluntary contributions and bequests, for the ecclesiastical purposes of the parish, are, under the Act, now administered by a body of Church trustees. Those who do not contribute are by the statute disqualified from interfering with the administration of the funds raised as C. R.

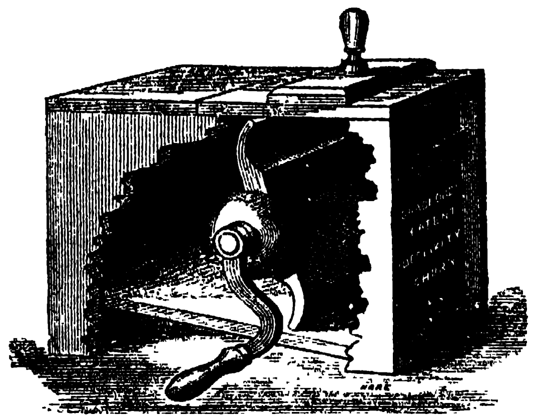
Churchwardens, in England, are ecclesiastical officers whose function it is to take care of the edifice of the church, and all that belongs to it. They are also expected to take cognisance of the behaviour of the congregation in all matters within ecclesiastical jurisdiction. They are chosen annually on 28th March, or within fourteen days after, either by the clergyman or by the parish, or by both together. Every churchwarden is *ex officio* an overseer of the poor.

Church'yard. In England a C. has been legally described by Sir William Scott as 'a consecrated place, entitled to public protection, and in which nothing should be done but under the direction of public authority.' In Scotland, there is no rite of *consecration* either according to civil or ecclesiastical laws; but the C. is entitled to legal protection. See BURIAL.

Churchill, Charles, an English satirist, whose profligacy has perhaps hindered justice from being done to his genius, was born at Westminster in February 1731, and educated at Westminster School, where he neglected his studies, and contracted a clandestine marriage in his eighteenth year. In 1756 he took holy orders, and in 1758 succeeded his father as curate of St John's, Westminster. In 1761 he published anonymously the *Rosciad*, a clever satire on actors and theatrical managers, which took London by storm. 'The noise in the theatrical world was like that caused by the report of a gun in a rookery. The actors ran about the town, spreading their own grievances, and the satirist's name at the same time' (Hannay). Now avowing the authorship, he published in rapid succession *The Apology* (addressed to the writers of the *Critical Review*), *Night* (which is an excuse for his vices), *The Ghost*, and other satires. Meanwhile he had been living so dissipated a life that he had to resign his curacy. His health failed, and he died at Boulogne on a visit to Wilkes, of whom he was a warm partisan, November 4, 1764. C. was once known as the British Juvenal; and even yet, all who can forget the man and look only at his works must admit him to be a true poet. See Bell and Daldy's edition of his poetical works (1867), with a Memoir by James Hannay.

Churching of Women, or *Thanksgiving after Childbirth*, is a usage of the early Church, borrowed from the Jewish rite of purification (Lev. xii.), still retained as compulsory in the Roman Catholic and Greek Churches, and for which there is also a service in the Liturgy of the Church of England

Churn (Old Eng. *cyrn*, from *cerran*, 'to turn;' Low. Sc. *kirn*), an implement for preparing butter from cream or milk. For the separation of the fatty particles which form butter, it is necessary that the minute sacs in which the fat is enclosed should be ruptured, and this is accomplished by violent agitation or 'turning' about of the fluid in a C. The object of churning is therefore to enable the solid fat to come together in the masses which constitute butter. A great many plans for the construction of churns have been adopted, and as the operation they have to perform is simple, they are all more or less efficient. The chief aim in the construction of the C. is to save time and labour, and to separate the butter completely. The most common form of the C. is the upright plunger, which consists of a long narrow tube or cylinder of cooper-work, tapering gently upwards, with a movable cover on the top. Through the centre of this cover the staff of the plunger is made to work piston-wise, at the lower extremity of which the agitator is secured. The agitator consists of a reticulated framework of wood, of a diameter sufficient to work easily within the C. Another common form is the Box-C., which consists of a box of birch or plain wood very carefully jointed, having an agitator formed of four radial arms joined by cross bars, which is worked by a winch-handle. Some churns have a reciprocating motion, and others a seesaw or cradle motion, but they are little used. The atmospheric C. is a form which has recently come into favour. Its peculiarity consists in an arrangement by which air is introduced into the fluid, and by its bubbling out causes a very effective agitation. It is said to save considerable time and labour, while at the same time it thoroughly separates the butter. A form of C. recently patented by Messrs T. Bradford & Co. is seen in the fig. It is known as the 'Declivity C.,' and its peculiarity consists in the bottom sloping downwards at an angle of about 30°, so that while the concave side of the agitator dashes the cream upwards, the fluid is constantly running downwards, and thereby a powerful concussive stroke is produced.



Churn.

Churr'us. See HEMP.

Chusan', the principal island in a small group off the E. coast of China, 45 miles N.E. of Ningpo, is about 18 miles long and 10 broad, and 50 miles in circumference. It is mostly mountainous, but is intersected by cultivated valleys, yielding tea, rice, wheat, sweet potatoes, cotton, tobacco, chestnuts, &c., and growing bamboo, camphor, and tallow-trees. Ting-hai, the capital, is surrounded by walls, and has a fine Buddhist temple. C., called 'the key of China,' was taken in 1840 by the British, who evacuated after eight months' occupation, but again seized it in October 1841, and held it till the end of the Chinese war. It was again taken by them in 1860, but was ceded to China by the convention of Pekin. The sacred island of Pu-tu is the next in importance of the group to which C. gives name. It is inhabited solely by Bonzes and others of the religious class, and contains many fine pagodas and Buddhist temples.

Chut'ney, a condiment of Indian origin used with meat, game, fish, and animal food generally. The basis of the preparation is an acid or sub-acid fruit, to which spices and flavouring ingredients are added. The fruit most usually employed as a basis of C. is the mango, and numerous varieties are prepared for use, the recipes for which vary. The banana is also used in the preparation of C.

Chyle (Gr. *chylos*, 'a juice,' from *cheō*, 'to be fluid'), the name given to the matter absorbed by the lacteals in the villi of the small intestine. It is found in two conditions—first, before, and second, after it has passed through the mesenteric glands. To the naked eye, in both conditions it presents much the same appearance; but when examined under a magnifying power of 250 diameters, it is found to present a marked difference. Before passing to the mesenteric glands it consists of a fluid in which there are multitudes of very small molecules which refract light strongly, and evidently consist of fat. These molecules have been termed the *molecular basis of the C.* When examined after passing through the glands into a special cavity called the *receptaculum chyli*, it is found that the molecular matter is much more scanty, while there are numerous corpuscles present, resembling either the colourless cells of the blood, or biscuit-shaped cells, not unlike the coloured corpuscles. The C. passes from the receptacle just alluded to through the thorax along the thoracic duct, and is poured into the venous system at the root of the neck, at the junction of the left internal jugular vein with the left subclavian vein. C. has been found to contain fibrin, albumin, fat, alkalies, and a small amount of iron. During fasting the C. is poor in solid matters, more especially in fat. A diet containing fat increases the milky appearance of C. owing to the increased amount of fat absorbed. The C. of a cat, according to Nasse, yielded in 1000 parts the following constituents:—Water, 905·7, and solid matter, 94·3. The solid matter was composed of—fibrin, 1·3; fatty matter, 32·7; albumin, 48·9; chloride of sodium, 7·1; other soluble salts and traces of iron, 2·3; and earthy salts, 2·0. See DIGESTION, LACTEALS, VILLUS.

Chyme (Gr. *chymos*, 'a liquid or juice,' from *cheō*, 'to be fluid'), the name given to food after it has been digested in the stomach, and before it has been acted on by the biliary, pancreatic, and intestinal secretions. Some apply the term to food while in the stomach or small intestine. In the latter, part of it becomes absorbed either by the blood-vessels or by the lacteals. See DIGESTION.

Cialdi'ni, Enrico, an Italian general and politician, was born at Lombardinæ, Modéna, August 8, 1811. Exiled for sharing in a rising against the Austrians in 1831, he studied at Paris and fought against Don Carlos in the Spanish war of succession. He played a brilliant part in the Venetian campaign of 1848-49, and served as colonel among the Piedmontese who engaged in the Crimean war. He won distinction in the Italian war of 1859; defeated the Papal troops at Castelfidardo in 1860; was made, after capturing the citadel of Messina, general of the army; and in 1861 succeeded San Martino as lieutenant-general of Naples, where he strove vigorously to suppress brigandage. He was elected senator in 1864. He ably opposed the Austrians in the Venetian campaign of 1866, and was in the same year made commander-in-chief of the troops of Central Italy. His political has been less successful than his military career.

Cibb'er, Coll'y, English dramatist, was the son of Caius Gabriel Cibber or Cibbert, a sculptor from Holstein, and was born in London, 6th November 1671. About 1690 he became an actor, and came before the world as a writer of plays in 1695, when he produced the *Love's Last Shift*, soon followed by *The Woman's Wit*, *Careless Husband*, &c., which were very popular at the time, and brought C. much money. In 1711 he became one of the joint patentees of Drury Lane, and in 1730 was made poet-laureate, an appointment which secured him an unenviable immortality in the *Dunciad*, to the author of which he had given offence. He died 12th December 1757. Some of C.'s pieces are still acted, but the work by which he is best known is his amusing *Apology for his own Life*.

Cibol, or Ciboule, the French form of the Lat. *cæpulla*, a diminutive of *cæpa* (Sc. *sybæ*), an 'onion.' See ONION.

Cibo'lium. See BAROMETZ.

Cibra'rio, Luigi, an Italian jurisconsult and historian, born at Turin, 23d February 1802, where he graduated as doctor of civil and common law in 1824. In 1825 he published his *Notizie sulla Storia dei Principi di Savoia*; in 1826 his *Notizie di Paolo Simone de' Balbi*, and in 1827 his *Delle Storie di Chieri Libri IV.* Nominated a senator in 1848, he was, after the fall of Carlo Alberto and his retirement to Oporto, deputed by his colleagues to visit him in his voluntary exile, and try to induce him to return to his kingdom. The result of this unsuccessful mission he published in 1850 in *Ricordi di una Missione in Portogallo al Re Carlo Alberto*, which threw a vivid light on the Italian Revolution of 1848. Besides these he published several histories, a treatise *Della Economia Politica del Medio Evo* (2 vols. Tur.

1839; 5th ed. 1861), as well as numerous editions of ancient Italian authors, illustrated by valuable notes. Under Vittorio Emanuele he was appointed superintendent-general of customs in 1850, Minister of Public Instruction in 1852, Minister of Foreign Affairs in 1855, and afterwards principal secretary to the King. His *Operette Varie* were published at Turin in 1860. C. died at Salo, in Brescia, 1st October 1870.

Cica'da, a genus of Homopterous insects, included in the section *Trimera* (three-jointed tarsi). These insects belong to the Hemipterous group of the order Homoptera, and possess short broad heads. The eyes are large and prominent, and three ocelli exist, placed in the back of the head. The beak or rostrum is long and three-jointed. The males possess peculiar 'drums' at the base of the abdomen, whereby they produce loud sounds. The females possess ovipositors, saw-like in form. The antennæ are seven-jointed. The sound of the males is very loud, and can be heard at a great distance. The colour of the insect is yellowish. The wings are firm, transparent, and shining, and the nervures are distinct. These insects are mostly tropical in habits, one species (*C. Anglica*) occurring in the S. of England. Several species are eaten like locusts. The ancients knew of these insects, and said that the cicadas should be happy insects, since they had 'voiceless wives.'

Cicatric'ula. See Egg.

Cicc'a, a genus of plants of the natural order *Euphorbiaceæ*, consisting of small trees and shrubs, natives of tropical India, Africa, and America. *C. disticha*, the 'Otaheite gooseberry,' is a native of India, but is cultivated in that and in many other countries for the sake of its fruits, which are used either raw or cooked in various ways. The Europeans pickle or preserve them, or bake them in tarts. In Java they are sold in the market for about threepence per gallon. A decoction of the leaves causes perspiration, and the roots are a violent emetic. The wood of *C.* (*Prosorus*) *Indicus*, of Bombay and Ceylon, is white and tough, and is used for shipbuilding in the latter country. Its light-blue seeds constitute a favourite food of the green pigeon.

Cic'ely (*Myrrhis*), a genus of umbelliferous plants, of which one species (*M. odorata*, the sweet C.) is common in Southern and Central Europe, though in Britain, from being generally found near human habitations, it is looked upon as introduced. It is allied to the *Chevril* (q. v.), and indeed is sometimes so called; in Scotland it is known as *Myrrh*. In Germany the seeds, roots, and young leaves are used for giving an anise-like flavour to soups, &c., and at one time they were used as an aromatic in medicine. In America, *Osmorrhiza* is called *sweet C.*

Cicer. See Chick-Pea.

Cic'ero, Marcus Tullius, the prince of Roman orators, and famous also as statesman and man of letters, was born near the town of Arpinum, under the Volscian Hills, 3d January 106 B.C. His family belonged to the equestrian order, but was not accounted 'noble.' C.'s father—a quiet country gentleman—anxious to give his sons the best education in his power, had them removed to Rome, where the future orator was instructed under Greek teachers in all the branches of a liberal education. At the age of sixteen he entered on his special studies for the bar. In the Marsic War, 89 B.C., he acquired a knowledge of military tactics under Sulla; but after a brief period of service he returned to philosophical studies. He made his first appearance as a pleader at the age of twenty-five, and two years after secured the acquittal of Roscius, who had been charged with parricide by Chrysogonus, one of Sulla's favourites. Briefs now poured in upon him, and after a time of intense exertion, which threatened to impair a constitution never robust, he retired for a while to Athens and Asia Minor, to pursue the congenial studies of elocution and philosophy. Fame and honours awaited him on his return. Elected Quæstor 76 B.C., he earned by his able and just administration of the government of Sicily in the following year the gratitude of the Sicilians, to whom he still further endeared himself by his successful impeachment of their Prætor, Verres, 70 B.C. After passing through the offices of Ædile, 69 B.C., and Prætor, 66 B.C., he was elected Consul in 64 B.C. by acclamation rather than by vote. In the following year, with consummate courage, caution, and decision, he denounced and crushed the famous conspiracy of Catiline (see Catiline), for which he received the thanks of the people, and was hailed 'Father of his country.' Public thanksgivings in his name were voted to the gods, an honour hitherto accorded only to victorious generals. But in putting the imprisoned conspirators to death without trial, C. had been guilty of an act which, though perhaps morally justified by the emergency, was clearly illegal, and he was called to account for it by Metellus Celer. The enthusiasm of the people proved all-sufficient for him at the time, and but for the vehemence with which he attacked Clodius for invading the rites of the Bona Dea, the charge might have been allowed to rest for ever. Clodius, however, bent on revenge, sought, and in time obtained, the tribuneship, revived the charge, and compassed C.'s banishment, April 58 B.C. On 4th August 57 B.C., a bill for his recall was submitted to the Comitia Centuriata and carried; whereon he set out for Rome, which he reached on 4th September, 'borne back,' as he himself says, 'on the shoulders of Italy.' But his spirit had been broken by exile, and he tamely submitted to many degradations, and condescended to acts of servility towards men whom he despised. His time-serving policy with regard to Cæsar and Pompey was fraught with mischief to the state, and marred his reputation as a patriot. On the other hand, the independence evinced by his defence of Milo is a redeeming feature in his character. During the years 57-52 B.C. were composed his *De Oratore*, *De Republica*, and *De Legibus*. In 53 B.C. C. was elected into the College of Augurs, and in the following year appointed to the government of Cilicia, which he managed with great ability and success (51-50 B.C.). He returned to Rome by Ephesus and Athens at the outbreak of the civil war, 49 B.C., and after much vacillation joined the side of Pompey, whose standard he forsook after the battle of Pharsalia, 48 B.C. Having obtained a reconciliation with Cæsar, he retired to the country and wrote many philosophical and theological works, chief of which were *Orator*, *De Finibus*, *Hortensius*, *Tusculanæ Disputationes*, *De Natura Deorum*, *De Senectute*, *De Amicitia*, *De Officiis*. On the murder of Cæsar, 44 B.C., C., who was inclined to throw in his lot with Brutus and Cassius, advised an adjustment of the differences between Antony and the Senate, but to no purpose. Then followed those terrible philippics—of fame how fruitful, to himself how fatal!—in which he denounced Antony with relentless bitterness. The dazzling glory with which he had been for a few brief months encircled now paled; the defection of Octavian, in whom he had placed unlimited confidence, was followed by the second triumvirate, and the name of C. was in the list of the proscribed. Octavian made no effort to save him, and the emissaries of Antony overtook him near Formiæ as he fled in a litter to Cajeta. Deeming resistance vain, with becoming fortitude and resignation he extended his head from the litter, and it was severed from his body by Herennius, 7th December 43 B.C., in the sixty-third year of his age.

Dr Middleton, in his charming but partial biography of the orator, has exhibited him as a pattern of splendid virtue and blameless honour; while Drumann and Mommsen have assailed him with great bitterness and severity. C.'s character was of the Asiatic type. He was ambitious, fond of pomp, greedy of applause, timid, and irresolute. In private life he was kind and amiable. In his literary compositions his fame is of the highest, and his style is a model of purity. His philosophical works breathe the strictest morality, and are especially valuable as reflecting the different views of the Greek schools of philosophy. As a poet he ignominiously failed. As a statesman his abilities were great, but often misdirected; to the active virtues of a patriot he can lay no claim. As an orator he was without a rival.

The *editio princeps* of C.'s collected works was printed at Milan (4 vols. fol. 1498). The best edition is that of Orelli (9 vols. 8vo, 1826-37), and the best English Life of C. is that by Forsyth (2 vols. Lond. 1864).

Cicero'ne (from *Cicero*, the orator), a term given by the Italians to those persons who point out to strangers the curiosities of a place, and now generally applied to any one who acts as a guide. The etymology of the word indicates ironically the noted garrulity of such officials.

Cicisbe'o, an Italian term for a gallant, a dangler after women. In the *Dizionario della Crusca* it is applied to the knot of ribands formerly attached to the hilts of swords or to the handles of fans. So a C. is a man in constant attendance upon a woman, and at hand to receive her commands. The term was applied more particularly to a class of men who attended on married ladies, and is synonymous with *cavaliers* *servente*. The custom, formerly prevalent in fashionable Italian society, has now almost disappeared.

Cico'nia. See STORK.

Cicut'a, or **Water Hemlock.** See HEMLOCK.

Cid, The, Don Rodrigo Diaz de Bivar ('he of the perfect beard'), was born at Burgos in the year 1025, in the reign of Sancho III. of Navarre, and of a family from whom had been chosen the 'judges of Castille.' C. is derived from the Arabic *Said*, or master: his other title, *El Campeador* (corrupted by the Arabs into *Cambitûr*), means either national champion or umpire. Soon after his birth, the dynasty of Ommeyad Califs at Cordova was broken up, and Fernando I. of Castille united the petty Christian states of N.W. Spain. The story of *The C.*, told by Corneille and Voltaire in their dramas so named, of his love for Ximena, the daughter of Count Lozano of Gormaz, whom he had slain to avenge an insult offered to his father, of his conquest of five Moorish chieftains who had invaded Castille, of his horse Babieca (or Booby), on which he drove the Moors from Estremadura (on E. bank of Douro) and captured Coimbra, how he resisted the imperial pretensions of Henry III., and assisted Sancho II. of Castille to annex his brother's inheritances of Leon and Galicia, of his banishment by King Alfonso, and his great deeds at Barcelona, Zaragoza, Valencia, Alicante, and other places on the E. coast, how he defended Valencia against the Moors, how the cause of the C. and the Counts of Canion was tried before the Cortes at Toledo: all this is told in the prose *Chronicles of the C.*, belonging to the end of the 13th c. (one of which has been translated and edited by Southey), and in the *Ballads of the C.*, collected by Juan de Escobar in 1615, which have been translated into German by Herder, and partly into English by Frere, Lockhart, and Dennis. These ballads are among the finest and earliest of the Spanish *redondilhas* sung by the *Juglares*, the form of which has been connected with Arabian poetry, and also with the songs of the Roman soldiery. They are written in *coplas* of four lines, each line with seven or eight syllables, or three and a half feet, generally trochaic; the chief feature being the assonant rhyme, according to which the *last vowel*, when the line ends with a single syllable (a half foot), or the *last two vowels* when it ends in a trochee, should correspond in every alternate line, be the consonants what they may. The *Poem of the C.* is in Alexandrines. See Southey's *Chronicle of the C.* (Lond. 1808); Huber's *Geschichte des C.* (Brem. 1829); and Dozy's *Récherches sur l'Histoire Politique et Litteraire de l'Espagne pendant le Moyen Age* (1849).

Cid'aris, a genus of *Echinoidea* or Sea-urchins, included in the family *Cidaridæ*, and distinguished by having the mouth central in position, and the anus opposite the mouth, surrounded by genital plates. The ambulacra, or perforated areas of the shell, are prolonged on the buccal membrane, or that surrounding the mouth, and no buccal branchiæ, or gill-like processes surrounding the mouth, are developed. *C. papillata* is a familiar species of these forms.

Ci'der, or **Apple-Wine**, a fermented drink prepared from the juice of apples, for which particular varieties of apples are cultivated in Herefordshire and Devonshire, Normandy and Holland, the most famous C.-producing districts. The apples, when thoroughly ripened and matured, are reduced to a pulp in a grinding mill under edge rollers, with a small quantity of water added, and after being left in a tub for twenty-four hours, the juice is pressed out by the application of strong pressure. The expressed juice, after being put into barrels, soon begins to ferment violently, and when the fermentation has sufficiently advanced, which happens in from two to ten days, according to the strength of the must, and the amount of alcohol desired, the C. is racked off into stone barrels. C. contains generally malic acid, alcohol, and sugar, besides water, &c., its alcoholic strength varying from 5 to 10 per cent.

Cie'za, a town in the province of Murcia, Spain, 25 miles N. W. of Murcia, near the river Segura, has manufactures of linens, silk, and hemp, and a trade in oil and wine. Pop. 9500.

Cigar' (Span. *cigarro*), a loosely wound spindle-like roll of tobacco-leaf for smoking, supposed to be of Spanish origin. A *cheroot* is a variety of C. in the form of a slightly conoidal cylinder, with the tips cut straight. A *cigarette* (Span. *cigarrito*) is a smaller roll of finely-cut tobacco, or of triturated leaf (as in Spain), wrapped in a binder of unsized paper or the leafy covering of Indian-corn. Cigars are manufactured in enormous quantities wherever the tobacco plant is cultivated. Those made from Havannah tobacco are unsurpassed for fine flavour, aroma of smoke, and firmness and whiteness of ash, and next in order of excellence stand the Manilla cigars and cheroots. The value of a C. does not increase in direct ratio with its size, for the difficulty of obtaining wrappers of proper length, colour, and fineness for the larger sizes, immensely augments the expense of manufacture. A duty of 5s. per lb. is levied upon cigars imported into Great Britain, and in 1873 this source of revenue yielded £283,492. Simple and well-contrived machines for making cigars and cigarettes are in extensive use.

Cig'oli, Ludovico Cardi da, an Italian painter, was born at Cigoli in Tuscany in 1559, studied Correggio assiduously, and was among the first of the Florentine school to successfully oppose the anatomical style of the imitators of Michael Angelo and the other mannerists of his day. His design is correct, his colour is remarkable for force, warmth, and harmony, and his handling exhibits much vigour and *abandon*. His 'Apostle healing the Lame' in St Peter's was declared by Andrea Sacchi to be surpassed by only two pictures in Rome—the 'Transfiguration' of Raphael, and the 'Communion of St Jerome' by Domenichino. Tuscany is particularly rich in specimens of his work. The 'Martyrdom of St Stephen,' in the palace of the Uffizi, Florence, is reckoned one of his finest efforts. C. died at Rome in 1613.

Cil'ia. These are small hair-like bodies, having a power of motion, attached to a variety of epithelial cells. A layer of cells of this variety is called a layer of *ciliated epithelium*. Such cells are of a columnar shape, bearing the C. on one extremity, while the other lies on, or is attached to, subjacent tissue. The cells are usually arranged in three or four layers deep, but the external layer is the only one fully developed, the deeper layers being destitute of C. Ciliated epithelial cells vary in size. In the human trachea or windpipe, they are about $\frac{1}{3000}$th to $\frac{1}{2500}$th of an inch in length, but in many of the invertebrata they are much larger. They are found in the following situations in the human body:—(1) On the mucous membrane of the respiratory tract, from the base of the epiglottis to the smallest bronchial tubes in the lung. The vocal cords and the air-cells of the lung are not covered by C. (2) On the mucous membrane of the nose, with the exception of the area in the upper chambers devoted to the sense of smell. (3) On the mucous membrane of the female generative organs from the middle of the neck of the uterus to the free edge of the fibriated extremity of the Fallopian tube. (4) On a portion of the tubular structure of the testicle. (5) On the lining membrane of the cavities of the brain and spinal cord in the new born child. In adult life, however, they are limited to the central canal of the cord, the posterior end of the fourth ventricle of the brain, the aqueduct of Silvius, and the lateral ventricles. (6) In the Eustachian tube and in the middle ear or tympanum.

Form of Cilia.—They are slender, conical, or sabre-shaped filaments, narrow at the free extremity, and broad at the base. Under the highest powers, they show no indication of definite internal structure.

Motion of Cilia.—This may be best studied by examination of a portion of the gills of the common mussel. It is seen to be a sort of lashing movement, and when many act together on the same bar or surface, the motion gives rise to the optical effect of a series of waves passing along the free border of the ciliated surface, like the waves caused by wind passing over a field of corn. Occasionally the movement is so rapid that the C. are not seen, but their presence is indicated by the movements of particles of matter in their vicinity. Adopting the classification of Valentin and Purkinje, the movements of C. may be divided into (1) the *hook-like*, in which the movements are like those of a finger alternately flexed and extended; (2) the *funnel-shaped*, in which there is a kind of twisting action of the cilium by which its apex describes a circle or ellipse, and the whole cilium a cone having the base uppermost; (3) the *oscillating*, in which it swings like a pendulum; and (4) the *undulating*, or flail-like, in which it acts like the lash of a whip. Few objects are more beautiful than a mass of C. in vigorous action. In cold-blooded animals the motion of the C. may continue for hours, or even days after the death of the animal, but in warm-blooded animals they rarely act for more than two hours.

Effects of physical and chemical applications on Cilia.—(1) *Temperature.*—A rise of temperature increases the activity of the movement, but it ceases at 57° or 60° F. Cold does not retard the action even when reduced to freezing-point. (2) *Water.*—Fresh water retards or destroys the action of C. of sea-animals, while salt water has a similar effect on those which frequent fresh water. (3) Bile, alkalies, acids, and alcohols arrest the motion. (4) Vapour of chloroform arrests the motion for a time, if not applied for too long a period. (5) Oxygen is required for the activity of C.; deprivation of it, or an atmosphere of hydrogen, arrests the movement. (6) A stream of carbonic acid retards the action. (7) Continuous or Faradic currents of electricity, or a discharge from a Leyden jar, have no effect unless extremely powerful, when they cause either electrolysis or sudden stoppage.

C. are endowed with the vital property of contractility, and it is in virtue of this they move. Their actions are not dependent directly on the integrity of the nervous or circulatory systems, as they work vigorously for some time after the death of the animal. See CONTRACTILITY.

Cili'cia, anciently a province of Asia Minor, coinciding partly with the modern vilayet of Adana, bounded on the N. by Taurus, on the S. by the Levant, on the W. by Pamphylia, and on the E. by the range of Amanus. Its physical characteristics divided it into two parts, the Western or Rough C., and the Eastern or Plain C., the former clothed with forests, and the latter producing corn and wine. C. was governed by native kings, even after it became a Persian satrapy. After the victory at Issos (333 B.C.) it became a Macedonian province, and on the death of Alexander it became part of the kingdom of the Seleucidæ, till Pompey made it a Roman province, B C. 63.

Cimabu'e, Giovanni Gualtieri, an early Italian painter, was born at Florence in 1240. Being sent while a youth for purposes of education to the convent of Santa Maria Novella, he there learnt his art from certain Grecian painters, who were engaged in decorating the church of the convent, and soon acquired so much celebrity that in 1263 he was commissioned to adorn with frescoes the Church of St Francis at Assisi. Among his subjects were the 'Life of Christ,' 'Life of St Francis,' 'Life of the Virgin,' 'Four Evangelists,' &c., portions of which still remain. Returning to his native city, C. painted his famous 'Madonna' (still preserved), which was regarded as a marvel of art, and excited such enthusiasm that the people bore it in procession from his studio to the Church of Santa Maria. He died at Florence, probably in 1302. His chief distinction is, that he materially helped to emancipate Italian art from Byzantine traditions. He ceased to be a copyist, turned his attention towards nature, and diversified the mechanical *pose* of Greek figures by study from living models. In this restoration of art, however, C. cannot be regarded as having done more than prepare the way for Giotto (q. v.), who was his pupil and protege.

Cimaro'sa, Domenico, an Italian musician, was born at Naples in 1754, and studied under Sacchini at Loretto. He very early attained celebrity as a composer of operas, of which one—*Il Matrimonio Segreto*—is still well known. C. undertook musical engagements at St Petersburg, Vienna, and other European courts, but eventually returned to Italy, and died at Venice, 11th January 1801.

Cim'balo, an old keyed instrument, one of the precursors of the harpsichord.

Cim'bri, or **Kim'bri**, a people who, in conjunction with the Teutones, invaded Southern Europe towards the close of the 2d c. B.C., and defeated several Roman armies in succession, till they themselves were conquered by C. Marius, B.C. 101, in the Campi Raudii, near Vercelli, with a loss estimated at from 100,000 to 140,000 men. Who these C. were has given rise to much discussion. Tacitus, Pliny, and Strabo agree in making their original country the Chersonesus Cimbrica, now the peninsula of Jutland. The preponderance of ancient testimony is in favour of their Celtic origin, and H. Müller, in his *Die Marken des Vaterlandes*, holds to this opinion, and contends that the name is identical with *Kymri*, the designation of the modern Celts of Wales. Modern opinion, however, favours their Germanic origin; and the definite facts that support this hypothesis are stated by Mommsen, *History of Rome*, vol. iii. pp. 178, 179, (Dickson's translation). The name C., or *Chempho*, is certainly Teutonic (comp. Old Eng. *Kempa*, and Ger. *Kämpfer*), and means the 'champions,' which their enemies translated the 'robbers.' Mommsen suggests that 'round a nucleus of Germanic emigrants from the Baltic' had gathered in the course of their wanderings 'an immense multitude of various origin.' This would satisfactorily account for many Celtic traits which the motley host exhibited.

Cim'ex and **Cimic'idæ**. See BUG.

Cimicifu'ga, or **Bugbane**, a genus of plants belonging to the order *Ranunculaceæ*, natives of Eastern Europe, Siberia, and N. America. The European *C. fœtida* is extremely fetid, and is used to drive away bugs and other vermin—hence the specific name ('bug-fleer').

Cimme'rians, or **Cimme'rii**, a people of whom Homer may be said to give a dim, fabulous tradition, and Herodotus a definite and partially historical account. In the Odyssey they are represented as dwelling in darkness beyond the ocean-stream. In Herodotus they occupy the territory between the Borysthenes (Dnieper) and the Tanais (Don), and are represented as having invaded Asia after they were expelled from their own country by the Scythians. They seem to have occupied the Tauric Chersonesus (Crimea), and from them the Cimmerian Bosporus (Strait of Yenikale) takes its name. They were a nomadic race.

Cim'olite. See FULLER'S EARTH.

Ci'mon, a famous Athenian general, son of the Miltiades who conquered at Marathon, was born 510 B.C. His life was mainly devoted to the overthrow and humiliation of his country's great enemy, Persia. In 477 he shared with Aristides the command of the Athenian contingent of the Greek armament under Pausanias, reduced Eion on the Strymon, and in 476 subdued and colonised the island of Scyros. In 466 he completely defeated a great Persian fleet at the river Eurymedon, and subsequently expelled the Persians from the Chersonese. C. regarded Sparta as the 'yoke-fellow' of Athens, and on the revolt of the Helots headed two expeditions to aid the Spartans. Having been, however, on the second occasion, insultingly dismissed by them, C. lost his popularity at Athens, failed in the struggle against Ephialtes and Pericles, and was eventually ostracised. He was recalled five years later, and under his influence the Athenians made peace with Sparta, and renewed the war with Persia. In 449 he sailed with 200 ships to Cyprus, where he died at the siege of Citium.

Cincho'na, an important genus of evergreen shrubs or trees, natives of the valleys of the Andes, and which give the name to the order to which they belong (*Cinchonaceæ*). They are found from about lat. 19° S. to Caracas, in about 10° N. lat., and at heights from 4000 to nearly 12,000 feet above the sea-level. There are many species, but all do not yield the medicinal bark known in medicine and commerce as C. or Peruvian bark. The different species have been the subject of elaborate investigation, by Weddell, Howard, Markham, Spruce, and others, and the general result of their investigations is, that the Calisaya or yellow bark is the produce of *C. Calisaya*, the grey or Huanco bark of *C. micrantha* and *C. nitida*, Loxa or crown bark of *C. Condaminea* (*officinalis*), while the red bark is furnished by *C. succirubra*. The value of C. bark as a tonic and remedy for fever is owing to the presence of the alkaloids *quinia*, *quinidia*, *cinchonia*, and *cinchonidinia*—some of the barks, however, containing more than others. For instance, *quinia*, the most useful of all of them, is found in greatest quantity in Calisaya bark, *cinchonia* in grey and red bark, while *quinidia* exists in largest amount in Loxa bark. All of these alkaloids, though varying in degree of strength, have similar properties. The C.-trees grow in the forests of Bolivia, Peru, and neighbouring countries in small groups. The *cascarilleros* or bark-gatherers are native Indians or half-castes, whose occupation is one attended with great labour. After a tree is cut down, the bark is stripped off, and the larger pieces stacked to dry, while the thinner bark from the twigs and branches rolls up in 'quills' like that of the cinnamon-tree. The bark nearest the root is most esteemed, on account of the quantity of alkaloids contained in it. After being dried, it is conveyed to the coast on the backs of the *cascarilleros*, or in any other way that the circuitous paths through the mountainous forest will admit of. The object of the *cascarilleros* being to collect the greatest quantity of bark in the shortest possible space of time, they indulge in the most wasteful destruction of the C. forests, young trees and old being indiscriminately cut down without any attempt to replace them by planting others. In course of time the effects of this suicidal policy began to be apparent. The supplies of bark became more and more difficult to obtain, and it was evident that in time the tree yielding this drug, so all-important in tropical countries, would soon become practically extinct. Accordingly the Indian Government took measures to naturalise it in the cooler hill-regions of India. This task was committed to Messrs C. R. Markham, R. Spruce, M'Ivor, and others, and was performed with such success, that extensive forests are now growing in various parts of India, and promise to yield, in course of time, a supply of C. much greater than ever was obtained by the precarious labours of the S. American *cascarilleros*. Owing also to the scientific skill with which the trees are cultivated, it is found that the Indian-grown bark yields a greater supply of the alkaloids than the wild trees. It is also now naturalised in Jamaica and Java. C. bark was first employed in Europe about the middle of the 17th c., though its valuable properties as a febrifuge were long known to the natives of Peru. It was first brought from that country to Europe in 1639 by the Countess del Chinchon, wife of the then Viceroy of Peru, and from whom the genus is now named, though—notwithstanding the appeal of Mr Markham for the correct spelling of the word, C*h*inchona—long usage has now established the genus without the *h*. From the fact of the Jesuits using it as a remedy in intermittent fever, the C. bark was at one time generally known as, and is still sometimes yet called, 'Jesuit's bark.' It is also called China bark, Quinia, Quinquina, &c. It is now generally administered in the form of its alkaloid quinine, or in the sulphate or disulphate of quinine, in doses of from 1 to 20 grains. In addition to its anti-periodic febrifugal and tonic properties, the bark is somewhat astringent, and has been occasionally found serviceable as a topical astringent and antiseptic. See Pareira's *Materia Medica*; Moquin-Tandon's *Botanique Médicale*, and the various works and reports of Markham, Weddell, Howard, Spruce, and others on the subject.

Cinchona'ceæ, a natural order of Dicotyledonous plants, of which the genus *Cinchona* (q. v.) is the type. By some botanists it is considered only a division of *Rubiaceæ* (q. v.). There are about 2600 species, distributed over 300 known genera, consisting of trees, shrubs, and herbs, all natives of tropical and warm regions. It is very important as furnishing many plants useful in medicine, the arts, and domestic economy. Some possess tonic, febrifugal, emetic, astringent, or purgative properties; others yield dye and tanning agents; while a third group possess edible fruits and seeds. A few are reputed to be intoxicating and even poisonous, and several are cultivated for the sake of their beauty and the fragrance of their flowers. In addition to Cinchona, Coffee, (q. v.), Ipecacuanha (q. v.), *Morinda citrifolia*, the root of which yields Soorangie dye, *Uncaria Gambir*, which yields white Gambir, a variety of catechu, *Gardenia*, and other plants yielding pleasant fruits, Chayroot (q. v.), &c., may be mentioned as some of the more important economic plants of this order.

Cin'chonine and **Cinchon'idine** are isomeric alkaloids (q. v.), contained, along with the quinine alkaloids, in the bark of the different varieties of Cinchona. Pale Peruvian bark is richest in C. and its isomer; yellow Peruvian bark in quinine. Another alkaloid called *Cinchonicine*, isomeric with C. and C., is obtained under certain conditions by heating the latter substance. The composition of these bodies is represented by the formula $C_{20}H_{24}N_2O$; that of quinine and its isomers by the formula $C_{20}H_{24}N_2O_2$. Sulphate of C. is used in medicine, and is similar in its physiological action to sulphate of quinine. See QUININE.

Cincinde'la, a genus of *Coleoptera* or Beetles, forming the type of the family *Cincindelidæ*, and popularly known as 'Tiger-beetles' or 'Sparklers,' from their carnivorous habits, and from the brilliant hues and lustres of their bodies. The tiger-beetle (*C. campestris*) is a familiar British species, and is noted for its voracious habits, feeding on other insects, and being able to pursue its prey into the air. It exudes a powerful odour or scent, like that of a crushed verbena leaf. The Indian tiger-beetle (*C.* [illegible]) is another well-known species. These insects have five-jointed tarsi; the head is wider than the chest, and the mandibles are large, sharp, and toothed.

Cincinna'ti, the 'Queen City of the West,' is the chief town in Ohio, and is situated on the N. bank of the Ohio river. It is built on two terraces, the one 50, the other 100 feet above the river. The streets and the environs of the city are alike beautiful. C. has many fine buildings, as the C. College, the custom-house, the post-office, and Burnet House. There are two Roman Catholic colleges, and one Methodist; a Presbyterian theological seminary, a law school, several medical and ladies' institutions, besides many free schools, and about a hundred churches. C. is connected with Covington, on the Kentucky side of the Ohio, by a magnificent suspension-bridge, 100 feet above low-water. The city is supplied with water from the Ohio by a reservoir which cost $796,000. C. is the greatest pork-market in America, the killing and packing being an immense industry. Wine, from the native Catawba (q. v.) grape, is also an extensive article of trade, and there are large manufactories for iron, steam-engines, lard, flour, soap, and candles. The Ohio is the great outlet for traffic, the river being navigable to its junction with the Mississippi, 500 miles below, and to Pittsburg, 460 miles above the city. In 1864 the exports were $239,079,825, and the imports $389,790,537. C. was founded in 1788, and had only 500 inhabitants in 1800; in 1830 it had 24,830; in 1870, 216,289.

Cincinnati (Order), a society in the United States, which was formed in 1783 by the officers of the revolutionary army, to perpetuate their friendship, and to provide for the widows and orphans of those who had fallen in the war. The badge of the society is a bald eagle of gold, with the motto *Omnia reliquit servare rempublicam*. It is suspended by a deep-blue ribbon edged with white. The order was to be hereditary; hence it met with much opposition. It still, however, exists in some of the States, and meets on the 4th of July.

Cincinna'tus, Lucius Quinctius, a Roman statesman and soldier, famous in the national legend preserved by Livy for the simplicity of his life and manners. He was born sometime before the expulsion of the Tarquins. In 460 he was illegally appointed *consul suffectus*; and two years afterwards, being made dictator, he extricated the Roman consul and army from imminent destruction at the hands of the Æqui. Livy's narrative of the manner in which he effected this is rejected by Niebuhr as transparently mythical. In B.C. 439, at the age of eighty, he was a second time appointed dictator, to suppress a plebeian discontent fostered by Spurius Mælius, after which he disappears from history. In the Roman legend, C. stands forth as a type of simple antique virtue; but modern criticism, when it allows his existence, is somewhat hard upon his patrician narrowness.

Cin'erary Urns (Lat. *cinis*, 'ashes') were the vessels in which the ashes of the dead were placed amongst those nations who were accustomed to burn their dead. When the funeral pyre was burned down, the embers were extinguished with wine, and the bones and ashes of the dead collected by the nearest relatives, who sprinkled them with perfumes and placed them in an urn, which was then deposited in a niche of the *sepulcrum*, or family tomb. The urns were mostly made of baked clay, but also of stone and metal, and even, though rarely, of gold and silver. They were of various shapes, but commonly square or round.

Cinn'a, Lucius Cornelius, the leader of the Marian party during the absence of Sulla in the East. Though elected consul (B.C. 87) with the sanction of Sulla, his first act was to impeach him, and to take measures for bringing back the banished Marians to power. Defeated in the senate, he fled from the city, on which, however, he soon marched with an armed force, and invested it by land, while Marius, who had returned from his African exile, blockaded it by sea. They captured the city, massacred the friends of Sulla, and declared themselves consuls (B.C. 86). Marius died soon after. In his fourth consulate, Cn. Carbo being his colleague, C. collected an army at Brundisium to meet Sulla, who had returned to Italy to take vengeance on his foes, but he was slain while attempting to quell a mutiny that had broken out among his troops.

Cinn'abar, native mercuric sulphide, HgS, the most abundant ore, and chief source of the quicksilver or mercury of commerce. It occurs fibrous and amorphous, also crystallised in hexahedral prisms. In the mass it is dull-red coloured, opaque or translucent, with adamantine lustre. The most important mines are those of Idria in Carniola, Austria, of Almaden in Spain, and of New Almaden, New Idria, and Redington, in California. C., artificially prepared, constitutes the well-known colour Vermilion (q. v.).

Cinnam'ic Acid and the **Cinnamyl Group.** C. A. is a white crystalline substance, resembling benzoic acid in appearance, and is contained in Storax (q. v.), Tolu, and Peru balsams, in old oil of cinnamon, and in gum benzoin. C. A. is best obtained by boiling storax with a dilute solution of caustic soda, when soluble cinnamate of soda is formed. The aqueous solution of this salt is filtered from the undissolved portions of the storax, and mixed with excess of hydrochloric acid, when the C. A. is precipitated, and may be purified by recrystallisation from boiling water.

C. A. crystallises in rhombic prisms: it fuses at 133° C., and boils at 290° C., with partial decomposition. It rises in vapour at temperatures below its boiling-point, and may therefore be purified by sublimation. It is sparingly soluble in cold water, more readily in boiling water, but its best solvent is alcohol. C. A. is a monobasic acid, and has the composition represented by the formula $C_9H_7O(OH)$, or $C_8H_7(COOH)$. It forms crystalline salts with metals, and several interesting derivatives, the following being among the most important:—

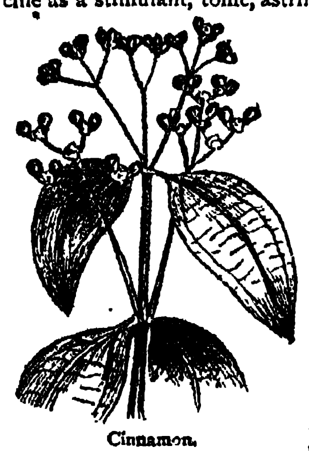
Cinnamic Aldehyde, $C_8H_7(COH)$.—This is an oily liquid, which forms the chief constituent of the essential oils of cinnamon and cassia, and gives to them their characteristic odour. It may be prepared artificially by distilling a mixture of formiate and cinnamate of calcium. See ALDEHYDES.

Cinnamate of Cinnyl or Styracine, $C_8H_7(COOC_9H_9)$, is a crystalline substance contained, along with C. A., in storax, and may be obtained from the latter after the C. A. has been extracted by squeezing the remaining resin, when the styracine is forced out in oily drops, which crystallise on standing.

On distilling styracine with caustic potash, it is resolved into *Cinnamic Alcohol*, $C_8H_7(CH_2OH)$, and cinnamate of potassium. The cinnamic alcohol passes over as an oily liquid, which soon crystallises. It has a pleasant odour of hyacinths.

Styrol, C_8H_8, is another substance contained in storax. If the latter be distilled with water, styrol is carried over with the steam, and condenses in oily drops, which are readily separated from the water by decantation. It is a liquid body, which, when heated to 200° C., is converted into a solid crystalline substance called *meta-styrol*.

Cinnamoden'dron, a genus of plants allied to *Canella* (q. v.), natural order *Canellaceæ*. The bark of *C. axillare*, a Brazilian tree, is aromatic, tonic, and anti-scorbutic.



Cinnamon.

Cinn'amon, a bark much employed as a condiment, and in medicine as a stimulant, tonic, astringent, carminative, antispasmodic, &c., chiefly derived from the inner bark of *Cinnamomum Zeylanicum*, a tree belonging to the natural order *Lauraceæ* (q. v.). The best comes from Ceylon, but it is now naturalised in various tropical countries. The tree grows to the height of from 20 to 30 feet, and sometimes attains the thickness of 1½ foot. Its properties are owing to a volatile oil, the *oil of C.* It contains in addition a concrete fatty substance, obtained from the ripe fruits, and known in Ceylon as *C.-suet*; this is believed to be the *Comacum* of Theophrastes. From the leaves a volatile oil, having the odour and taste of oil of cloves, is also distilled. The tree itself has been long known: in the Bible, for example, it is frequently referred to under the name *kinnemon* or *kinman*. There are various other species in addition to the one mentioned. *C. Cassia* (*C. aromaticum*) yields *cassia-lignea*, or the Cassia Bark of commerce (q. v.), and C. buds—also, however, obtained from *C. dulce*, *C. Loureiri*, and *C. iners*. This tree is the *kiddah* or *cassia* of the Bible. C. bark is frequently used to adulterate C. Indian Clove Bark (q. v.) is obtained from *C. Culilwan*, Sintoc bark from *C. sintoc*, while *C. nitidum* (*eucalyptoides*) and *C. Tamala* were the sources of the *folia Palabathri*, in such repute among the old pharmacologists as stomachics and sudorifics. The 'Nepal sassafras' is the root of *C. parthenoxylon* and *C. glandulifera* (Bentley).

C. is obtained by stripping the bark off the branches, when it rolls up into 'quills.' The smaller of these are introduced within the larger, and then dried in the sun, and the whole tied up in bundles, each of about 88 lbs. weight. The thinner bark is accounted the finest flavoured. About 500,000 lbs. are annually imported into London.

Medicinally C. is valued as a stomachic and carminative in nausea and vomiting, in cases of flatulence, and spasmodic conditions of the stomach and alimentary canal. It is also reputed to possess the property of restraining uterine hæmorrhage. Its uses by cooks and confectioners are too well known to require description. Bastard C. is *C. Cassia*; black C., *Pimenta acris*; Isle of France C., *Oreodaphne cupularis*; Santa Fé C., *Nectandra cinnamomoides*; wild C., *Canella alba* and *Myrcia acris*.

Cinn'yris. See SUN-BIRD.

Cin'qué Cento (Ital. 'five hundred'), an art term for the 'fifteen hundred period,' *i.e.*, the 16th c., especially the early part—the second period of the revival of the arts in Italy—and for the style of art then prevalent.

Cinque'foil (in botany). See POTENTILLA and COMARUM.

Cinquefoil, or **Quintfoil**, in heraldry, a flower of five foils or leaves, which are usually depicted as issuing from a ball as a centre point. In architecture, the name is applied to an ornamental foliation in five compartments—often represented in a circular form—five points or cusps marking off spaces between each pair, which are called the leaves. The C. is to be observed in the tracery of windows and panellings.

Cinque Ports are Dover, Sandwich, Romney, Winchelsea, and Rye, to which are now added Hythe and Hastings. They are under the government of a Lord Warden, whose office was formerly an adjunct of the premiership. The C. P. have various privileges as to pilotage, issuing of writs, and other judicial matters. They are supposed to have been incorporated previous to the Conquest, by Edward the Confessor. Their ancient organisation has, however, been broken up by the Municipal Reform Act, and assimilated to that of English municipalities in general. The jurisdiction of the Lord Warden has been curtailed by Acts of the present reign.

Cin'tra, an old town in the province of Estremadura, Portugal, near the base of Sierra de C., 15 miles W.N.W. of Lisbon. It has two royal residences, one originally a Moorish palace, the other formerly the convent of La Penna. There is also a ruined castle, and many handsome private buildings. Pop. 4300. The well-known *Convention of C.*, concluded between Sir Hew Dalrymple and Marshal Junot, was signed here August 22, 1808. By this treaty the French, who had retreated upon Lisbon after the defeat at Vimieira, were allowed to return to France with all the honours of war. A storm of indignation was roused in England by this event, and the generals concerned were subsequently tried by court-martial, but acquitted of blame. Wellington sided in opinion with the generals. A severe comment is made by Byron on 'that martial synod' in the first canto of his *Childe Harold*.

Ci'otat, La, a town in the department of Bouches-du-Rhône, France, on the Gulf of Lèques, 15 miles S.E. of Marseille. It has a good harbour, has Government shipbuilding yards and valuable fisheries, and is surrounded by plantations of the olive, orange, and pomegranate. Pop. (1872) 8232. C., the ancient *Citharista*, a Massilian colony, was destroyed by the Teutonic invaders of Gaul, but rose to importance through the Levant trade in the 16th c. It was ruined a second time by the revocation of the Edict of Nantes, and has only begun to recover its prosperity in the present century.

Ci'pher (Fr. *chiffre*, Low Lat. *cifra*, from Arab. *sifr*, 'empty'), in arithmetic, properly denotes the character 0, used to fill an empty space, but is now loosely applied to any of the nine figures. In metaphorical language, however, it retains its primary sense—*e.g.*, 'he is a mere C.,' *i.e.*, a nonentity, a person who counts for nothing. Another use of the word is to designate the interweaving of the initials of a name, an arrangement which renders them a private mark. This usage has long been especially affected. The C. of Tenniel's name is familiar to all who look at the cartoons of *Punch*. Lastly, and perhaps from the preceding practice, the word has also come to be a name for secret writing—*e.g.*, 'the despatch was in C.,' *i.e.*, in an arrangement of letters or marks the meaning of which was only known to the initiated. See CRYPTOGRAPHY.

Cipria'ni, Giovanni Battista, painter and engraver, born at Florence in 1732, travelled to Rome when nineteen years of age, and devoted himself to the study of Correggio. He removed to England in 1754, and settled in London, where he died in 1785. His drawing is correct, and his painting is marked by harmony of colour and sweetness of style. His best plates are his composition named the 'Mother and Daughter,' the 'Death of Cleopatra,' after Benvenuto Cellini, and his 'Descent of the Holy Spirit,' after Domenico Gabbiani. C. furnished the design for the diploma of the Royal Academy, of which he was one of the original members.

Circæ'a, a genus of Herbaceous plants of the natural order *Onograceæ*, of which there are various species in the Himalayas, Europe, &c. *C. Lutetiana*, the 'enchanter's nightshade,' is a native of Britain. It has no relation to the nightshades, and probably the name has, through some mistake, been transferred from the Mandrake (q. v.) to this plant (*Prior*); while the term 'enchanter' has been given it from the sorceress-goddess Circe (q. v.), after whom the genus was named. *C. alpina* is not unfrequent in Scotland and the N. of England. Beyond a little astringency, the plants possess no notable properties.

Cir'cars. See NORTHERN CIRCARS.

Circass'ia, formerly an independent country, now a district in the W. Caucasus, Russia, occupies the N. and part of the S. declivity of the Caucasus (q. v.).

Circass'ians. Under this name may be included all the tribes of the Caucasus, but the C. proper hold only the northwestern slope of that range, excepting the country of the Abasians, between the lower Kuban and the Black Sea. The C. are called by the Turks *Tcherkas* (*i.e.*, robbers), but call themselves Adighé. They number about 300,000, and comprise fifteen tribes. They do not belong to the Aryan race—of which, from their fine physique, they were once regarded as a high type—but to the Semitic or Turanian variety. Their peculiar language seems akin to the Turanian tongues. They are brave, strong, and handsome, and the beauty of the Circassian women, who are the favourite ornament of the Turkish harems, is famous throughout the East. Their social state is rude and unprogressive. They are predatory and warlike; and their most stringent customs are to respect age, to revenge a kinsman's death, and to observe a law of hospitality called *kunadi*. Almost none of them except their bards, who are much respected, can write. They are governed by a kind of feudal oligarchy, and are divided into five castes—the chiefs, the nobles, the ordinary freemen, who form the mass of the people, the vassals, who till the soil and follow the nobles to war, and the slaves, either prisoners of war or descendants of such prisoners. Their religion is a mixture of Christianity, Mohammedanism, and Paganism. Christianity was introduced among them in the 11th and 12th centuries, but lately Mohammedanism, which is the creed of the chiefs and nobles, has prevailed. During the middle ages they were subject to the Arabs and Georgians. After throwing off the Georgian yoke in 1425 they fell under the power of the Khans of the Crimea, but during the 18th c. they became free from Tartar influence. The Russians, after annexing Anapa on the Black Sea in 1807, made repeated efforts to subdue the C., who, by the treaty of Adrianople in 1830, were ceded to Russia by Turkey, but, under Schamyl, resisted Russia until Prince Orbelliani defeated them in 1857, and captured Schamyl in 1859. A large number of the C. then sought refuge in Turkish territory, many of whom perished by starvation. Their country may now be considered thoroughly conquered, and the bold spirit of the mountaineers finally quelled. See Spencer's *Travels in Circassia* (8vo, Lond. 1839), and Haxthausen's *Tribes of Caucasus* (8vo, Lond. 1855).

Cir'ce (lit. 'the she-hawk'), a mythic sorceress, 'the daughter of the sun,' who dwelt in the island of Æsea, on the W. coast of Africa. Her 'charmed cup' had the power of changing those that tasted it into swine. When Ulysses, in the course of his wanderings, came to her isle, this fate befell twenty-two of his companions, but the hero himself escaped it by the aid of Hermes, and remained in safety with the enamoured witch for a whole year. The story is told in the 10th and 12th books of the Odyssey. The Latin poets make great use of the story of C., particularly Ovid in the 14th Book of the Metamorphoses.

Cir'cle, according to Euclid, is a plain figure contained by one line, called the *circumference*, and is such that all straight lines drawn from a certain point within the figure to the circumference are equal to one another; this point is the *centre*. It is perhaps easiest conceived of as the path described by either extremity of a rod which rotates in a given plane round a given *fixed* point in the rod. This definition suggests at once a practical method for its description. For the fundamental properties of the C. see Euclid's *Elements*, Book III. The great problem among the ancient geometers with regard to the C. was its *quadrature*—*i.e.*, the construction by rigid mathematical methods of a square equal in area to the C. This area was soon shown to be equal to the product of the radius and the semicircumference; and accordingly the problem was reduced to that of rectifying the curve and of finding the ratio of the circumference to the diameter. This ratio is the same for all circles; but it is undiscoverable by the geometry of C. and straight line, the constituents being incommensurable. The incommensurability seems to have been suspected by Euclid, whose most wonderful and complete book is perhaps his 10th, dealing with the investigation and classification of incommensurable quantities. The ratio, then, of the circumference to the diameter, invariably represented in mathematics by the Greek letter π, can only be approximately expressed as a number. The first approximation (22 : 7) was given by Archimedes. Another, and nearer, and very convenient value, is 355 : 113. Vieta calculated it to the 10th decimal place, Van Ceulen to the 36th, Sharp to the 72d, De Lagny to the 128th, and Clausen to the 250th. The value of π to the first 15 decimal places is 3·14159,26535,89793. Although indisputable demonstration is not wanting that π cannot be expressed in finite terms, we have still, every now and again, some self-styled mathematician giving to the world his so-called solution of what he deems the most important problem of the day. An instructive and entertaining account of these C.-squarers is to be found in De Morgan's *Budget of Paradoxes*.

In modern geometry, the C. is classed among the quadrics or curves of the second order, to which the ellipse, parabola, and hyperbola also belong. Its most general equation, referred to rectangular co-ordinates, is $(x-a)^2 + (y-b)^2 = r^2$, where a b are the co-ordinates of the centre, and r the length of the radius. Many of the properties of the C. can be extended to the sphere by the substitution of planes for straight lines; and this similarity is recognisable at once from their *quaternion* equations, which are identical, there being merely the further condition, in the case of the C., that it lies in one plane. See QUATERNIONS.

The *Curvature* (q. v.) of a C. is the same wherever you take it. Hence the curvature of a curve at any point is determined by drawing through this point the C. which has the same tangent, and the same ultimate deflection from the tangent, that the original curve has, since there is no other C. that can have a more perfect and higher degree of contact. This C. is called the *C. of curvature*, and its radius the *radius of curvature*. in practical life, the unit angle or *Degree* (q. v.) is that angle which is subtended by an arc, equal in length to the 1-360th part of the circumference of a C. of unit radius. The only truly scientific method is that known as the *circular measure* of angles, which depends upon the proposition that angles at the centre of a C. are proportional to the arcs upon which they stand. The unit, called a *radian* by Professor James Thomson, is that angle whose subtending arc is equal in length to the radius; hence two right angles are represented numerically by π, and one right angle or 90° by $\frac{\pi}{2}$. If θ be the circular measure of an angle of n degrees, the relation subsisting between these is given by the equation $\frac{\theta}{\pi} = \frac{n}{180^\circ}$.

Circle, Magic, the charmed limits within which magicians and sorcerers, according to popular belief, were safe from the fury of the evil spirits whom their spells had raised. Described on a space of 9 sq. feet—7 was the number in the E.—there was an outer and an inner C., and the spaces between them, as well as in the angles of the square outside the larger one, were filled 'with all the holy names of God,' and other symbols, in which lay the potency of the charm.

Circle, Mural. See MURAL CIRCLE.

Circle, Quadrature of. See CIRCLE.

Circles of the Sphere. See ARMILLARY SPHERE.

Cir'cuits. England and Wales, except Middlesex, are for judicial purposes divided into C., which the fifteen judges visit twice or thrice a year, in pairs, to adjudge civil and criminal charges. The criminal charges for the county of Middlesex and city of London, and parts adjacent, are adjudged at sessions held monthly at the Central Criminal Court (see CRIMINAL COURT, CENTRAL); and the judges of the superior courts sit during term for the adjudication of civil cases only in Westminster Hall, and before and after term in the Guildhall of the city of London. The Lord Chancellor and the Vice-Chancellor also sit out of term at Lincoln's Inn. The circuit districts of England are eight—the Home, the Midland, the Norfolk, the Oxford, the Northern, the Western, the N. Wales and the S. Wales. In Ireland they are the N.E., the N.W., the Home, the Leinster, the Connaught, and the Munster. (See ASSIZE.) The Act of 1672 divides Scotland into three districts, in which C. are to be made by the justiciary judges. This regulation is affected by different statutes. The circuit courts of the southern district are directed to be held at Jedburgh, Dumfries, and Ayr; the western at Stirling, Inverary, and Glasgow; and the northern at Perth, Aberdeen, and Inverness. The court must remain at each place not fewer than three days, and no business begun at any of the places must be left unfinished. There are two C. in the year; one must be held between the 12th March and 12th May; the other is appointed to be held in the autumn. An additional criminal circuit has been appointed to be held at Glasgow during the Christmas recess of the Court of Session. Circuit courts are established in Scotland for the trial of small-debt causes by the sheriffs.

Cir'cular Dec'imals. See DECIMALS.

Circular Notes are a kind of bank-notes, which the chief banking-houses of the United Kingdom supply for the convenience of travellers abroad. They are of the value of ten pounds and upwards. No charge is usually made by the bank for commission, it making its profit on the interest arising on the purchase-money between the time of purchase and the date at which the bank is called on to cash the C. N. A French *Lettre d'Indication*, addressed to a long list of foreign bankers, is given along with the notes, which must be presented on discounting any of them. The traveller should sign this letter at once on receiving it, and put it in one repository and the notes in another; thus, if his notes are lost or stolen, they cannot be cashed if he retain the letter, and even though both letter and notes come into the possession of a dishonest person, the former being signed, there will be the difficulty of endorsing the notes with a sufficiently good imitation of the signature to the letter. Messrs Coutts & Co. of London have, we believe, the widest circle of foreign correspondents. They pay the foreign banker a small commission; the traveller is therefore entitled to the full rate of the discount of the day, without any charge for commission. In France, the usual rate of exchange is from 25·30 francs to 25·50 per £1—*i.e.*, 253 francs to 255 francs per £10 C. N. In Switzerland it is not commonly above 25·0 per £1. In Italy, the exchange *in paper* is about 25·8 to 25·95 per £1. (See *Exchange*, in POLITICAL ECONOMY.) The traveller must be very careful about paper in Spain and Italy. He should take paper, because in paying his hotel-bills, if he pay in gold he will get no discount; but before quitting any place he must get quit of his *local* paper, as it is not current out of its locality. In leaving Turin for France or Switzerland, he must take care to have gold to pay his railway fare, as the railway will not accept paper, not even the paper of the National Bank of Italy. We consider the C. N. the most safe and convenient form of carrying money abroad, and we have never met with incivility. On one occasion, when the fault was our own, we found our passport from the Foreign Office very valuable. We recommend all travellers to carry a passport from the Foreign Office. See PASSPORT.

Circular Numbers are those whose powers all end in the same letter—that is, every number whose final letter is 1, 5, 6, or 0.

Circular Parts, the name given to two rules, invented by Napier, which facilitate the solution of right-angled spherical triangles. They may be found in any treatise on spherical trigonometry.

Circular Polarisa'tion. See POLARISATION.

Cir'culating Li'brary, a library of books lent on hire. In the middle ages the stationers of Paris were compelled to lend books to students at rates of charge fixed by the university. The first C. L. in England was established about 1740 by Samuel Fancourt, a Salisbury clergyman, and in 1748 there was a large C. L. in Crane Court, London. Allan Ramsay opened a C. L. in Edinburgh about 1725. The *London Library* was founded in 1841, and is now a very valuable institution. Circulating libraries are now common throughout the country. The largest in England is that of Mr Mudie, New Oxford Street, which was founded in 1842.

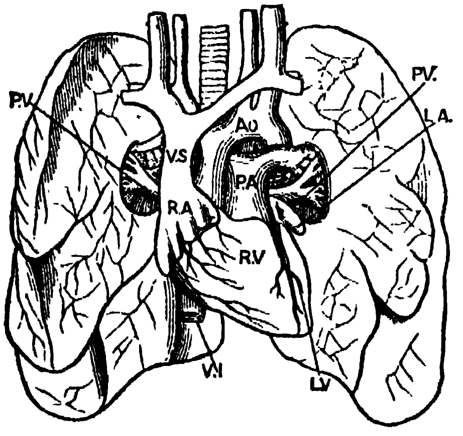
Circula'tion of the Blood. The blood is formed (1) from the chyle poured into it by the thoracic duct, (2) from the fluid and soluble matters absorbed by the blood-vessels of the alimentary canal, and (3) from the matter collected by the absorbents from all parts of the body, and elaborated by the lymphatic glands, called the *lymph*. (See BLOOD.) This fluid contains in it all the materials necessary for nourishing the various textures of the body; and, consequently, for the purposes of nutrition, and also for the purposes of respiration and excretion, it must be distributed throughout the body. It is in a state of constant movement in a definite direction, and the name given to this movement is the *C. of the B.*

A description of the C. of the B., or nutritive fluid in the different great groups of the animal kingdom, will be found under such headings as AMPHIBIA, ANNULOSA, ANNULOIDA, CRUSTACEA, FISHES, MOLLUSCA, PROTOZOA, REPTILIA, and what will be detailed here will be the function as manifested in man, the mammalia, and birds.

History of the Discovery of C. of the B.—Hippocrates confounded veins and arteries under the general name of *phlebes*, the term *arteria*, artery, being applied by him only to the windpipe. Aristotle distinguished between arteries and veins, but supposed that the latter alone contained blood, which they carried outwards. The arteries were believed by him to be filled with air. Galen demonstrated that the arteries did not contain air, but blood. He thought, however, that there was a communication between the two sides of the heart through the septum. Vesalius pointed out that there was no such communication. Servetus showed that before the blood could pass from the right to the left side of the heart it must pass through the lungs. It was still thought, however, that blood passed from the heart outwards into the body by both arteries and veins. Fabricius ab Aquapendente showed that there were valves in many of the veins, so placed that the blood could only pass through these vessels *towards* the heart, not *from* it. At last the celebrated William Harvey appeared, and in 1628 he published his great work, *De Motu Cordis et Sanguinis*, which finally established our knowledge of the C. of the B., and which has always been regarded as one of the finest examples of purely experimental research and of inductive reasoning. He based his discovery, the greatest ever made in physiology, on the following considerations and facts:—(1) The continuity of the connections between heart, arteries, and veins; (2) that on dividing an artery blood spurted out from the end still connected with the heart, while on dividing a vein, blood flowed from the end furthest from the heart; (3) that when he applied a ligature to a vein, the vessel became swollen on the side of the ligature furthest from the heart; (4) on the arrangement of the valves in the heart and veins being such that it could flow only in a certain direction; and (5) that on calculating the amount of blood sent out from the heart along the arteries in a given time, it was found to be so great as to prove that a large proportion of it must return to the heart in that time, as there was not sufficient time either for the complete consumption of the old, or for the formation of new blood, to keep up the supply. Still Harvey did not understand how the blood passed from the extremities of the arteries into the commencement of the veins. The capillaries were not then known. In 1661 Malpighi showed, by means of the simple microscope, the circulation in the web of the frog's foot. Thus it was shown that the blood passed from arteries to veins by the capillaries or intermediate vessels, and the discovery of the course of the circulation was complete.

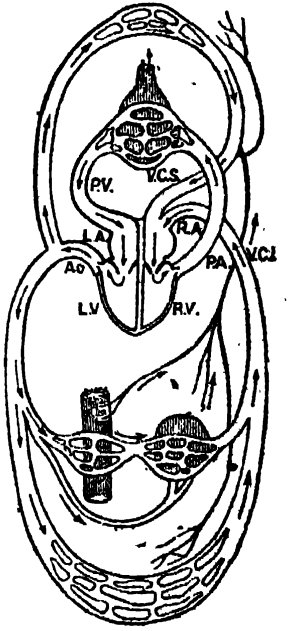
The Organs of the Circulation.—These are the heart, arteries, veins, and capillaries. A description of the structure of the last three will be found under their respective headings, but in order to understand the C. of the B., it is necessary here to describe the heart.

The Heart.—This is an organ placed somewhat obliquely in the thorax. It is of a conical shape. The base is directed upwards, to the right, and somewhat backwards, and corresponds to the middle of the back. The apex is situated a little to the left of the breastbone, opposite the space between the fifth and sixth ribs, a little below the left nipple. The organ, in the human being, is about the size of the clenched fist, and in the male it weighs from 10 to 12 ounces, while in the average female it is somewhat lighter. The heart is divided into four cavities, two corresponding to the base, called the *auricles*, RA, LA, and two to the body and apex, known as the *ventricles*, RV, LV. The auricular part is separated from the ventricular by a transverse groove, called the *auriculo-ventricular* groove, in which lie the nutrient vessels of the organ. Two longitudinal furrows are also seen, one on the anterior, the other on the posterior surface of the heart, and indicating a division of the organ into a right and left half, each consisting of an auricle and a ventricle. When the thorax is opened, the right side is the part chiefly seen, the left resting on the diaphragm. The auricles are called *right* and *left auricles*, RA, LA, the ventricles, *right* and *left ventricles*, RV, LV. Into the right auricle two great vessels open, namely, the superior and inferior venæ cavæ, VS, VI, the former of which returns the blood from the head, neck, and upper extremities, while the latter does the same office for the abdominal and pelvic portions of the body, and the lower extremities. Into this cavity there are also numerous apertures of small veins belonging to the heart. The blood then passes into the right ventricle by an opening called the *right auriculo-ventricular* aperture, which is guarded by a valve called the *tricuspid*. The right ventricle is shut off from the left by the strong partition between the cavities. From the right ventricle there issues a large vessel, termed the *pulmonary artery*, PA, which conveys the blood to the lungs. At the orifice of this vessel there is a valve, termed *semilunar*, from its shape. After the blood has passed through the lungs (see RESPIRATION), it is returned to the left auricle of the heart by four pulmonary veins, PV. From the left auricle it then passes to the left ventricle. The left ventricle is longer than the right, and has much thicker walls. At the left of the base of this cavity is the oval opening from the left auricle known as the *left auriculo-ventricular opening*. In front, and to the right of this, there is a round aperture, the mouth of the aorta, Ao, the great trunk artery of the body. The left auriculo-ventricular opening has a valve known as the *mitral*, so termed from its fancied resemblance to a bishop's mitre, and the orifice of the aorta has a semilunar valve, resembling that seen in the pulmonary artery.



The Heart, Great Vessels, and Lungs.
(Front view.)

The cavities of the heart are lined by a serous membrane, called the *endocardium*, which is continuous with the lining membrane of the vascular system. The substance of the heart is composed of muscular fibres, which are remarkable for being striated, whilst they belong functionally to the class of involuntary muscles. (See MUSCLES.) They are arranged in a series of layers. According to Pettigrew, who has chiefly dissected the hearts of ruminants, seven layers enter into the composition of the walls of both ventricles—three external, three internal, and one intermediate between these two groups. He has also shown that certain fibres of the external layers are continuous with corresponding internal layers, thus forming a series of loops. This continuity occurs around the auriculo-ventricular orifices, and upon the septum, and at the apex of the ventricles. The fibres of the first or external layer are continuous with the deepest, those of the second with the sixth, those of the third with the fifth, while the fibres of the middle or fifth layers return as it were upon themselves. Again, he has shown that some fibres pass round both ventricles. The direction of the fibres changes as we proceed from without inwards; the external layer is very oblique, and in the right or left ventricle passes from right to left, from base to apex, of the heart; the next two layers are less oblique; the fourth layer is transverse; and in the three innermost layers the obliquity becomes greater as we pass inwards, and the direction is changed, so that the fibres pass from right to left, but now upwards, from apex to base.



Course of the Circulation.
(Back view.)

Mode of Action of the Heart.—The right auricle, RA, receives the blood from the body by the inferior and superior venæ cavæ, VCI, VCS, and the left, LA, receives it from the lungs by the pulmonary veins, PV. When both auricles are full of blood, they contract and expel the blood from their cavities through the auriculo-ventricular orifices into the ventricles. The blood is prevented from passing backwards into the venæ cavæ, or pulmonary veins, by the pressure of the blood filling the lungs and venous system. The two auricles contract simultaneously. After the ventricles have filled completely, they also contract simultaneously, and force the blood from the right into the pulmonary artery, PA, and that from the left into the aorta, Ao. To prevent the blood from regurgitating into the auricles, the auriculo-ventricular orifices are guarded by valves already alluded to. The right possesses the tricuspid, while the left has the mitral. It is necessary to understand the mechanism of these valves, which is identical in both. Take, for example, the tricuspid. As its name indicates, it consists of three cusps. These are of a somewhat triangular shape, the base of the triangle being attached to a fibrous ring surrounding the auriculo-ventricular opening, while the margins are free. When these three cusps have their edges in opposition, the orifice is nearly closed. They are brought into apposition when the ventricle contracts by the blood behind them lifting them up, but when the ventricles are dilated, the cusps hang downwards into the cavity of the ventricles. It is evident that some provision must be made for preventing the cusps from being forced backwards into the auricle. This is accomplished as follows: To the ventricular surface of the cusps a number of delicate tendinous cords (*chordæ tendiniæ*) are attached. These are in continuation with small muscular papillæ (*musculi papillares*) springing from the wall of the ventricle. When the ventricular wall contracts, these papillæ also contract, and pull upon the cusps, when these are forced upwards in the manner already described, so as to keep them tense, and thus prevent the possibility of their being forced backwards into the auricles.

We have now to consider how the blood is prevented from flowing backwards into the ventricles, during their relaxation, from the aorta, Ao, and pulmonary artery, PA. This is effected by the action of the semilunar valves placed in these vessels, near their junction with the ventricles, RV, LV. These valves are each composed of three semilunar segments, attached by their convex margins to the sides of the vessel, but free at their borders, which, during the flow of blood past them, are turned upwards in the direction of the vessel. In the middle of the free border there is a small fibrous nodule, the *corpus aurantii*, and by the apposition of the three *corpora aurantii*, the irregularly triangular space which would be left when the margins of the segments are brought into the same plane is completely filled up. Behind each segment a small dilatation or pouch is seen, termed the *sinus of Valsalva*, most distinct in the pulmonary artery. The mechanism of these valves is extremely simple. After the complete contraction of the ventricle by which it forces the blood into the vessel, it dilates. The walls of the vessels, being highly elastic, when relieved from the propelling or distending force (*vis a tergo*), recover themselves, and tend to push part of the blood backwards into the ventricles. But as it passes behind the segments of the semilunar valves, and fills the sinuses of Valsalva, the segments are pushed downwards as far as they will go, thus closing the lumen of the vessel and preventing regurgitation into the ventricles.

Cycle of the Actions of the Heart.—A complete action of the heart consists (1) of contraction of the auricles, (2) of a short pause, during which the auricles have begun slowly to dilate, (3) of contraction of the ventricles, and (4) of a long pause, during which the ventricles relax and become filled with blood which is flowing into them from the auricles. After the auricles have filled they again contract, and another cycle of actions is begun. It has been found that the time occupied by the contraction of the auricles is about equal to that of the short pause, and the time of the contraction of the ventricle to that of the long pause. If so, it is evident that in each cardiac cycle the muscular walls of the heart are relaxing as long as they are contracting; or, in other words, there are brief periods of rest equal to brief periods during which energy is being expended.

Sounds of the Heart.—When we listen over the cardiac region of the chest of a healthy person, we feel an impulse, and we hear two sounds like those occasioned by pronouncing in a medium pitch of voice the words *lupp dupp*. The first sound is dull, deep, prolonged, immediately precedes the pulse at the wrist, and is heard most distinctly over the apex of the heart. It is called the *first* or *systolic* or *inferior* sound, and it coincides with the contraction of the ventricle. It is due, or at all events coincident with, the combined effect of the four following actions:—(1) The contraction of the ventricles; (2) the rush of blood through the aortic and pulmonary orifices; (3) the flapping together of the auriculo-ventricular valves; and (4) the movement of the apex of the heart against the wall of the chest, caused by the change of form of the ventricular portion of the heart during its contraction. The second sound is sharp, short, superficial, and is heard with greatest distinctness over the base of the heart. It has been experimentally ascertained to be entirely due to the sudden closure of the semilunar valves in the way already described.

Forces Carrying on the Circulation.—1. The chief of these is the heart. 2. The next usually mentioned is the elasticity of the larger arteries, which effects (1) the gradual conversion of the pulsatile or wave-like movement into a uniform flow, and (2) diminishes the resistance the ventricle has to overcome. But it can scarcely be said that the elasticity of the vessels is a new force, as the amount of recoil, supposing the arteries to be perfectly elastic, will be exactly equal to the amount of distension caused by the action of the ventricles. The elasticity of the ventricles modifies the character of the flow of the blood rather than adds to the force for propelling it forwards. 3. By some it is contended that the attractive influence of the tissues in the meshes of the capillary system forms one of the forces of the circulation (*vis a fronte*). 4. The blood is propelled along the veins towards the heart by muscular pressure on their walls forcing the blood onwards, as it cannot pass backwards, on account of the pressure of the valves in these vessels, which open *towards* the heart. 5. Lastly, Burdon Sanderson and others have shown experimentally that inspiration, by diminishing pressure on the venæ cavæ, favours the flow of blood to the heart, and thereby increases the vigour of the succeeding contractions. See RESPIRATION.

Arterial and Cardiac Pressure.—By this is understood the force or pressure of the fluid on the inner surface of the heart or arteries during a contraction of the heart. It is measured by an apparatus termed a *kymograph* (see KYMOGRAPH), and it has been estimated in the human subject to be about 4 lbs. 4 oz. on the sq. inch. Now, if we assume the superficial area of the inner surface of the left ventricle, which has to propel the blood through the whole body, to be 13 inches, as has been determined to be the mean, it follows that when the walls of this cavity contract they do so with a force equal to about 52 lbs.

Rapidity of the Circulation.—There is no accurate method of measuring this. According to Vierordt, the blood flows in the carotid, an artery of the neck, at the rate of about 10½ inches in a second. In smaller arteries he estimated the speed as being much slower. Volkmann found in the carotid of the horse the rapidity to be 20·28 inches per second. According to Valentine and Weber, in the capillaries the rate is 1 inch per minute. All of these measurements are vague and unsatisfactory, and this most difficult problem is still unsolved.

Other details regarding the C. of the B. will be found under the following heads:—ARTERY, CAPILLARY, KYMOGRAPH, PULSE, SPHYGMOGRAPH, VEIN, VASOMOTOR SYSTEM.

Circulation of the Sap in Plants. See NUTRITION OF PLANTS.

Circumcis'ion (Lat. 'a cutting round,' *i.e.*, cutting off the prepuce), is a religious rite which has prevailed among various nations all over the world. It is probably a relic of nature-worship, and points back to the practice of offering human sacrifices to the God of Increase, or the reproductive principle in nature, the symbol of which was the Phallus. As civilisation advanced, instead of the whole victim, a significant part was offered by fire to the deity.

The idea long prevalent among Christians was that C. is and was exclusively a Jewish rite, and that it was given to Abraham as a token and seal of the covenant, the institution of which is described in Gen. xvii. This idea may now be considered to be abandoned; for it is capable of absolute demonstration that C. was practised among peoples well advanced in civilisation—*e.g.*, the Phœnicians and Egyptians—long before the ancestors of the Hebrews had left Mesopotamia. But Scripture does not say that C. was first made known to Abraham. In fact, it implies exactly the reverse. The passage in Genesis assumes a knowledge of the practice, and only represents it as transformed for the first time into a religious rite, and acquiring a symbolic meaning.

Circumduc'tion of the Term, in Scotch law, is the sentence of a judge declaring the time elapsed for leading proof in a case, after which no further evidence can be adduced.

Circum'ference, or Periphery, the curved boundary of a plane figure: when the boundary is made up more or less of straight lines, it is usually termed *perimeter*.

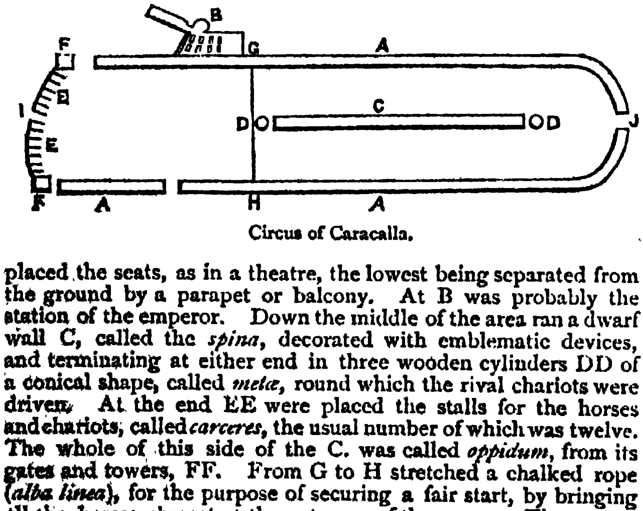
Circumnaviga'tion, the act of sailing round the world. This feat was performed first by Magalhæns (q. v.) in 1519. Drake (q. v.) accomplished it in 1577; and Captain Cook (q. v.) between the years 1768 and 1779 circumnavigated the globe no less than three times. In the present day it is frequently done, but not in the same way, nor in the same vessel. An Englishman who wishes to spend a year in visiting Australia, has only to go out by the overland route, or round the Cape of Good Hope, and return by San Francisco, the Pacific Railroad, and an Atlantic steamer; and he has performed what was once a daring and hazardous feat.

Circumstan'tial Evidence is evidence which—assuming it to be true—does not directly prove a question at issue, but indirectly tends to prove it. Thus if A swear that he saw B stab C, the evidence is direct; and if we believe A, the question of whether or not B stabbed C is disposed of. But if A swear that he saw B and C quarrelling on the day when C was stabbed, belief in A does not satisfy us of B's guilt; but it is C. E. of more or less weight. And if we have an accumulation of such items of evidence, they may, though there be no direct evidence, amount to conclusive proof of guilt. But if any one item of circumstantial proof depend on another, the two must only have the weight of one. Thus A swears that he sold to B the knife which D swears that he found blood-stained near the murdered C. Here we have not two but only one item of proof, since if either A or D is swearing falsely, the testimony of the other is valueless against B. C. E. is in this better than direct evidence, that the witnesses to it can hardly combine to swear falsely without being detected. It is plainly impossible that any concatenation of circumstances should ever prove the innocence of one accused to be impossible. When the probability of innocence bears an appreciable ratio to that of guilt, according to the just principle of our law, the prisoner must be acquitted.

Circumvalla'tion (Lat. *circum*, 'about,' and *vallum*, 'a rampart'), in fortification, is a line of entrenchment thrown up by the besieging party round a place under siege, but facing outwards so as to resist attacks from the field.

Circumven'tion legally means deceit or fraud in making a bargain, or in procuring the making or execution of a deed. Either may be set aside by law if proved to have been entered into or done through C. It will not, however, be sufficient to prove that the act sought to be annulled is hurtful to the doer, or irrational on his part; for the law will not protect a man from the consequences of his own folly. It must be shown that deception was used towards him. If, however, the granter of a deed or maker of a will be of weak mind, a very slender circumstance or fraud may lead the law to set the deed or will aside.

Cir'cus, The, of ancient Rome, was a place in which chariot-races and other games were exhibited. The Circensian Games were believed by the later Romans to have been first instituted by Romulus, and were named *Consuales*, in honour of the god Consus. To Tarquinius Priscus was ascribed the construction in the Murcian Valley, between the Palatine and Aventine, of a building for such exhibitions, which was known by way of eminence as the *C. Maximus*. It was frequently repaired and extended, and was reconstructed by Julius Cæsar, in whose time it was three stadia (about 600 yards) long, one stadium wide, and the surrounding buildings half a stadium deep. At different periods of its history, it was computed to contain 150,000, 260,000, and 385,000 persons. Scarcely a vestige of it now remains; but an excellent idea of an ancient C. may be obtained from the remains of the Circus of Caracalla, the ground-plan of which is shown in the annexed woodcut. Around the lines AA were placed the seats, as in a theatre, the lowest being separated from the ground by a parapet or balcony. At B was probably the station of the emperor. Down the middle of the area ran a dwarf wall C, called the *spina*, decorated with emblematic devices, and terminating at either end in three wooden cylinders DD of a conical shape, called *metæ*, round which the rival chariots were driven. At the end EE were placed the stalls for the horses and chariots, called *carceres*, the usual number of which was twelve. The whole of this side of the C. was called *oppidum*, from its gates and towers, FF. From G to H stretched a chalked rope (*alba linea*), for the purpose of securing a fair start, by bringing all the horses abreast at the entrance of the course. There were in all five gates, of which the chief were the *Porta Pompæ* (I), through which the opening procession entered; the *Porta Triumphalis* (J), through which the victors departed; and the *Porta Libitensis*, through which the bodies of those killed in the games were carried out. The *Euripus* in the C. Maximus was a canal 10 feet wide round the bottom of the front balcony, formed by Julius Cæsar to protect the spectators during the wild-beast hunts. The shows exhibited in the C. were the races, of which the Romans were passionately fond at every period of their history; the *Ludus Trojæ*, a sort of sham-fight, by young men of rank on horseback; the *pugna*, the representation of a battle; gymnastic contests in running, leaping, &c.; the *venatio*, a fight of wild beasts with one another or with men; and the *naumachia*, or representation of a sea-fight. In the races four chariots usually entered, drawn by two or four horses. The extent of the course was seven times round the *spina*, and twenty-five races were run in each day.



Circus of Caracalla.

Ciren'cester, or Cic'ester, a town of Gloucestershire, on the Churn, and on the Thames and Severn Canal, 17 miles S.E. of Gloucester, has some manufactures of woollens, carpets, and cutlery. It possesses a fine old church (St John's), and in the vicinity there is an agricultural college, founded in 1846. C. returns one member to Parliament. Pop. (1871) 7681. C., according to Henry of Huntingdon, was originally a British city, called *Caer-corin* ('camp on the Corin,' mod. Churn). It became the *Corinium* or *Corinum* of the Romans, and stood at the junction of five Roman roads. The English invaders added *ceaster*, to mark that it had been a military station; and the modern name is only a corruption of *Corinium-ceaster*. Canute held a council here in 1020. C. once possessed a fine abbey, founded by Henry I., but no remains are extant. The town was attacked by Rupert in 1642-43, and was afterwards captured by Essex. Traces of a fortified wall have been discovered, as also various Roman remains.

Cirrhop'oda, or Cirrip'edia, an order of lower Crustacea represented by the Barnacles (*Lepas*) and Sea-acorns (*Balanus*). These forms are distinguished by the fact that when adult they are fixed, being free-swimming in their young state. They are attached to fixed objects by the front part of the modified head; the first three joints of the head being enlarged, and enclosing the rest of the body. The larva or embryo fixes itself by means of a peculiar *cement* furnished by special glands, which consist of modified parts of the ovaries. The hinder part of the animal, with its twelve feet converted into *cirri* or tentacular organs (hence the name *Cirripedia*), can be protruded from within the shell with which it is provided, and the cirri subserve respiration and nutrition. The mouth is provided with mandibles and maxillæ, and a complete digestive system exists. No distinct heart is developed. The larva is a free-swimming body known as a *nauplius*, provided with antennæ, a single eye, and a dorsal carapace or shield. Subsequently twelve limbs are developed on the abdomen, and the antennæ become prehensile organs, whilst a pair of eyes now exist. The antennæ are next fixed to some rock or stone by the cement, the carapace becomes calcified to form the adult 'shell,' and the feet become the cirri of the fully grown and metamorphosed animal, which loses the eyes of the larval stage. The Barnacles (q. v.) (*Lepadidæ*) are stalked and possess peduncles, at the free end of which the body of the animal, contained within a shell, composed of calcareous plates, is found. The Balani (q. v.) or sea-acorns are sessile or unstalked, and fix themselves directly to rocks, their bodies being enclosed within shells composed each of six segments or pieces, and having the twelve divided cirri, capable of being protruded from or retracted at will within the aperture of the shell, which is closed by an *operculum*. All cirripedes are hermaphrodite, but, as shown by Darwin's researches, peculiar bodies termed *complementary males* are also developed, these latter being lodged, sometimes two, within the shell of each female (as in *Scalpellum*), and being destined simply to fertilise the ova of their female hosts.

Cirr'hus, or Tendril, is the name applied to the thread-like twining organs by which plants climb around others or up any support. They may be formed by various modifications of the leaves, as in the Pea tribe, *Fumaria capreolata*, *Methonica gloriosa*, various species of *Clematis*, &c. In other cases they may be thread-like leafless branches capable of coiling spirally. Some tendrils hook their tops round supporting objects, while others expand their tops into a flat disc, which clings to objects, and enables the plant to climb up in the same way as do the accessory rootlets of the Virginian creeper (*Ampelopsis*). The term 'C.' is applied in zoology to any curled filament, and also to the modified feet of the *Cirripedia*.

Cirr'us. See CLOUDS.

Cis, a Latin preposition, meaning 'on this side,' the opposite of *ultra* and *trans*, and prefixed to names of mountains and rivers to form adjectives of place: Cisalpine, 'on this side of the Alps,' the opposite of Transalpine, 'beyond the Alps; Cismontane, 'on this side of the mountain;' Ultramontane, 'on the further side of the mountain;' Cisrhenane, 'on this side of the Rhine;' Transrhenane, 'beyond the Rhine,' &c. It must be noted that the standpoint of those who first used the term is Rome, or some place within the bounds of the Roman dominion.

Cisal'pine Republic, The, formed out of the Cispadane and Transpadane republics, was proclaimed by General Bonaparte, 28th June 1797, and recognised by Austria as an independent state at the peace of Campo-Formio. It comprehended Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, Rovigo, Modena, Massa, and Carrara, Bologna, Ferrara, and Mesola. On the 22d October of the same year it received an accession of territory, and was divided into ten departments, with an area of 16,384 sq. miles, and a pop. of 3,500,000. The victories gained by the Russians and Austrians in 1799 produced a temporary dissolution of the republic, but it was re-established by Bonaparte after the decisive battle of Marengo. On January 25, 1802, it assumed the name of the Italian Republic, and was divided into thirteen departments, with Bonaparte for its president, a title exchanged in 1805 for that of King of Italy, held by him till 1814, when the so-called Kingdom of Italy was dissolved.

Cissampelos (Gr. 'ivy-vine'), a genus of plants of the natural order *Menispermaceæ*. The root of *C. Pareira*, the 'velvet leaf' of the W. Indies, Central America, and India, yields the '*Pareira brava*,' or 'Butua root' of the shops, extensively and beneficially used in diseases of the bladder and other urinary organs; at one time it was believed to be efficacious in breaking up stone in the bladder; other species are used as diuretics and tonics. The root of *C. obtecta* is used for making an intoxicating drink, while *C. glaberuma* and *C. ebracteata* may be classed among that category of plants which have been reputed as remedies for serpent-bites. The root contains an alkaloid, *Cissampelin*, to which it owes its active properties.

Ciss'oid (Gr. *kissos*, 'ivy,' and *eidos*, 'a shape') **of Di'ocles**, a curve invented by Diocles (a Greek geometrician of unknown date) for the solution of the duplication of the cube, and the insertion of two mean proportionals between two given straight lines. If, from the extremity of a diameter of a circle as origin, lines be drawn to meet the tangent at the other extremity, that point on each line whose distance from the origin is equal to the distance between the intersections of the line with the circle and tangent, lies on the C. Hence, taking the diameter as the axis of x, the equation of the curve in rectangular co-ordinates is $x^3 = (a - x)\ y^2$,—a being the length of the diameter. It has a cusp at the origin, and a point of inflexion at infinity. The space between the curve and its asymptote (the tangent of the circle) is triple the area of the circle. Newton, in his *Universal Arithmetic*, gives a mechanical method of describing this curve.

Cissus. See VITACEÆ.

Cister'cians, an order of monks founded in 1098 by Robert, abbot of the Benedictine monastery of Molesme in Burgundy, who retired with twenty companions to Citeaux (Lat. *Cistercium*), and there established the fraternity of C. The C., after degenerating, were reformed in the beginning of the 11th c. by St Bernard of Clairvaux, who founded ninety-two monasteries, and from whom the C. in France were known as Bernardines. After St Bernard's death, the C. shook off episcopal control and became very influential through Europe. They wore a white robe with a black scapulary. Their rule was austere. At first they shunned luxury, eat no flesh, slept on straw, and walked unshod. Among the various offshoots from the C. were the Recollets in Spain, the Feuillans or Bare-footed monks in France, and the Trappists of La Trappe in Normandy, who, in the 16th c., sank into dissolute banditti. In England and Scotland the C. were very numerous. In the reign of Henry VIII. there were in the former country seventy-five Cistercian abbeys, among which were Woburn, Tintern, Furness, Kirkstall, and Rievaux. The Scotch abbeys of Melrose, Dundrennan, Culross, Deer, &c., belonged to this order. In France the Cistercian Convent of Port Royal became famous in the Jansenist controversy. Since the French Revolution, the C. have had few convents in Europe. The first vol. of a history of the C. by Father Janauschek appeared at Vindobonæ in 1877.

Cis'tern, a vessel for storing water or other liquid, with apparatus for regulating its supply and discharge. The kind most extensively in use is of wood lined inside with lead soldered at the angles. Cast-iron in one piece for small cisterns, and for large, in plates joined with flanges and bolts, and made water-tight with cement, is also employed, notably for water-tanks at railway stations. Very efficient and cheap cisterns are likewise made of slate slabs.

Cistus.

Cis'tus, or Rock-Rose, a genus of Dicotyledonous plants, belonging to the natural order *Cistaceæ*, to which it gives its name, shrubs, natives of Southern and Western Europe, N. Africa, and the Canary Islands. From the leaves and branches of *C. Creticus* exudes the ladanum or labdanum gum of Crete. In that island it is collected by means of a kind of rake 'with a double row of long leathern straps, employed in the heat of the day when not a breath of wind is stirring. Seven or eight country fellows, in their shirts and drawers, whip the plants with these straps, which, by rubbing against the leaves, lick off a sort of odoriferous glue sticking to the foliage. At one time, it is said that it was gathered from the beards of goats who had been browsing on the foliage. It is now used as a perfume, but it was formerly esteemed as a stimulant and expectorant in the cure of the plague, and as a constituent in plasters. The ladanum of Spain and Portugal is chiefly derived from *C. ladaniferus*, and is said to be obtained by boiling in water the summits of the branches. It has somewhat similar properties to the former, but is not in such high repute. Many of the species of C. are cultivated in our gardens, *e.g.*, *C. ladaniferus*, *C. cyprius* (often confounded with the former), *C. virginatus* of Teneriffe, &c. Altogether there are about 200 species known, a number of which are figured in Sweet's '*Cistineæ*.' *Helianthemum vulgare*, the 'rock-rose,' a common little plant on dry ground, and remarkable for the irritability of the stamens, is the only species of the genus found as far N. as Scotland.

Cit'adel (Fr. *citadelle*, from Ital. *cittadella*, 'a little city'), a fort serving the double purpose of keeping in subjection the inhabitants of the town or city in or near which it stands, and, in case of a siege, of forming a stronghold to shelter the defenders after the rest of the town has been taken. The C. is always built in a space clear of buildings, and commands the entire fortifications of the city or town.

Cita'tion is the act of calling upon a party to appear in court to answer to an action, to give evidence, or to perform some other judicial act. In England the term is chiefly used in the ecclesiastical courts. In Scotland C. is done by an officer of the court, or by a Messenger-at-Arms (q. v.) under warrant. When a party is not in Scotland, but under the jurisdiction of the Court of Session, he is cited edictally; formerly this was by a citation published at the market-cross of Edinburgh and on the shore and pier of Leith; but now it is done by leaving a copy at the office of the keeper of Edictal Citations (q. v.). Lists of citations are printed and published. In criminal cases it is not sufficient that the party appear voluntarily. He *must* be brought into court in regular form, and he can plead any omission of form, even though he has consented to it. Prescription (q. v.), positive or negative, in a process may be interrupted by C.

Cities of Refuge were six Levitical cities—namely, Kedesh, Shechem, and Hebron on the W. side of Jordan, and Bezer, Ramoth, and Golan on the E. side—appointed as a refuge to which the manslayer might flee from the Avenger of Blood (q. v.), and where he was protected till he could be tried by the authorities of his own city. If it was found on his trial that the deed had been involuntary, he was taken back to the C. of R., and on the death of the high priest, could return in safety to his home. The right of sanctuary was also possessed by many Greek and Roman cities, especially Ephesus, and by many churches in the middle ages—a privilege which was often too much abused, by letting real criminals escape.

Cit'izen (Old Eng. *citezaine* and *cyteseyne*, from the Old French form of *citozen*, and that from Low Lat. *civitadanus*, a derivative from *civitas*). Neither *C.* nor *city* is a word of definite meaning in modern Britain. The *civitas* of the Romans, which was a central corporation governing inferior ones of a like kind, was unknown there. Some burghs were called cities because they were royal residences, others because a bishop's cathedral stood there. Thus St Andrews and Glasgow in Scotland, though mere burghs of barony, were called cities, and their inhabitants citizens. In Athens, citizens had the privilege of receiving a *theoricon*, or two oboli to each, as entrance money to the theatres; each C. who attended the ecclesia or public assembly received three oboli about fifty days in every year; every member of the *boulè* or senate, a drachma a day about 300 days in every year; besides, the freemen who served as jurymen or dicasts in the courts of justice received daily pay from the public treasury. The resident aliens were compelled to pay a capitation tax of twelve drachms and to choose patrons; and there was a large body of slaves. Such state donations were, however, rare. At Rome we find *civitas* along with *libertas* and *familia* making up the notion of *status*. Freemen were divided into *cives* and *peregrini*. The rights of cives were—(1) the *jus suffragii*, electoral and legislative power; (2) *jus honorum*, capacity for office; (3) *jus commercii*, or full rights in property; and (4) *jus connubii*, full rights in marriage. Aliens enjoyed only numbers (3) and (4), and these only in a limited way. An intermediate class, Latini, enjoyed number (3) fully. These rights were liable to be lost by the various modes of degradation (*capitis minutio*), and the political rights *suffragium* and *honores* were forfeited by infamy (*infamia*) or loss of civic honour (*existimatio*). Although the imperial revenue consisted to a great extent of provincial tributes, Roman citizens had after the time of Augustus to pay customs on most imported articles, an excise not exceeding 1 per cent. on all articles sold in the home markets, a tax of 5 per cent. on legacies and successions. Caracalla did not exempt from tribute where a subject became a C., and citizenship thus became a burden instead of a privilege. The Roman army felt insulted when addressed as 'citizens.' All political significance had, of course, left the term, and the state at last supported its citizens by distributions of corn and largesse, and by giving gratuitous spectacles. The Italian cities were generally administered by a *curia* or municipal senate elected by the people, and *duumvirs* or annual consuls. In the 9th c. these cities began to rebuild their walls; and after the War of Investiture many were able to recover a jurisdiction and corporate life independent on their feudal surroundings. They had the parliament or general meeting of citizens for election; their *gonfaloniere* and *barroccio* of the town militia; the secret financial council, or *consilio di credenza*; the *signorias*, or municipal magistrates. The feudal lord frequently became a burgess. These free Italian cities formed a league against Barbarossa, and by the treaty of Constance (1183) all their previous privileges and immunities were confirmed, although the Emperor reserved a full right of sovereignty over most of them. Charters of immunity and franchise began to be granted in France in the reign of Louis le Gros. These were distinct from the early charters freeing serfs and fixing their feudal payments; they made careful provision for the security of the person and property of citizens, on the principle of a common responsibility and of joint contribution to the expenses of defence and justice. The term C. was used universally during the French Revolution to express the complete political equality of all Frenchmen. In the municipal constitution of Brissot the electoral right was confined to the *citoyens actifs*—*i.e.*, those paying a *marc d'argent*, or yearly tax equal to three days' labour In America the term has been used with a similar connotation. Christian thought has dwelt much on the conception of the *Civitas Dei*, or invisible spiritual kingdom, embracing as citizens all devout Christians.

Cit'ric Acid is a colourless crystalline compound contained in the juice of lemons, oranges, gooseberries, tamarinds, and in most acidulous fruits, and was first isolated by Scheele in 1784. C. A. is usually prepared from lemon-juice. The juice is allowed to remain for some time undisturbed, when fermentation sets in and mucilaginous substances separate: the clear liquid is decanted from these, neutralised with chalk, and then boiled with lime, when insoluble citrate of calcium is deposited; this is washed with cold water, decomposed by the proper quantity of sulphuric acid, and the solution of C. A. which results, after being syphoned off from the insoluble sulphate of lime, is evaporated to the proper concentration and allowed to crystallise. C. A. crystallises with one molecule of water of crystallisation, and has the composition expressed by the formula $C_6H_8O_7,H_2O$. It has a pleasant acid taste, readily dissolves in water and in alcohol, and forms salts in which one, two, or three atoms of its hydrogen are replaced by metals; it is therefore a tribasic acid. C. A. is used by the calico-printer to discharge the mordant from cloth, and in the manufacture of bright colouring matters from cochenille and safflower. It is also used in medicine. Lime-juice is always given on board ship to sailors as an antiscorbutic. C. A. is also employed in the manufacture of effervescing powders, lemonade, &c.

Cit'ron (*Citrus medica*), a tree cultivated in Southern Europe, but a native of the N. of India, belonging to the natural order *Aurantiaceæ* (q. v.) (the Orange family). By some botanists it is looked upon as a variety, or even as the type of the various plants which we now distinguish by the names of orange, lemon, shaddock, and lime, an opinion which Dr Lindley was inclined to adopt (*Journ. Horticultural Society*, ix. [illegible]71). It has, however, been cultivated in Europe since the earliest period of the Christian era, or even earlier, and is now naturalised in most countries the climate of which is suitable for its growth. There are many cultivated varieties, distinguished by the shape, &c., of the fruits. In China, the variety known as the 'five-fingered C.' has the lobes separated into finger-like divisions. The pulp of the C. is cooling, but it is for the rind, which is made into a preserve, that the fruit is chiefly valued, and it may be said that it is used for the same purposes as the fruit of the lemon. From the *cedrate* variety of the C., oil of cedrate, greatly valued by the perfumers, is obtained. C. is frequently cultivated in Great Britain. It is believed that the word which the translators of the Bible have rendered 'apple' would in most places be more appropriately translated C.

Citros'ma, a genus of trees of the natural order *Monimiaceæ*, containing about fifty species, all natives of tropical S. America. The leaves are covered with glands, which secrete an oil with a citron-like odour; hence some of the species are called *Lemoncillo*, or 'little lemons,' the fruit being only about the size of a pea when ripe.

Citrull'us. See COLOCYNTH.

Cit'rus, a genus of plants of the natural order *Aurantiaceæ*, consisting of trees and shrubs, natives of India and of the warmer parts of Asia, though also extensively cultivated in America, Southern Europe and other warm regions, for the sake of their fruits. The flowers are very fragrant, and, like the leaves and rind of the fruit, abound in a volatile oil. Among the best-known fruits referred to the genus C. are the Citron (q. v.), Orange (q. v.), Lemon (q. v.), Lime (q. v.), Bergamot (q. v.), Shaddock (q. v.), Pompelmoose (q. v.), Forbidden Fruit (q. v.).

Citta', the Italian form of *city*, enters into the composition of many names of places in Italy, of which may be noted:—

CITTADELLA ('little town'), a walled town in the province of Venice, N. Italy, on the Brentella, 14 miles N.E. of Vicenza; has woollen-cloth and paper mills. Pop. 6600.

CITTA DI CASTELLO ('castle town'), the *Tiphernum Tiberinum* of the Romans, a town in the province of Perugia, Central Italy, on the Tiber, 12 miles N. of Arezzo; has some manufactures of silk-twist, &c. It is chiefly notable in connection with Raphael, who painted many of his earlier pictures here. The town has many rare Gothic churches and other fine buildings. Pop. 22,916.

Others will be found under CIVITA.

Cit'y, a term introduced about the time of the Norman conquest. The word is derived from the Latin *civitas*, and is not limited in its application to episcopal towns. It is applicable to all towns of eminence, signifying that they are subject to municipal government. Long after the conquest, C. is used synonymously with *burgh*, as appears in the charter of Leicester, it being called *Civitas Burgus*, which shows that it is an error to suppose the term to be only applicable to a town which 'either is or has been the see of a bishop.' On this point Mr Woodeson, the Vinerian Professor, has adduced a decisive authority. It is that of Ingulphus, who relates that at the great council assembled in 1072 to settle the claims of two archbishops, it was decreed that bishops' sees should be transferred from *towns* to *cities*. In London, when 'the C.' is spoken of, it denotes the mercantile quarter of the town E. of Temple Bar. In America, the term is applied to all incorporated towns governed by a mayor and aldermen.

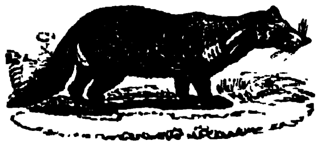
Ciudad', the Spanish form of the Lat. *civitas*, enters into the composition of many names of places both in Spain and her colonies. The most important are :—

CIUDADE'LA, a walled town of Minorca, on the N.W. coast of the island, 30 miles N.E. of Port Mahon, has some woollen manufactures, and a trade in agricultural produce. Its cathedral is an imposing structure. Pop. 7000.

CIUDAD REAL' ('the royal city'), the capital of a province of the same name, Spain, between the rivers Jabalon and Guadiana, 100 miles S. of Madrid, with which it is connected by railway. It has several famous Gothic churches, a public square of 150 by 75 paces, some manufactures of woollens, leather, tablecloths, &c., and a trade in wine, oil, fruits, and mules. Pop. 10,500.—The *province* of C. R. occupies the S. of New Castile, and has an area of 7840 square miles, and a pop. (1870) of 264,649.

CIUDAD ROD'RIGO ('city of Rodrigo'), a strongly fortified town in the province of Salamanca, Spain, overlooks the Agueda, 50 miles S.W. of Salamanca, has a citadel, a cathedral, part of which was erected in the 12th c., and several fine churches. In the Plaza Mayor are three Roman columns bearing inscriptions. The river is here spanned by a magnificent bridge. Pop. 4850. As a key to the W. of Spain, C. R. was a place of great importance during the Peninsular War. The French captured it in 1810, and the British besieged it for eleven days, and eventually carried it by storm in one of their most brilliant actions, January 20, 1812.

Civ'et (*Viverra*), a genus of Carnivorous mammalia included in the family *Viverridæ*, which, from their applying part of the sole of the foot to the ground in walking, have been named *Semi-plantigrada*. They are of moderate size. The muzzle is sharp and the tail long. The flesh-tooth has a cutting edge, and the canines are sharp, long, and pointed. The tongue is roughened with numerous sharp papillæ. The claws can be partly retracted. The pupils of the eyes can contract very markedly on being exposed to light. The *Viverra civetta* of N. Africa, or C.-cat, is the most familiar species. It is nocturnal in habits, and supplies the 'C.' of commerce, in the form of a pomade-like secretion, elaborated by a double pouch present in both sexes, and placed close to the anus. (See ANAL GLANDS.) This substance is used in the manufacture of perfumes, and is removed periodically from the secreting glands. The genette (*V. genetta*) inhabits N. Africa and S. Europe, and may be domesticated like a cat. The food consists of raw flesh of various kinds. The common C. attains an average length of about 10 inches, and is coloured a brownish grey with black markings. The last-mentioned species does not afford 'C.'



The Civet.

Cividale ('the little town'), the ancient *Forum Julii*, a walled town of Undine, N. Italy, on the Natisone, 8 miles E.N.E. of Udine. The cathedral of Santa Maria, built in the 8th c., has several fine paintings and a beautiful altar-screen. Its museum of antiquities and the municipal archives are rich in old and valuable MSS. C. carries on silk, cotton, and linen manufactures. Pop. about 6812.

Civ'il Death occurs when a person alive, or possibly alive, is adjudged dead by the law. Those attainted of treason or felony are, with exceptions, held to be civilly dead. A presumption exists in favour of life for a reasonable number of years, so as to throw the *onus probandi* on the party alleging death. But this presumption may be overcome by a counter presumption of death arising from circumstances. No general rule can be given on this point. See *Dickson on Evidence*, p. 183, *et seq.*

Civil Engineer, strictly every engineer not connected with the army—every engineer, that is, not a military engineer—but in common usage a man who makes or designs railways, docks, roads, canals, &c., as distinct from a *mechanical engineer*, a man who makes engines, boilers, and machinery in general. See ENGINEER.

Civil Establishments. Certain public departments of civil organisation, but provided for by the army estimates, are so called.

Civil'ian. This word has three meanings, two of which are legal. In the law, it may denote one versed in the principles and rules which form the basis of civil rights, or it may denote one who has specially studied these principles and rules as they appeared in the laws and government of ancient Rome. In a popular sense, a C. is one whose vocation is neither clerical nor military.

Civil Law. See LAW.

Civil List. Previous to the Restoration in 1660, the civil and military expenses of the state in England were paid out of what was called the royal revenue. This arose from crown lands, and from forced loans, or taxation by the will of the sovereign. (See BENEVOLENCE, SHIP-MONEY, TONNAGE AND POUNDAGE.) At the Restoration the expenditure was divided into two branches, the military and the extraordinary, and the ordinary for maintaining the civil establishments of the country; the revenues appropriated to the latter being called the hereditary or C. L. revenues. They were derived from the crown lands, and from taxes voted by Parliament at the beginning of each reign. In the reign of William III. the C. L. amounted to £680,000 a year. It went on increasing during the reigns of the Georges. In 1812 it amounted to £1,080,000 independent of annuities to members of the royal family paid out of the Consolidated Fund (q. v.). In the reign of William IV. the C. L. charges were confined to the expenses of the King's household, secret-service money, and pensions. These were fixed at £510,000 a year. At the beginning of the present reign, a C. L. was settled upon Her Majesty for life of £385,000 a year, of which £60,000 is for the privy purse. In return for this grant, it was provided that the hereditary revenue should be carried to the Consolidated Fund. By the C. L. Act, 1 and 2 Vict. c. 2, Her Majesty is empowered to grant pensions to the amount of £1200 a year, chargeable on the C. L. revenues, to those having fair claims on the royal beneficence, or who, by service or discovery, have earned the gratitude of their country.

Civil Service. The paid service of the state which is not military or naval is called the C. S. Appointments in it were formerly under patronage, but in June 1870 an Order in Council was issued by which the home C. S. was in a great measure opened to public competition. Success in examination is not in itself a guarantee for permanent employment. A six months' probation is necessary, and should the candidate during this time not satisfy the chief of the department in which he has been placed, the appointment will be cancelled. The C. S. Commissioners hold examinations in London, Edinburgh, and Dublin, on days which are previously advertised in the principal newspapers. Persons wishing to become candidates must apply to the C. S. Commissioners by letter in their own handwriting, addressed to the office in Cannon Row, Westminster, for permission to attend the preliminary examination, at least ten days before the day named. On receipt of this application, requisite instructions are supplied. Before being allowed to compete, candidates must satisfy the Commissioners that they are natural-born subjects of the Queen, and that, for the first-class examinations, they are not less than eighteen or more than twenty-four years of age on the first day of the competitive examination. For the second-class examinations the limits of age are sixteen and twenty. Candidates must produce certificates of good health and character. They may compete without reference to any special office vacant, or the competition may be for a special office. Appointments may now be obtained by successful candidates in the Treasury, Privy Council Office, Colonial Office, India Office, War Office, Admiralty, Board of Trade, Poor-Law Board, Customs, Inland Revenue, General Post-Office, and a great many other Government offices. The most important and lucrative department, however, of the C. S. open to competition is that of the C. S. of India. In this the successful candidate will at once, on arrival in India, receive a salary of 3000 rupees or £300 a year; his promotion, with good conduct and practical capability on his part, will probably be rapid, the salaries rising not by tens or twenties, but by hundreds of pounds per annum, until they reach the maximum. The highest salaries are those of the judges of the Sudder Courts,

£5000 a year. In the Forest Service of India there are also valuable appointments open to public competition. The India Public Works Department is one of the most important branches of the Indian C. S. The civilian officers are passed students of Government Civil Engineering Colleges in England and India, and civil engineers in practice of approved qualifications appointed direct by the Secretary of State or Government of India. The Indian Civil Engineering College at Cooper's Hill, Surrey, was established in 1870 for the education of civil engineers for this department. Admission to the college is obtained by competitive examination. In the Colonies also there are valuable C. S. appointments open to public competition. The more important departments of the C. S. of the United Kingdom, India and the Colonies are described under their titles in this work. For a description of the nature of the competitive examinations, see article EXAMINATIONS FOR THE C. S. See *Guide to Employment in the C. S.*, by J. D. Morell, LL.D., London.

Civil Service Estimates include all the expenses of the state, except those included in the estimates for the army and navy, and the interest on the National Debt. They come to about £12,000,000 a year. They are voted by the House of Commons in Committee. See REVENUE, PUBLIC.

Civ'ita, an older and fuller form of Citta (q. v.), and similarly used. The most important towns of whose names it forms part are:—

CIV'ITA CASTELLA'NA ('the castled town'), a town in the province of Latium, Central Italy, 28 miles N. of Rome, on the site of the ancient *Falerium Vetus*, and containing numerous Etruscan remains. It is built on a steep hill near the Rio Maggiore, here crossed by a bridge 150 feet in height, and has a cathedral (1210) with beautiful mosaics, a very remarkable crypt, and wonderful altar figures of the 15th c., a college, and a citadel, which has been converted into a state prison. Pop. about 4000.

CIVITA DI PENN'E ('the city of the summit or pen'), the ancient *Pinna Vestina* (the chief city of the Vestini), a town in the province of Teramo, Central Italy, 29 miles E. by N. of Aquila. The cathedral and diocesan seminary are handsome edifices, but the town is in general ill-built. C. has a manufactory of silk-flowers, a dyework, and a tannery. Pop. 9800.

CIVITANUO'VA ('new town'), a commercial town of Central Italy, province of Macerata, in what was formerly designated the Marches, 12 miles W. of Macerata, with a commodious harbour on the Adriatic, at a short distance from the town. Vines and olives are produced abundantly in the neighbourhood, which also possesses rich pastures. Pop. of town and port, 8583.

CIVITA SAN-AN'GELO, a town in the province of Teramo, Central Italy, 25 miles S.E. of Teramo, and near the Adriatic. It has considerable trade, and a pop. of about 7000.

CIVITA VEC'CHIA, a city, fortress, and free port in the Italian province of Latium or Roma, on the Mediterranean, 38 miles N.W. of Rome, with which it is connected by railway. Its harbour, which is strongly fortified, is formed by two semicircular moles and an exterior breakwater, has at its southern extremity a lighthouse 74 feet above the sea-level, and has depth of water for vessels of 400 and 500 tons. The streets, narrow but regular, are well built. C. V. is the seat of a bishop, has an arsenal, shipyards, and magazines, and a large prison for convicts. It has communication by steam with Marseille, Genoa, Leghorn, Naples, Messina, Malta, Greece, Egypt, and Turkey. Pop. 8000. C. V. is the ancient *Centumcellæ*. It was greatly enlarged by Trajan, in honour of whom it was also called *Portus Trajani*. In the reign of Justinian it became a bone of contention between Greeks and Ostrogoths. Often plundered and destroyed, it always rose again from its ruins. The place obtained its present name ('the old city') after its destruction by the Saracens in 812, when the inhabitants withdrew into the interior and founded a 'new city.'

CIVITELL'A DEL TRONTO ('the little town of the Tronto'), a strongly fortified town in the province of Teramo, Central Italy, 9 miles N. of Teramo, situated on a rock on an affluent of the Tronto. It is noted historically for two events: the defeat of the forces of Pope Leo. IX. and the Emperor Heinrich III. by the Norman Guiscard in 1053, and its successful defence against the Duke of Guise at the head of a French and Papal army in 1557. Pop. 6690.

Clackmann'an (Gael. *clach* or *clachan Mannan*, 'the stone circle or village of Mannan,' an ancient district of Scotland), the capital of Clackmannanshire, on the Devon, near its junction with the Forth, 29 miles N.W. of Edinburgh. Pop. (1871) 1309. It was formerly a royal burgh, and in 1330 was the residence of King David Bruce. Many objects in the neighbourhood bear testimony to this fact, as 'the King's stone,' &c. Though C. is the county town, the courts are held at Alloa.

Clackmann'anshire, the smallest county in Scotland, 16 miles long from E. to W., and 8 broad from N. to S., bounded N. and W. by Perthshire, E. by Perthshire and Fifeshire, and S. by the Forth. The Ochil Hills occupy the N. part of the county, but the remainder, consisting principally of the valley of the N. Devon, is very fertile and produces heavy crops. Area, 31,876 statute acres, or 50 sq. miles; pop. (1871) 23,747. The Ochils, which are composed principally of trap, rise in Bencleugh to 2352 feet. The total acreage under crop, in bare fallow and grass, in 1875, was: corn crops, 5844 acres; green crops, 1463; grasses under rotation, 2876; permanent pasture, exclusive of heath or mountain land is 5311. Wheat and barley are cultivated in nearly equal proportions, in each case to about the third of the quantity of the oats sown. Beans are a heavy and favourite crop. The minerals are iron, limestone, and coal, which is found in abundance. The chief manufactures are woollens, especially tartans and tweeds, glass, earthenware, and bricks. The most important town in the county is Alloa (q. v.); but the village of Dollar (q. v.) is also widely known in Scotland as a seat of education. C., which is divided into four parishes, returns one member to Parliament in conjunction with Kinross-shire.

Clad'ium (Gr. *klados*, 'a branch or twig'), a genus of plants of the order *Caperaceæ*. One species (*C. mariscus*) is common on the bogs and marshes of some parts of Britain; for example, Cambridgeshire, where hundreds of acres are covered with it. It is used for thatching and lighting fires. It is the most northerly of its genus, the twenty-one species described (Steudel's *Plantæ Cyperaceæ*) having an extended geographical distribution, though the majority are natives of Australia.

Cladodystroph'ia (Gr. *klados*, 'a branch,' and *dustrophos*, 'hard to rear'), a disease of aged oaks and other trees growing in a light soil, in which the upper branches are more imperfectly nourished than the lower, and therefore sooner decay—in other words, become what is called 'stag-headed.' It has been supposed that this is in consequence of the decay of the tap root, possibly from the attacks of fungi, but Mr Berkley considers this mere conjecture.

Clado'nia. See REINDEER MOSS.

Cladopto'sis (Gr. 'a falling away of the twig'), a disease of oaks, willows, and other forest trees, in which the small branches snap off with a regular circular fissure, leaving a cup-shaped scar, somewhat similar to that which takes place when a leaf or fruit separates at the stalk. It appears to be somewhat similar to the disease to which vine branches are subject after a cold summer, and which is known as *Phriganoptosis*. The branches fall off, 'a process facilitated by the peculiar formation of the stem, there being a transverse layer of cellular tissue at each bud' (Berkley).

Claim, in law, is a demand of right in something which is not possessed by the claimant.

Claim of Liberty is a petition to the Queen in the Court of Exchequer for confirmation of liberties and franchises. See LIBERTY, FRANCHISE.

Claim on a Bankrupt Estate.—To enable a Scotch creditor to prove under a fiat issued against an English trader, he must forward to his agent in England an affidavit setting forth fully the nature of his debt, accompanied by the securities, if any, held by the creditor, and a copy of the account, if any, between the parties. To rank under a Scotch sequestration, the claimant must describe distinctly the ground of his debt, accompanying his C. with an oath of verity, specifying every security which the claimant holds for the debt.

Clair, St, a lake, 30 miles long by 12 broad, between Lakes Huron and Erie, with the former of which it is united by the river St Clair, which is merely the outlet of Lake Huron.

Clairac', a town in the department of Lot-et-Garonne, France, on the Lot, 16 miles N.W. of Agen, has some manufactures of paper and leather, and a trade in wine and fruits. Pop.

(1872) 2423. C. accepted the Reformation doctrines as early as 1527, and suffered greatly during the religious wars, more especially in the year 1621.

Clairaut, Alexis Claude, a distinguished French mathematician, was born May 7, 1713, at Paris, where he died May 17, 1765. At the early age of eighteen he was admitted to the Academy of Sciences, to the scientific journal of which he contributed many elaborate and original papers. His most famous works are his *Théorie sur la Figure de la Terre* (1743), his *Théorie de la Lune* (1752), and his *Théorie du Mouvement des Comètes* (1760). His *Problème des Trois Corps* is to this day one of the most profound specimens of analysis in existence.

Clairvaux' (Lat. *Clara Vallis*, 'bright valley'), a small village of France, in the department of Aube, on the left bank of the river Aube, 7 miles E. of Bar-sur-Aube, derives its origin and its name from the celebrated Cistercian abbey founded here by St Bernard in 1115. The abbey had at one time an annual revenue of 120,000 livres. It was suppressed at the Revolution, and its extensive buildings are now used as a house of correction and workhouse.

Clairvoy'ance (Fr. 'clear-seeing') is a term applied to a faculty supposed by the vulgar to be possessed by certain parties, in virtue of which they can see in the dark, describe objects they may have never seen with the naked eye, but which they are conjectured to see mentally, and by which also they can describe objects separated from them by any opaque substance or enclosed in a box. It is said to be possessed by spiritual 'mediums,' and by people under mesmeric influences. Of such a faculty there is no scientific proof, for in all cases the pretensions of the clairvoyant break down when submitted to searching inquiry by men who are acquainted with all probable sources of fallacy, and who bring to bear upon them the acumen and caution with which a successful lawyer investigates a case. C. is cleverly imitated by conjurors by means of a language of signs known only to the conjuror and the reputed clairvoyant. See MESMERISM.

Clam, in heraldry, an escalop or cockleshell, indicating that the bearer has been a crusader or has made long voyages at sea.

Clamshell and **Clam Bear's Paw**, the names applied to various genera of Lamellibranchiate molluscs, included in the family *Chamidæ*. (See CHAMA.) The C. (*Tridacna gigas*) attains gigantic dimensions, and in some cases the shell alone may weigh 500 lbs. The C. B. P. (*Hippopus maculatus*) is found in the South Seas; its whitish colour, spotted with red or purple, and its ribbed and triangular form, placing it in high favour for beauty among conchologists.

Clan. This Gaelic word, meaning 'children,' inferentially descendants of a common ancestor, has come to be applied almost exclusively to the communities of the Scottish Highlands, as these are divided topographically, and by distinctive surnames. The peculiarities of clanship are well described in a book written about the year 1730, entitled *Letters from an Officer of Engineers to his Friend in London*. 'The Highlanders,' it says, 'are divided into tribes or clans, under chiefs or chieftains, and each C. is again divided into branches from the main stock, who have chieftains over them. These are subdivided into smaller branches of fifty or sixty men, who deduce their origin from their particular chiefs, and rely upon them as their more immediate protectors and defenders. The ordinary Highlanders esteem it a most sublime degree of virtue to love their chief and pay him a blind obedience. . . . Next to this love of their chief is that of the particular branch whence they sprang, and in the third degree to those of the whole C. or name, whom they will assist, right or wrong, against those of any other tribe with whom they are at variance. . . . Lastly, they have an adherence to one another as Highlanders, in opposition to the people of the Low Country, whom they despise as inferior to them in courage, and believe that they have a right to plunder them whenever it is in their power. This last arises from a tradition that the Lowlands in old times were the possessions of their ancestors. The chief exercises an arbitrary authority over his vassals, determines all differences and disputes that happen among them, and levies taxes upon extraordinary occasions. . . . Some of the chiefs have not only personal dislikes and enmity to each other, but there are also hereditary feuds between C. and C., which have been handed down from one generation to another for several ages. These quarrels descend to the meanest vassals, and thus sometimes an innocent person suffers for crimes committed by his tribe at a vast distance of time before his being began.' This description conveys a clear idea of clanship as it existed in the Highlands early in the 18th c., when the system was in full force. It shows a curious mixture of patriarchal and of feudal government, and the customs and feelings of the people tended to keep it unimpaired amid the improvements and diffusion of knowledge which was taking place in other parts of the country. The distinction between the Highland and the feudal chief was, that the former was the hereditary lord of his C., wherever they dwelt or whatever land they occupied, while the latter was entitled to the military service of all who held lands under him. The one dignity was personal, the other territorial; the rights of the chief were inherent, those of the baron were accessory; the one might lose or forfeit his possessions, but could not thereby be divested of his hereditary character and privileges; the other, when divested of his fee, ceased to have any title or claim to the service of those who occupied the lands. It thus often happened in the Highlands that the head of the C. was one man, and the feudal owner of the land which it occupied was another. The following is General Wade's list of the Highland clans and their numbers that fought for King James in 1715:—Islands and clans of Lord Seaforth, 3000; M'Donalds of Slate, 1000; M'Donalds of Glengarry, 800; M'Donalds of Moidart, 800; M'Donalds of Keppoch, 220; Camerons of Lochiel, 800; M'Leods, in all, 1000; Duke of Gordon's men, 1000; Stewarts of Appin, 400; Robertsons of Strowan, 800; M'Intoshes and Farquharsons, 800; M'Ewen in Skye, 150; the Chisholms of Strathglass, 150; M'Thersons, 220; the Atholl men, 2000, and the Breadalbane men, joined without their superiors—total for King James, 14,140. The following, with a total of 8000, remained loyal:—Duke of Argyle, Lords Sutherland and Strathnaven, Lord Lovat's Frasers, the Grants, Rosses, and Munroes, Forbes of Culloden, Rose of Kilravock, and Campbell of Clunes. See *History of the Highlands and Highland Clans*, by James Browne, Esq., LL.D., Advocate (Glasg. 1840); *Concise Historical Proofs respecting the Gaels of Alban, or Highlanders of Scotland*, by James A. Robertson, F.S.A. (Edinb. 1866); *Sketches of the Manners and Present State of the Highlands of Scotland*, by Major General David Stewart (Edinb. 1825).

Clandes'tine Marriage. See BANNS, MARRIAGE.

Clandestine Mortgage. In England, if any one mortgage his estate a second time, without previously informing the postponed mortgagee in writing of the prior mortgage, or of any judgment or incumbrance he has voluntarily brought upon the estate, the postponed mortgagee is entitled to hold the estate as an absolute purchaser, free from the equity of redemption of the mortgager. In Scotland, C. M. is impossible. See RECORDS, PUBLIC; BOND, HERITABLE; MORTGAGE.

Clan Macduff, Law of. This was a barbarous privilege which formerly belonged to those related within the ninth degree to Macduff, Earl of Fife. If one having the privilege was found guilty of homicide, he was absolved by coming to Macduff's Cross, between Fife and Strathearn, and giving nine *kye* (cows) and a *colpindash*, a young cow.

Clap-Net, a ground-net used by birdcatchers in the S. of England, consisting of two equal sides or parts, each about 12 yards long by 2½ wide, and having a slight frame. The parts are placed parallel to each other, about 4 yards apart, and are closed upon one another by the pulling of a string, so as to cover the space between them. Call-birds are used as decoys for the wild birds the netters wish to catch.

Clapp'erton, Hugh, an African traveller, was born at Annan, in Dumfriesshire, in 1788, was sent to sea at the age of thirteen, and entering the navy, rose to the rank of lieutenant in 1814. He accompanied Lieutenant Denham and Dr Oudney (1822) on a Government expedition to Central Africa, with the view of ascertaining the length and course of the Niger. Oudney died at an early stage of this enterprise, which only resulted in determining the exact position of Bornu, Houssa, and Mandara. In 1825 C., along with Captain Pearce, Dr Morrison, and Mr Dickson, again set out for the same purpose. The party started from the Bight of Benin, but were almost immediately attacked by severe illness, which C. alone survived. Pushing into the interior, he reached Sakkatu, where he was detained by the Sultan Bello. Here his health gave way, and he died at the village of Changary, 4 miles from Sakkatu, April 13, 1827. See *Narrative of Travels and Discoveries in N. and Central Africa in 1822–24, by Denham, C., and Oudney* (Lond. 1826), *Journal of a Second Expedition into the Interior of Africa, &c.* (Lond. 1829), and Lander's *Records of C.'s Last Expedition to Africa* (Lond. 1830).

Claque (Fr. 'a clap or slap with the hand'). A theatrical C., a distinct and acknowledged feature of the Paris theatres, is a body of individuals retained at a salary to applaud a special actor, and thus, so far, to secure the success of his engagement.

Cla'ra, Santa, or **St Claire,** was born at Assisi, in the Duchy of Spoleto, Italy, about 1193. At the age of eighteen she left the house of her father, a wealthy nobleman, and betook herself to the convent of Portioncula, under the auspices of St Francis of Assisi. She founded the order which bears her name in 1212, and was soon after joined by her sister Agnes, her mother, and several other ladies of high rank. After twenty-nine years of infirm health, occasioned by her excessive austerities, C. died, August 11, 1253, and was canonised, two years after her death, by Pope Alexander IV. See Prudent de Faucogney's *Vie de Sainte Claire* (Par. 1782). The *Order of St C.* is divided into 'Urbanists,' those that follow the mitigated rule drawn up by Pope Urban IV. in 1264, and 'Damianists,' a severer sect of the sisterhood. The convents of the order are numerous in Catholic Europe and in America.

Clare, a western maritime county of Ireland, in the province of Munster, N. of the estuary of the Shannon. Area, 1294 sq. miles; pop. (1871) 147,864. It is hilly in the E. and W., but an extensive and fertile plain occupies the centre, while on the mountain-sides and river-banks there are fine pastures or 'corcasses.' In 1871 there were 151,035 acres under tillage, 469,446 in pasture, 7349 in plantation, and 132,244 in waste bog, mountain, &c. Besides the Shannon, which bounds it on the S. and E., C. is watered by the Fergus, with its great estuary, the Ardsallas, Graney, Forsett, Dumbeg, &c., and has as many as 100 miniature lakes. The loftiest mountains are in the Slieve Baughta and Barnagh ranges, which reach a height of 1312 and 1758 feet respectively. C. has a wild and precipitous sea-line of over 100 miles. Where the Shannon merges in the Atlantic, the land runs out into the long, tapering promontory of Loop Head. C. is mostly formed of carboniferous limestone, and there are mines of coal, lead, manganese, copper pyrites, &c., and quarries of slate, flag, and black marble. The chief crops are oats, potatoes, wheat, and barley, and the manufactures include coarse linens, flannels, and friezes. There is a good coasting trade and active fisheries. Ennis is the capital, and communicates with Limerick by railway. A local line, 10 miles long, also connects Kilrush and Kilkee. C. has round towers, cromlechs, and other antiquities. It returns two members to Parliament.

Clare College, Cambridge, founded in 1326 by Elizabeth, sister and coheir of Gilbert, Earl of Clare. Its buildings, which are in the style of the Renaissance, are much admired. The chapel was built in 1535. The college contains eight senior and ten junior fellows, who elect the 'master.' The whole eighteen fellowships are open to Bachelors of Arts, or persons of a higher degree, without restriction as to marriage. C. C. has thirty-three scholarships, seven exhibitions, and the patronage of eighteen livings. In 1875 the number of undergraduates was eighty-five.

Clare Constat, Precept of, in Scotch law, is a deed executed by a subject-superior to complete the title of his vassal's heir to the lands held by the deceased vassal under the granter of the precept.

Clare Island, at the entrance to Clew Bay, forms part of County Mayo, Ireland. It is 4½ miles long and 2 broad, and supports a lofty lighthouse.

Clar'encieux, one of the three kings-of-arms of the Heralds' College of England—Garter, C., and Norroy. The two latter are provincial, and C. ranks first. His jurisdiction embraces all England S. of the Trent, and his duty is to survey all the coat-armour within his province, to register descents and marriages, and to marshal the funerals of all his subjects who are not under Garter (q. v.). C. also grants arms within his province, subject to the approval of the Earl Marshal (q. v.).

Clar'endon, Constitutions of, is the name given to the concordat between Church and state in England drawn up at a council of nobility and clergy held at the village of Clarendon, in Wiltshire, in 1164, in the reign of Henry II. These constitutions or laws were sixteen in number, and their main object was to restrict the power of the Church in England, and to give the crown the right to interfere in the election to all vacant offices in the Church. 'Many of the clauses,' says Mr Green (*Short History of the English People*, p. 103), 'were simply a re-enactment of the system established by the Conqueror.' This is no doubt true, but it is impossible to doubt that the sharp separation between the civil and ecclesiastical jurisdictions introduced into England by William was the real cause of the conflict between the two. Although the primate, Thomas Becket, signed them, they were rejected by the Pope of the period, Alexander III., and Becket himself vehemently retracted his consent. This led to his assassination, and subsequently to the penance of Henry II.; but in spite of the latter event, the C. of C. remained on the statute-book, and may be regarded as the germ of the ecclesiastical revolution accomplished in the reign of Henry VIII. In Professor Stubbs's *Select Charters illustrative of English Constitutional History*, the reader will find (pp. 137–140) the C. of C. 'in probably the exact form in which they were reported to the King, and confirmed by the bishops and barons.'

Clarendon, Edward Hyde, Earl of, an English politician and historian, was the son of a private gentleman, and was born at Dinton, in the county of Wilts, 18th February 1608. He studied first at Oxford and then at the Middle Temple. Entering Parliament in 1640 as member for Wotton Bassett, he took the side of those who insisted on a redress of grievances, but was at no time a Puritan—always strenuously upholding the cause both of the Church and the crown. When the civil war broke out, he left the House, joined the King at York, was made Chancellor of the Exchequer, and received the honour of knighthood. When fortune deserted the royal cause, he accompanied Prince Charles to Jersey, where he began to write his *History of the Rebellion.* Called to Paris in 1648, he was sent to Spain in the following year to solicit help from the Spanish court, but returned without success in 1651. He then went to Antwerp; was made 'High Chancellor of England' in 1657 by his exiled monarch, and was confirmed in the office at the Restoration. He was also created Baron Hyde, and subsequently Viscount Cornbury and Earl of C., and, in fact, was for a time Premier. Court intrigues, however, and popular indignation at the failure of the war with Holland and the selling of Dunkirk to France, brought about his fall; he was deprived of his employments (1667), and retired to France. He died at Rouen, 9th December 1674. He was buried in Westminster Abbey. C. was a well-intentioned and virtuous man, and an honest and moderate politician, though lacking in firmness of purpose. His *History,* marred though it is by numerous inaccuracies and prejudices—one may even go further, and say, with deliberate perversions of fact—is still, from a literary point of view, an admirable work. Its 'portraits' are superbly executed, even when the likeness is not true. C. wrote several other works, of which the most interesting is an account of his own life. His state papers have been published in three folio volumes. C.'s daughter, Anne Hyde, married the Duke of York, afterwards James II., and was the mother of Queens Mary and Anne. His son, **Henry, Earl of C.** (1638–1709), was for a time Lord-Lieutenant of Ireland under James II., and wrote a *History of the Irish Rebellion.* His state letters and diary were published at Oxford in 2 vols., 1763.

Clarendon, George William Frederick Villiers, Earl of, an English statesman and diplomatist, was born 12th January 1800. He was descended from Thomas Villiers, who married the heiress of the last Earl of C. of the Hyde family, and was made Earl of C. himself in 1776. From early life C. was trained to be a diplomatist, being appointed ambassador at Madrid in the year 1833, in which office he helped to establish the Spanish Government on a constitutional basis. Succeeding to the earldom on the death of his uncle (1838), he took his place in the House of Peers as a Whig, and supported Sir Robert Peel in his free-trade policy. After being Keeper of the Great Seal, he was, under Lord Russell's premiership in 1846, made first President of the Board of Trade, and subsequently Lord-Lieutenant of Ireland. The ability and firmness with which he put down the Irish rebellions of the time earned him the gratitude of his country. In the subsequent Liberal administrations of Lord Aberdeen, Lord Palmerston, and Mr Gladstone, C. held the office of Foreign Secretary, and few British statesmen have been more respected on the Continent. He died June 1870.

Clar'et. The red varieties of French wines imported into this country pass under the general name of C. They vary extremely in their qualities and value, the bulk being cheap light wines. Others, such as Chateau Lafitte, are of a very high class, and held in great repute.

Clarifica'tion, the process of removing suspended matters from liquids, accomplished either by filtration, by allowing the matter to deposit, or by adding albumen or a similar substance, whereby the suspended body is mechanically dragged down. It is a process of great importance in many departments of manufacturing chemistry.

Clar'inet, or **Clar'ionet,** a wooden reed instrument which occupies the place in military bands that the violin has in orchestras. The peculiar quality of its tone is caused both by its shape, and by the nature of the reed through which—held between the performer's lips—the air is blown into it. Its compass is about three octaves, but as it cannot be played conveniently in keys very distant from its natural key, each performer has always three instruments, of which the natural keys are A, B♭, and C, so that he may be able to play easily the varied keys of orchestral music. In military bands some higher clarionets are often used, and in orchestras occasionally a bass and contra-bass C.

Clar'ion, a form of trumpet of high pitch, not now used. It is also the name of a four-feet reed organ-stop.

Clark, Sir James, M.D., Bart., a British physician, was born at Cullen, Banffshire, December 14, 1788. Educated at the grammar-school of Fordyce and at King's College, Aberdeen, he studied medicine at Edinburgh and London, held for some years the position of navy surgeon, took the degree of M.D. at Edinburgh in 1817, and after travelling on the Continent, and practising as a physician for eight years in Rome, he settled in London in 1826. He soon acquired a high reputation, became physician to the Duchess of Kent, and, on the accession of Queen Victoria, her physician in ordinary. C. was made a baronet in 1838. He died June 29, 1870. Among his many contributions to medical science deserving of notice is his *Treatise on Pulmonary Consumption,* which he considered might be arrested by proper regulation of food, air, and exercise. He was a zealous advocate of the study, at an early age, of the laws of health.

Clarke, Adam, a Wesleyan divine, was born at Maggerafelt, in the N. of Ireland, in 1760. He became a 'circuit' preacher in Wiltshire in 1782, but settled in London in 1805; was appointed a sub-commissioner of the public records in 1807, and, after a laborious literary life, died at Bayswater, 26th August 1832. The chief fruits of his studies are his *Biographical Dictionary,* published in 1802, and his edition of the Bible in English (8 vols. 1810–26), illustrated with a commentary and critical notes. For his attainments in Oriental literature and biblical knowledge, the University of St Andrews conferred upon him the degree of LL.D.

Clarke, Edward Daniel, a traveller and savant, was born June 5, 1769, at Willingdon in Sussex. He studied at Jesus College, Cambridge, and acted as travelling tutor and companion to a number of noblemen and gentlemen, including Mr Hill (afterwards Lord Berwick) and Mr Cripps. His tour with the latter lasted from 1799 to 1802, and embraced the whole of Scandinavia, Russia, Circassia, Turkey, Asia Minor, Syria, Palestine, Egypt, and Greece. His travels were a source of great profit to his university and to his country. For the library of the former he secured a number of valuable marbles and MSS., and the colossal statue of the Eleusinian Ceres; and for the latter the celebrated sarcophagus of Alexander, now in the British Museum, and upon which he published a dissertation. Cambridge University conferred upon C., who had been instituted to the rectory of Harlton, the degree of LL.D., and a professorship of mineralogy was in 1808 created for him. His *Travels,* published during his life in 5 vols. (1810–19), and after his death in 11 (1819–24), were received with much favour, and his experiments with the oxyhydrogen blowpipe, have been productive of valuable scientific results. After his death, which took place March 9, 1822, his university purchased his Greek and Oriental MSS., including a Codex of Plato, discovered by him in the island of Patmos.

Clarke, Dr Samuel, a distinguished scholar, philosopher, and theologian, was the son of an alderman at Norwich, where he was born, October 11, 1675. Educated at Caius College, Cambridge, he there pursued with special zeal philosophical studies, and became an adherent of the system of Newton. C. filled various posts in the Church, and was ultimately made one of Queen Anne's chaplains and rector of St James's. Although his views on the Trinity (in his *Scripture Doctrine of the Trinity,* 1712) were considered semi-Arian, and censured by Convocation, he was a keen assailant of the free-thinkers of his time, and among the best-known of his works is his *Demonstration of the Being and Attributes of God* (Boyle Lecture, 1704). The basis of his ethical system is the famous 'eternal fitness of things,' or the relations of things established from eternity by God. Among the proofs of his scholarship are his editions of Cæsar (1712) and of Homer (1729–32), the latter of which was finished by his son. C. was offered the mastership of the Mint on the death of his friend Newton, but declined it. He died May 17, 1729. C. was a man of amiable disposition and irreproachable character. A collected edition of his philosophical works, among the most interesting of which are his letters to Leibnitz on Space and Time, was published in 4 vols. 1738–42.

Clarkson, Thomas, one of the most eminent of English philanthropists, was born at Wisbeach, Cambridgeshire, March 28, 1760, and studied at St John's College, Cambridge. He is said to have been led into the agitation against slavery in Africa by writing a prize-essay on the question 'Is it right to make slaves of others against their will?' After this he became the leader in, and devoted himself to, the agitation, secured the co-operation in Parliament of Wilberforce, wrote pamphlets innumerable on the subject, and, after the bill for suppressing the slave trade was passed in 1807, wrote a history of it (2 vols. 1808). C. lived to see the abolition of slavery in the W. Indies in 1833. He died at Playford, Suffolk, September 26, 1846, having spent the last years of his life in promoting various benevolent schemes. See Thomas Taylor's *Biographical Sketch of T. C.* in the *Gentleman's Magazine.*

Clar'y (*Salvia sclarea*), a plant, a native of Italy and the S. of Europe generally, but long cultivated in our gardens for the sake of its aromatic and medicinal properties. It is antispasmodic and stimulant, and is used for flavouring soups and confectionery with its characteristic odour of the balsam of Tolu. Its flowers are used in making a fermented wine. Wild C. is a name applied to *Salvia verbenacea;* Hormenium C. is *Salvia Horminium.* The name of Wild C. is also applied to *Heliotropium Indicum.*

Class'ics. The name *classici* was applied to the highest of the six classes into which Servius Tullius divided the Roman citizens; and hence authors of pre-eminent worth have been termed *classic authors;* thus Aulus Gellius says—'Classicus scriptor non proletarius.' At the Renaissance, scholars, struck with the superiority of Greek and Latin to contemporary literature, distinguished the ancient from the modern writers by the word *C.*, but this restricted signification is no longer maintained. The Germans, and afterwards the French and English, extended the word to modern as well as ancient writers of eminence; and by the *C.* of a nation we now understand its leading authors, whose merits have been sufficiently proved by time and criticism to assure them of a permanent place in its literature. 'I call the classic,' says Goethe, 'the healthy. The *Nibelungen* is as classic as the *Iliad,* for both are healthy. The antique is classic, not because it is old, but because it is strong, fresh, joyous, and healthy.' The word is, however, still used in the narrower sense of the Greek and Latin authors; a *classical* education refers to the study of Greek and Latin writers alone, not to the study of the more recent authors of other nations, whose beauties of thought and form have entitled them to the epithet *classic*, which was formerly monopolised by the ancients, as almost the sole examples of established fame and perfection of style in literature. 'Classic' and 'Romantic' are occasionally used to distinguish Southern Romantic from Northern Teutonic art; and again they are frequently opposed in regard to French writers—'Classic' being applied to the school of Racine, and 'Romantic' to that of Hugo. But these partisan uses of the word are only the perversions of prejudice.

Classifica'tion of Animals. Two principles may be employed in classifying animals. One of these, forming the *artificial* method, has for its essential feature that of founding its characters upon resemblances between animals of a more or less external and superficial kind. Thus the savage employs an artificial method of classification when he classifies together fishes and whales from their outward appearance, or birds and bats because both fly. Such a procedure resembles the practice of arranging the books in a library solely by their outside resemblances or styles of binding—a method this, which could give no one any reasonable idea of the true nature of the volumes, any more than the classification of the savage expresses any definite relation between the animals he thus classifies. In opposition to this artificial method, which characterised the earlier history of zoology, we have the *natural* method. By means of this latter we group together only animals that are like in the *details of their structure*, and this method, therefore, is the expression of a true structural relationship between the organisms which it brings together. It is, in other words, a convenient expression of the facts and laws of morphology and physiology. The whale would, therefore, in this classification, be placed among the mammals, from a consideration of its structure, and not with the fishes, which it somewhat resembles in outward appearance. The animal kingdom is divided through the consideration of the morphological *type*, or broad features of structure, into five or six sub-kingdoms, which, beginning with the highest, are named respectively *Vertebrata* (q. v.), *Mollusca* (q. v.), *Annulosa* (q. v.), *Annuloida* (q. v.) or *Echinosoa* (q. v.), *Cœlenterata* (q. v.), and *Protozoa* (q. v.). Each sub-kingdom admits of division into *classes*, the classes are divided into *orders*, the latter into *families* and *genera*, and the genera into *species*. See also SPECIES, &c.

Claude, St, a town in the department of Jura, France, 25 miles S. of Lons-le-Saulnier, at the confluence of the Bienne and Tacon. It owes its origin to a Benedictine abbey, founded here in the 5th c. St C. has tanneries, potteries, and paper-works, and manufactures of turnery-ware on a large scale, consisting of articles in ivory, bone, horn, shell, boxwood, &c. Pop. (1872) 6085.

Claude Gelée, usually called **Claude Lorraine**, was born of humble parentage at Champagne, in Lorraine, in 1600, went in youth to Rome, in company with some adventurers of his district, and entered into the service of Tassi, a painter, for whom he acted as cook, groom, and colourman, and by whom he was taught the principles of art. He was an earnest and conscientious student of nature, and delighted in observing the varying phases of light and colour under which the same view presents itself at different seasons. This constant habit, together with his unwearying practice at the easel, raised him to the highest rank as a landscape painter. He settled finally at Rome in 1627, painted assiduously, and, after enjoying the patronage of Popes Urban VIII., Clement IX., and Alexander VII., died at Rome, 1678. C.'s works are to be found in every great gallery in Europe. England is particularly rich in specimens—Dr Waagen counting fifty-four in all. The picture which C. himself considered his best is the 'Villa Madama.' Four exquisite pieces, 'Morning,' 'Noon,' 'Evening,' and 'Twilight,' are in the St Petersburg Gallery. C.'s landscapes combine beauty of scene with truth in the highest degree. No painter has rendered the foliage of trees, and the character of their different species, with greater fidelity combined with high picturesque effect. It was the wish of Turner to be considered his rival, and the greatest of English landscape-painters presented one of his finest works to the English nation on the condition that it should hang in the National Gallery side by side with one of the acknowledged masterpieces of the greatest landscape-painter born in France.

Claudia'nus, Cla'udius, born at Alexandria, flourished at the close of the 4th c. and the commencement of the 5th. He wrote at first in Greek, but the success of his panegyric on the consulate of Probinus and Olybrius in Latin verse induced him to abandon the language in which he had been educated. C.'s extant works consists chiefly of idylls and epigrams, and of panegyrics on the Emperor Honorius and his powerful minister Stilicho, the patron of C., and 'the perpetual theme' of his verse and of invectives against their enemies. The most important of his works is the very fragmentary epic poem the *Rape of Proserpine*. C.'s poetry is characterised by an 'absolute command of the Latin language,' splendid powers of description, and a brilliant, if somewhat ill-regulated, fancy. There are editions of C. by Heinsius (Leyd. 1650, 1665), Burmann (Amst. 1760), Gessner (Leips. 1759), and Doullay (Par. 1836).

Clau'dius I., more fully **Tibe'rius Clau'dius Dru'sus Nero**, Roman Emperor, was born, August 1, B.C. 10, at Lyons, in Gaul. He was the son of Drusus, step-son of Augustus, and succeeded to the purple on the murder of his uncle Caligula, in A.D. 41. C. in early life suffered much ill-treatment and neglect, being considered by his family little better than an imbecile. His natural stupidity, however, was strangely combined with an eager desire for knowledge, which led him to study with secret industry both science and literature; but his cowardice and weakness of character unfitted him for a public career. He was fifty years of age when proclaimed Emperor by the Prætorian Guards, who found him hiding in terror in a corner of the palace. Though he set an evil precedent by granting a donation to the Prætorians, C. began his reign with a just and moderate policy, but speedily fell under the dominion of others, who abused the imperial power. He was uxorious and fond of favourites; so that his wife Messalina, and his freedmen Narcissus and Pallas, found it easy to govern or plunder and torture in his name. The union of C. with his niece Agrippina, after the execution of his former consort (48 A.D.), was not more fortunate; for, having persuaded him to adopt her son Nero, she afterwards poisoned him (54 A.D.) in order to secure the succession. C. was endowed with abilities which might have gained him eminence in an obscurer sphere; he composed several historical works, among them a *History of Etruria*. The wars of his reign were, on the whole, victorious. C. himself undertook an expedition to Britain, and Mauritania was made a Roman province. Several public works, on a large scale and of great utility, were executed by C. Among these were the *Aqua Claudia*, the vast aqueduct which supplied Rome with water all through the middle ages; the port of Ostia, and the canal between Lake Fucinus and the river Liris.

Clause of a Deed is, in law, one of its subdivisions.

Clause of Pre-emption, in Scotch law, is a clause sometimes inserted in a feu-right, stipulating that the vassal shall not sell the lands without first offering them to the superior, or that the superior shall have the lands at a certain price fixed in the clause.

Clause of Devolution, in a Scotch deed, is a clause devolving some office or duty on some one on a stated event.

Clause of Return, in a Scotch deed, is a clause by which the granter of a right makes a particular destination of it, and provides that in a certain event it shall return to himself.

Clauses, Irritant and Resolutive, in a Scotch deed. These are two clauses which limit the right of an otherwise absolute proprietor, and which make the conditions imposed—without these clauses only a personal obligation—effective against creditors and singular successors. See SINGULAR SUCCESSOR.

Claus'el, Ber'trand, a French marshal, was the son of Jean-Baptiste C., a French Revolutionist of some mark, and was born at Mirepoix, in the department of the Ariège, 12th December 1772. Entering the army at an early age, he distinguished himself in Holland, Italy, Austria, and Spain. After the defeat of Marmont at Salamanca, July 22, 1812, he obtained the command of the French army, and conducted its retreat into Portugal with much ability. On the restoration of the Bourbons C. was declared a traitor, and even condemned to death, but he was ultimately allowed to return from America, whither he had escaped. In 1830 he was appointed to the command of an expedition to Algiers, and being successful, was made a marshal of France. In 1835 he was appointed governor-general of Algeria, but being blamed for the disasters that befell the

French army under the walls of Constantine in the following year, he returned to France. C. died at Secourrieu (Haute Garonne), 21st April 1842.

Claus'enburg. See KLAUSENBURG.

Claus'thal. See KLAUSTHAL.

Clavagell'a, or Clubshell, a genus of Lamellibranchiate mollusca, belonging to the family *Gastrochænidæ*. The shell in C. is club-shaped and oblong, and one of the valves or halves of the shell is free, whilst the other is attached to an elongated tube, frequently divided by a longitudinal partition. This tube terminates like that of Aspergillum (q. v.), or the 'Watering-pot Shell,' which belongs to the same family as C. *C. aperta* and *C. lata* are familiar species. *C. cretacea* occurs as a fossil in the Chalk rocks, and the genus commences in a fossil state in the Upper Greensand. Several living species exist as above named.

Clav'ichord, or Clav'ecin, one of the older forms of the piano, used frequently until about a century ago. Its strings were struck by pins attached to the ends of the keys, and were damped by pieces of cloth so as to produce a very soft sound.

Clav'icle. This is a bone familiarly known as the collar-bone. It passes from the summit of the breastbone, or sternum, to the acromion process of the scapula, and it connects the superior extremity with the trunk. It has a curved form, somewhat like the italic *f*. To it are attached various muscles of the neck, trunk, and arms, and it acts as a fulcrum for the action of these muscles. It is absent in all pachydermata, ruminants, and solidungula, because in these animals there is no lateral movement of the fore extremity. In birds the two clavicles are very large, and unite to form a single bone known as the furculum, or 'merry-thought.' This arrangement in birds is probably for preventing the powerful pectoral muscles from approximating the shoulders. The C. is the first bone in the body to ossify. The first ossific nucleus makes its appearance about the sixth week. Two other nuclei make their appearance; that of the sternal end joins the body of the bone from the 18th to the 25th year. See SKELETON.

Dislocations of Clavicle.—Either end of the C. may be dislocated. Surgeons describe three dislocations of the *sternal* end of this bone—*forwards*, *upwards*, and *backwards*—according to the position of the displaced end. Of these three, the dislocation *forwards*, though a rare injury, is the most common. It is the result of violence, generally caused by a fall or blows on the shoulder. This dislocation is easily recognised by feeling the displaced end of the bone projecting in front of the upper part of the Sternum (q. v.). There is also depression of the shoulder. Reduction is effected by moving the shoulder upwards and backwards, and using pressure on the displaced end of the C. As some difficulty is generally experienced in retaining the bone in position, the advice of a surgeon should always be sought.

The dislocation *upwards* is very rare. It is easily recognised by the end of the bone being felt to be elevated into the neck, with depression of the shoulder. Reduction is effected in much the same way as in the previous case, and the limb is retained in position by a pad and bandage.

The dislocation *backwards* is very rare, and is generally caused by direct violence to the parts. It has also been caused by curvature of the spine. When due to this latter cause, little relief can be obtained. In this dislocation the shoulder is elevated, and there is generally more or less interference with the circulation and respiration, on account of the displaced end of the bone pressing on the nerves and blood-vessels of the neck. After reduction it is necessary to keep the shoulder removed from the side, which is best accomplished by placing a pad in the armpit, and binding the elbow towards the side.

When the *acromial* end of the C. is displaced (which is not uncommon), it is generally, if not always, *upwards*, and is the result of a fall on the shoulder. This dislocation is easily recognised by the end of the C. being felt to be projecting upwards whilst the shoulder is depressed. The bone is easily replaced, but some little care is necessary afterwards to retain it in position.

Fracture of Clavicle.—Fracture of the C. is much more frequent than dislocation. It is generally due to violence; the fracture is oblique, and occurs most frequently near the middle of the bone. The shoulder is depressed and drawn forwards. By moving the arm, pain is elicited, and *crepitus* felt at the seat of injury. The outer portion of the C. is dragged downwards by the weight of the arm—causing the inner or sternal end to appear very prominent. This fact has frequently caused the ignorant to mistake which end of the broken C. was displaced. The treatment consists in raising the shoulder, and keeping it removed outwards by a pad in the armpit or other appliance, and retaining it in that position by means of bandages.

Clavicor'nes, the name given to a tribe of *Coleoptera* or Beetles, distinguished by the clubbed tips of their antennæ or feelers, which exceed the palpi of the maxillæ (or lesser pair of jaws) in length. Of this group the Burying Beetles (q. v.) form typical examples, and the genus *Dermestes*, or Bacon Beetles, also present a familiar group.

Clavig'ero, Francesco Saverio, a historian of Mexico, was born about 1720, and sent by the Jesuits as a missionary to the Mexican Indians, among whom he laboured for thirty-six years. While thus engaged, he collected materials for the history of the country, both before and after its conquest by the Spaniards. On the suppression of his order in 1767, he withdrew to Cesena, in Italy, where, in 1780–81, he published the fruit of his researches, under the title of *Storia antica del Messico, cavata da' migliori storici Spagnuoli, e da' manuscritti e pitture antiche degli Indiani*, translated into English by C. Cullen (2 vols. Lond. 1687). C. died at Cesana, October 1793.

Clavija, a genus of *Myrsinaceous* plants, of tropical S. America, named in honour of J. Clavijo Faxardo, a Spanish botanist. The fruits of some of them are eatable, and the roots of others are emetic.

Clay (Old Eng. *clæg*, the 'g' is still retained in the Lowland Sc. 'clag' and 'claggy'), a natural earthy compound, in a state of minute division, which with water acquires plasticity, and may be kneaded or moulded into a particular form, and hardened by heat. Typical or pure C. is composed of silica, alumina, and water, forming, in chemical language, a hydrous-silicate of alumina; but as natural clays are the result of the disintegration of primary rocks, they are never absolutely free from the admixture of other substances, such as lime, sand, magnesia, mica, and oxide of iron. The impurities give different colours to the numerous varieties of C., and so it occurs of all shades, from white, when nearly pure, to grey, red, blue, brown, and even deep black, from the presence of carbon. The purest clays are the most plastic, and as they burn white in the kiln, they are highly valued for the manufacture of fine earthenware, and are known by the names of Kaolin or China-C., Potter's-C., and Pipe-C. (q. v.). Fire-Clays (q. v.), of which *Stourbridge C.* is the most famous, contain much silica, and are very infusible. Common C. or loam is abundantly distributed over the earth's surface, and is largely employed in the manufacture of bricks, tiles, and coarse earthenware, which assume a red colour on firing, because of the oxide of iron present in the C. Brick-C. should contain much sand and little potash, soda, lime, or iron; indeed, any C. that is to be exposed to a high temperature should be almost free from the alkaline earths, as they give fusibility. C. constitutes an important part of all fertile soils, and possesses the highest agricultural value on account of its absorbent action on moisture, ammonia, and other fertilising agents. A C. soil is difficult to work; still the excellence and luxuriance of the crops which it produces amply repays the extra labour entailed.

Clay, Cassius Marcellus, a Southern abolitionist, was born in Kentucky, 19th October 1810, and graduated at Yale College in 1832. He early entered the field of politics, and gained much *éclat* by taking what in his state was the unpopular side of 'abolitionism,' and displaying in his speeches considerable audacity. He supported Mr Lincoln, and was sent as U.S. minister to Russia in 1862, where he remained. Since his return, he has not taken a prominent part in politics. A volume of his *Speeches* was published in 1848. C. has more than once permitted himself to use language regarding England which all respectable Americans would probably reprobate.

Clay, Henry, an eloquent American orator and statesman, was born in Hanover county, Virginia, April 12, 1777. He studied law, was licensed in 1797, and commenced in Lexington, Kentucky, where he soon gained a lucrative practice. In 1806 he was elected to Congress, and in 1811 was chosen Speaker of the House of Representatives. C. strongly repudiated the British claim to 'right of search' at sea, advocated the war of 1812, and was sent to Ghent in 1814 as U.S. commissioner to sign the treaty of peace. On his return he espoused the cause of South American independence, and also introduced what he called 'the American system,' which was a heavy protective tariff to promote home manufactures. C. laboured for the compromises with slavery in 1820 and 1850, and was three times a candidate for the presidency, but was defeated each time; yet he was undoubtedly one of the most popular leaders that America has ever had. He died at Washington, June 29, 1852. See Colton's *H. C., Life, Letters, and Speeches* (1857).

Claymore' (Gael. *claidheamh-mor;* lit. 'big sword'), a formidable weapon used by the Scottish Highlander. It was double-edged and two-handed; the length of its blade was sometimes nearly 4 feet.

Clazom'enæ, one of the cities of Ionia, on the S. side of the Hermæan Gulf (mod. Bay of Smyrna), at first built on the mainland, from which the people, through fear of the Persians, passed over to an adjacent island, which Alexander made a peninsula by uniting it to the mainland. Its site is now occupied by Vurla.

Clean'thes, a Greek philosopher, born at Assos, in the Troad, about 300 B.C., came to Athens in his manhood, and received instruction from Zeno for fifteen years. Poverty obliged him to draw water for a gardener during the night, and to write his lecture-notes on bits of potsherd and ox-bones. He nevertheless refused the proffered gift of the Areopagus (10 *minæ*). Slow in apprehension, he was at first called the Ass, but latterly the second Hercules. In 263 C. succeeded Zeno in the Stoa. There he taught the immortality of the soul, varying in intensity with the soul's life here. He repeated that man's duty was to live harmoniously with universal nature, *i.e.*, with the Divine Reason, which impresses laws upon passive matter. In metaphysics he maintained that in sense-perception the soul was affected as wax by a seal, but that the soul could distinguish the cataleptic phantasm, or true perception, from the acataleptic, or perception produced by dreams or insanity. His morality resulted in the starvation of all bodily desires, and his death proves his consistent faith, for it was either occasioned or accelerated by voluntary abstinence from food. Only a few fragments of C.'s works (of which Diogenes Laertius gives a list) have reached us—the finest being a *Hymn to Zeus* preserved in Stobæus.

Clear'ance, a term of the mercantile marine, denoting the custom-house or emigration-office licence for a ship to leave the port. All dues must be paid and all proper formalities observed before the C. can be got. A foreign vessel must be certified by the consul of the nation to which she belongs. See BILL OF LADING, CHARTER-PARTY.

Clear, Cape, on an island of the same name, forming part of County Cork, is the extremest S.W. point of Ireland. It is a lofty headland, 400 feet high, with a lighthouse and revolving light 455 feet above the sea.

Clear Days, an English law-term. In a lawsuit there are several steps in the proceedings which must be taken within a specified number of C. D. In reckoning these, the day on which the process is served and the day of hearing are not counted.

Clear'ing-House, in banking. Formerly the London bankers used to exchange cheques and settle amounts by a daily meeting of their clerks at one of the banks. But in 1775 a building, now called the C.-H., in Lombard Street, was acquired for the purpose. The arrangements are directed by a committee appointed by the banks. There are two paid managers or inspectors. During the day each house transmits the cheques and bills which it receives on the others, and keeps a note of the obligations coming against itself. Accounts are closed at four o'clock. Three-quarters of an hour is allowed for the banks to consider drafts upon it, and to decide whether they are to be honoured. Meanwhile the bills and cheques have been classified at the C.-H., and by half-past five accounts are adjusted, each bank paying or receiving the balance due by or to it. The payment is made by what is called a *Transfer Ticket*. This is a draft on the Bank of England signed by the bank whose account is settled by it and by an inspector of the C.-H. When the balance is against the bank the ticket is white, when against the C.-H. a green one is used. Thus transactions involving millions of pounds are settled without the intervention of a sovereign or a bank-note.

Clearing-House, The Railway.—This is an ingeniously devised institution for regulating the complicated accounting between the railways of Great Britain. Plainly the equitable adjustment of the expense and receipts of the *through* traffic must be a work of much labour and difficulty; nevertheless, by means of the staff of the C.-H., these tangled accounts are, month by month, unravelled and a balance struck. The office of the institution is in London, near the Euston Station. It is regulated by the 'Railway Clearing Act, 1850.' There is a similar institution in Ireland, having its office in Dublin. The expenses are defrayed rateably by the companies forming the association; of these, there were ninety-three in 1873. Officials of the C.-H. attend at each railway junction. They note the number of each carriage, van, waggon, or other vehicle which quits the original line. They also take a note of damaged stock. They make weekly returns to headquarters; these, with the collected passenger tickets, supply dates, which form the basis of the accounting. A balance due by one railway to another on passenger or stock traffic, must be paid within five days after the date of the C.-H. advice. Balances arising otherwise are payable within twenty-three days. Interest on over-due balances is charged at the rate of 7 per cent. per annum. Cases of disputed liability are considered and decided by committees of duly qualified men.

Clearing-Nut, an Indian name for the nut of *Strychnos potatorum*, a plant belonging to the same genus as that which yields *Nux Vomica* (q. v.). It is commonly sold in the Indian bazaars for the purpose of clearing water. If the seeds are rubbed on the inside of a vessel, muddy water put into it soon becomes clear by the deposition of impurities. Their efficacy is due 'to the presence of albumen and casein, which act as fining agents, in a similar manner to analogous agents employed for beer and wine.' The seeds are also emetic, but devoid of poisonous qualities, while the pulp of the fruit is eatable. It may be also noted that this is also true of *S. Pseudo-Quina*, and that birds eat greedily of that of *S. Nux Vomica*, which yields strychnine (Roxburgh).

Clear-Story, or **Clere-Story**, is the name given to the upper story or wall of a church immediately above the roof of the side aisle, pierced with windows, through which light is admitted to the centre aisle. It is so called in opposition to the blind story or Triforium, which, opening from the centre aisle into the space covered in by the roof of the side aisle, is consequently blind or dark. C.-S. windows are to be found in the Basilicas, and in all the various periods of Gothic architecture; and till about the middle of the 14th c. they were generally small in size and wide apart. About this time they began to be greatly enlarged, in many instances the masonry being reduced to a minimum consistent with strength. A narrow passage is often found in the thickness of the wall at the C.-S., level, and leading all round the church, thus giving access to close the shutters or louvers when required, as well as for repairs.

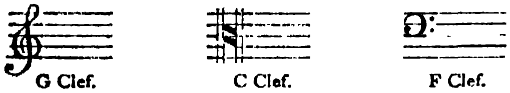
Cleats, on ship-board, are projecting pieces of wood or iron, formed so that ropes may be secured to them.

Cleav'age, the name given in geological science to that condition or state of rock-particles, in virtue of which a rock can be readily split up into thin *laminæ* or plates, independently of any original lamination (or division into layers) which may have existed in the rocks. C.—'transverse' or 'slaty C.,' as it is termed—is best seen in *clay-slates*, but also occurs in sandstones and limestones, and in some trap rocks. It is best seen in purely-grained rocks, and splits such into very thin plates, lying smooth and parallel to each other. Of the origin of C., theories of *compression* are those most in vogue to explain the phenomena. Tyndall has shown that, if clay or white wax be subjected to pressure, allowing of expansion in directions at right angles to the pressure, slaty C. may be thus produced in these substances. This 'C.' of slate gives to that deposit valuable features in rendering it useful, in the form of thin plates, for many industrial purposes. C. tends to alter or destroy the presence of fossils in rocks, and its action is therefore to be taken into important account by the palæontologist.

Cleav'ers, or **Cliv'ers** (*Galium Aparine*), a species of Bedstraw (q. v.) very common in hedgerows and similar situations in

Britain, &c., so called from clinging to clothing coming in contact with the leaves, which are covered with reflexed stiff-pointed hairs or bristles. At one time it was believed to be a specific in many cutaneous diseases, but its efficacy in these affections has not yet been fully determined.

Clef, in music, a sign placed upon the staff to indicate the absolute pitch of all the notes upon one particular line or space, and thus to fix indirectly the absolute pitch of all the other notes upon the same staff. Clefs are used, the forms of which are shown below, to indicate the positions of G, C, and F respectively in the staff.



G Clef. C Clef. F Clef.

The G (or soprano) C. is in modern music invariably placed, as in the figure, upon the second line; the C C. is generally, but not always, upon the middle line, and the F (or bass) C., always upon the fourth line.

Cleg, a popular name applied to some Diptera or Flies belonging to the family *Tabanidæ*, or to that of the Breeze and Gad-flies. The *Chrysops cæcutiens* is the English 'C.,' which averages one-third of an inch in length, and is coloured black with yellow abdominal markings. The eyes are large. The 'C.' of Scotland, a smaller species, is the *Hæmatopota pluvialis*, or English 'Stout.' These flies possess a mouth adapted for piercing the skin of animals, and annoy horses, cattle, and domestic animals in summer especially, whilst they also attack man.

Clem'atis, a large genus of twining shrubs belonging to the natural order *Ranunculaceæ*, and easily distinguished by the long feathery style attached to their one-seeded carpels. There is only one English species, *C. vitalba*, the Virgin's Bower, the Traveller's Joy, or the Old Man's Beard. *C. flammula* is a sweet-scented species, a native of Southern Europe and Northern Africa, now common in our gardens. *C. florida* is accounted one of the most beautiful of all the species, and is that which remains longest in bloom; but *C. azurea*, *C. lanuginosa* (a fine blue-flowered Japanese species), and *C. tubulosa*, in addition to numerous hybrids, such as *C. Jackmanni*, must also be classed among the favourite cultivated species of C.

Clem'ens, Samuel Langhorne, better known by his *nom-de-plume* of 'Mark Twain,' an American humourist, was born in Florida, Missouri, U.S., November 30, 1835. He worked first as a printer, but afterwards, in Nevada, as a journalist, when he developed a fresh phase of American humour, extravagant, surprising, and grotesque. In 1867 C. published *The Jumping Frog*, and in 1869, as the results of his travels in Egypt and the Holy Land, *The Innocents Abroad*, an amusing travesty of lofty and serious things—*e.g.*, in his weeping over the tomb of Adam, his blood-relation, in the Church of the Holy Sepulchre. His other works are his *Autobiography* (1871), *Roughing It* (1872), *The Gilded Age* (1873), by C. and Warner. A collection of his choice humorous works was published in London (1875).

Clemens, Titus Flavius, surnamed *Alexandrinus*, in distinction from *C. Romanus*, a philosopher and theologian of the 2d and 3d centuries, was born either at Alexandria or Athens. Versed in all the science of the Greeks, at the age of manhood he convinced himself, by free inquiry, of the truth of Christianity. He now travelled over Greece, Italy, Egypt, Palestine, and the East in search of instruction from the great exponents of the new religion; but the only one whom he expressly names is Pantænus, the catechist or head of the Christian school at Alexandria. C. finally settled there, succeeded Pantænus as catechist and bishop (? 180), and died between 212 and 220. His peculiarity was that he did not cast aside his philosophy when he became a Christian, but held the eclectic system afterwards called Neo-Platonism, and always sought to illustrate his teaching by the light which could be thrown on the doctrines of the Church from heathen antiquities. C.'s three great works are *The Exhortation to the Heathen*, *The Instructor* or *Pædagogus*, and the *Stromata* or *Miscellanies*. The object of the first is to win over heathens to Christianity; of the second, to build up converts in righteousness; of the third, to furnish the materials for a true gnosis on the basis of Christian faith. See Clarke's *Ante-Nicene Library* (1867).

Clemens, surnamed *Romanus*, and, according to the ancient Church, the fellow-labourer of Paul (mentioned Phil. iv. 3), was one of the earliest Bishops of Rome, and is one of the 'Apostolic Fathers' (q. v.). His (First) Epistle to the Corinthians is of dogmatic importance in relation to the doctrine of the Resurrection. The other writings attributed to him, a Second Epistle to the Corinthians, Two Letters on Virginity, the Apostolic Constitutions, the Apostolic Canons, and the Clementines, are unquestionably spurious. The two Epistles of C. to the Corinthians were found at the end of the *Codex Alexandrinus* (see ALEXANDRIAN CODEX). Both were defective; a leaf had been torn out of the first, and the end of the second was wanting. No other MS. of these was known to exist until Philotheos Bryennios, Metropolitan of Serræ in Macedonia, discovered one in the library of the Holy Sepulchre at Constantinople, and published an edition of them in 1875. His MS. contains both of the Epistles in a complete form.

Clem'ent is the name of seventeen Popes, of whom the most notable are—**Clement VII.** (Giulio de Medici), who, as cardinal under Popes Leo X. and Adrian VI., had devoted himself to the Spanish cause in Naples and Milan. On his election as Pope in 1523, however, C. attempted to organise a national Italian party against Karl V., whose increasing power he dreaded. This led to the capture of Rome in 1527 by 'Bourbon's black banditti.' The growth of the Reformation after the Diet of Spires and the peace of Kadan was equally alarming to C., who sought the help of François I. and Henry VIII. He died in 1534, having by a secular policy reduced the influence of the Church to the lowest point. He founded the 'Monte della Fede,' or system of public credit, in which the creditors were associated in the management (*dogana*).—**Clement VIII.** (Cardinal Ippolito Aldobrandini) was elected 20th January 1592. Although belonging to the Ecclesiastico-Spanish party, he is chiefly remembered in connection with the return of Henri IV. to the Church (which enabled C. to wrest Ferrara from Cesare d'Este), the readmission of the Jesuits to France, and the peace of Vervins. He died in 1605.—**Clement XI.** (Cardinal Giovan Francesco Albani), was elected 16th November 1700. At first a warm supporter of the French claim to the Spanish succession, he was compelled after the victories of Marlborough to acknowledge Charles III. as the Catholic King. By the peace of Utrecht, Sicily and Sardinia, which C. regarded as his own fief, were bestowed on the House of Savoy, with whom he soon had a bitter dispute as to *Di Monarchi* (a Sicilian tribunal which encroached on Papal privileges). In 1713 C. published the Bull 'Unigenitus,' condemning the 101 propositions in Father Quesnel's book; this irritated the French Jansenists and Nationalist clergy against Rome. C. was also connected with the great Jesuit missionary movement in China, the Stuart rebellion of 1715, and the expedition of Prince Eugene against the Turks in 1716. He died in March 1721.—**Clement XII.** (1758–69). His rule is marked by the suppression of the Jesuits by Choiseul in France, Wall and Squillace in Spain, Fanuci in Naples, and Carvalho in Portugal. C. refused to abolish the order, and thus lost nearly all influence in Europe.—**Clement XIV.** (Cardinal Giovanni Vincenzo Antonio Ganganelli), was elected through Bourbon influence, 19th May 1769. He was of a mild, religious disposition, and anxious to establish peace in the Church. The Curia was then divided into the *Zelanti*, or upholders of the ancient privileges of the Church, and the *Regulisti*, or party of concession to the crowned heads. C. belonged to the latter. He discontinued the reading of the Bull *In Cœna Domini*, allowed the claims of Sardinia and Parma, and on 21st July 1773 abolished 'the Society of Jesus, its offices, houses, and institutions.' This act greatly assisted the Cismontane movement in Austria under Maria Theresa and Joseph II. C. died 22d September 1774.

Clemen'ti, Mu'zio, one of the earliest composers and performers of the modern pianoforte school, was born at Rome in 1752. He came to England as a boy, and for some time devoted himself to composing and teaching, but later on took up a music-publishing and pianoforte-making business, which he carried on successfully until his death, 10th March 1832. Most of his compositions (over 600 in number) are for the pianoforte.

Two of his works are considered authorities, *Practical Harmony* (4 vols. 1811–15), and the *Gradus ad Parnassum* (3 vols.).

Cleome, a genus of plants of the order *Capparidaceæ*, found in the tropical regions of America. Most of the species are annuals —one, *C. pungens*, attaining the height of 4 or 5 feet. Among other species may be mentioned *C. spinosa* and *C. speciossima*, one of the handsomest of the genus, several of which are cultivated for the sake of their beautiful flowers.

Cleome'des, an ancient Greek astronomer, of whose life absolutely nothing is known. His treatise, *The Circular Theory of the Heavenly Bodies*, is a work in which truth is strangely mixed up with error. He held that the earth was spherical, and was a mere point in relation to the stellar sphere; that the moon rotated on its axis; that the fixed stars were as large, if not larger than the sun, and he also discussed the refraction of light. The two latest editions of this work are by Bake (Leyd. 1820) and Schmidt (Leips. 1832).

Cle'on, a famous popular leader of the Athenians, the son of Cleænetus, was brought up as a tanner. Even before the death of Pericles, however, he had achieved success in the more profitable trade of demagogue. In 427 B.C. he urged the Athenians to put to death all the adult males in Mitylene (about 6000), and to sell the women and children into slavery, and he so far attained his object. In 425 he succeeded, along with Demosthenes, in taking captive the Spartans who garrisoned the island of Sphacteria. In 422 he took the field against Brasidas, the famous Spartan general, in Chalcidice. He captured Torone, but in an attack on Amphipolis, the Athenians were defeated, and C. fled and fell. Thucydides and Aristophanes represent C. as the impersonation of violence, dishonesty, rapacity, and venality. Apart from the inconsistencies involved in this representation of his character, Grote forcibly urges in proof of its extravagance, that C. had proposed the banishment of Thucydides, and that Aristophanes himself admits that he had a grudge against him.

Cleopat'ra, the beautiful and accomplished, but ambitious and voluptuous Queen of Egypt, the last of the dynasty of the Ptolemies, was born B.C. 69. By the will of her father, Ptolemy Auletes, C. succeeded to the kingdom, along with her brother Ptolemy, but was expelled by him, B.C. 49. She was, however, reinstated by Cæsar, who was conquered by her charms, and to whom she bore a son, named Cæsarion, afterwards put to death by Augustus. In the war that ensued, young Ptolemy was killed, but a younger brother of the same name, whom she eventually poisoned, was associated with her in the government. On Cæsar's return to Rome, C. followed him, and there lived in his house, and received from him many gifts. On his death; B.C. 44, she fled to Egypt, and materially aided the triumvirate against the murderers of Cæsar. After the battle of Philippi, Antony summoned her to attend him at Tarsus, and her beauty so completely bewitched the impetuous and passionate Roman, that he remained her slave through life, and returned to her even after his marriage with Octavia, sister of Augustus. The infatuation of Antony in paying extravagant honours to C., and in assigning extensive territories to her and her children, so incensed and disgusted the Romans, that they declared war against her, and the great victory of Actium, B.C. 31, decided the fate of Antony and C. Augustus pursued them to Alexandria, where Antony, misled by a false rumour of C.'s death, fell on his sword. C., after vainly endeavouring to captivate Augustus, put an end to her life by the poison of an asp, B.C. 30.

Clepsyd'ra (Gr. *klepto*, 'I conceal,' and *hydor*, 'water'), a kind of organ, used by the ancient Greeks, and described by Athenæus. The air was forced through the pipes by the action of water, giving rise to a soft musical sound.

Clepsydra, also an instrument used, before the discovery of the pendulum, for measuring intervals of time by means of the flow of water through a small orifice. The rate of flow varied with the temperature, barometric pressure, and generally with the height of the column of water above the orifice. This last source of variation is of the greatest importance, and is sometimes got rid of by keeping the vessel always full. In order that the rate may be the same at whatever height the surface of the fluid is, the vessel must be the surface of revolution of a cubical parabola.

Clerc, Jean le, a French theologian, was born at Geneva, 19th March 1657. Having adopted the tenets of the Arminians, he settled in Holland in 1683, joined the Remonstrants in Amsterdam, and being interdicted by the Walloon ministers from preaching, was elected Professor of Hebrew, Philosophy, Classical Literature, and afterwards of Church History in the Arminian College there, a post which he held till his death, 8th January 1736. Besides an extraordinary number of other works, he wrote commentaries on the whole of the books of the Old Testament, of which those on the historical books, especially the Pentateuch, have a permanent value. They may be regarded as the early dawn of the Rationalistic movement. C. is perhaps most likely to be remembered by his *Bibliothèque Universelle et Historique* (25 vols. 1686–93); his *Bibliothèque Choisie* (1703–13); and his *Bibliothèque Ancienne et Moderne* (1714–27). See *J. Clerici Vita et Opera ad Annum* 1711 (Amst. 1711); MM. Haag, *La France Protestante* (Par. 1847–59).

Clergy (Gr. *klērikoi*, from *klēros*, 'a lot'), were so called, according to an early Christian writer, 'either because they are the heritage of the Lord, or because the Lord is their heritage.' The name was applied first to the three orders of bishops, priests, and deacons, but in the 3d c. also to the inferior orders which were then introduced—sub-deacons, readers, acolytes, exorcists, doorkeepers. In the New Testament all Christians are God's heritage (*klēros*, 1 Pet. v. 3). The idea of a sacerdotal caste, a class of persons peculiarly consecrated to God, employed on the affairs of religion to the exclusion of all worldly concerns, and to be supported by the laity, was imported from the Jewish Church with its priests and Levites. Many privileges were claimed by and conceded to the C., especially during the middle ages. (See BENEFIT OF CLERGY.) In the Church of Rome, 'secular' C. are those whose duty lies in the outer world, *e.g.*, the parish priests, and those who do not belong to any religious order, like the 'regular' C., so called from Lat. *regula*, a monastic 'rule.'

Clerical Error is, in law, an error accidentally committed in the transcription of a deed or other instrument. Where the error is not *in substantialibus*, it is not fatal to validity.

Clerk, is strictly a person in holy orders; but the term is now generally applied to any one whose chief occupation is writing as a subordinate. In English law, a C. is regarded as a superior servant.

Clerk, Parish.—An official of the Church of England. He leads the responses, and otherwise assists in the service of public worship. In cathedrals and collegiate churches there are several clerks, sometimes forming a corporate body.

Clerk of the Assize is he that records all things judicially done by the judges of the circuits.

Clerk of the Crown is an officer in Chancery, whose function it is to attend on the Lord Chancellor. He makes out writs for the election of members of Parliament. All returns are made to him. These he cannot alter, except by order of the House, under a penalty of £500—*toties quoties.*

Clerk of the Parliament Rolls is the name of an officer in each House of Parliament, who records the proceedings, and engrosses them on rolls for preservation.

Clerk of the Peace is an officer belonging to the Quarter Sessions (q. v.), whose duty it is to read the indictments, enrol the proceedings, draw the processes, and transact other business incident to the Quarter Sessions.

Clerk of Session.—The clerks of the Court of Session (see COURT OF SESSION) in Scotland are so called. There are four principal clerks and five deputies. Each principal and depute has an assistant C. The duty of the principal clerks is to attend upon and assist the Judges of the Inner House. The deputies attend upon and assist the Lords Ordinary. The principal clerks and deputies have no fees. They are paid by fixed salary. The former have £1000 a year each, the latter £550. Each assistant C. has £475 a year, and no fees.

Clerks of the Bill Chamber.—There is one C. of the Bill Chamber (see BILL CHAMBER) of the Court of Session. He is responsible for the reputed solvency of cautioners (see CAUTIONER, CAUTIONARY), and for consigned money. There is also an assistant C. and two ordinary clerks. They are all paid by salary.

Clerk to the Court of Teinds.—There is one principal and one depute C. of the Teind Court in Scotland. See TEIND COURT.

Clerk of Justiciary.—There is one principal, one depute, and one assistant C. of the Justiciary Court of Scotland. See JUSTICIARY COURT.

Clerks to the Signet. See WRITER TO THE SIGNET.

Every court of law has necessarily a C., whose duty it is to write out the judgments and extract the decrees of the court.

Clerk, John, of Eldin, Mid-Lothian, Scotland, the sixth son of Sir John Clerk of Penicuik, obtained for himself, in 1779, a considerable reputation by the invention of the modern naval tactics of 'breaking the enemy's line'—an invention all the more remarkable that C. was not in any sense a naval man. This invention, being communicated to various naval officers, was adopted by Admiral Lord Rodney, April 12, 1782, when he obtained his great victory over De Grasse in the W. Indies, and subsequently the manœuvre was systematically employed by the other great British admirals, such as Howe and Nelson. C. published various editions of his *Essay on Naval Tactics*—the latest and most complete in 1804. An unsuccessful attempt was made by General Sir Howard Douglas, son of the captain who, under Rodney, tried the manœuvre, to prove that it was suggested to his father, not by C., but merely by the chance position of the British and French fleets. C. died May 10, 1812.—His son, **John Clerk,** born in 1757, was educated for the law, passed advocate in 1785, and soon obtained the largest practice of his time. He was raised to the bench in 1823, taking the title of Lord Eldin. C. died in 1832. He is still remembered in Edinburgh society for his social qualities and his quaint, coarse humour.

Cler'mont (the *Clarus Mons* or *Clarimontium* of the middle ages), the name of several towns in France, the most important of which is **C.-Ferrand** (the *Augustonemetum* of Ptolemy), the capital of the department of Puy-de-Dôme, on an affluent of the Allier, and connected with Paris and Lyon by railway. It is beautifully situated at the foot of a range of extinct volcanoes, surmounted by the Puy-de-Dôme. The principal buildings are the cathedral (1248), the Romanesque church of Nôtre Dame du Port, said to date from 853, the Hôtel de Ville, Hôtel Dieu, linen-market, grain-market, the hospital, the theatre, and Palace of Justice. C. has a valuable public library, museums of natural history and antiquities, and a college. It has iron-foundries and machine-works, considerable traffic in grain, wine, oil, and cheese, and a large transit trade. In the suburb of St Alyre is a fine mineral spring. Pop. (1872) 29,070. Pope Urban II. presided here in 1095 at the council in which the first Crusade was resolved on. Pascal was a native of C., and a statue has been erected in his honour. Other distinguished natives were Gregory of Tours and General Desaix.—**C.-l'Hérault,** a town in the department of Hérault, France, on an affluent of the Lergue, 23 miles N. of Agde by railway. It has manufactures of woollens, linens, verdigris, candles, &c., and an active trade in cattle and millstones. Pop. (1872) 5458.

Cleroden'dron, a genus of plants of the natural order *Verbenaceæ*, one of which, *C. Thomsonæ*, of W. Africa, is cultivated for the beauty of its flowers. *C. infortunatum*, an Indian species, is bitter and sub-astringent, and possesses antiperiodic and tonic properties. These plants are chiefly natives of tropical Asia, but they are also found in Africa and America.

Cler'us, a Beetle genus, included in the Pentamerous section of the *Coleoptera*, and in the family *Serricornes*. *C. apiarus* is common on the continent of Europe, and is found in a larval state on the young of the hive-bee. It averages about half an inch in length, and is of green colour, the *elytræ* or wing-covers being red with purple markings. The adult beetles inhabit flowers, and particularly umbelliferous plants.

Cleve'land ('the Forest City'), in Ohio, U.S., on Lake Erie, at the mouth of the Cuyahoga river. It stands on a bluff 80 feet above the lake, and is beautiful and well laid out; the streets adorned with shady trees and fine public buildings. C. has a good harbour, and carries on an extensive trade with the lakes and with the mineral fields of Pennsylvania, especially in coal, iron, and copper. It has also communication with the Ohio river by the Ohio Canal, besides having railways to all parts of the country. Shipbuilding, copper-smelting, iron-rolling, and oil-refining are large and important industries. The city is supplied with water from Lake Erie by works which cost $400,000. In the year ending June 30, 1869, the number of vessels cleared was 493, tonnage 60,486; vessels entered 554, tonnage 87,523. The taxable value of property in 1875 was $73,305,277. C. was founded in 1796, but in 1830 was only a village of 1100 inhabitants. In 1850 its population had risen to 17,034; in 1870 to 92,829; and in 1875 to 157,000.

Cleves, the French spelling of the German KLEVE (q. v.).

Clew, in ships, the lower corner of a sail. *C.-lines* are the ropes by which the C. is worked.

Clew Bay, an inlet on the coast of Mayo county, in the W. of Ireland, 15 miles deep, with an average breadth of 8 miles, containing numerous indentations which form excellent harbours, and having at its upper end an archipelago of 300 fertile islets. It has valuable fishings. Clare Island lies at the mouth of the bay.

Cli'ché (Fr.), a process by which a sharp impression is obtained from a medal die. A quantity of semi-fused metallic alloy is placed in a box under the die, which then descends forcibly upon it, causing the metal to take the finest lines of the die, which from its coldness immediately solidifies the whole impression. 'C.' is also applied to the formation of stereotype plates.

Cli'chy, a town in the department of the Seine, France, on a plain near the right bank of the Seine, and 4 miles N.W. of Paris, of which it forms a suburb. It has manufactures of white lead, chemical products, glue, and varnish. The parish church was erected in 1612 by Vincent de Paul, who was then curate of C. Pop. (1872) 14,366.

Click-Beetles, a popular name given to beetles belonging to the family *Elateridæ*, the larvæ of some species of which are the destructive 'Wire-Worms' (q. v.) of the agriculturist. The name 'C. B.' is derived from the noise they make on regaining their natural position after being laid on their backs; a spine arising from the front of the body, by means of a spring-action, enabling these insects to execute leaps, and to make the peculiar sound referred to. One familiar species of C. B. is the *Elater* or *Agriotes lineatus*—the striped species—found in hedges in summer, the larva of which is destructive to turnips and other plants.

Cli'ent. See AGENT.

Cliffor'tia, a genus of S. African bushes, belonging to the natural order *Rosaceæ*. The holly-like leaves of *C. illicifolia* are used by the Cape Boers (farmers) as an emollient and expectorant in coughs. The name *Cliffortiaceæ* is sometimes given to the *Rosaceæ* proper (including *Sanguisorbeæ*, as distinguished from *Amygdaleæ* and *Pomaceæ*).

Clif'ton, a suburb, and part of the parliamentary and municipal borough of Bristol, is built on the sides and summit of lofty cliffs (hence its name) of carboniferous limestone overhanging the Avon, and rising in St Vincent's Rocks to the height of 308 feet. The river, which is here navigable, is spanned by a suspension bridge 702 feet in length, and having an elevation above low water of 275 feet. Its mineral springs and the beauty of its scenery made it, as early as the beginning of the 18th c., a favourite watering-place, which it continues to be, though its spa has declined in favour. C. has some fine public buildings, is a favourite residence of wealthy Bristowans, and has a proprietary grammar-school, *C. College*, which at present ranks among the foremost educational institutions in England. Traces of a large Roman camp are visible on C. Down.

Climac'teric Year, a period of human life superstitiously supposed to be a turning-point in health or fortune, and thought to recur at the years produced by multiplying 7 into the odd numbers 1, 3, 5, 7, 9—to which some added the 81st year. The 63d year was called the *grand C.*, and was supposed to be well-nigh impassable by most men, being the product of the two largest odd numbers, 7 and 9.

Cli'mate, in meteorology, is the sum of all the atmospheric variations at the locality under consideration, viewed especially in their relation to and effect upon animal and vegetable life. It depends first and chiefly upon the latitude and the mean annual temperature of the latitude, receiving from this consideration its usual subdivision into tropical, sub-tropical, temperate, and polar climates. Now, as a rule, the higher the latitude the lower the temperature, because the sun's rays, striking more obliquely on the surface, supply the same heat to a larger area, and therefore less to each unit of area. There are many conditions, however, which go to modify this general fact, but most, if not all of these, are due to the particular configuration of the land and sea. Thus, in the southern hemisphere, the *isothermal* lines, or lines drawn through localities whose mean annual temperatures are the same, approximate more or less to the parallels of latitude having their greatest contortions where the presence of land interferes most with the homogeneity of the surface. In the northern hemisphere, again, where the configuration of land and sea is much more irregular, the isotherms are extremely contorted. For instance, the isotherm representing a mean annual temperature of 0° C. corresponds, S. of the equator, almost exactly with the 60th parallel of latitude, suffering a slight disturbance just S. of Cape Horn; while, N. of the equator, it is traceable from the Aleutian Islands E. and S.E. over the American continent to the southerly extremity of the Labrador coast, then N.E. to Cape Farewell and to the North Cape, touching the N.W. of Iceland in its passage, then doubling southwards to the northern end of the Baltic, continuing E. and S.E. through the northern coasts of Russia and the southern districts of Siberia, undergoing a slightly northward flexure as it leaves Japan, and finally cutting through the S. of Kamchatka and across the N. Pacific.

All influences which are commonly enumerated as modifying C. may be said to depend on these four fundamental conditions: (1) the solar heat, (2) the earth's annual and diurnal motions, (3) the configuration of land and water, and (4) the character (physical and geological) of the country. It may be desirable to consider briefly the more important of these influences. The presence of aqueous vapour especially has a marked effect; for on account of its high specific heat, it tends to lower the temperature in summer and raise it in winter, thus equalising the C. Ocean currents, originating in the equatorial regions, and flowing towards higher latitudes, have the same equalising effect, as is well shown in the case of N.W. Europe, whose C., under the ameliorating action of the Gulf Stream, is much more equable than that of the corresponding latitudes on the American continent. In this connection also may be mentioned the similar influence of vegetation, and more particularly of forests. The elevation above the sea-level is another important element in the adjustment of the C.—places situated in equatorial regions (*e.g.*, Quito, the capital of Ecuador, in S. America) enjoying a fine temperate, or even, as shown by the snow-capped peaks of the Andes and Himalayas, a veritable polar C. The nature of the soil too has a very significant influence—a damp clayey soil being very much colder, because a much better conductor for heat, than a dry, sandy one. By more thorough drainage in various parts of England the mean annual temperature has been raised by several degrees, and statistics show a corresponding decrease in the death-rate arising from consumption, ague, rheumatism, and other maladies depending chiefly upon damp for their prevalence. Again, the slope and position of the land with reference to the sun and surrounding hills, and the consequent protection from certain winds, must also be taken into account. For instance, Bridge of Allan, in Scotland, owes its suitability as a resort for invalids to its protection from the east wind, and Torquay, in England, to its southern exposure. The more equable a C. is, the better, as a rule, is it suited for life; and the character of a C. is perhaps best judged of from a knowledge of the fauna and flora which flourish under its influence. From fossil testimony, we gather that in former geological epochs the C. of Europe was very different from what it is now. The rocks of the Tertiary formations indicate a sub-tropical development, even as far N. as Iceland; while the absence of organic remains in certain Post-tertiary deposits, and the occurrence of ice-markings, are unmistakable signs that Britain and France were then visited with a C. as bleak and polar as that of Greenland at the present day. In all works of any consequence on Physical Geography, Meteorology, and Geology, the conditions on which C. depends are fully discussed, and to these the reader is referred, as well as to articles GLACIERS, RAIN, SEASONS, &c., which, as parts of the Science of Meteorology, all bear to a greater or less extent upon this subject.

Cli'max (Gr. 'a ladder,' from *klino*, 'I bend,' because a ladder leans aslant), a figure in rhetoric denoting that artifice by which objects or propositions are, for the sake of impressiveness, presented to the mind of the hearer or reader in a gradually ascending series from weaker to stronger. The corresponding Latin term is *gradatio*. The converse figure is *anti-C.*, in which the ideas gradually or suddenly sink. It forms the main element in what is known as *Bathos* (q. v.).

Climb'ing Perch (*Anabas scandens*), the name given to a peculiar species of Teleostean fishes belonging to the family *Anabatidæ*, inhabiting the Ganges and other fresh waters in the E. Indies, and which have the power of leaving the water for considerable periods, and of making their way on the land, supporting themselves on their stiff spiny fins. The dorsal fin is single and elongated. The upper pharyngeal bones are divided into a number of curious labyrinthine chambers, in which moisture can be retained, for the purpose of keeping the gills moist, and of enabling them to breathe in their overland journeys. They migrate overland from their pools, when these are being dried up, in search of a fresh water supply. The name 'C. P.' has been given to this species of fish from the assertion that it is able to climb trees—the Tamul name of the creature being *Paneiri* or 'Climber of trees.' But this latter statement has not been satisfactorily determined, although there is no doubt of its land-loving habits, and of its ability to live out of water for days together. Another species allied to the C. P. is the Gourami of China. *A. scandens* is on the average 6 inches in length. These fishes are allied to the *Mugilidæ* or Mullets.

Climbing Plants, or **Climbers**. Some plants have such weak stems that, in order to rise from the ground, they must twine round other plants, or seek support for the same purpose from other objects. They may be divided, according to the means by which they attach themselves to the objects around which they twine, into:—(1) Those which specially twine around a support; (2) those which ascend by the movement of the petiole or by the tops of their leaves; (3) those which ascend by true tendrils; (4) those which are furnished with hooks; and (5) those which are furnished with rootlets. Some twine round the support from right to left (*sinuirorsal*), as in the case of the hop and honeysuckle; while in others, as in the case of the Chinese yam, the haricot bean, the great hedge bearbine (*Calystyia sepium*), &c., the twisting is from left to right (*dextrorsal*). The first form of twining is expressed in systematic works by the sign ☾, the latter by the sign ☽. Since the observations of Darwin, Unger, and others have called attention to the remarkable phenomena displayed by C. P., facts have been noted in regard to them which would almost incline us to designate some of these movements by a higher term than the mere phrase of 'vegetable irritability' would denote. For a full account of these curious 'instincts' of plants, see Darwin *On the Movements and Habits of C. P.* (1875); also *Journ. Linnean Society* (1865); and Brown's *Manual*, pp. 78, 79, 579-583.

Clin'ic Baptism (Gr. *klinikos*, from *klinē*, 'a couch'), in the early Church was private baptism administered to the sick. It was done by sprinkling instead of immersion, which was the regular mode when done in the Baptistery (q. v.).

Clink'er, a firm mass of ash and other matters which is apt to form upon the bars of a furnace in which strongly caking coal is burnt, and which in this case, by impeding the access of air to the fuel, impairs the combustion, and allows the bars to be destroyed.

Clinker or **Clincher-Built**, a term applied to boats so made that each strake of planking overlaps at its edge the strake next below it, like the slates of a roof. If the planking be made flush throughout, the boat is said to be *carvel-built*.

Clink'stone, or **Phon'olite**, a compact felspathic rock, greenish-grey in colour, and somewhat slaty in texture, which emits a clear metallic sound when struck with a hammer.

Clinom'eter, a small instrument used by surveyors for finding the slope of ground, and by geologists and others for finding the dip and strike of strata.

Clinton, De Witt, son of James Clinton, U.S. general, was born in Orange county, New York, March 2, 1769. After his admission to the bar, he was appointed secretary to his uncle, General George Clinton, and signalised himself as a political rival of Aaron Burr (q. v.). In 1802 he was appointed U.S. senator, and in 1803 Mayor of New York city. He was several times elected by the Democrats as Mayor of New York; and was Governor of the state from 1817 to 1822, and again in 1824. C. founded many valuable institutions; but his greatest work was the Erie Canal, connecting the waters of the lakes with the Hudson. He suggested the idea, and was mainly instrumental in carrying the work to its completion. He died February 11, 1828. See Hosack's *Life of C.* (1829), and Renwick's *Life of C.* (1840).

Clinton, Henry Fynes, a most distinguished classical scholar, was born in 1781, and educated at Westminster School, and Christ Church, Oxford. He inherited a large fortune, and for twenty years (1806–26) sat in Parliament for Aldborough. His great works are his *Fasti Hellenici* and *Fasti Romani*, containing respectively a most learned and exhaustive account of the chronology of ancient Greece and Rome. Both of these works were epitomised by the author. C. died at Welwyn, Hertfordshire, 24th October 1852.

Cli'o (Gr. *Kleiō*, the 'proclaimer' or 'fame-giver'), in the Greek mythology, is the daughter of Zeus and Mnemosyne. She is the Muse of History, and is represented in a sitting attitude, wearing a laurel wreath, holding in her left hand a half-open inscribed roll of parchment, and beside her an open cylindrical chest, containing more rolls of manuscript. Sometimes she has a parchment roll in one hand and a stylus in the other. See MUSES.

Clio, a genus of Pteropodous mollusca, the familiar species of which (*C. borealis*) is named 'Whales' Food,' from the fact that the cetaceans of the Arctic seas feed chiefly upon the immense myriads of these minute forms, which they draw into their mouths. *C. borealis* averages about three-quarters of an inch in length. No mantle or shell is developed. A distinct head exists, and the gills are rudimentary. The fins by which it swims are attached to the sides of the neck. The head bears numerous tentacles. *C. australis* is another species, found in the S. Seas. These animals are nocturnal in habits. See MOLLUSCA and PTEROPODA.

Clio.

Clipp'er, a term applied generally to any sailing ship built with the object of attaining considerable speed. Almost all passenger ships, and very many merchant vessels for long voyages come into this category. Under favourable conditions of wind and weather, a C. may sail as fast as an ordinary steamer.

Clith'eroe (formerly *Cliderhow*; perhaps the Cymric *Cleddwr*, 'the rock by the water,' to which has been added the Old Eng. *hou*, 'a hill'), a manufacturing town in the W. of Lancashire, on the Ribble, 28 miles N. of Manchester by railway. It lies at the base of Pendle Hill, which rises to a height of 1803 feet, and in the vicinity is the famous Pendle Forest, a favourite haunt of the Lancashire witches. C. has extensive cotton and print industries. Its castle (now a ruin) was founded by the Lacys in the 12th c. C. returns one member to Parliament. Pop. of parliamentary borough (1871) 11,786. About 5 miles W. of C. is situated the Jesuit College of Stonyhurst.

Clito'ria, a large genus of plants of the order *Leguminosæ* (sub-order *Papilionaceæ*), widely distributed over tropical Asia, Africa, and America, but more particularly in the latter country on the eastern side of the Andes. *C. Ternatea* is originally from the island of Ternata, one of the Moluccas, but now common in most tropical countries and in European conservatories. The corollas of the blue variety yield a dye which is used in Cochin-China, though it is not permanent, and in Amboyna it is employed to colour boiled rice. The root is powerfully purgative, and in India is administered to children to promote sickness and vomiting. The butterfly-pea (*C. Mariana*) is remarkable on account of its curious geographical distribution. It is found in the southern American states and Mexico, and in the Khassia Hills in India, without being found in any intermediate place.

Clit'oris is a small body found in the external female generative organs. It is the homologue of the penis in the male. About an inch and a half long, it is concealed in the mucous membrane. Unlike the penis, it is not perforated by a canal resembling the urethra, and it has no spongy structure resembling the *corpus spongiosum* of the penis. It is a rudimentary organ in the female, and has no known function except that it becomes excited and turgid during the sexual act.

Clive, Robert, Lord, born near Market Drayton, Shropshire, 29th September 1725, was the eldest son of a lawyer of very ancient family. After a turbulent and idle boyhood, he obtained, at the age of eighteen, a writership in the East India Company's service at Madras. C. was disgusted with mercantile employment, and twice attempted suicide while in the 'Writers' Buildings.' He obtained means of study in the Governor's library. When Labourdonnais, the French Governor of Mauritius, captured Madras, C. escaped to Fort St David and obtained an ensign's commission in the Company's army. Two years later the French Governor of Pondicherry, Dupleix, took advantage of the disputed claims to the viceroyalty of the Deccan and the nabobship of the Carnatic to get himself recognised as Governor of India from the river Kristna to Cape Comorin, and the war between the English and French Companies began. It was then that C., now a commissary with the rank of captain, raised the siege of Trichinopoly by the capture of Arcot (1751), the capital of the Carnatic, which he defended for fifty days with a handful of English and Sepoys against the large army of Rajah Sahib, who was not only compelled to raise the siege with great loss, but was twice defeated in open field. Under the command of Major Lawrence, C. added to these triumphs the storming of Covelong and Chingleput. He then married Miss Maskelyne and returned in 1752 to England, where he was a good deal lionised. In 1755 he was appointed by the Company Governor of Fort St George, with a commission as lieutenant-colonel in the British army. Surajah Dowlah, the viceroy in Bengal of the court of Delhi, had just, on a frivolous pretext, attacked the English factory of Fort William, the modern Calcutta. The tragedy of the Black Hole (q. v.) roused the Madras settlement to fury, and C. was despatched with 2400 men to Bengal. Hoogly and Calcutta rapidly fell, and, assisted by Admiral Watson, C. distrusting the proposals of the Rajah, stormed the French factory of Chandernagore. A conspiracy against Dowlah, which C. carried on with the grossest deceptions, was played out on the field of Plassey, where an army of 55,000 well-appointed natives was dispersed, only 500 being slain. C. accepted from the new viceroy, Meer Jaffier, between £200,000 and £300,000. Although the act was much blamed, he was appointed by the Company Governor of the Bengal settlements, which he greatly strengthened by the defeat at Patna of Shah Alum, a prince of the Delhi family, who was threatening Bengal. The grateful Meer Jaffier gave C. the rent paid by the Company for the Bengal settlements; but soon commenced an intrigue with the Dutch factory of Chinsurah. This was promptly suppressed by the defeat of the Dutch fleet on the Hoogly, and the imposition of conditions on the Dutch factory. In 1760 C. returned to England, where he received an Irish peerage, and entered the House of Commons, where he attached himself to the Grenville party. His chief interest was still in Indian affairs: he opposed Sullivan in the Court of Proprietors, and was obliged to take his former employers into Chancery, as they had rescinded Meer Jaffier's grant of rent. Frequent revolutions and the corrupt administration of the Company's servants led to C.'s return to Calcutta in May 1765. In less than two years he succeeded in abolishing the private trade of the Company servants, and in prohibiting the receipt of presents. Their salaries he supplemented out of the Government monopoly of salt. Equally important reforms were carried out in the army, although a conspiracy of 200 officers was formed to oppose them. C. also obtained from the court at Delhi a recognition of the Company's supremacy and right to collect the revenues in Bengal, Orissa, and Behar. For a short time, however, the fiction of a native viceroy at Moorshedabad was continued. C. set an example of self-denial to his fellow-countrymen. The only large present he accepted (£60,000) he formed into a fund for the invalided servants of the Company. On his final return to England in 1767, his great services seemed to be forgotten in the general dislike with which the nabob class were at that time regarded. The sufferings of the Bengal population from famine were contrasted with the splendour in which C. lived at Berkeley Square and Claremont. At length in 1772, the financial position of the Company having become serious, a parliamentary committee was appointed to inquire into its recent history. Chiefly owing to the eloquence of Wedderburne, the House of Commons, while affirming the general illegality of the private appropriation of military acquisitions, passed no censure on C. His health, however, gave way soon after: he became addicted to opium, and committed suicide on 22d November 1774. There are Lives of C. by Malcolm and Greig.

Cloa'ca (Lat. 'a sink') is a cavity at the extremity of the alimentary canal of birds, reptiles, and amphibians, into which the great intestine, the ureters, or ducts of the kidneys, and the ducts of the reproductive organs open. In the *Ornithodelphia*, a group containing the two genera *Echidna* and *Ornithorynchus*, there is a spurious C. common to the rectum and genital and urinary organs. In the *Didelphia*, or Marsupials, there is a shallow C., the sphincter muscle being common to the urinary and genital apertures, but there is no true urogenital chamber.

Cloaca Max'ima, a celebrated subterranean vault, the construction of which is ascribed in Roman legend to Tarquinius Priscus, by which the filth of ancient Rome was conveyed to the Tiber. It was formed by three arches, one within the other, the innermost being a semicircular vault about 14 feet in diameter, the blocks of which were united without lime. It was large enough to allow the passage of a cart loaded with hay, and Agrippa passed through it in a boat on an occasion when it was cleansed. The original C. M. extended only from the Forum to the river, but was ultimately extended as far up as the Subura, and of this extension vestiges were discovered in 1742. The expenses of cleaning the common sewers at Rome were defrayed partly by the treasury and partly by an impost called *cloacarium*. The censors were intrusted with the administration of the sewers under the Republic, but under the Empire this was vested in special officers, with the title of *cloacarum curatores*—'curators of the sewers.' The sewers at Rome were constantly flushed by the superfluous waters of the aqueducts.

Clock Bell-Metal is an alloy of copper, into which tin, lead, and zinc in variable proportions enter. Small quantities of antimony and bismuth are sometimes introduced, to give a crystalline grain and a certain tone to the bell-metal.

Clocks and Watches. See HOROLOGY.

Clog Al'manac, Rim Stock, or **Prime Staff**, an almanac or calendar of days, made generally of wood, but sometimes of horn, bone, or brass. When four-sided it contained three months on each of the edges; the days were marked by notches, every seventh by a larger notch. On the sides symbols, each linked to the proper notch by a line, indicated the Golden Number, a cycle of the moon, and festivals of saints. Some were perfect, containing the Dominical Letter (q. v.), the Prime (q. v.), and marks for all the feasts; others were imperfect, having only the prime and immovable feasts engraved on them. There was the family C. A., hanging like a modern clock or weatherglass, and the smaller one, carried in the pocket as watches or handy compasses now are. This instrument was much used in England and Denmark; but in the latter country it was generally flat, each side being divided into six columns; even six-sided ones were not uncommon, two months being notched on each edge. There also it was called a *Runic staff*, after the Runic characters used for notation. Specimens of the C. A. are to be seen in the British Museum, London; the Bodleian Library, Oxford; and St John's College, Cambridge; and a few other places.

Clogheen' (Irish Gael. *cloichin*, dim. of *cloch*, 'a stone'), a town in the county of Tipperary, Ireland, 14 miles S.W. of Clonmel, on the river Tar, at the crossing of the roads from Dublin to Cork and from Cahir to Lismore. It has extensive flourmills, as the limestone soil of Tar Vale produces rich crops of wheat. Pop. (1871) 3176.

Clog'her (Irish Gael. *clochar*, 'stony land'), a decayed episcopal city in the county of Tyrone, Ireland. It is near the Londonderry and Enniskillen Railway, 15 miles S.S.E. of Omagh, and 98 N.N.W. of Dublin, on the Launy, a tributary of the Blackwater. St Patrick is said to have been, in A.D. 444, the first bishop of the see, which is now united to that of Armagh. Pop. (1871) 1515.

Clois'ters (Lat. *claustra*, 'enclosed places'), vaulted passages connected with cathedrals and collegiate or monastic institutions, generally situated on the S. side of the church. They enclose on four sides a large area, called the cloister garth, and give covered access to the church, and to the various offices of the establishment ranged around the three remaining sides. The side-walls of the C. are in Northern Gothic generally of a design similar to the aisle-walls of a church, having windows sometimes glazed, with tracery and buttresses between; while in warmer countries the C. are generally open pillared arcades of the most graceful and beautiful design. A stone seat is often continued along one side of the C., and many of them have stalls or carrols, where the monks were in the habit of studying and copying books; and at certain hours of the day the C. formed a common place of meeting for conversation and recreation, as well as for processions to and from the church. Certain orders used the C. for interments. The prototype of the C. is to be found in the colonnade surrounding the court in front of the Basilican churches.

Clonakil'ty (Irish Gael. *Clough-na-Kiltey*, 'the stone-house of the O'Keelys'), a town in the county of Cork, Ireland, 26 miles S.W. of Cork. It stands at the head of a small inlet from C. Bay, and exports grain. Pop. (1871) 5084.

Clo'nes (Irish Gael. *Cluain-Eois*, 'Eos's meadow'), a market-town in the county of Monaghan, Ireland, on the highroad between Monaghan and Belturbet, 12 miles W. of the former town, and near the Ulster Canal. It is a station on the Dundalk and Enniskillen Railway, and the terminus of the Ulster line. C. has large cornmills, a brewery, and some manufactures of crochet-lace. Near the town are the ruins of an ancient monastery, which is said to date from the 6th c., a round tower, and some very old earthworks, probably of heathen origin. Pop. (1871) 4414.

Clonmel' (Irish Gael. *Cluain-meala*, 'the honey-meadow,' so called from the abundance there in old times of wild bees' nests), a parliamentary and municipal borough in Tipperary, Ireland, with a small portion in the adjoining county of Waterford. It is situated in a beautiful valley on the Suir, here crossed by a bridge of twenty arches, is a well-built town, and has a considerable trade in corn, cattle, bacon, and butter. In the neighbourhood are extensive cornmills, breweries, and a distillery. Pop. (1871) 10,112, of whom 74 reside in Waterford. C. returns one member to Parliament. The town was the birthplace of Sterne, and the scene of Smith O'Brien's 'insurrection' in 1848.

Clontarf' (Irish Gael. *Cluain-tarbh*, 'the meadow of the bulls'), a town in the county of Dublin, Ireland, 3 miles E.N.E. of Dublin, a favourite sea-bathing place, and famous in ancient Irish history as the scene of the defeat of the Danes by Brian Boroimhe in 1014. Pop. (1871) 3442. C. had a 'priory' as early as 550, which afterwards came into the hands of the Knights Templars, and is now a Carmelite monastery. C. Castle, recently burnt, is said to have been one of the finest specimens of antiquity in the British Isles.

Cloots or **Clootz, Jean Baptiste**, born at Val-de-Grace, near Clèves, June 24, 1755, and educated at Paris, conceived the idea of making that city the metropolis of the universe, and abolishing national distinctions. Under the assumed name Anacharsis, he traversed Europe, announcing his doctrine, and losing great part of his inherited wealth. Returning to Paris, he renounced his rank (of baron) in the Prussian nobility, and assumed the title of 'orator of the human race,' in which capacity he assisted at the absurd ceremony of introducing fictitious delegates from all foreign nations to the Assembly. After the September massacres he was elected a deputy, and in the interests of his universal republic he savagely called for the death of the King. A treatise of his in support of Mohammedanism was gravely approved of by the Assembly. At last Robespierre, feeling that the Hébertist party was threatening not only the Jacobins but the Republic, denounced C. as too rich, a foreigner, and an atheist. C. was executed 23d March 1794. His writings are, like himself, curious, but of no consequence.

Close, a term used in heraldry in connection with birds addicted to flight, as the eagle and falcon, indicating that the wings are not expanded, or *disclosed*, which is the technical term. C. applies also, in the same art, to barnacles or bits for horses, when they are not extended.

Close-Hauled, in navigation, is the manner in which a ship's sails are arranged when she is wanted to sail as nearly in the teeth of the wind as possible.

Clos'et, in heraldry, a diminutive of the Bar (q. v.)—one-half of its width.

Clotaire, the French form of the name of several Frankish kings of the Merwing or Merovingian dynasty. See MERWINGS.

Clothes-Moth (*Tinea*), the name given to various species of Lepidopterous moths, the young or larvæ of which destroy cloths, furs, and other fabrics, by biting them and otherwise destroying them, for the purpose of forming cocoons or pupæ-cases from the materials. Of this genus of moths (included in the sub-order *Heterocera*, and in the family *Tineina*), the *T. destructor*, *T. tapezana* of woollen fabrics, and the *T. pellionella* of furs, are familiar species; whilst *T. granella* or the Corn Moth (q. v.) is found in granaries and libraries also. *T. destructor* is of a buff colour; *T. tapezana* has the front wings black at their roots and the rest of the wings white; whilst in *T. sarcitella*, another common species, the colour is a silky grey, the head and chest being white. The antennæ are filiform, and the larvæ or caterpillars have eight or ten pro-legs. By means of their sharp jaws the larvæ nip out the fabrics in which they live, and amid which the female moth has deposited her eggs. Exposure to air, and saturation with the odour of camphor or spirit of turpentine, are the most effectual means for destroying these forms. But free exposure to currents of air and cleanliness are the surest preventives from their attack.

Clo'thing, Army, is a department of the British military system. Formerly the colonel of the regiment was paid so much a year for clothing it. This system, as was to be expected, led to gross abuse. The colonel contracted with a tailor for a wholesale supply at lowest possible price; the officer making a profit, it used to be calculated, of fully fifteen shillings per man. The disasters of the early part of the Crimean war gave rise to a national demand for reform in the system. Under the royal warrant of 21st June 1855, the troops are clothed at the direct expense of the state, the colonels receiving compensation for the loss of their former perquisite. The cost of clothing a complete regiment of the line is about £2500 a year. The cost for the whole army was, in 1873, £923,078, of which £180,000 fell to the Government of India. The cost of a uniform for a private in the line is £2, 15s. 4d.; for a Life-Guardsman it is £8, 15s.

Clothing, Navy. In the royal navy a certain sum is subtracted from the pay of the seamen to meet the expense of their clothing. In 1859, with the view to facilitate the manning of the navy, the Admiralty made the following offer:—To every man on his first entering the navy for ten years' continuous service, and to all boys on being advanced to man's rating, a suit of clothes, consisting of the following made-up articles:—A blue cloth jacket (No. 2 cloth), 17s. 8d.; a pair of blue cloth trousers, do., 11s. 7d.; a blue serge frock, 8s. 6d.; a duck frock, 2s. 9d.; a pair of duck trousers, 2s. 7d.; a black silk handkerchief, 2s. 10d.; and a pair of shoes, 6s. 7d. Seamen provided already with proper costume are to receive the money value of the above —£2, 12s. 6d.

Clo'tho, in ancient mythology, one of the three Fates or *Parcæ* (q. v.).

Clotho, a genus of *Arachnida* (q. v.) or Spiders (q. v.), inhabiting the S. of Europe and N. of Africa, which construct a curious tent-like habitation of conical shape, fastened to rocks and in crevices; egress and ingress being obtained through a curious doorway. The exterior of the tent is purposely stained for concealment, and it is fastened securely by cord-like structures to its basis of attachment. *C. quinquemaculata* is a familiar species, about half an inch long, and coloured black on the abdomen. Another is *C. Durandii.*

Cloud, St, a town in the department of Seine-et-Oise, France, [illegible] slope of a hill on the left bank of the Seine, 6 miles S.W. of Paris. The name C. is a corruption of Hlodoald, a grandson of Clovis (Hlodowig), who, forced to become a monk, took up his residence at *Novigentum*, the modern St C., and was afterwards canonised. Its principal attraction was its splendid château, built by Mazarin, long the residence of the Dukes of Orleans, and the scene of many memorable historical events. Bonaparte was here named First Consul in 1799, and here Charles X. signed the famous ordinances of July 1830. It was the headquarters of the Allies from April 7 to June 3, 1814, and also of Blucher in 1815 during the siege of Paris. It was almost wholly destroyed by the fire of the French artillery, 13th October 1870, as it was believed to be the headquarters of the German staff. Pop. (1872) 2378.

Cloudberry (*Rubus Chamæmorus*), a plant of the natural order *Rosaceæ*, allied to the bramble, raspberry, &c., bearing an agreeably flavoured fruit, greatly used for preserves in Norway and Sweden, where it is common. It is also found, though not so plentifully, in high situations in Britain. The Antarctic representative of it is *R. geoides* of Tierra del Fuego and the Falkland Islands.

Clouds. Moisture is always being evaporated from all points on the surface of land and sea: its rate of evaporation being in direct ratio to the dryness of the atmosphere, and in inverse ratio to its density. The amount of moisture is shown by the wet-bulb thermometer, which gives the temperature of evaporation. 186,240 cubic miles of vapour are annually raised from the surface of the globe. Although the southern hemisphere possesses three times as much water as the northern, yet partly by the direction of the trade-winds, partly from the superior condensation-power in the N., more rain and fog occur there. There is absolutely less vapour in the atmosphere in January than in any other month; while in July, on account of the heat, the evaporation is greatest. The chief effect of moisture in the air is to obstruct the passage of the sun's heat; there is also considerable absorption of heat on evaporation. In the region of C., which is stated by Kämptz to be from 1300 to 21,320 feet, but which balloon observations extend to an elevation of perhaps 10 miles for light cirrus, the cloud-air is dry, the moisture being condensed by the colder air into C.: these C. prevent the free radiation of heat, and thus obstruct the formation of dew on the earth. The quantity of C. manufactured out of the invisible vapour depends on the differences of the air currents in temperature, moisture, and velocity. In Britain, the heavy E. wind, or polar current, forces upwards and transforms into dense black C. the light and moist S.W. wind. In the balloon observations at Kew, the temperature of the cloud-stratum, varying from 2000 to 3000 feet in thickness, was found to be the same at the top and at the bottom. As a general rule, the cloud-stratum is higher over land than over water, and increases in height with the oxygen of the air, *i.e.*, distance from the sea. In intense cold, C. often consist not of vapour, but of small crystals of ice. The appearance of a cloud depends on its being connected with an ascending current of vapour; when this ceases, the cloud is formed, and immediately begins to dissolve. C. also, if near the earth, imitate the depressions and elevations which they extend over. There is no radical difference between C. and fog, the latter being always close to the ground, which is then generally moister and warmer than the atmosphere. The *cirrus*, or cat's tail, is the highest cloud; it consists of long white silver horizontal bands, perhaps containing snow or ice. Travelling in the direction of its length, it seems stationary. Their parallelism has been assigned to electrical conditions. The *aurora* is supposed to be connected with them; it is in this region that halos and parhelia are formed. The *cumulus* is the rounded, dense, white, mountainous cloud of the daytime. They move in currents near the earth, and are in fact formed from the ascending air which has been heated on the earth's surface. In the evening they often mass themselves and deepen in colour. Still lower is the stratus or horizontal band which forms at sunset and disappears in the morning. It includes the white and grey mists formed in valleys and over marshes. There are four subordinate forms of C.—the *cirro-stratus*, a compact structure of filaments, resembling in outline and position the *cirrus*; the *cumulo-stratus*, a mass of C., having at sunrise a black or bluish tint on the horizon, and passing into the *nimbus*, or rain and thunder cloud, which has a uniform grey tint, fringed at the edges; and the *cirro-cumulus*, which is a combination, of course in endless variety, of the *cumulus* and the *cirro-stratus*.

C. move much faster than the wind at the surface of the earth; the rate of 109 miles an hour has been observed at Edinburgh, and the rate of 72 miles when the wind was blowing at 42 miles an hour. See Mrs Somerville's *Physical Geography* (6th ed. Lond. 1870), and Buchan's *Meteorology* (2d ed. Edinb. 1868).

Clough, Arthur Hugh, an English scholar and poet, was born at Liverpool, 1st January 1819, educated at Rugby under Arnold, passed to Balliol College, Oxford, and was elected a fellow of Oriel in 1842. The theological *fever* was strong at the time, and for a moment it seemed as if C. would catch it; but his spirit was too exquisitely susceptible of living impressions, and his mind too speculative, or rather too critical, to be long enthralled by 'archæological formulas.' The result was that he went the other way, and his brief career was mainly shaped by his antagonism to the 'form of thought which Oxford exacted of her children.' In 1848 he resigned his fellowship, and in the same year, a little earlier, published the *Bothie of Tober-na-Vuolich*, a 'true long-vacation pastoral,' in classical hexameters, instinct with the finest aroma of elegant culture, the bright joys of college friendship, the humour, sympathy, sarcasm, and luminous talk of youth, relieved by picturesque descriptions of Highland scenery and delineations of Highland character. The work is imperfect in art, and is now beginning to fade from the memory; but at the time it was thought to indicate a new poet. Next year (1840) appeared his *Ambarvalia*. After leaving Oxford, C. travelled in France, Italy, and America, was appointed an examiner in the Education Department of the Privy Council in 1853, and in 1856 secretary to the Commission of Report on Military Education. His health now gave way; after visits to Greece and Constantinople, and a short return to England, he was again ordered to the Continent; but was carried off by malaria fever at Florence, 13th November 1861. C.'s nature was singularly pure, tender, and strong, and his talent incomparably greater than his fame is likely to be. See *Poems by A. H. C. with a Memoir*, by F. T. Palgrave (Lond. 1862).

Clouted or **Clotted Cream,** a delectable luxury, prepared by boiling milk on which the cream has risen, and skimming off the cream, in which a quantity of coagulated casein becomes entangled by boiling. The S.W. of England, especially Devonshire, is noted for its C. C.

Clove, or **Culilawan Bark** (see CINNAMON), is a name also applied to the bark of *Myrtus caryophyllata*, a native of Ceylon and the Mascarene Islands.

Clove Gilliflower, the aromatic scented double-flowered varieties of *Dianthus Caryophyllus*.

Clove Nutmeg, the fruit of *Agathophyllum aromaticum*, one of the *Lauraceæ*, which is aromatic, though the kernel which it encloses is of an acrid caustic taste. The leaves are used in Madagascar as a condiment.

Clo'ver, or **Trefoil** (*Trifolium*), a genus of plants belonging to the order *Leguminosæ* (sub-order *Papilionaceæ*). There are from fifteen to twenty British species of *Trifolium*; about one half are pasture plants, the rest mere weeds, of no economic importance. The cultivated species of C. are—The red C. (*T. pratense*), the zigzag C. (*T. medium*), the carnation C. (*T. incarnatum*). All the above have red flowers. The following species have pinkish or white flowers:—The Alsike C. (*T. hybridum*), the white or Dutch C. (*T. repens*); while *T. procumbens* and *T. filiforme* have yellow flowers.

The red C. is much employed as a 'shifting' crop, either by itself or in the mixtures known to the farmer as 'seeds.' It is now so much a cultivated plant that it is found difficult to make it stick to lands as perfectly as it once did: such soils are described as 'C. sick.'

The zigzag C., so called from the angular bends at each joint of the stalk, is a lover of sandy soil, and is probably only a variety of the red or broad-leaved C. It is usually known by the seedsmen as the 'cow grass,' though it is rare to find two seedsmen supplying the same plant under that name. The carnation or Italian C. is an introduction from the Continent, and is used on upland soils upon the white-crop stubble sown in the autumn. There are several varieties of it.

The Alsike C. is also a Continental form. From possessing characters intermediate between the red and the Dutch C. it gets its name of *hybridum*, though its hybridity is not admitted by botanists. It is a good pasture grass. The Dutch C. is a valuable feeding plant in dry and thin soils. *T. procumbens*, the hop or procumbent trefoil, is a different plant from the hop trefoil of the farmer (which is *Medicago lupulina*). *T. filiforme* is of little importance (Professor Buckman). Bokhara C. is *Melilotus leucantha*; bush C. and Japan C., American names for *Lespedeza*; prairie C., an American name for *Petalostemon*; Soola C. and Maltese C., *Hedysarum coronarium*; sweet C., an American name for *Melilotus*. See MEDICK, MELILOT, and SHAMROCK.

Clover Weevil (*Apion*), a genus of Coleoptera or Beetles of the section *Pentamera* and family *Rhynchophora*. This insect has, therefore, the head prolonged to form a *rostrum* or *beak*, and derives its name from its feeding on the leaves of the clover, the larvæ eating into the clover flowers. *A. africans* infests the red, and *A. flavipes* the white clover. The former is about a line or a little more in length, and is coloured of a dark-blue or blackish-blue tint.

Cloves. See CARYOPHYLLUS.

Clo'vis, the Latinised form of the name of the Frankish King *Hlodowig* (q. v.).

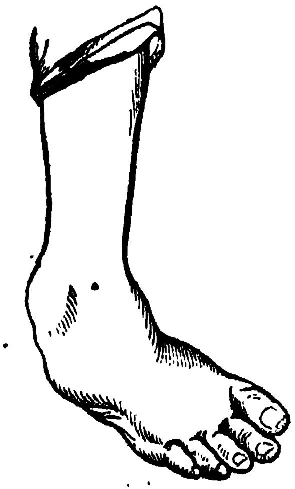
Cloyne (Irish Gael. *Cluain-uamha*, 'the meadow of the cave'), a town in the county of Cork, Ireland, 15 miles E. by S. of Cork. Its cathedral dates from the 13th c. C. was once a separate bishop's see, but was re-united in 1835 with that of Cork, from which it had been disjoined in 1678. The famous Berkeley was Bishop of C. There is little or no trade. Pop. (1871) 1235. St Colman MacLenin founded a monastery here in 604, and the cave from which the place is named is still to be seen.

Club (which has been conjecturally derived from the Old Eng. *cleofian*, 'to cleave,' and Welsh *clapiaw*, 'to form into a lump'), may be applied to any voluntary unincorporated society possessing a common fund, derived from the contributions of its members, and generally managed by a committee, who are not entitled to make their constituents liable for any expenses beyond the purposes for which the C. was formed. Clubs for dinner in common were popular in Athens, and eating in common was a prominent feature in the early religious or social *gilds* (a word connected with the Welsh *gwyl*, Breton *goel*, and Gaelic *feill*, 'a feast or holiday'). Thus the gild of Abbotsbury had a yearly banquet, to which the poor were admitted, the members being obliged to furnish so much bread 'well boulted and thoroughly baked.' Support and nursing of sick gild brothers, burial of the dead, and performance of religious services, were also objects of the early gilds. This common meal has been derived from the old Teutonic sacrificial banquet, and has been compared to the Greek *eranoi* (see Bekker's *Charicles*, ii. 239) and the banquets of the Roman *collegia*. These fraternities were spread all over Catholic Europe in the middle ages, there being eighty in Cologne and one hundred in Hamburg. One of their ceremonies is curiously preserved in 'the march of the members of the English benefit societies to morning service in their church before the midday dinner, the cricket-match and games of the afternoon, and the evening dance.' As the later frith-gilds, gilds-merchant, and trade-unions all in their time acquired a corporate existence, they seem hardly to fall under the term C. It would, of course, be impossible to mention the objects, charitable, political, convivial, and religious, for which clubs have been formed. Among others, we may note the 'Mermaid' of Shakespeare; the 'King's Head and Green Ribbon C.' of the Shaftesbury clique; the 'C.' of Presbyterian and Tory Jacobites, which organised in Penston's Tavern the opposition to the Revolution settlement in the Scots Parliament of 1689-90. Specimens of the fantastic club are the 'Calf's-Head C.,' which (as late as 1735) used to dine off calf's-head, in contempt of the memory of Charles I., solemnly burning the *Ikon Basilikè*, and swearing republicanism over Milton's *Defensio Populi Anglicani*; and the 'Ugly C.,' celebrated by the *Spectator*, of which the qualifications of members were defined by an 'Act of Deformity.' Early in the 18th c. the Hell-Fire Clubs, which used Tartarëan names, and burned sulphur at their blasphemous meetings, were denounced by an Order of Council (28th April 1721). In the latter half of the same century the celebrated convivial clubs of 'The Society of Bucks' and 'John Shaw's Punch-House' were formed at Liverpool and Manchester respectively. The 'Scramble C.,' and the 'Oyster and Parched-Pea C.' of Preston (which included among its office-bearers an Oystericus and a Clerk of the Peas), belonged to the same period. Among the political clubs of the period of the French Revolution, may be mentioned the *C. des Enragés*, Breton C., *Société Publicole*. The 'Breton' developed into the 'C. of Friends of the Constitution,' and, after it met in the hall of the Jacobin Convent, the 'Jacobins,' who, known as the *Société Mère*, had 300 affiliated clubs in France. Barnave, Mirabeau, and Robespierre belonged to it. Still more violent were the 'Cordéliers,' among whom were Desmoulins and Danton. Lafayette's C. was the *Feuillans*, or 'Club of 1789, Friends of the Monarchic Constitution.' Of the same complexion was the *C. des Monarchiens*. It was the 'Electoral C.' which, meeting at the Hôtel de Ville, constituted itself a provisional municipality, and, as the affair of the Bastille approached, a permanent committee for arms. Clubs for amusements, such as cricket, boating, chess, debating, are now common. The London 'Four-in-Hand C.' is perhaps the most aristocratic. In France, Italy, Switzerland, and England, Alpine clubs have existed for many years; their *Transactions* contain much interesting description and some scientific observation. Dr Ball and Mr Tucker have been the most successful members of the English Alpine C. Their chief advantage lies in the certainty of reliable guides and experienced companions. In 1812 the 'Roxburghe C.,' for the printing or reprinting of a limited number of copies of rare and interesting books or documents, was formed on the occasion of the public sale of the Duke of Roxburghe's library; it was followed by the Maitland, Spalding, and Bannatyne clubs in Scotland.

Among the great London clubs ought to be mentioned the 'Rota Coffee C.' in New Palace Yard, to which Milton, Marvell, and Harrington belonged; the 'October and March C.,' consisting of Tories under Harley and St John; the 'Kit-Kat C.' in Shire Lane, to which Halifax, Marlborough, Walpole, and other Whigs belonged; 'Almack's (originally 'Brooke's') Chocolate C.,' founded in Pall Mall in 1764; 'White's,' removed to St James Street in 1736, to which Chesterfield, Cibber, and Bubb Doddington belonged; 'Turk's Head C.,' to which in 1763 Reynolds, Johnson, Burke, and Goldsmith belonged, removed to Thatched House, and now the 'Literary C.;' 'Cocoa-Tree C.,' where Smollett did his election bribing; 'Beefsteak C.,' founded, with the motto 'Steaks and Liberty,' by Lord Peterborough in honour of Peg Woffington, to which Colman and Garrick belonged, and from which Wilkes was expelled for his *Essay on Woman*, 'Will's C.,' where Dryden talked; and 'Button's C.,' frequented by Addison.

Clubb'ing, a disease affecting the roots of cabbages and allied plants, the result of which is that the whole force of vegetation is carried upwards to the leaf and stem, causing the destruction of those parts. It is a local disease, and probably depends upon peculiar conditions of the soil. Mr Berkley recommends, as the most effectual preventive of it in districts subject to the disease, to put a small quantity of wood ashes into the hole in which the root of each plant is placed.

Club-Foot, or **Tal'ipes**, may be due to the contraction of certain muscles, or to the paralysis of others. It is generally congenital, but is sometimes the result of disease or destitution. Four kinds are usually described by surgeons. 1. *Talipes equinus*. The muscles of the calf are contracted, the patient walks on the front of the foot, and the heel is raised from the ground. This kind is usually a result of teething. 2. *T. varus*, the most common form of C.-F. The patient walks on the outer edge of the foot. 3. *T. vagus*, a rare form, compelling the person to walk on the *inner* aspect of the foot. 4. *T. calcaneus*, in which the person walks on the heel. Sometimes we find several of these forms in the same foot. The proper treatment consists in dividing the tendons of the contracted muscles by a thin knife underneath the skin, and applying means to keep the limb in position. In children C.-F. is always curable.



Club-foot.

Club-Grass, a common name for *Corynephorous*, a grass belonging to the oat tribe (*Avenæ*), by some not considered distinct from *Aira*. Though rare in England, it is generally diffused throughout the continent of Europe.

Club-Houses, in London, Law Regarding. It is now settled (Fleming *v.* Hector) that these have no legal character similar to commercial partnerships or joint-stock companies, and that the members are not liable for the acts of their secretaries, stewards, or committees.

Club-Moss. See LYCOPODIACEÆ.

Club-Rush. See SCIRPUS.

Clupei'dæ, a family of Teleostean fishes belonging to the sub-order *Malacopteri*, and including the herrings, pilchards, sprats, sardines, anchovies, &c. It is distinguished by its members possessing scales of large size, by the wide mouth, into the formation of which both maxillary and inter-maxillary bones enter; by the single dorsal fin, and by the absence of a second soft or *adipose* fin. Most of the C. possess numerous *pyloric cœca*, or appendages to the stomach. The ventral fins are abdominal in position (*Abdominalia*). The Air-Bladder (q. v.) communicates with the throat by a duct. Sometimes the belly is rendered serrate by the presence of irregular scales.

Clupesoc'idæ, a family of Teleostean fishes, included in the Malacopterous sub-order, and allied to the Herring family (*Clupeidæ*, q. v.), and to the Pikes (*Esocidæ*). The members of this group are both marine and fresh water in habits. None are found in British waters. The genera *Arapaima*, *Heterotis*, and *Butirinus* are examples of the C., which is not, however, regarded as a typical group by some ichthyologists.

Clu'sia, a large genus of tropical American trees or shrubs, the type of the natural order *Clusiaceæ* or *Guttiferæ*, so named from Charles de l'Ecluse or Clusius, a famous botanist of the 16th c. *C. grandiflora*, with its large leaves, from 7 inches to a foot in length, and white flowers 5 or 6 inches in diameter, is one of the beautiful trees of the tropics. *C. insignis*, or wax-flower, is a Brazilian and Demerara species, whose flowers excrete a quantity of resin, which, when rubbed with the butter of the chocolate-nut, is used by the Brazilian women to alleviate the pain of a sore breast (Von Martius). A similar resin, yielded by *C. alba*, *C. rosea*, and *C. flava*, of the W. Indies, is used by the Caribs for painting the bottom of their canoes. *C. Galactodendron* is one of the Palo de Vaca, or 'cow trees' of Venezuela and other portions of S. America, so called from the milky juice which exudes from incisions made in the bark being used as a substitute for milk. It is affirmed by the credulous that the 'milk' flows more fully just before the full of the moon; one tree will yield a quart in an hour. The milk is nourishing, though the use of it leaves a sensation of astringency on the lips and palate. *C. Duca* yields the duca resin of Colombia, which is burnt for the sake of its agreeable odour. Many of the species are epiphytes—*i.e.*, parasites on the stems of other trees. Altogether about thirty species are described.

Clusia'ceæ, or **Guttif'eræ**, a natural order of trees or shrubs belonging to the Dicotyledons (division *Thalamifloræ*), natives of the humid tropics of S. America. There are thirty-two genera, and about 150 species described. Most of the plants have acrid properties, and yield a yellow resin. Among the chief and common plants of the order are Gambooge (q. v.), Mangosteen fruit (*Garcinia Mangostana*), the American Mammee apple (*Mammea Americana*), bitter or Weandee oil (from *C. inophyllum* of India), the butter-tree of Sierra Leone (*Pentadesma butyracea*), &c.

Cluso'ne, a town in the province of Bergamo, N. Italy, near the Serio, 17 miles N.E. of Bergamo, has linen manufactures, and a trade in iron, copper, vitriol, corn, &c. Pop. 5500. C. is also the name of a small river of N. Italy, which joins the Po some 18 miles S. of Turin.

Clus'tered Col'umns, or **Compound Piers**, one of the richest features in Gothic ecclesiastical architecture, when the shafts or columns are attached to each other sometimes for their whole length, at other times only at the base and capital. C. C. are susceptible of very effective adornment, as with floriated fillets.

Clu'tha, or **Mol'yneux**, the largest river in New Zealand, issues from Lake Wanaka, in the province of Otago, in 44° 35′ S. lat., 169° 20′ E. long., and after a S.E. course of 200 miles, falls into the S. Pacific in 46° 18′ S. lat., 169° 38′ E. long. Its principal tributaries are the Kawarau (draining Lake Wakatipu), Manuherikia, and Pomahaka. The C. is a very deep and rapid river, and was computed by the late Mr Balfour, colonial marine engineer, to discharge 1,690,000 cubic feet of water per minute.

Cluy'tia, a genus of Euphorbiaceous plants, natives of Africa, and found in great abundance at the Cape of Good Hope. *C. lanceolata* is said to be used in Abyssinia as a cure for dysentery in cattle.

Clwyd, a Celtic word found both in the Cymric and Gaelic tongues, and derived from an adjective meaning 'strong.' This adjective is seen in the names of several rivers in Scotland and Wales—*e.g.*, the 'Clyde' in Lanarkshire, and the 'Cluden' near Dumfries; the 'C.,' 'Cloyd,' and 'Clydach,' in Wales, which were probably so named from the strength or rapidity of their current. By far the largest and most important is the Scottish river, the Clyde (q. v.). The only other requiring notice is the C. of N. Wales, which rises in the Bronbanog Hills, in the S.W. of Denbighshire, flows in a northerly direction past Ruthin, St Asaph, and Rhyddlan, and falls into the Irish Sea between the shires of Denbigh and Flint, after a course of 30 miles.

Clyde, a river of Scotland, rises in an amphitheatre of the Lowther Hills, in the extreme S.E. angle of Lanarkshire, near the sources of the Tweed and the Annan. It has its origin in the Daer Water and several other mountain streams, of repute among anglers. After flowing N. for some 20 miles, and sweeping round the E. base of Tinto Hill, it has a sinuous course in a north-westerly direction through the picturesque Dale of C. or Clydesdale, till it expands into a broad estuary, and eventually into a firth of the same name. Its only considerable tributaries are the Douglas, Avon, Calder, and Leven, and the principal towns it passes are Glasgow, Lanark, Hamilton, Renfrew, Dumbarton, Helensburgh, Greenock, and Gourock. The Vale of C. is famous alike for its orchards, its coal and iron, and its horses. By far the most singular feature of the upper C. itself is its series of romantic falls near Lanark, where the bed of sandstone and shale has been ploughed into deep gorges and gloomy defiles, through which the river descends some 230 feet in less than 6 miles. The falls, which are beautifully flanked with savage cliffs and wooded slopes, are four in number—(1) Bonniton Linn, consisting of a single leap of 30 feet; (2) Corra Linn, the most magnificent of the four, having one cataract of 90 feet, and a total descent of 120; (3) Dundaff Linn, a miniature cascade of 10 feet; and (4) Stonebyres, forming three successive falls, like Corra Linn, of 70 feet. At Glasgow the C. becomes navigable for large vessels, and begins to assume the appearance of a great trading and shipbuilding river. Its estuary rapidly widens below Dumbarton, until between Greenock and Helensburgh it has a width of 4 miles; but the promontory of Roseneath here hinders its further extension, standing well out into the channel, and separating the Gare Loch from Loch Long, both arms of the estuary stretching in a northerly direction. After sending off Loch Long to the N. and Holy Loch to the W., the main stream turns abruptly S., opens into the Kyles of Bute, but continues along the coast of Renfrew and Ayr, until it merges in the Irish Channel at Ailsa Craig. Its length to Glasgow is 75 miles, and its further course is 48 to Cantire, where it is considered that the Firth of C. begins. The river has a basin of 1500 sq. miles. In 1859 a fort (Mathilda) was erected about a mile to the W. of Greenock for the defence of the C. Sir John Hawkshaw issued a report on the pollution of the C. and its tributaries in 1876.

Clyde, Lord. See CAMPBELL, SIR COLIN.

Clydesdale Horse, a breed which originally belonged to Lanarkshire and Ayrshire, but whose great strength, fine action, noble form, and substance have made it much appreciated in England, on the Continent, in America and Australia. It is the best workhorse in the world, and as much as £1500 has been given for one. See HORSES.

Clys'ter (from Gr. *kluzō*, 'I wash out'), or **En'ema** (Gr. *enema*, 'an injection,' from *enïēmi*, 'I send in'), is a medicine which is injected up the lower bowel in the liquid form. It is used when we wish to empty the bowels speedily, or when the patient cannot swallow, as in apoplexy or paralysis; also for the purpose of conveying into the system stimulant or nourishing substances. Turpentine is frequently administered as a C. to arouse from coma, opium to relieve pain, and brandy and beef-tea to nourish, &c.

Clytæmnes'tra, according to Homer, a daughter of Tyndareus and Leda, and half-sister of Helen, became the wife of Agamemnon, to whom she bore Orestes, Iphigenia, and Electra. During her husband's absence at Troy she formed an adulterous connection with Ægisthus, and on Agamemnon's return she murdered him in the bath; a crime for which, seven years afterwards, her own son Orestes took her life.

Cnidos'colus, a genus of *Euphorbiaceæ*, consisting of shrubs or herbaceous plants belonging to Africa. *C. stimulans*—a native of the Southern States of America—on account of the lacerated segments of the leaves, which are covered with spreading hair, stinging the naked feet of the negroes, is well known as 'Tread Softly.' Its tuberous roots are eaten like those of cassava. *C. quinquelobus* stings even more terribly, and on this account is shunned as a cultivated plant. In some cases the persons so stung will fall down, and remain quite unconscious for some time. In every case an excruciating pain is experienced, which, according to Mr Black, from whom we take this account, 'lasts for some days, and the parts swell, and sometimes continue swollen, accompanied by an itching sensation, for months.'

Cni'dus, or **Gni'dus**, anciently a city of Caria, Asia Minor, on the W. extremity of the peninsula of Triopion (now Cape Krio), which formed the S. side of the Ceramic Bay. A Lacedæmonian colony, and a member of the Dorian Hexapolis, it soon acquired wealth, and patronised art—one of its temples being adorned by the famous naked Venus of Praxiteles. The larger of its two ports was formed by transverse moles carried out into the sea, one of which is still almost entire. Eudoxus, the mathematician and friend of Plato, was a native of C.

Coach. The word is said by Taylor to be an English form of the Ger. *kutsche*, which itself comes from the Magyar *kotczy*, while that again has been formed from *Kottsee*, the name of a town in Hungary. The C. is a box-like carriage, with four wheels, mounted on springs or suspended on leathers. Carriages were employed by the ancients in travelling. The *carpentum* of the Romans was a richly decorated two-wheeled vehicle, covered with an awning, and chiefly used for the conveyance of Roman matrons in the days of the Republic, and during the Empire a four-wheeled carriage, called *carruca*, was invented; but there is no reason to suppose that either of these was suspended on leathers. Towards the end of the 13th c., the Queen of Charles of Anjou entered Naples in a *caretta*, a small highly-adorned car; which, according to Beckman, is the first instance of the use of a C. in Europe. In the 16th c. coaches commonly appeared in European state ceremonies, particularly in Germany; and in 1588 they had become so general that the Duke of Brunswick forbade his vassals to use them, in so far as they discouraged the more manly and skilful exercise of horsemanship. The first coach made in England was built for the Earl of Rutland by Walter Quippen in 1555. In 1556 he built one for Queen Mary, and in 1564 a state-coach for Queen Elizabeth, which on account of its jolting she discarded for a Dutch coach imported for her in 1570. Within the next fifty years German coaches came into extensive use in England. Private coaches were not uncommon at the end of the 16th c., and at this period it appears that carriages were divided into two classes, coaches and *caroches*, the latter being larger and heavier, though considered more stately and more appropriate for court pageantry than the former, which were relegated to the country. Carriages were quite common throughout Europe generally in the two succeeding centuries. Hogarth has embalmed in his pictures the appearance of the sumptuously carved and gilt carriages of his time, and they certainly look ill-adapted for rapid motion, highly perched as the body is on [illegible] supports between the two widely separated pairs of wheels. An example of English coachmaking of the 17th c., still in a condition for use, exists in the 'Speaker's C.' It is made of elaborately carved oak with richly painted and gilt panels, and measures 14 feet from axle to axle, the total length being 19 feet. The royal state C. was constructed, for the coronation of George III. in 1761. Its frame is composed of eight palm-trees whose branches support the roof, which is surmounted by a crown, borne by boys emblematical of the three kingdoms. Various figures support the body and the coachman's box, his footboard being a scallop-shell, and the whole structure is adorned with carved trophies, painted allegorical and mythological designs, &c. Its length is 24 feet, breadth 8¼ feet, and height 12 feet.

Hackney Coaches first appeared in the streets of London in 1605. They do not derive their name from Hackney, in London, as is commonly supposed, but from the French *haquenée*, a cob-horse, the vehicle to which the animal was harnessed being called *coche-à-haquenée*. The *hansom* was patented in 1834, but since then many improvements have been effected on the original design. About the same time a four-wheeled vehicle was introduced into London, and usurped the name *cab*, which previously belonged to the two-wheeled *cabriolet* imported from Paris about 1820. It is said that Lord Brougham was so fascinated with the general appearance of the 'cab,' that he ordered a better finished C. of the same shape, which has since borne his name, and become the national carriage of England. Carriage-building is carried to greater perfection in England than in any other country, and of the numerous varieties of pleasure carriages, the *brougham, landau*, and *barouche* need only be mentioned for their symmetry and elegant form, and combination of strength with lightness. The chief kinds of wood employed in carriage-building are ash for framework of bodies, Honduras mahogany for panelling, and white pine for seat-boards and under part of bodies; the wheel spokes are formed of sapling oak or hickory. Canadian black walnut wood has recently been found to be an excellent substitute for most of these woods. The painting of a carriage is a most tedious process, and the beautiful glossy colour is only acquired by a great number of successive coats of paint and varnish, each layer after drying being smoothed and polished before another is applied. See Thrupp's *History of Coaches* (Lond. 1877).

Coadju'tor, a subordinate fellow-worker. In ecclesiastical law the word is specially applied to the assistant to a bishop.

Coagula'tion. There are many substances which exist in a soluble and insoluble condition. The act of passing from the soluble to the insoluble state is termed *C.* The spontaneous C. of the fibrine contained in blood — the clotting, as it is termed—the C. of albumen by heat, as in the case of the boiling of an egg, and of caseine by rennet in the manufacture of cheese, are familiar examples of this phenomenon.

Coagulation of the Blood.—The change which occurs in blood usually after removing it from the body by which it separates into a solid and fluid portion. See BLOOD.

Coa'ita, or **Qua'ta** (*Ateles paniscus*), a species of Platyrhine, S. American monkeys, belonging to the genus *Ateles* (q. v.), or spider-monkeys. The C. measures about a foot long in the body, the tail itself, which is very elongated, measuring 2 feet. The face is dark coloured. This monkey is not to be confounded with the *Coaiti* (q. v.), or Coaiti-Moudi, a carnivorous mammal.

Coai'ti (*Nasua*), a genus of Carnivorous mammalia, included in the family *Ursidæ* or Bears, and belonging solely to the New World, being found in Surinam and Brazil. In this genus the molar teeth are small, and the canines compressed and sharp. The muzzle is very elongated, proboscis-like, and extremely mobile. The claws are long, and of curved, compressed shape, and the tail is also of considerable length. The red C. (*N. rufa*), or C.-Moudi, has a fur of reddish-chestnut colour, the ears and legs being black, the tail banded with maroon colour, and the lower jaw white. It is fond of climbing trees. The brown C. (*N. Narica*), or *Narica*, has a brown-coloured fur, which is sometimes mottled with black, and tinted with chestnut. The under parts are coloured grey. The fur is thick and coarse. The C. feed on both animal and vegetable matters, and although shy, may yet be domesticated with success.

Coal (Old Eng. *col*, Dutch, *kool*, Fr. *koal*, Ger. *kohle*, a word found indeed in all the Teutonic languages, and having its congeners in Latin), is the name given to a substance which it is much easier to recognise than to define, and the question, What is C.? has at once baffled the law courts and scientific men to answer. Dr. Percy (*Fuel*) has thus attempted to distinguish it from all other bodies. 'C. is a solid, stratified, mineral, combustible substance, varying in colour from dark-brown to black, opaque, except in extremely thin slices, brittle, not fusible without decomposition, not sensibly soluble in ether, chloroform, benzole, or oil of turpentine, not containing sufficient earthy matter to render it incapable of being applied with advantage as a source of heat in ordinary fireplaces or in furnaces.' There is no doubt that C. is vegetable matter which has undergone great changes from the length of time it has been stored up within the earth, and the various influences to which it has there been subjected. A gradation in physical as well as chemical characteristics can be traced, leading from wood and peat at one extremity, up to anthracite, which is the ultimate product of these changes recognised as C. Liebig explains the chemical changes necessary to produce C. from wood or peat by the theory of the elimination of a compound of hydrogen and carbon as marsh gas, of carbon and oxygen as carbonic acid, and of hydrogen and oxygen in the form of water. As regards physical characteristics, certain varieties of peat are hard, black, and lustrous like C., and some lignites or brown coals retain so much woody appearance and structure that boxes have actually been made from them.

The varieties of C. are usually classified as—(1) Anthracite, (2) Bituminous C., and, (3) Lignite or brown C.; but it is not possible to strictly limit any class, and each contains within itself many minor variations. Anthracite or stone-C. is usually of a brilliant black lustre; it has a conchoidal fracture, and it does not soil the fingers on handling. It is often called Blind C., on account of the difficulty with which it is ignited and burns. It includes such coals as contain the highest proportion of carbon, its range being from 90 to 95 per cent. Enormous deposits of anthracite exist in the eastern division of the great Pennsylvanian C.-field in the U.S. Bituminous C. includes the greater proportion of C. in common use, and nearly all the deposits in British C.-fields come under this head. It contains generally from about 73 to 90 per cent. of carbon, leaving out of account the ash or earthy matter always present in variable proportions. Several varieties of bituminous C. are distinguished according to their mode of burning, which depends chiefly on the relative proportions of carbon, oxygen, and hydrogen they contain. Steam-C. approaches anthracite in its properties; dry or non-caking C. does not possess the valuable property of agglutinating during burning which characterises caking or household C. and makes it so valuable for domestic use. Cannel or parrot C. differs considerably in appearance from ordinary bituminous C., being of a dull, lustreless, black colour, not splitting into thin layers, and generally devoid of vegetable structure under the microscope. Cannel-C. contains a comparatively large percentage of oxygen and hydrogen, and it is therefore of value for the manufacture of C.-gas or paraffin oil. It is only distinguished from the bituminous shales now extensively used for paraffin and gas by the much larger proportion of ash which the latter contain. Lignite or brown C. is a name generally restricted to such deposits as are of more recent origin than the carboniferous epoch to which the great C.-fields at present worked belong. Lignites vary in colour from a light earthy brown to a deep lustrous black, which last is undistinguishable from ordinary bituminous C., and they contain from 50 to 70 per cent. of carbon, leaving out of account the ash they contain. They also usually have a large percentage of water. Deposits of lignite of great industrial value occur in Germany, and some of them yield on distillation a very large proportion of paraffin. Taking 100 parts of carbon as a standard of comparison, the following may be regarded as showing the average composition of these leading varieties of C.:—

	Carbon.	Hydrogen.	Oxygen.
Anthracite . .	100	2·84	1·74
Bituminous C.	100	6·21	21·23
Lignite . . .	100	8·37	42·42

Although the greater proportion of the C. in Europe and America belongs to the deposits of what is known as the carboniferous epoch, it must not be concluded that C. is on that account a product peculiar to that period. In Great Britain workable seams of C. are found in oolitic deposits at Brora in Sutherlandshire, and C. of a similar age is also found in Yorkshire, while at Bovey Tracey, in Devonshire, a lignite has been worked which belongs to a period so comparatively recent as the Miocene age. The brown C. deposits of N. Germany are not older than the Wealden of England, and the enormous C.-fields of India and China are supposed to have been formed during the Permian epoch.

C.-fields are very widely and generally distributed throughout the world, and the total quantity of C. known to exist within available depths is at present great beyond compute. France contains numerous small patches of carboniferous deposits, and in the N. has one considerable field in the Departments du Nord and Pas de Calais, conterminous with the rich C.-field of Belgium. The Belgian C.-field covers an area of 326 sq. miles, and has about 120 seams of C. in progress of active working, the annual output from which reaches to about 12,000,000 tons. In Prussia, the Westphalian C.-field, although long known and worked, has only of recent years risen into great importance, its yield having risen from 2,000,000 tons in 1851 to 10,500,000 tons in 1867. It extends over a surface of 200 sq. miles, contains more than sixty workable seams of C., and is estimated to possess about 40,000,000,000 tons of available C. Prussia also contains the greater portion of the Saarbrucken field, which has an area of nearly one thousand miles. It contains seventy-seven seams of more than 2 feet in thickness, measuring in all 240 feet of workable C., and it is calculated to contain 2,750,000,000 of tons within reach of human art. The C.-field of Silesia also, of which the limits have not been accurately defined, is known to contain 333 feet of C. in seams of not less than 2½ feet thick, and it is estimated to contain an attainable supply of at least 50,000,000,000 of tons. C. also is worked largely in Saxony, and Austria likewise possesses extensive deposits of both true C. and lignite. It is known that Spain and Russia both contain extensive C.-fields almost entirely unopened. The C.-fields of N. America cover an enormous area, and are rich in workable seams of excellent C. In the British provinces it is estimated that there are 8000 sq. miles of C.-bearing area, some of the seams being of great thickness—one at Pictou in Nova Scotia measuring no less than 37½ feet across. The C. deposits of the U.S. extend over an area of no less than 200,000 sq. miles, divided into five separate fields. The Appalachian field is computed as equal to 65,000 sq. miles; the Illinois and Indiana field has 51,000 sq. miles; Iowa, Missouri, and Arkansas are together credited with 73,000 sq. miles; Texas has 3000, and the Michigan field is estimated at from 12,000 to 15,000 sq. miles. These enormous deposits are scarcely even yet broken into, the entire produce of the States for 1873 being stated at 28,343,964 tons, of which no less than 22,828,178 tons were anthracitic. Professor Oldham reckons the C.-fields of India to contain 16,000,000,000 of tons. In recent years it has been made known by the investigations of Baron von Richthofen, that the C.-fields of China extend over an area of 400,000 sq. miles, and it is understood that the opening up of these vast treasures is about to be undertaken by the Chinese Government.

The extraordinary rapidity with which the annual output of C. from British mines has increased in recent times, led a few years ago to a species of panic regarding the possible early exhaustion of our mineral wealth, and in consequence a Royal Commission was appointed to 'inquire into the several matters relating to C. in the United Kingdom.' As a result of the labours of that commission, we have the most accurate and reliable statistics attainable regarding the limits of the various British fields, their available contents, and the rate at which they are being worked out. The following table exhibits the progressive increase of the demand upon our C.-fields since reliable statistics were first collected, it being estimated that the consumption, at the beginning of the century, was about 10,000,000 tons:—

1855,	64,453,070	1865,	98,150,587	1873,	127,016,747
1860,	80,042,698	1870,	110,431,192	1874,	126,590,108

The whole available C. in ascertained C.-fields, according to the report of the commissioners in 1871, including only such as exists within 4000 feet of the surface, and seams of not less than one foot in thickness, amounts to 90,207 millions of tons. To this amount they add as existing under Permian and recent rocks, but still within the 4000 feet limit, 56,273 millions of tons as the probable contents of fields yet unexplored, making an aggregate attainable amount of C. of 146,480 millions of tons. Lying at a depth ranging from 4000 to 10,000 feet, in all the fields included in the above estimate, it is calculated there is an additional quantity of more than 48,465 millions of tons. But as the internal temperature of the earth increases at the rate of 1° Fahr. for each 60 feet downwards from the surface, and as there is good reason to believe that it rises in much more rapid proportion as we penetrate inwards, it is not supposed to be possible, under any conditions at present known, to work at a depth of more than 4000 feet, while at the depth of 10,000 feet the heat must be much greater than that of boiling water, and the shaft of the pit reaching to that depth would be nearly 2 miles long. The total available deposit of workable C. is, therefore, for the present 146,486 millions of tons, and of that amount Scotland possesses 9843 millions of tons, of which 1800 millions lie under the Firth of Forth. Ireland possesses only the insignificant total of 140 millions of tons, little more than the output of the United Kingdom for one year. In judging of the possible exhaustion of British C.-fields, three methods of viewing the subject may be adopted. Judged by the annual output at which we have now arrived, it is easy to say we have C. which will furnish our present rate of supply for somewhat more than one thousand years. Taking the alarmist view of the rapid development of C.-mining during the past quarter of a century, and supposing the demand to continue progressive in the same ratio, we must, according to Mr Price Williams and others, exhaust our C.-fields in 360 years. Neither of these views take into account the conditions under which the demand for C. has increased so rapidly, nor the probable future of the industry. 'On the one hand,' say the commissioners, 'the rate of consumption may be thrown back to any extent by adverse causes affecting our national prosperity, and on the other hand, new discoveries and developments in new directions may arise to produce a contrary effect upon the consumption of C.' They also point out that long before the period of total exhaustion a time of scarcity and dearness would first be reached; that naturally the best and most accessible seams are first exhausted, leaving only such as are more difficult to win, and of less value. Gradually thus we would lose the easy industrial supremacy we now possess through C., and instead of exporting, as we do at present, it would become cheaper to import C. from America or other fields than to work out the remnants of our own. Other considerations might be adduced pointing towards the improbability of the consumption of British C. continuing to increase at the rate of recent experience. Continental and American fields are being rapidly opened up, and worked more in proportion to their size than hitherto; improved scientific processes and machinery are yearly extracting much larger proportions of calorific effect from C. than heretofore, and there is much less waste in the mining processes. The introduction of improved processes in metallurgy, such as the hot blast and the Bessemer process, has already been the means of effecting enormous economies, and in almost all directions involving the burning of C., great room for other like improvements yet exists.

The industrial applications of C. do not end with its great value as a calorific agent. Distilled at a low temperature, it yields paraffin and paraffin oils used for illuminating and lubricating, and by applying a higher temperature, C.-gas is produced. The residual gas-tar and liquor of these processes are also of great value, being the sources of ammoniacal salts in the case of the liquor, while the tar yields aniline, whence the C.-tar dyes are produced, the disinfectant carbolic acid, pitch for artificial asphalt and other useful products.

For mining of C. and the regulations of C.-mines, &c., see under MINING.

Coal'brook Dale, a valley and hamlet in Shropshire, on the Severn, which is here crossed by a cast-iron bridge of more than 100 feet span, and 40 feet high. The dale has a valuable coal-field, the group of strata enclosing the beds having a thickness of from 700 to 800 feet, and also extensive ironworks. The inhabitants are mainly employed in the foundries and collieries.

Coal'fish (*Merlangus carbonarius*), a Teleostean fish included in the *Gadidæ* or Cod family, the fry or young of which are known as *Podleys*, whilst the adult form is also known by the name of *Saithe*. The length varies from 10 inches to 1 or 1½ feet; the upper parts are of a deep bluish-black colour; in shape and form it resembles the Whiting (q. v.) very closely. The flesh is coarse, but is eaten salted in the northern parts and islands of Scotland. The C. occurs also on the American coasts and in the N. seas. It is voracious in habits, swallowing many kinds of bait.

Coalition is a term applied in English politics to the union of two parties or portions of parties for the attainment of a common end. The most noted C. in British history is that of 1782, when Lord North and Charles James Fox, the leaders of opposing parties, took office in the same cabinet. More recently (1853) the C. of the Whigs and Peelites in the Aberdeen cabinet is memorable in connection with the Crimean war. If Mr Disraeli is to be believed, 'England does not love coalitions'—perhaps because they have never been successful, and rarely honest.

Coal-Mines, Law as to. A coal-mine is legally part of the lands within which it is situated; but it may form a separate estate. A proprietor may sell the surface of land, reserving the coal and other minerals, or he may sell the latter and reserve the former.

Coal-Mines Regulation Acts were passed in 1872 for the purpose of consolidating and amending the Acts relating to mines.

Under the Act, no boy under ten years old, and no woman or girl of any age, is to be employed in any mine to which the Act applies below ground. The Act makes regulations regarding hours of labour and meals. It also deals with the education of boys employed underground. Wages are not to be paid at public-houses. Single shafts are prohibited. A daily inspection by a competent person of every mine is directed, and a great number of regulations are made with the view of promoting healthfulness and safety in the coal-mines. See METALLIFEROUS MINES REGULATION ACT.

Coal-Tar. See GAS-TAR.

Coam'ings of ships are frames of wood or iron placed round hatchways and other openings in the deck to keep out water.

Coan'za, Cuan'za, or **Quan'za,** after the Congo (q. v.) the most important river of Lower Guinea, Africa, rises in the plateau of the interior, and, after a course of 600 miles marked by numerous cataracts, enters the sea 38 miles S. of San Paulo de Loando. It forms several islands near its mouth, has numerous tributaries, and is navigable for large boats as far up as the lowest cataract, about 110 miles. See Valdez, *Six Years of Traveller's Life in Western Africa* (2 vols. Lond. 1861).

Coast-Guard, a body of seamen formerly employed by the customs department exclusively to keep a look-out for smugglers, but since 1856 under the control of the Admiralty, and liable to be called to serve as regular sailors on board ships of war. The force may be augmented to the number of 10,000 at the utmost. The coasts of the United Kingdom are divided into eleven districts, at each of which there is a district gunship, while there is also a headquarters ship. Able-bodied seamen employed in the service are divided into three classes—boatmen, commissioned boatmen, and chief-boatmen; they receive high sea-pay, free house, rent, and medical attendance, and 1s. 4d. a day besides in place of provisions. They are drilled in the serving of land-batteries, gunboat exercise, and naval gunnery. The number of the C.-G. on shore, officers and men, provided for in the naval estimates for 1874–75 was 4300; and the expense of the C.-G. service, royal naval coast volunteers, and royal naval reserve was £163,311.

Coast Volunteers, or **Royal Naval Coast Volunteers,** an attempt, which has not been very successful, to organise seafaring men and others, in connection with the Coast-Guard (q. v.), but separate from it, specially for the defence of the coasts of the United Kingdom. The Admiralty was empowered by an Act of Parliament passed in 1853 to raise such a body, not exceeding 10,000; to enrol them for five years' service; to have them exercised, on shipboard or on shore, twenty-eight days every year; but not to send them on duty beyond 50 leagues from the coast, unless at an emergency, when they might be sent 100 leagues. Their pay, allowance, and rank during active service is the same as that of able-bodied seamen. At present, 1875, the men enrolled in the C. V. do not number 1000.

Coast'ing Trade is the maritime commerce between ports of the same country. Formerly no goods or passengers could be lawfully carried coastwise from one port of the United Kingdom or Channel Islands to another except in British ships. This restriction on foreign vessels has been repealed by 17 Vict. c. 5, subject to the Customs Act, 1853, and the right of retaliation. See NAVIGATION LAWS.

Coatbridge', a town in the parish of Old Monkland, Lanarkshire, 8 miles E. of Glasgow, and a station on the Caledonian Railway. It stands in the centre of a district rich in minerals, and is near the great ironworks of Gartsherrie, Summerlee, Dundyvan, Calder, and Langloan. In the immediate neighbourhood are upwards of fifty smelting furnaces. C. is one of the most thriving towns in Scotland, the pop. having increased from 1599 in 1841, to 13,624 in 1871.

Coat of Arms, a garment worn in the knightly exercises and actual battles of the middle ages, embroidered with the armorial insignia of the wearer. It was made of velvet, fur, cloth of silver or of gold, and descended to the knee. The phrase is applied in modern heraldry to the insignia alone, on whatever field they are emblazoned. See HERALDRY, SHIELD.

Coat of Mail, a suit of armour made of plates or scales of metal, or of linked rings, which was worn in the middle ages.

Co'balt is a steel-grey metal, occurring in small quantities in the free state in Meteoric Iron (q. v.), in combination with arsenic as *tin-white C.* ($CoAs_2$), with arsenic and sulphur as *C. glance* ($CoSAs$), and with arsenic and oxygen as *C. bloom* ($3CoOAs_2O_5$); it is also present in many copper ores. Before the discovery by Scheurer, in 1540, of the beautiful blue colour which oxide of C. imparts to glass when fused with it, compounds of the metal possessed no value, and their presence in the mines was attributed by the superstitious German miners to a malevolent demon or *kobold*, who was supposed to have placed them there instead of the useful ores which they resemble in appearance; it is from this curious superstition that C. derives its name. Metallic C. was isolated by Brand in 1773. It may be obtained by strongly igniting oxalate of C. It is hard, very infusible, and magnetic, and in its chemical properties and compounds resembles iron. Its atomic weight is 59, and the symbol for its atom Co. Chloride of C. ($CoCl_2$) is a red salt, obtained by dissolving oxide of C. in hydrochloric acid; its solution is employed as a *Sympathetic Ink* (q. v); nitrate of C. $Co(NO_3)_2$ is prepared in a similar manner. C. has two oxides, the protoxide CoO, and the sesqui-oxide Co_2O_3; the latter is used for staining glass and porcelain, and is obtained as a black powder by precipitating chloride of C. by a solution of bleaching powder. When C. ores which have been previously roasted are fused with sand and pearl ash, the oxide of C. produced by roasting the ore dissolves in the glass formed by the pearl ash and sand, with a magnificent blue colour, whilst nickel, copper, iron, &c., also present in the ore, collect at the bottom of the vessel in which the fusion has been made in a metallic mass called *speiss*. The blue glass when finely levigated forms *smalt* or *C. ultramarine*, whilst from the speiss, nickel is extracted. *Zaffre* is an impure oxide of C., obtained by roasting C. ores with sand. *Thenard's blue* is prepared by igniting a mixture of freshly-precipitated alumina and carbonate of C., or of the phosphate of alumina and C. *Rinman's green* is obtained by evaporating a mixed solution of nitrate of C. and nitrate of zinc to dryness, and calcining the residue.

Coban', a town of Guatemala, Central America, on the Rio Dolce, 55 miles N. of Guatemala. It lies in a region rich in sugar-cane plantations and in tropical fruits. Pop. (mostly Indians) 14,000.

Cobbett, William, an English political writer, born 9th March 1762, at Farnham, in Surrey, was bred to work on his father's farm. In 1783 he enlisted in the 54th Foot and went to Nova Scotia; while there he taught himself constantly, and rose to the rank of sergeant-major. Discharged in 1791, C., after spending a few months in Paris, settled in Philadelphia as bookseller and pamphleteer. Here he wrote in the bitterest manner against free thought, free institutions, &c., and was twice fined for libel. His *nom de plume* was Peter Porcupine; latterly his publication became periodical, and was called the *Political Censor.* Returning to London in 1800, where he was received with considerable attention by public men of Pitt's party, he started first a daily paper called the *Porcupine*, and then the *Weekly Register.* His influence may be inferred from the fact that Windham stated in the House of Commons that C. deserved a statue of gold. By his discussion of the treaty of Amiens he contributed to the rupture with France. In 1803 he suddenly went over to the Radical side of politics, either because he was slighted by Pitt or from conviction. This led to more than one Tory prosecution followed by fine and imprisonment. In 1817 his *Twopenny Tract* alarmed the Government into passing the 'Six Acts,' and C. retired for two years to America, where he studied agriculture, and drew certain conclusions on 'cottage and farm economy,' which, on his return to England, he tried unsuccessfully to realise on two farms. In 1825 appeared his *History of the Reformation in England and Ireland*, which, with his *Legacy to Parsons*, expresses his opinion that the transactions in Church property at the Reformation were fraudulent, and that the original Catholic endowments should be restored to educational and charitable objects. C. was now a popular leader on social and economic, as well as political, questions, as may be seen in his *Advice to Young Men and Women*, *Poor Man's Friend*, *Rural Rides*, *Emigrant's Guide*. As the Reform Bill drew near, the political interest became predominant. C. was once more prosecuted for some intemperate language, in which, in the *Register*, he had defended the burning of threshing-machines by the distressed labourers (Luddites) as leading to the reduction of tithes. Returned to the House of Commons for Oldham in 1832, he sat there for three years. He died at his farm of Ash, near Farnham, 18th June 1835. The rugged independence and energy of C.'s character were somewhat marred by an inordinate vanity, which led him to regard himself as one of the leading men in Europe of his time, and by the superficial knowledge of social and political institutions, which is so often the bane of self-educated men. He is acknowledged to be a master of plain, forcible prose; and the warmth of his public and private affections and his substantial honesty have not been seriously questioned. C. is seen at his worst in his conceited *History of George IV.* See an admirable essay by Professor Thorold Rogers. His son, **John Morgan C.**, published a complete collection of his *Political Works* (2d ed. 9 vols. Lond. 1848).

Cobden, Richard, an English politician, born at Dunford, near Midhurst, 3d June 1804, was the son of a small gentleman farmer. In 1838 he abandoned his career as a calico-printer in Manchester (which had been rapidly successful) that he might devote himself and his fortune to the Anti-Corn Law agitation. He seconded Mr J. B. Smith's celebrated motion before the Manchester Chamber of Commerce, and for nearly six years attended the Inner Council of the League, which met twice a day at Newall's Buildings, Market Street, Manchester. It was C. who gained over many of the Chartists and the clergy, and who founded the Anti-Corn-Law Conference, which sat in the Palace Yard to watch the Free-trade motions in Parliament. At Drury Lane and Covent Garden, and at the great centres of Protectionism through the country, C. and Bright, during the memorable year of 1843, seemed to carry everything before them, until the *Times* itself declared (18th November) that the 'League was a great fact.' In the meantime C. had been, in August 1841, returned to Parliament for Stockport, and took part in the debates on Mr C. Villier's annual motion, 'that all duties payable on the importation of corn, grain, meal, and flour do now cease.' In 1844 he brought forward his motion for a select committee to inquire into the effects of protective duties on imports in the interest of the tenant farmers and farm labourers of the country. He was replied to by Mr Gladstone. After the triumph of his principles in 1846 (a triumph which Sir R. Peel stated in Parliament to be mainly due to C.'s efforts), he was returned unopposed for the W. Riding of York, which he represented till 1857, when he was rejected by his constituency for having offered what was considered at the time a factious opposition to Lord Palmerston. In 1859 C. was chosen by Rochdale. In 1860 he carried through the Commercial Treaty with France, was offered a baronetcy and a seat in the Privy Council, but declined these honours; soon after fell into bad health, and withdrew from political life. He died 2d April 1865. C. was an ardent advocate of free trade in land, viz., the abolition of primogeniture, strict settlements, &c.; of financial reform, in which he included the substitution of direct for indirect taxation, and the consequent throwing open of all ports; of reduction in the votes for the services, as involved in his principle of non-intervention; of national, in the sense of undenominational, education. He spoke against the confiscation of the unarmed vessels belonging to subjects of a hostile belligerent, and against the practice of public loans being negotiated without inquiry for purposes of tyranny and oppression. Although there was no rhetorical art or epigram in C.'s speeches, they were marked by unaffected grace and simplicity, by keen logic, and by an abundance of well-chosen and accurately-stated facts. His *Political Writings* were published in 2 vols. (Lond. 1867).

Cobi'ja, or **Puerta la Mar**, the only seaport of Bolivia, and capital of the province of Atacama, 300 miles N. of Copiapo, has an insignificant trade. Pop. 2380.

Cobi'tis. See LOACH.

Cob'le, or **Cobb'le**, a low, flat boat, with the stern square. It is much used by salmon-fishers.

Coblenz', or **Koblenz'** (the Roman *Confluentes*), the capital of Rhenish Prussia, situated on the Rhine, at its confluence with the Moselle, is a fortified city of the first rank. It is connected, for purposes of defence, with the strongly fortified castle of Ehrenbreitstein (q. v.), on the opposite bank of the Rhine. The old town is irregularly built, with many of its streets narrow and ill-kept, but the new town is well built, and its streets airy and clean. The church of St Castor, founded early in the 9th c., stands on a tongue of land jutting out between the Rhine and the Moselle; other public buildings are the Government-house, the town-hall, the king's palace, and the old castle of the Electors of Treves. There are manufactures of linen, cotton, furniture, and japan-ware. Vine culture engages the industry of many of the inhabitants. C. is a free port, and carries on an extensive commerce, especially in corn, wine, and iron; it has also a trade in volcanic products for millstones and mineral waters. Pop. (1872) 28,748. There were also in garrison 2169 soldiers, and in the castle of Ehrenbreitstein 2488.

Cob-Nut, a large cultivated variety of the Hazel (q. v.). The Jamaica C., or Hog-nut, is *Omphaba triandra*, a tree of the natural order *Euphorbiaceæ*. Its white juice, which turns black in drying, is used in Guiana and other countries as ink. The nut is wholesome if the embryo is extracted; otherwise it is cathartic.

Cob'ra (*Naja*), a genus of Colubrine snakes belonging to the section *Venenosa*, and included in the family *Elapidæ*. The distinguishing features of the genus *Naja* are the possession of one or two smooth teeth behind the poison fangs, and the power of distending the loose skin at the sides of the neck, so as to form a kind of movable hood. The Portuguese name of the C. (*C. da capello*) means 'hooded snake.' This snake, the *Naja tripudians* of the naturalist, is one of the most deadly and venomous of known serpents. It inhabits India, and receives the name of 'spectacle snake' from the spectacle-like mark which exists on the back of the neck—a mark wanting in the nearly-allied *Naja Haje* of Egypt. The C. attains a length of 3 or 4 feet, and is coloured of a pale brown on the upper parts, and a lighter tint below; whilst the colour is variously marked with black, and exhibits variations. Specimens destitute of the spectacle-mark come from the E. Indies. The poison proves fatal to man within a comparatively short period.

Co'burg, or **Koburg**, capital of the Duchy of Saxe-Coburg, Germany, and alternating with Gotha as the residence of the Grand Duke of Saxe-Coburg-Gotha, is situated on the left bank of the Itz. The town is mostly old, and not well-built. Of its six churches, the most notable is the *Moritzkirche*, with a tower nearly 340 feet high. The old castle of the Dukes of C., in which Luther was concealed in 1530, stands on a height 500 feet above the town. The ducal palace was erected in 1549, and is the principal building. C. has manufactures of cotton, linen, and woollen fabrics, artistic work in marquetry, gold, and silver, also bleaching and dye works, breweries, &c. Pop. (1872) 12,891. Near C. are the 'pleasure-castles' of Rosenau and Kallenberg.

Coburg Peninsula, in the N. of Australia, forms the N.W. extremity of Arnhem Land, to the W. of the Gulf of Carpentaria, and partly encloses Van Diemen Gulf. It is an irregular promontory, about 50 miles from E. to W., but slightly connected with the mainland, and separated from Melville Island by the narrow channel of Dundas Strait.

Co'ca, or **Cu'ca** (*Erythroxylon C.*), a shrub of the natural order *Erythroxylaceæ*, the leaves of which are extensively chewed by miners and travellers in Peru, mixed with a little unslaked lime or the ashes of the Quinoa (q. v.) or of the trumpet-tree (*Cecropia peltata*). They have an effect on the constitution analogous to that of wine, enabling those using them to bear up under great fatigue and hunger. Respiration, so difficult at high altitudes, no longer becomes a labour; the desire for sleep departs, and the spirits attain buoyancy unknown before. Taken habitually and in large quantities, C. occasions various biliary and stomachic disorders, and eventually ruins mind and body. Used to a great extent with tobacco, it produces a sort of intoxication. Such, at least, is the account given by the native Indians who have long been acquainted with its use, and by Spruce, Tschudi, Scherzer, and other travellers. Weddell does not, however, think so highly of it, affirming that it does not supply the place of food, but merely deadens the sense of hunger for a time. Its use is now rapidly spreading, not only among the Indians, but among the Europeans and other settlers in Peru. Some years ago it was calculated that 30,000,000 lbs. were annually gathered, and that the use of the drug was indulged in by 10,000,000 people. In Bolivia alone about 15,000,000 lbs. are produced annually. It is probable that C. owes its peculiar properties to an organic base, to which Weddell has applied the name of *cocaine*, which in many of its properties resembles *theine*. A tonic wine has been made from it, and this, as well as the leaves, may probably yet be used as a medicinal agent.

Cocce'ji, Heinrich, Freiherr von, a very able and learned jurist, was born at Bremen, 25th March 1644, went to Leyden to study law in 1667, and to England in 1670. Having acquired a profound acquaintance with the subject in all its branches, he was appointed Professor of the Law of Nations at Heidelberg in 1672, of Jurisprudence at Utrecht in 1688, and regular Professor of Law at Frankfurt on the Oder in 1690. C. was sent on a mission to the Hague by Friedrich I. in 1712, and after his return was created a baron of the empire and a privy councillor. He died 18th August 1719. His chief work is his *Juris Publici Prudentia* (Frankf. 1695), which was long used as a text-book in German universities. Other productions of C. are *Anatomia Juris Gentium* (Frankf. 1718), and *Grotius illustratus* (3 vols. Bresl. 1744-48).—His son **Samuel**, born 1679, succeeded him as professor (1703), but devoting himself to a public career, rose to the highest legal position, dying (22d October 1755) High Chancellor of the Prussian state. He was the great reformer of the administration of justice in Prussia. His great professional work is the *Corpus Juris Fridericianum* (Berl. 1749-52). Other of his writings are *Jus Civile Controversum*, and *Novum Systema Jurisprudentiæ Naturalis et Romanæ*.

Cocce'jus, Johann, whose original name was Koch, born at Bremen, 9th August 1603, was first appointed Professor of Hebrew at Bremen (1629), then at Franeker (1636), afterwards Professor of Theology in the same place (1643), and finally Professor of Theology at Leyden (1650), where he died, 5th November 1669. He established a peculiar theological system called the *fœderal* method, founded on the idea of a covenant between God and man, which again was twofold—the covenant before the fall (of works), and the covenant after the fall (of grace); the latter embracing a threefold economy—prior to the law, under the law, and of the gospel; and also a school of biblical interpretation, according to which the Old Testament history exhibited, as in a mirror, the history of Christ and of the Christian Church, and which carried on a great controversy in the Netherlands during the 17th c. with the opposite school of Grotius (q. v.). His collected works were published at Amsterdam in 8 vols. (1673-75, and again in 10 vols. 1701), to which was added his *Opera Anecdota* in 2 vols. (1706). See Conybeare's *Bampton Lectures* (1824).

Coccinel'la. See LADYBIRD.

Coccin'ia, a climbing cucurbitaceous shrub, common in the hedges in India, the ripe fruits of which are used by the natives in their curries, and the leaves and other portions are also used medicinally.

Coco'o, Co'coa Root, or **Eddoes,** a name applied to various species of *Colocasia* and *Caladium*, tropical and sub-tropical, closely allied genera of plants belonging to the natural order *Araceæ*, the underground root, or Corms (q. v.), of which are used as food, *e.g.*, *C. antiquorum*, *C. esculenta*, *C. macrorhiza* (the Taro of the South Sea Islands—q. v.), *C. Himalensis*—the root of which, in addition to its nutritive properties, is, when fresh, stimulant, diaphoretic, and expectorant. The leaves of *C. antiquorum* when raw are acrid, but by boiling they lose their acridity, and are eaten as a substitute for spinach. The corms of *C. esculenta* are sometimes called Yams (q. v.) in the W. Indies, Madeira, &c. Lecoq has described curious spasmodic movements in its leaves, occurring spontaneously, at irregular intervals, and at different periods of the day and night. The quivering was sometimes of sufficient force to ring little bells attached to the leaves. M. Lecoq states that *C. esculenta* is quite destitute of Stomata (q. v.), and he attributes the phenomenon to the incessant pulsation of the imprisoned sap.

Coccoloba. See SEASIDE GRAPE.

Coccosteus (Gr. 'berry-boned'), a genus of extinct *Ganoid* fishes, included in the sub-order *Ostracostei*, and having the head defended by a large ganoid shield, the plates of which were covered with small tubercles; the presence of these latter giving origin to the name 'berry-bone.' A ventral or sternal shield also existed, but this latter had probably no connection with the upper one. A lower jaw or mandible existed, and this carried teeth of small size. The Notochord (q. v.) was persistent, but the neural spines of the vertebræ, their hæmal spines, and the fin-rays were ossified. This genus of fishes is exclusively confined in Britain to the Devonian rocks. Barrande has, however, described one from the Silurian rocks of Bohemia.

Cocc'ulus, a genus of plants of the natural order *Menispermaceæ*. A decoction of the roots of *C. villosus*, an Indian species, is used in cases of rheumatism, &c., and the fruits supply a kind of vegetable ink.

Cocculus Indicus, the fruit of the Anamirta Cocculus, a plant belonging to the natural order *Menispermaceæ*, a native of the E. Indies. The pericarp contains an alkaloid (*Menispermint*) which is not poisonous. The seeds are very poisonous, of the size of a large pea, and are very bitter. They owe their poisonous and bitter properties to Picrotoxin, $C_5H_6O_2$, a white, intensely bitter substance, crystallising in needles. C. I. has been used to give bitterness to beer, porter, and ale, but it is forbidden by law under very heavy penalties. It is sometimes used to destroy lice. In some countries it is employed to stupify fish, so as to render them easily caught.

Cocc'us, a genus of *Hemipterous* insects, belonging to the sub-order Hemoptera, and forming the type of a tribe named *Coccina*. From members of this genus the Cochineal (q. v.) and Kermes dyes are obtained. Many species infest our hothouses under the general name of bugs, and do harm to our plants; but it is to the tropical members of the group that we owe our dyes and other commercial products—such as lac, wax, &c. They are all minute insects, the males being two-winged, and the females wingless, but possessing a rostrum or beaked process. The females infest plants, and suck nutriment from them by means of the rostrum. The abdomens of the males are usually provided with two elongated filaments. The *C. aceris* is a well-known British species. *C. cacti*, living in the Nopal or *Cactus opuntia* of Central America, furnishes Mexican cochineal. *C. lacca*, of the E. Indies, gives us lac. The females alone appear to yield the colouring matter. See COCHINEAL INSECT.

Coc'cyx is the inferior or posterior terminal portion of the vertebral column. In man it consists commonly of four rudimentary vertebræ, sometimes of five, rarely of three. These unite together, and in advanced life the C. unites with the sacrum. See SKELETON and VERTEBRAL COLUMN.

Coccy'zus. See CUCKOO.

Cochabam'ba, the second largest city of Bolivia, and capital of a department of the same name, on the Rio de la Rocha, is the see of a bishop, and has fifteen churches, manufactures of cottons, woollens, leather, saddles, starch, soap, &c., and an active trade in grain and fruits. Pop. 40,678. C. was founded in 1572, and played a conspicuous part in the Revolution of 1815.—The *department of C.* is rich in precious metals, and grows cotton, sugar, dyewoods, &c. Area 26,481 sq. miles; pop. (1865) 349,892.

Co'chin (*kochi*, 'a morass'), one of the most prosperous principalities of India, in the province of Madras, is bounded

N. by British Malabar, S. by Travancore, W. by Indian Ocean, and E. by the Ghauts. Area, 1131 sq. miles; pop. (1872) 399,060. It is divided into (1) an eastern hill region, clad with splendid forests of red cedar, teak, and other hard woods; (2) a tract of plain between these hills and a lagune or backwater, which extends along the entire coast, and (3) a strip of land between this backwater and the sea, covered with cocoa-nut trees. The rich damp plains yield rice, pepper, cardamons, ginger, betel-nuts, yams, arrowroot, sweet potatoes, &c., while the plantations on the Nelianipathy Hills produce excellent coffee. The revenue is £125,458, being £14,664 in excess of expenditure; there are state schools, which educate up to the university entrance examinations; roads and bridges are made and maintained, and the present Rajah (Rava Virmah) has established a system of forest conservancy. C. is inhabited by a Malayan-speaking people, and of its places of worship 2734 are Hindu, 31 Mohammedan, 8 Jewish, and 108 Christian. It is specially interesting as belonging to the portion of India first visited by European adventurers. The state was under the yoke of Hyder Ali and his son from 1776 to 1791, and the first treaty of the Rajah with the English was in 1793, when he agreed to pay a tribute of £20,000 a year, and received a guarantee of all his rights.

Cochin, a seaport in the district of Malabar, province of Madras, British India, and formerly capital of the native state of the same name, is situated at the N. point of the narrow peninsula separating the long coast stretch of backwater from the sea, and has some trade in cocoa-nut oil and fibre, pepper, coffee, &c., and a considerable industry in shipbuilding. Its fine harbour is injured by a bar, over which there is a depth of some 18 feet of water. The water is brought from a place 18 miles off, and the mean temperature is 78° F. Pop. 20,000, comprising, besides Hindus, Arabs, Dutch, Persians, &c. C. was the site of the first Portuguese fort in India, erected in 1503. It was taken by the Dutch in 1663, and by the British in 1796.

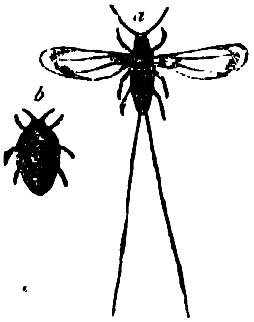
Co'chin-Chi'na, the Anamese' Empire, occupies a long and narrow strip of territory on the E. coast of the Indo-Chinese Peninsula, and consists of the inland province of Anam, and the maritime provinces of Tonquin in the N. and C.-C. in the S. It is bounded on the N. by China, on the E. and S. by the Gulf of Tonquin, the China Sea, and Lower or French C.-C., and on the W. by Siam. Area, 83,190 sq. miles; pop. stated at 9,000,000. A mountain range runs N. and S., separating the inland from the two maritime provinces. Spurs from this central chain occupy much of the area of Anam and C.-C., and numerous streams descending from it flow E. through the latter into the China Sea. Anam is watered by the Mekong. The province of Tonquin is flat, and is watered by the great and valuable river Song-koi, which, rising among the mountains of Yunnan, passes through rich alluvial plains in its lower course, and falls into the Gulf of Tonquin. The inhabitants are Mongols, Chinese, and Malays, engaged chiefly in the cultivation of rice, which is the principal article of food, and in working the tin and other valuable mines. The religion is Buddhism, the form of government is modelled upon that of China, and the capital is Hûe, on a river of the same name in the province of C.-C.

History.—The early history of Anam, by which name the empire is always spoken of by the natives, has been said to be 'either a wild fable or a revolting recital of internal war, anarchy, and bloodshed.' Little is known about it with certainty until 1624, when the Christian religion was introduced into the country by Portuguese Jesuits from Macao. In 1778 Warren Hastings, Governor-General of India, despatched a mission to Anam with the view of establishing commercial relations with the empire. A frightful civil war was then raging throughout the country. The envoy was inhospitably received, and was at last counselled to take refuge on his ship in the harbour of Hué, whence with difficulty he escaped with his life. A few years afterwards the French attempted with greater success to establish relations with Anam. A Franciscan friar, usually designated Bishop of Adrian, but whose real name was Pigneaux de Behaine, and who was of French birth, while prosecuting a Christian mission in the country, became intimate with the reigning sovereign, had an opportunity of affording him signal services which led to the extension of his sovereignty in Tonquin and Cambodja, and thus obtained an ascendancy over his mind. The result was the ratification of an offensive and defensive alliance between the Anamese sovereign and Louis XVI. of France in 1787, or immediately thereafter. This treaty, however, led to no results materially beneficial to France. In the present century France has been more successful. See C.-C., LOWER or FRENCH.

Cochin-China, Lower or French (*Basse Cochin-Chine*), a French colony in the extreme S. of the Indo-Chinese Peninsula, consisting of tracts of land on both sides of the lower course of the Mekong or Cambodja, bounded on the N.E. by C.-C., on the N.W. by the kingdom of Cambodja, and on the S. by the China Sea. Area, 21,716 sq. miles; pop. (1871) 1,335,842, chiefly Anamites and Cambodjans, but embracing over 20,000 Chinese engaged in commercial pursuits, and about 600 European civilians. The colony consists of the six provinces of Saigon, Mytho, Bienhoa, Vinhlong, Hattien, and Angiang. In the extreme N. and N.E. (the province of Bienhoa), the land is covered by spurs of the mountain range that runs S. through the Anamese empire, and by elevated uplands. This hilly district is productive in indigo, tobacco, cotton, sesamum, hemp, vegetables, earth-nuts, sugar-cane, betel, maize, mulberry-trees, &c. Forests of valuable timber trees also occur. In the other provinces of the colony the surface is flat, the soil alluvial and rich, and covered by an intricate and widely extended network of rivers and *arroyos*, or channels scooped out partly by nature and partly by human labour. The chief river is the Mekong or Cambodja, 'which,' says Louis de Carné, 'will bear comparison with the noblest rivers of Asia.' It divides itself into three great branches in its passage through the inland districts, and these are again subdivided into many minor branches, forming a delta 40 miles wide by 60 miles. Other important streams are the Donnai and the river of Saigon. All the greater rivers are navigable for vessels of considerable draught, though the sandbars at their entrances, over which the water is seldom more than from 9 to 12 feet deep, are an obstacle to navigation. A vast tract of the area of the colony is in rice-fields, and rice is the chief product of the country. In 1873 the amount of rice exported from C.-C. was 272,000 tons, or over 50,000 tons more than in the previous year. In 1874 the export of rice was 182,120 tons, and other exports were cotton, silk, sugar, pepper, coffee, and fish. The only great seaport, and the centre of commerce of the colony, is Saigon (q. v.). The climate is not considered healthy for Europeans. The rainy season, that of the S.W. monsoons, lasts from May to October, during which the temperature ranges from 68° to 86° Fahr. The hottest weather occurs in the months of February and March. The administration of government is in the hands of a governor and council.

History.—The connection between France and the Cochin-Chinese empire dates from the latter part of the 18th c., when, in 1787, the King of Anam, in return for services performed, engaged himself by treaty to cede the town and harbour of Touran or Kwang-han, with the territory belonging to it, to Louis XVI. The King failed to implement his treaty by the stipulated transfer of territory, but he yielded so far as to treat the French representatives with respect, and he extended protection to the French missionaries. In the succeeding reign the Christians suffered severe persecution at the instigation of the King, and many of the French missionaries were murdered. Under Tien-fri, who ascended the throne in 1841, the persecutions of the Christians were recommenced, until, in 1847, Captain Rigault di Genouilly arrived on the shores with a demand for the fulfilment of the treaty of 1787. His demand being refused, he fired into and destroyed five Cochin-Chinese junks. The relations of the two powers remained, however, unaltered—the Anamese persecuting, the French protesting—till 1857, when the Anamese Emperor, Tu-duc, fiercely assailed the Christians, and, among others, murdered a Spanish prelate. An alliance of France and Spain against Tu-duc was the result, and on the 30th August 1858 a squadron of French and Spanish ships appeared before Touran, summoned the forts to surrender within a given time, and receiving no answer, fired and took possession of the town and forts on the following day. The town and surrounding territory of Saigon was taken by the French in 1859, Mytho and Bienhoa in 1861, and Vinhlong in 1862. By treaty dated May 26, 1862, the King of Anam engaged to pay France an indemnity of 1,000,000 sterling, to cede to that power the three provinces then known as Lower C.-C., and to guarantee toleration in religion and commerce. Having acquired these three provinces, the first care of the French governor of the new colony was to secure the peace of the frontiers. To attain this end was a matter of no small difficulty. The little kingdom of Cambodja, on the N.W. of the colony, had for years been ravaged by Siam on the W. and C.-C. or Anam on the E. It was evident to the French authorities that tranquillity was only to be secured by protecting Cambodja against her rapacious neighbours, and thus guaranteeing her independence. Accordingly, Rear-Admiral de la Grandière was despatched to the Viceroy of Cambodja (then under suzerainty to Siam), to inform that ruler that henceforth he was to consider himself a tributary to France, and a treaty giving validity to this arrangement was ratified between the two powers in August 1863. This arrangement naturally and not unexpectedly led to complications. The French felt themselves called upon to suppress an insurrection of a section of Cambodjans assisted by Anamites in 1867, and to prevent the recurrence of similar disturbances, the French governor wrested the three southern provinces of Lower C.-C.—Vinhlong, Hattien, and Angiang. Since this period the French have applied themselves to the object of developing their colony. In 1866 an expedition was organised to explore the course of the Mekong, and to open up a commercial highway by this river between the western provinces of China and the great seaports of the French colony. The river, obstructed by impracticable rapids, and with an irresistible current, was found to be quite unfit for navigation, and thus the dream of making Saigon the seaport of Yunnan and Szechuen vanished conclusively. But the resolution to extend French influence in Indo-China has not been abandoned, and in furtherance of this aim the minutes of a treaty with Anam were signed on the 14th March 1874, the chief conditions of which were—Opening three ports in Tonquin; liberty for Europeans to reside therein; liberty to travel in the interior under passport from French consul; leave to pass Chinese productions through Tonquin; freedom in regard to the Catholic (Roman) faith; obligation that French protection be called upon in case of internal disturbance. See *The Land of the White Elephant*, by Frank Vincent (1873); *Travels in Indo-China and the Chinese Empire*, by Louis de Carné, member of the commission of exploration of the Mekong (1872).

Coch'ineal Insect (*Coccus Cacti*), a species of the Hemipterous genus *Coccus* (q. v.), which lives on the *Cactus Opuntia* or Nopal of Central America, and on other species of cacti as well—such as the *Cactus* or *Opuntia Tuna* of Peru, &c. The C. I. was first introduced into Europe in 1523 from Mexico, but cochineal is now produced in the E. Indies and Algiers, as well as in Europe. This insect is of small size, and of a deep red or mulberry colour. The insects scraped from the cacti are killed by boiling water and dried in the sun. 70,000 of these small insects go to the pound of cochineal. In 1868, Britain imported 35,375 cwts. of cochineal, valued at £588,691.



Cochineal Insect.
(*a*, winged insect; *b*, wingless female.)

Coch'lea, a portion of the internal ear. See Ear.

Cochlea'ria. See Scurvy-Grass.

Cochlosper'mum, a genus of small trees and shrubs indigenous to tropical India, Africa, America, and N. Australia, belonging to the natural order *Flacourtiaceæ* (*Bixineæ*). The stem of *C. Gossypium* of India yields kuteera gum, used as a substitute for gum and tragacanth. The cottony substance which adheres to the seeds is used to stuff pillows, &c. A decoction of the roots is used in Brazil as a cure for abscesses, and for pains which are the result of falls and other accidents. *C. Planthoni* is a native of Western Africa; its roots yield a yellow dye. *C. tinctorium* of Senegambia also furnishes a yellow dye, as well as a medicine used in amenorrhœa.

Cock, a name applied generally to the males of Rasorial or Gallinaceous birds, but sometimes restricted to denote the male of the common or Domestic Fowl (q. v.). In the C.-birds of most Rasores (q. v.) the ornaments displayed in the form of plumes, brilliant lustres, wattles, and epidermal appendages are seen to greatest perfection. The presence of these appendages is doubtless a mark of sexual difference and selection. See Sexual Selection.

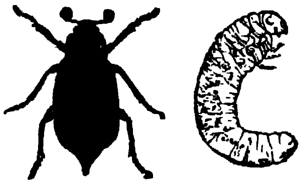
Cockade' (*cocarde*, Old Fr. *coquarde*, 'a cockscomb,' then a red device in the hat like a cockscomb), originally applied to the ribbon with which the loop of a cocked-hat was ornamented, is a term now used to signify a ribbon, a knot of ribbons, of leather, or something similar, worn on the hat as a badge of office or a party symbol. The badge of the Stuarts was a white rose, and a white C. became the symbol of their party after the Revolution, while that of Nassau was orange, and the Hanover C. black—the latter becoming common in this country after the accession of George I. It was in the 18th c. that these marks of distinction assumed military importance, a tuft of grass or corn being worn by the soldiers under Marlborough and Prince Eugene. In the War of Succession the French C. was white, that of Spain red; and the two colours were blended when the armies of these countries were subsequently combined. When in 1789 French citizens generally exhibited the 'red, white, and blue,' it was partly in defiance of an order issued in 1782, which forbade all who were not soldiers to wear the regulation white C. of France. The red and blue were added as being the colours of Paris. The tricolor has been the badge of the French army since the Restoration, at the beginning of which an ineffectual attempt was made to establish the white of the monarchy as the sole colour. The Austrian C. is black and yellow; the Prussian, black and white; the Belgian, black, yellow, and red—the shape on the Continent being generally a flat disc, and the material generally leather, but at times silk or other stuff. On the flat disc the colours are disposed concentrically. The adoption of the C. by European nations was only the systematising of ancient usage. The Plantagenet family was named after their sprig of broom—*Planta genista*; and the Wars of the Roses are so named after the badges of Lancaster and of York.

Cockatoo', the name by which several distinct genera of Scansorial birds, included in the family *Psittacidæ* or Parrots, are distinguished. The sub-family *Cacatuinæ* is sometimes formed to include these birds, in which—the true cockatoos—the tail is broad and even, and the head adorned with an erectile crest. The bill is larger and less acutely curved than in the parrots. These birds are confined to Australia and the E. Archipelago. The food consists of fruits and seeds, and the nests are built in holes of trees. They may learn to speak, but not with the same distinctness or fluency as the parrots. The great sulphur-crested C. (*C. galerita*), the lesser sulphur-crested C. (*Plyctolophus* or *C. sulphureus*), the galeated C. (*Callocephalon galeatum*), and the Banksian C. (*Calyptorhynchus Banksii*) of Australia are well-known forms. The genera *Microglossus* of New Guinea is also included in the C. family.

Cockatoo (black).

Cock'atrice, a fabulous monster, said to be hatched by a serpent from a cock's egg, and to inflict death by its breath and by its look. The word occurs four times in the authorised version of the Old Testament, where it evidently means a venomous serpent, and is probably identical with the reptile named by the Greeks *basiliskos*. See Basilisk.

Cockburn (pron. *Co'burn*), **Henry**, a notable Scottish advocate and judge, was born at Edinburgh, October 26, 1779, educated at the High School and University of his native city, and was called to the bar in 1800. After seven years' waiting for briefs, he was appointed Advocate-Depute to the then Tory Lord Advocate; but having, through his long and intimate friendship with some of the chief Liberals of the time, Horner, Brougham, and above all Jeffrey, thrown aside the political principles hereditary in his family, he was dismissed from the office. C.'s very considerable ability, his shrewd common-sense, and his impressive and homely manner, began to win him a reputation and a practice—particularly after the introduction into Scotland of jury trial in civil causes. In 1831, under the Grey Ministry, he was made Solicitor-General for Scotland, and in 1834 became one of the judges of the Court of Session, when he took the title of Lord C. He died April 26, 1854, at his residence of Bonaly, near Edinburgh. C. was not a voluminous author, although he wrote some articles for the *Edinburgh Review*, chiefly on law reform. His best-known works are his *Life of Jeffrey*, published in 1852, and the *Memorials of his Times*, published two years after his death, containing glimpses of the Edinburgh society of the time in which he lived. This was continued by the publication in 1874 of his *Journal*, in 2 vols., a work principally valuable for the news gathered by C. of the 'Disruption' of 1843, which ended in the formation of the Free Church, of the events which led up to it, and of the men who took part in it. A volume of C.'s correspondence has also been published.



Cockchafer and Larvæ.

Cock'chafer (*Melolontha vulgaris*), the name given to a beetle of the tribe *Lammellicornes*, distinguished by the length and size of the leaves of which the terminal joint of the antennæ is composed. These leaves are largest in the male C., and fold up like a fan. The C. belongs to the *Phyllophaga*, or leaf-eaters. It is not common in Scotland, but occurs in England and Europe. The adult feeds on leaves, the larvæ feeding on the roots of corn and grasses. The C. is of a black colour, covered with a downy white substance, and is on an average an inch in length. It spends from three to four years in the grub or larval condition, but has not a long existence as the adult. The larvæ are very destructive to grasses, and occasionally immense hordes of these beetles appear in certain localities, and devastate the plant-surroundings. Such an invasion occurred in Galway in Ireland in 1688.

Cock'er, one of the spaniels, nearly allied to the Blenheim dog. Its colour is most usually of a blackish tint. The C. is of small size, and is employed in pheasant-shooting. Its ears are pendant, but the tail is not of great length.

Cocker, Edward, an arithmetician and caligrapher, was born probably in 1631 at London, where he died about the year 1677. C. was a schoolmaster by profession. His famous *Arithmetic* was published shortly after his death by John Hawkins. C. was also the author of a small dictionary, and of a book of sentences for writing, called *C.'s Morals*.

Cock'ermouth, a parliamentary borough in Cumberland, at the confluence of the Cocker and the Derwent, 25 miles S.W. of Carlisle. It is a station on the Penrith and Workington branch of the North-Western Railway. C. has considerable trade, manufactures of woollens, linens, cottons, hats, and hosiery, tanneries, breweries, and dyeworks. It returns one member to Parliament. Pop. (1871) 6936. The poet Wordsworth was a native of C. C., which is a place of considerable antiquity, has the ruins of a castle built soon after the Norman conquest. There is a fine promenade a mile long on the N. bank of the Derwent, with the old castle at one end and wooded cliffs at the other.

Cock-Fighting is now prohibited by Act of Parliament, under a penalty of £5 for each day that the offender has been connected with it.

Cock'le (*Agrostemma*), a genus of plants of the natural order *Caryophyllaceæ*, allied to *Lychuis*. The corn-C. (*A. Githago*) is a frequent and troublesome corn-weed in some parts of Britain and all over the continents of Europe and America, but is originally a native of Europe or the W. of Asia. The seed is still sold for medicinal purposes in Germany under the name of *black cummin*.

Cockle (*Cardium*), a genus of Lamellibranchiate mollusca included in the family *Cardiadæ*, the members of which possess equivalve shells of heart shape, with radiating ribs; the mantle is open in front, and the syphons are short. The foot is large and sickle-shaped. The common C. (*C. edule*) is a well-known edible mollusc of our coasts. It is enabled to take leaps of considerable extent by straightening its foot suddenly, and leaping through the impetus thereby gained. By means of the foot also these molluscs burrow in the sandy coasts in which they are found. A great many species exist. *C. Junonæ* is a second familiar species. Two adductor muscles exist for the purpose of closing the shell.

Cock'ney (from the Fr. *cocagne*—'*Pays de Cocagne*'—an imaginary land in mediæval mythology where the houses are made of cakes; perhaps formed from the Lat. *coquinus*, from *coquere*, 'to cook'), was a name given to the luxurious inhabitants of London, as opposed to the less effeminate denizens of the country. 'The King of Cockeney'—*i.e.*, of London—occurs in some verses ascribed to Hugh Bagot, Earl of Norfolk, in the time of Henry II. 'The Land of Cockaigne' is applied in a popular satire of the 13th c. to a Fool's Paradise for monks, in which the pleasures are all sensual.

Cock of the Plains (*Tetras urophasianus*), a species of grouse inhabiting N. America. It is the largest member of that family found in the New World; but is smaller than the Capercailzie (q. v.). The plumage is of a general yellowish-brown tint, the under parts being white, whilst generally it is mottled with dark tints. The males have bare sacs on the neck, which they can distend at will. C. occurs in California and Columbia. Its flesh is bitter, owing to the bird feeding on certain herbs (*Artemisia*, &c.).

Cock of the Rock (*Rupicola aurantia*), a Dentirostral (*Insessores*) bird, belonging to the Manakin family (*Piprinæ*), and so named from its possessing a singular double crest of feathers rising from the sides of the head, whilst the upper tail-coverts give the bird the appearance of a cock-like tail. It inhabits Guiana. Its colour is a fine orange, with the wing-gills and tail black. Another species (*R. Peruviana*) is found in Peru.

Cock of the Woods. See CAPERCAILZIE.

Cock'pit, a theatre in which gamecocks used to be exhibited fighting. The room in which Her Majesty's Privy Council meets at Westminster is so called, because it was built on the site of the C. of the palace at Whitehall. In *nautical language*, the term is applied to a place under the lower gun-deck, containing the rooms of several junior officers; here the surgeon keeps his medicine-chest, and attends to the wounded.

Cock'roach (*Blatta*), a genus of Orthopterous insects belonging to the Cursorial section of that order, and included in the family *Blattina*. All the legs are formed for running; the head is concealed beneath the thorax; the feelers are long and bristle-like; simple eyes or ocelli are generally wanting; wings may be wanting in the females only, or in both sexes; the hinder wings fold up fan-wise, the front wings forming elytra or wing-covers; spines exist on the tibiæ, and the tarsi are five-jointed. The body is flattened and ovate, and the abdomen is terminated by a pair of jointed appendages. *B. orientalis* is the common C. or black-beetle, found in great quantities in many houses. The wings in this species exist in the males only, and are rudimentary. These insects are supposed originally to have been imported from India. They occur also in ships, a second species, *B. Americana*, being found in the latter habitations. They are of nocturnal habits, devour animal and vegetable matters, and exhale a disagreeable smell. *B. gigantea* is a large W. Indian species, also named the *Drummer*, from its making a knocking noise in the night-time. The eggs are enclosed in horny cases, and are arranged therein in a double row, each egg being partitioned off from its neighbour. *B. Lapponica* occurs in Lapland.

Cocks'comb (*Celosia cristata*), a plant belonging to the natural order *Aurantiaceæ*, is a native of the E. Indies, and is now extensively cultivated in our conservatories, and in the open air in warm localities.

Cocksfoot Grass (*Dactylis*), a genus of grasses, of which one species, *D. glomerata*, the common C., is generally distributed over the cooler portions of Europe, Asia, N. America, and the N. of Africa. In Britain it forms one of the best of our pasture grasses, growing well on most lands, particularly where the soil is loamy or chalky. It is also suitable for growing on boggy soils under course of reclamation. In America it is called the *orchard grass*. Twenty-nine species are described by Steudel.

Cock's-Spur Thorn. See CRATÆGUS.

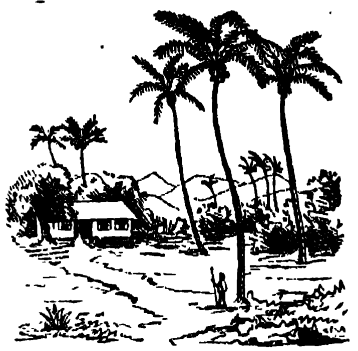
Cock'swain, or Coxwain (pron. *cosn*), is the commander of a boat's crew, and steersman of the boat. The *cosn's* whistle brings his men together on the shortest notice. The word is formed from the Welsh *cwch*, 'a boat,' and '*swain*,' properly a servant, but here the petty officer in command.

Co'coa, Caca'o, or Co'co (*Theobroma C.*), a tree belonging to the order *Byttneriaceæ*, from the seeds of which the drinks called C. and chocolate are prepared. It is a native of Mexico, Demerara, and other portions of tropical America, but is now naturalised in various other tropical countries, such as Martinique, the W. Indies, Colombia, the Philippine Islands, Guiana, the Canaries, &c. About the year 1520 the seeds were introduced into Europe as a medicinal agent. The tree is much branched, and attains a height of from 16 to 20 feet on an average, though occasionally it grows to twice that height. It produces ovoid fruits, each of which contains from 13 to 40 seeds—the *C. beans* of commerce. After being shelled and bruised to pieces, they constitute *C. nibs*. The seeds are extracted from the fruits by their being allowed to ferment for some time, and then opened by hand, or by being buried in the earth until the pulp becomes rotten, after which the seeds are dried in the open air or by means of a fire. The last method of extracting the seeds produced the *Cacao terré* of the French manufacturers, and is by some considered as yielding the best C. In commerce there are two kinds of C., viz., Caraccas C. from Caraccas, and Island C. from Bourbon, Mauritius, the W. Indies, &c., which is less esteemed than the first-named quality. Most of the C. used in England comes from Guyaquil. It is very nutritious, chiefly owing to the soft, solid oil known as *C. butter*, which forms more than 50 per cent. of the shelled bean. The rest consists of starch, gum, mucilage, gluten, albumen, &c., and a crystallisable principle called *Theobromine* analogous to Caffeine (q. v.). It is prepared for use in various ways. First it may be prepared as Chocolate (q. v.), or by grinding up the roasted seeds with their outer shells or husks between hot cylinders into a paste, when it is then mixed with starch, sugar, &c. This forms *common C.*, *soluble C.*, &c., or the *C. nibs* already mentioned. This latter is the purest form of C. The husks are sometimes imported from Italy under the name of 'miserable,' and are used in Ireland and Italy for making a thin, though wholesome and agreeable, beverage in favour with the poorer classes of these countries.

Cocoa—(Flower, Fruit, and Leaf).

Altogether it is calculated that C. in one form or another forms the beverage of about 50,000,000 of people, and that the consumption is about 100,000,000 lbs. annually. In 1867 nearly 12,000,000 lbs. were imported into Britain. From the pulp which surrounds the seeds a kind of spirit is distilled. C., as a beverage, is nourishing and wholesome, and is also used as a menstruum for administering various medicinal substances, and the *butter* is official in the English pharmacopœia. As an emollient, and as an ingredient for making 'suppositories,' it is valuable from not becoming rancid. C. mixed with rice, meal, starch, sugar, and flavoured with vanilla, constitutes the *Kacahout* of the Arabs.

Co'coa-Nut, or Coco-Nut (*Cocos nucifera*), a species of palm, a native of the Indian coasts and the South Sea Islands, but now naturalised in suitable situations in most tropical countries. It always prefers the vicinity of the sea-shore, though sometimes found at a considerable distance inland, It is one of the most graceful of its order, often rising to the height of from 60 to 100 feet, in a stem not over 2 feet in diameter. With the exception of the bamboo, there is perhaps no plant which is applied to so many and so varied uses as the C. From the husk surrounding the nut, coir or fibre is manufactured, and out of this mats, brushes, cables, &c., are made. In Southern India and other countries the fruits form one of the staples of life. The oil extracted from it is used in cookery when fresh. By pressure, stearine, used in making candles, can be extracted from it. The shells are made into spoons, drinking cups, lamps, &c.; when burnt furnish an excellent charcoal and lampblack. 'Toddy' is made out of the fresh sap, as already described in the case of other palms, and vinegar, arrack, and sugar are also some of the products of this juice. The leaves are used for thatching houses, making mats, baskets, hats, &c. The terminal leaf bud is boiled and eaten as a pot-herb. The hard wood is used for an infinite variety of purposes, and in this country is familiar under the name of 'porcupine wood,' out of which ornamental boxes, &c., are made. It is even considered that the flowers are potent as an astringent, the roots as a febrifuge, and the milk as a cure for ophthalmia. With this category of uses we have by no means exhausted the list of economic purposes to which the C. are applied, which are, indeed, almost endless. There are about a dozen other species of *Cocos*, one of the most interesting of which is *C. butyracea* of New Granada. From this tree toddy is also extracted, but the method adopted is somewhat different from that employed in other countries. The tree is cut down, and a long cavity excavated in the trunk near the top; at the end of about three days this cavity is found filled with the sap, which constitutes 'toddy.' *C. coronata*, a small Brazilian species, has a quantity of starch stored away in its loose pithy interior, which is used as food.



Cocoa-nut Palm.

The *Double C.*, the *Coco de Mer*, *Coco de Salomon*, *Coco des Maldives*, is *Lodoicea Sechellarum*.

Cocoa-Nut Beetle (*Batocera rubus*), a genus of *Longicorn* Coleoptera or beetles, the larvæ of which inhabit cocoa-nut trees and eat into the stems. The larvæ are eaten by the natives of the E. Indies, and are of large, soft conformation.

Cocoon', the shell or covering of fibrous material in which many species of insects are protected during their pupa or chrysalis condition. The cocoons of several species are of very great industrial importance, especially those of the moth *Bombyx mori*, or the silkworm, which is the source of all ordinary silk. Several other species of moths yield silky fibre used in textile manufactures, the most important of which is the Tusseh or Tussur moth of India, *Antheræa paphia*, which spins a large grey-coloured C. from which a very strong silky fibre is derived. In addition, the Ailanthus moth, *Attacus cynthia*, has been introduced from China for culture in France, and silk is obtained from a hybrid between it and the Arrindy moth of Bengal, *Attacus ricini*. Among other valuable cocoons may be mentioned the Moonga of Assam, *Antheræa assama*, which forms one of the principal exports of that country; and the Mezankooree of the same region, the *Antheræa mezankooria*, from which much of the native dress of Assam is made; and the Yama-mai or oak silkworm of Japan, *Antheræa yamamai*, which has been introduced into Europe. There are, besides, numerous other species of *Bombyx*, *Attacus*, *Antheræa*, which yield useful silk both in the Old and New Worlds.

Co'cum Oil, a vegetable butter obtained from the seeds of an Indian tree (*Garcinia purpurea*) belonging to the same genus as the mangosteen. It is of a pale greenish-yellow colour, and very friable. C. is exported to Britain, where it is used in the manufacture of pomatum.

Cocy'tus, a tributary of the Acheron, in Epirus, and supposed by the ancient Greeks to be connected with the lower world. In their mythology it was one of the rivers of Hades, and is mentioned in the Odyssey. Virgil also assigns it a place in Tartarus, as with the Pyriphlegethon flowing into the Acheron. The name is derived from *kôkuein*, to shriek, to wail. Hence Milton's—

> 'Cocytus, named of lamentation loud
> Heard on the rueful stream.'

Cod (*Gadus Morrhua*), a genus of Teleostean fishes belonging to the sub-order *Anacanthina*, and to the family *Gadidæ*, which also includes the haddocks, whitings, &c. The ventral fins are jugular in position, that is, exist on the throat beneath the pectoral fins. The body is spindle-shaped. The scales are soft and of small size. The median fins are large. The lower jaw is furnished with a *cirrhus* or barbule. Three dorsal and two anal fins exist. The fishery of the C. forms a source of industry, which gives employment to thousands of men on the coasts of Britain, Holland, Sweden, Norway, Iceland, Newfoundland, and elsewhere. The flesh is eaten both in a fresh and salted state. The air-bladder and roe are regarded as delicacies, and from the liver is obtained the cod-liver oil which, in tubercular and phthisical complaints, is so invaluable a remedy. The fishery is carried on by hand-lines chiefly, the bait being cuttle-fishes, shellfishes, &c.

Varieties of C. (rock and red C.) exist, and the Dorse (q. v.) is sometimes named 'Baltic C.' The average length of the C. is 2½ or 3 feet, and its weight from 10 to 12 lbs.

Co'da (Ital. 'tail,' Lat. *cauda*) is a name given to a phrase or passage sometimes added, like a peroration, at the end of a musical composition.

Coda'rium, a genus of plants of the order *Leguminosæ*. *C.* (*Dialium*) *acutifolium* and *C. obtusifolium* yield the Sierra Leone fruits known as brown and velvet tamarinds, the pulp of which has an agreeable flavour, and is very commonly eaten.

Code (Fr. *code*, Lat. *codex*, older form, *caudex*). A collection and chronological arrangement of the laws of a state is sometimes so named, but this is usually called a *Digest;* and by a C. we generally denote a legal system which, though it may adopt some existing laws and customs, is founded on principles fundamentally new, such, for instance, as are advocated in the *Fragment on Government* and other writings of Jeremy Bentham. Roman law was first reduced into a C. by order of the Emperor Theodosius, A.D. 438. This, under the name of the *Theodosian C.*, continued for some centuries to be the only authoritative compilation recognised in the western part of the empire. The *C. Justinian*, whose authority prevailed in the eastern division of the empire, was compiled and finished by Tribonian about the year 533. It consists of the *Institutes*, or elementary principles of Roman law; of the *Digest* or *Pandects* (q. v.), containing the opinions of eminent lawyers; of a new C. or collection of imperial *Constitutions;* of the *Novels*, or supplementary C. These form the *Corpus Juris Civilis*, as published about the time of Justinian. They are the foundation of the legal systems of most of the states of Europe.

The old laws of the French monarchy were founded partly on Roman law, partly on custom, and partly on ordinances of the kings. In 1800 Bonaparte appointed a commission to form a scheme of a civil C. This was promulgated in 1803-4 as the *C. Civil des Français.* Under the Empire it was named the *C. Napoleon*, by which name it is still known. To judge of its value, we should read reports of the discussions in the French Council of State. See *Esprit du C. Napoleon tiré de la Discussion*, by Locré, and *Analyse Raisonnée de la Discussion du C. Civil au Conseil d'État*, by Malville. See also Savigny *On the Aptitude of our Age for Legislation*, translated from the German by a barrister, and Rehberg *Uber den C. Napoleon.* In Thibaudeau's *Memoires sur le Consulat* the original expressions of Bonaparte in discussion are preserved. The *C. de Procédure Civil* (1806) prescribes the forms of civil process, and the rules of the courts' practice. The *C. d'Instruction Criminelle* was promulgated in 1808, the *C. de Commerce* in 1808, the *C. Penal* in 1810. Regarding the last, Thibaudeau says:—'Napoleon was absent from its discussion. He said that the laws should be concise, and leave much to the judges and the government in imposing the penalty, because,' he said, 'men have feelings of compassion unknown to the law.' Under the head of *Violations des réglements relatifs aux manufactures, aux commerce et aux arts*, any coalition to lower wages is punishable by fine and imprisonment, and workmen combining to stop a manufactory are to be punished in the same way; leaders in both cases being subject to severer penalties. For comments and strictures by French jurists on their criminal C., see *De la Justice Criminelle en France*, by Bérenger, and *Leçons Préliminaires sur le C. Penal*, by Bavouse. For a general view of the judiciary system of France, see *Esprit des Institutions Judiciaires*, by Meyer, and *Des Institutions Judiciaires de l'Angleterre comparées avec celles de France, et des quelques autres États*, by Rey.

Among mediæval codes the fullest and best was that of the *Gothic Law.* It was initiated by Alaric, King of the Visigoths, and enlarged by his successors. The second was the Burgundian; the third the Salic Law (q. v.), whose history is somewhat obscure. It dates from the exodus of the French from Germany. The fourth or Frisian law dates from the times of Pippin and Karl Martel. The *Asegabuch*, a set of Frisian laws, was composed about A.D. 1200. A complete collection of them was published by Richthofen (*Fries. Rechtsquellen*, 1840). All these codes ultimately merged in the law of the feudal system.

Codification is the process of forming a C. of laws. It may be either done by public authority, as in the cases of the *Codex Theodosianus* and the *Codex Justinianus*, or it may be done by a private person, as were the codes Gregorianus and Hermogenianus. Many attempts have been made to procure the codification of the laws of England. Notwithstanding the earnest advocacy of Lord Brougham, these have hitherto been almost totally ineffectual.

Co'deine is an Alkaloid (q. v.) present in opium, and was first extracted from that substance by Robiquet in 1832. It is a colourless crystalline body possessing a bitter taste and a powerfully alkaline reaction, combines with acids to form crystalline salts, and is a narcotic poison. The composition of C. is represented by the formula $C_{18}H_{21}NO_{3}$.

Codiæ'um, a genus of Spurgeworts (*Euphorbiaceæ*) indigenous to the Moluccas and islands to the N. of Australia. *C. pictum* of the Moluccas is often cultivated about houses in that country, and used for fences. The leaves are strewed on the ground on festive occasions, and are also used to decorate triumphal arches. When chewed, both bark and roots excite a burning sensation in the mouth.

Cod'icil (Lat. *codicillus*, a dim. of *codex*) is a supplement or addition made to a will by the testator, adding to, explaining, or altering some part of his former disposition. It may be written on the same paper as the will, or affixed to it, or written on separate paper and deposited in a different place from that in which the will is placed. In general, the law relating to codicils is the same as that relating to wills, and the same guarantees of signature and attestation are required. A man may make as many codicils as he pleases, and the last is equally valid with the first, if not contradictory. See WILL.

Cod'lin, or **Codling**, a variety of apple, for boiling or roasting, and thence deriving its name, which is probably connected with *coddle* and *caudle*, the origin of which again is the Lat. *calidus*, 'warm.'

Codling Moth (*Pyralis pomona*), a moth (*Lepidoptera*) belonging to the Tortricina tribe. The larvæ live in apples (hence its name), and destroy much fruit. The caterpillars have ten feet, and roll up leaves to form a cocoon. The wings are short but of broad conformation.

Cod'liver Oil is obtained from the liver of the cod, torsk, and other members of the Gadidæ family of fishes, the chief centres of its production being Newfoundland and Norway. Three varieties are known in commerce by the names of 'white,' 'pale,' and 'brown,' the difference in colour arising from the various modes of preparation. A fourth and very impure variety, prepared in Norway, is largely used by curriers under the name of cod oil. In Newfoundland the process of preparation is very simple. The livers are taken, as fresh as possible, and well washed to remove traces of gall, &c.; they are then heated in a boiler with steam or boiling water till the oil rises to the surface, when it is removed, and excess of water driven off by heat. The oil is next strained through cloth bags of different degrees of fineness, an operation which effectually prevents the admixture of solid extraneous matter. C. O. thus prepared is almost devoid of smell, taste, or colour, and possesses valuable medicinal properties. In Newfoundland it is worth from 5s. to 6s. per gallon. The disagreeable taste and smell of ordinary C. O. are partly due to the putrefaction of very minute pieces of liver and other solid impurities not removed by filtration. Its proximate constituents are olein, palmitin, and stearin, with small quantities of bu[illegible]c and acetic acids, and a peculiar substance called 'gaduin.' When taken internally, this oil supplies the system with nutritive fatty matter, and to this circumstance its efficacy in the treatment of pulmonary diseases is to be attributed.

Codogn'o, a town in the province of Milan, N. Italy, near the Po, 24 miles W. of Pavia, is a railway junction between Milan and Piacenza, has silkmills and linen factories, and an active trade in agricultural produce. Pop. 9632.

Cod'rington, Sir Edward, an eminent British admiral, was born in 1770, entered the navy in 1783, fought under Lord Howe, and at the battle of Trafalgar, in 1805, was captain of the *Orion*. In 1821 he was made vice-admiral, and in 1827 commanded the British, French, and Russian fleets which crushed those of Turkey and Egypt at the battle of Navarino. Although for political reasons he was recalled, C. continued to be honoured both at home and abroad, and in 1837 reached the dignity of Admiral of the Red. He sat for Devonport from 1832 to 1839, and died April 28, 1851. C.'s son, **Sir William John Codrington**, was born 1800, and entered the army as an ensign in the Coldstream Guards. On the outbreak of the Crimean war, he was made commander of a brigade of the Light Division, took part in the battles of Alma and Inkerman, and on the resignation of General Simpson, was appointed commander-in-chief of the English forces. On his return to England he entered Parliament as member for Greenwich in 1857, but accepted the governorship of Gibraltar in 1859. He was made a G.C.B. in 1865, and has received various foreign honours—French, Sardinian, and Turkish.

Cod'rus, the last King of Athens, according to the Greek legend, reigned about 1068 B.C. The Dorians having invaded Attica, the oracle declared that their success depended on the life of C. being spared. The Attic King, learning this, entered the hostile camp in disguise, and quarrelling with the soldiers, was slain. On this the Dorians returned home. The kingly authority was henceforth abolished at Athens by the Eupatrids, and Medon succeeded his father as Archon for life.

Coëffic'ient (Lat. 'together-making'), in algebra, is one of two factors, simple or compound, which together make up an expression. Thus, in 4 ab^2c^3, 4 ab^2c^2 is the C. of c, 4 ab^2 of c^3, 4 ab of bc^3, abc of 4 bc^2, &c.

Cœ'hoorn or **Cohorn, Menno, Baron Van**, a great military engineer, was born near Leeuwarden, in Friesland, in 1641, studied fortification under his uncle Bernardus Fullenius, Professor of Mathematics and Engineering at Franeker, entered the army at the age of sixteen, and after distinguishing himself in various battles and sieges, particularly those of Maestricht and Namur, rose to be lieutenant-general and chief director of Dutch fortifications, and the trusted engineer of William III. Of the towns he fortified, Bergen-op-Zoom is considered to be that which most unmistakably shows his genius. C., who has deservedly been called the Dutch Vauban, died at the Hague, March 17, 1704. He wrote several books, of which the *Nieuwe Vestingbouw* ('New System of Fortification,' Leeuw. 1685, new ed. 1702) is the best known. It was translated into many European languages. See Nicolas Ypey's *Narratio de Rebus Gestis Mennonis Cohorni* (Franek. 1771).

Coe'horns, so called from the engineer of that name, are small howitzers or mortars, about 4½ inches calibre, which, being easily moved, and requiring but a small amount of powder, were at one time much used in sieges, especially in pouring shells into the outworks of a fortress.

Coel, a town of British India, in the N.W. province, district of Allyghur, 2 miles S. of Allyghur and 80 S.E. of Delhi. It is a station on the East Indian Railway, and the residence of the civil authorities of Allyghur, with which town it is connected by a fine tree-shaded avenue. Pop. (1872) 48,403.

Cœlelmin'tha, literally 'hollow worms,' the name formerly given to certain groups of parasitic worms or *Entozoa*, belonging to the sub-kingdom *Annuloida* or *Echinozoa*, and included in the order *Nematelmia* or 'round worms.' Owen gave this name to these groups, in allusion to their possessing a distinct body-cavity, and in contradistinction to the Tape Worms (q. v.), and others, which possess no alimentary canal or body-cavity. The *Ascaris* or round worms, *Strongylus*, and *Filaria* or the Guinea-worm, are illustrative examples of C.

Cœ'le-Syr'ia (Gr. 'Hollow Syria'), now known by the Arabic name *El-Bŭkâ'a* ('the deep plain'), is properly defined by Strabo as the valley between Libanus and Antilibanus (about 100 miles long by 10 broad), but sometimes erroneously made to include the coast of the Mediterranean. The Lowland Scotch expression for districts similarly depressed is exactly the same, *e.g.*, 'The Howe of the Mearns,' and 'The Howe of Fife.'

Cœnæsthe'sis, a term designating undue susceptibility to external impressions. Some persons are susceptible of slight changes in the circumstances of their lives, while others are not so. To some individuals freedom from anxiety, good digestion, a bright sun and a dry bracing air, is the cause of cheerfulness, exhilaration, or even of joy; while some mental cause of depression, a slight disorder of digestion or of excretion, or a dull day, may cause gloominess and even despair. (Carpenter's *Mental Physiology*.)

Cœ'nobites ('dwellers in a *cœnobium*,' from the Gr. *koinos*, 'common,' and *bios*, 'life'), the name given to monks in the 4th c. who lived together in the same dwelling under an abbot or head, as distinguished from those who lived alone or solitary, as 'monks' (in the original use of the word) or *anchorites*.

Cœnu'rus, the name formerly given to several of the so-called Cestoid Worms (q. v.), which are now ascertained to represent merely stages in the development of the Tæniada or Tapeworms (q. v.) and their allies. The Cœnuri are, in fact, the *scolices* of Tæniada, and if swallowed by a second animal, develop into tapeworms. Thus the *C. cerebralis* found in the brain of the sheep, and causing the 'staggers' of that animal, when swallowed by the dog developes into the characteristic tapeworm (*Tænia serrata*) of the latter form. The cystic worms exist as cyst or bladder-like bodies, which are embedded in animals, and attached by a short neck and head—the latter being the head of the future tapeworm. See also CESTOID WORMS and TÆNIADA.

Cœ'rulein is a dye recently introduced for dyeing and calico-printing, and is obtained by treating Gallein (q. v.) with concentrated sulphuric acid at 200° C. (392° Fahr.). A beautiful green colour is produced by dissolving C. in an alkaline solution. In calico-printing this solution and the mordant alumina yield a rich green, while iron mordants produce a brown colour; both dyes are fast. On treating a hot aniline solution of C. with alcohol and acetic acid, an indigo-blue colour results, which may be communicated to wool.

Coff'ee (*Coffea*), a genus of *Rubiaceæ* or *Cinchonaceæ* (for opinions differ), consisting of between fifty or sixty species, but only one of which produces the fruit from which by decoction can be made the beverage known as *C.* All are shrubs or small trees under 20 feet in height, natives of the tropics—the greater number of the species being found in the western hemisphere. The most important is *Coffea Arabica*, which grows to a height of about 20 feet, but when cultivated is seldom allowed to attain to more than 10 or 12 feet. Though now cultivated solely within the tropics, the native country of the C. shrub is the mountainous country at the extreme S.W. point of Abyssinia—the word *C.* being derived, according to some, from *Caffa*, the name of one of the Abyssinian provinces; though it is more probably the Arabic *quahwah*, pronounced by the Turks *kahve*, whence the French *café*. From Abyssinia it was introduced into Arabia, and from Arabia to Batavia, about two centuries ago, by the Dutch. Whether it was the Dutch or French who first introduced C. into the western hemisphere is a disputed point, but at all events it is agreed on every hand that all the C. now imported from Brazil, Central America, the W. Indies, &c., is the progeny of a single plant, most probably derived from the Botanic Garden at Amsterdam, into which it was introduced from Batavia. Its use as a beverage soon spread among Eastern nations, though at first it was opposed by the priests, on the ground of its being one of those intoxicating beverages forbidden by the Koran. In 1652 the first C.-shop was established in London by a Greek named Pasquet, the servant of an English merchant—a Mr Edwards, who had got acquainted with the

Coffea Arabica.

beverage in the E., but who, to save himself from the annoyance of visitors anxious to taste the new drink, established his servant in a house where it could be bought. From this date the use of C. rapidly increased, and spread into the European continental countries, where it is now more used, and prepared to greater perfection, than in Britain. At the present time the consumption in Europe and the U.S. alone is estimated at 900,000,000 pounds—the greater part of this being from Brazil, though most of the C. consumed in Britain comes from Ceylon. In 1872 there were imported into Britain 166,269,052 lbs., of which 31,173,555 lbs. were retained for home consumption. The duty on this import was 14s. per cwt. for raw, and 2d. per lb. for roasted beans. The consumption for the whole world is estimated at 720,000,000 of lbs. Of this, the U.S. consumed the greatest quantity, and Britain the least. After the berries are ripe they are gathered, and deprived of their outer pulp by machinery, then steeped in water to remove all mucilaginous matter, after which the parchment-like covering of the seeds is removed by means of a mill and a winnowing machine. They are now roasted, the heat not only reducing the berries to one-half their original bulk, but also causing the development of a volatile oil and a peculiar acid to which the flavour and aroma of the C. is due. In Sumatra and other of the Malay islands, an infusion of the roasted leaf is used, under the name of C.-tea. It is said to contain a large quantity of Caffeine (q. v.), which constitutes the active principle of the C., and it is probable that the use of the leaf may extend. In Central Africa Speke describes the natives as chewing the C.-beans instead of making a decoction of them. The physiological effect of C. is that it acts as a stimulant to the brain, causing sleeplessness, and is accordingly used as an antidote to narcotic poisons. According to the most widely received belief, it acts like tea as a soother to the vascular system, and by preventing waste of the tissues of the body, enables it to support life on a less quantity of food than would be otherwise required for the maintenance of animal existence. Cocoa (q. v.), Paraguay Tea (q. v.), and other beverages which have a similar effect on the system, also contain a principle analogous to caffeine, but neither Chicory (q. v.), nor any of the numerous substitutes for C. do so, or have any pretensions to act in a similar manner on the system, except that they supply to the palate a sensation not unlike that of C. For instance, what is called Swedish C. is the seeds of *Astragalus bæticus*.

Essence of C. is a very concentrated infusion or decoction, mixed with extract of chicory and burned sugar until it is of the consistency of molasses. A teaspoonful, mixed with boiling water, makes a useful substitute for the legitimate decoction of the ground C.-beans. The name Wild C. is given in the W. Indies to *Faramea odoratissima*, *Zuelania lætioides*, and *Eugenia disticha*.

Coffee-Bean-Tree, or **Coffee-Tree, Kentucky**. See GYMNOCLADUS.

Coffee-Bug (*Lecanium coffeæ*), a genus of Hemiptera (*Homoptera*) belonging to the family *Coccidæ*, and so named from its destructive inroads on the coffee plantations. Ceylon has particularly suffered from its ravages. *Lecanium Ilicis* is an allied species which lives on the *Ilex* or evergreen oak of the Mediterranean coasts. The red ants are in turn destructive to the C.-B.

Coff'er (Fr. *coffre*, 'a chest;' Gr. *kophinos*, 'a basket') is the name given to a casket for keeping jewels and other valuable articles; the term being sometimes applied to a chest. In architecture, it denotes a deep panel in a ceiling, the same as a caisson; in fortification, a particular kind of *caponnière*. See CAISSON, CAPONNIÈRE.

Coffer-Dam, a water-tight enclosure within which the foundations for a bridge abutment, quay wall, or other such structure may be excavated and the masonry built. A C.-D. commonly consists of two continuous rows of wooden piles driven in the ground, and left sufficiently long to reach above high-water mark. The rows are several feet apart, and the space between them is filled with clay puddle, so as to make a thick wall impervious to water. The water is pumped from the enclosed space, so that excavation and erection can go on within it, without the use of divers, at all states of the tide. Of late years cast-iron has in a number of instances been used with success instead of the wooden piling.

Coff'in, a chest or box, in which a dead body is interred. The word is probably derived from *cophinus*, a Latinised form of the Greek *kophinos* ('a basket'), though it must be noted that no such use of *kophinos* was known to the ancients themselves. In the East at the present day a dead body is consigned to the earth wrapt merely in a cloth or 'winding-sheet,' which Mohammedans express by the Arabic word *kafan*, and it is probable that to it our English word is to be traced. In early times the bodies of persons of distinction were deposited in coffins, and when Joseph died, 'they embalmed him, and he was put in a C. in Egypt.' The Egyptians enclosed embalmed bodies in cases of cedar, which are still found in a state of almost perfect preservation, from the dryness of the rock tombs where they were deposited. Coffins of wood and burnt clay have been found at Athens; and while it was customary for the Greeks to burn dead bodies, recent investigations seem to prove that burial of unburnt corpses in coffins was equally frequent. Among the Romans, too, inhumation in coffins of wood and stone was practised. Pliny mentions that a kind of stone found near Assos in Troas, was made into coffins which speedily consumed the corpse. (See SARCOPHAGUS.) The kistvæn or C. of the ancient Britons was formed of rough slabs of stone; during the tenth and two following centuries, stone-coffins were in common use in England, and towards the end of that period they were employed in the interment of monks, whose bodies before that period were laid in the earth. Coffins both of lead and wood, belonging to the Old English and later periods, have also been discovered, those of the Templars found in the Temple Church in London being of the former material. The present mode of sepulture in closed coffins has recently been condemned on sanitary grounds, retarding, as it does, the resolution of the body into its component elements, and the question of adopting cremation has been openly discussed. As a compromise between the two modes, Mr Seymour Haden has suggested the use of coffins of basketwork and other easily perishable materials of open construction, which will accelerate the dissolution of the body, by freely admitting air and moisture, and in cases of death from infectious disease, he has proposed to use a double basket case, the intermediate space being filled with charcoal powder.

Coffin also signifies the raised crust of a pie, and in this sense it is frequently used by Shakespeare; and the whole hoof of a horse's foot above the coronet is so named in veterinary practice.

Cogg'eshall, a market-town of Essex, on the Blackwater, 40 miles N.E. of London, and 10 W. of Colchester, is a station on the Great Eastern Railway. It is connected with Little C. (pop. 367) by a bridge across the river, and contains a beautiful church, St Peter's, restored in 1868, a grammar-school, endowed by Sir Robert Hitcham, a mechanics' institute, a public library, &c. Its manufactures are chiefly silk, velvets, patent isinglass and gelatine. In 1142 King Stephen here founded a Cistercian abbey, part of the ground-plan of which was discovered in 1865. Pop. (1871) 2916.

Coggia's Comet, the last comet visible without telescopic aid to our earth, appeared in the summer months of 1874 in the northern hemisphere. The nucleus was bright and well-marked, and the tail could be traced for a considerable distance in the sky. Tietjen, Schulhof, and Geelmuyden have given calculations which all agree in assigning to it a great length of revolution, the period deduced by the last being 10,445 years.

Cogn'ac (Lat. *Cogniacum*, 'the corner of the water;' Fr. *coin*, Lat. *cuneus*), an old town in the department of Charente, France, on a height overlooking the plains of the Charente river, 20 miles W. of Angoulême. It gives name to the famous brandy, of which it exports £3,600,000 worth annually, and has also large manufactures of leather, linseed oil, and pottery. There are two important fairs held here in May and November. C. is the birthplace of François I., and its only historical building is a ducal château, now converted into a store. Pop. (1872) 12,761.

Cog'nate. See AGNATE.

Cog'nition, or **Cog'noscing**, is a process in Scotch law for inquiring into the mental condition of any one suspected of being idiotic or insane. See under BRIEVE, *Brieve of Idiotry and Furiosity*.

Cognition and Sale is, in the law of Scotland, the name given to a process before the Court of Session, at the instance of a Pupil (q. v.) and his Tutors (q. v.), for obtaining a warrant to sell the whole or a part of the pupil's estate.

Cognitionis Causa.—In Scotland, when the creditor of a deceased proprietor brings an action against the heir to constitute the debt against him, and the heir renounces the succession, the court will give a decree for the debt. This is called a *decree C. C.*

Cognition and Sasine is, in the law of Scotland, the form of entering an heir in burgage property.

Cogn'izance, a name given rather indefinitely to a distinguishing mark in heraldry. See BADGE and CREST.

Cognoscen'ti (Ital. form of the Lat. *cognoscentes*, 'knowing ones'), critics in matters of art, whose *knowledge*, genuine or otherwise, is their title to the function they assume.

Cogno'vit Actio'nem, an English law-term, indicating the written confession of a defendant that the cause of action against him is just. Judgment may then proceed on the C. A., and execution follow according to the terms agreed to in the writing.

Cohabita'tion, in the law of Scotland, means the living together of a man and woman as husband and wife. It may constitute marriage as implying contract. See CONTRACT, MARRIAGE.

Co'heir or **Coheir'ess**, one of two or more persons among whom an inheritance is divided. See SUCCESSION, COPARCENARY, COMMON TENANCY, &c.

Cohe'sion, that property of a homogeneous portion of matter on which depends its resistance to any straining or disrupting force. It is thus distinct from Adhesion (q. v.), which is a similar molecular attraction subsisting between two different portions of matter in contact. Both seem to be superficial attractions, independent of mass, and quite inappreciable at sensible distances. C. is most strongly marked in solids, and its experimental determination in the case of material used for purposes of construction, is of the greatest importance in practical engineering. Liquids possess the same property, though to a less extent, otherwise they could not hold together as drops. Further, all the curious phenomena of Capillarity (q. v.) are due to the simultaneous and mutual action of C. in the liquid, and adhesion between the liquid and some other kind or kinds of matter. The so-called C. and submersion figures of Tomlinson are also capillary phenomena, which are best noticed here, and are thus produced. When a drop of liquid is gently placed on the clean surface of a specifically heavier liquid, the former is observed to spread out according to a definite pattern, which is different for each pair of liquids, thus suggesting, as Tomlinson pointed out, a method of analysis. This is a C.-figure. Submersion-figures are formed by the gradual sinking of a liquid through a specifically lighter one; and some of these are extremely beautiful and regular, the vortex rings produced in many instances being singularly perfect. It is a common error in popular science to say that gases have no C., but even possess among the particles a repelling action. Such an hypothesis, however, is of absolutely no use in the molecular theory of gases, and adds a complexity which is not to be desired. C. acts between the particles *when they are sufficiently near*, but owing to their velocities at collisions, these particles rebound almost instantaneously, so that the cohesive forces act during a practically indefinitely short time, and are not sufficiently great to overcome the energy of motion of the particles.

When a solid is heated it generally expands, the molecules being driven further apart, and consequently the cohesive forces diminished in intensity. At length the solid melts, and the molecules acquire a certain freedom, the energy of heat being transformed into energy of motion; but the velocities are not sufficiently great to neutralise the effects of C., which is still apparent. By the application of more heat, however, the fluid expanding becomes more mobile, expands, and the molecules get more active, till at last their velocities become so great that the effects of C. are no longer evident—the liquid becomes a gas. Thus, though increase of temperature has a powerful effect upon cohesive forces, it seems to be only because the distances between the molecules and their velocities are increased; but it affords an argument in favour of the energy-nature of heat, placing it in the same category with motion.

Co'hort, a division of the legion, in the ancient Roman armies. There were always ten cohorts in a legion, and during the republic these were all equal to each other. Hence the strength of the C. varied with that of the legion, and ranged at different periods between 300 and 600. Under the empire the first C., which had charge of the eagle, was twice as strong as each of the other nine. The word was sometimes loosely used in the general sense of *battalion*.

Cohune' Oil, a valuable oil obtained from the kernels of a Brazilian palm, *Attalea cohune*.

Coif (Fr. *coiffe*, a head-dress, from Lat. *cofea*, used by Fortunatus), a defensive hood which was worn as a portion of a soldier's armour in the middle ages. It was sometimes continuous with the hauberk, and sometimes separate. The name was also given to a covering for the head, especially of the tonsure, worn by Roman Catholic priests. In legal language, it is the cowl or cap worn by serjeants-at-law—a relic of the ecclesiastical character of lawyers. To become a serjeant-at-law is the same thing as to attain the *Degrees of the C.*; after which a barrister leaves the Inn of Court which called him to the bar to become a member of Serjeants' Inn.

Coimbatore', the chief city of a district of the same name, in the province of Madras, British India, on the left bank of the Noyel, a tributary of the Cauvery, on an elevated and dry situation on the southern declivity of the Neilgherries. It is very healthy, as from its proximity to the Palgatcheri, a depression traversing the Western Ghauts from E. to W., it is ventilated both by the N.E. and S.W. monsoons. C. was taken by the British in 1783, and again in 1790. Pop. 12,000.—The *district of C.* has an area of 8470 sq. miles, and a pop. (1872) of 1,430,738, of whom 1,386,915 are Hindus, and 15,549 Christians. It comprises a portion of the Neilgherries, one peak of which is 9000 feet above the sea-level. The remainder is an undulating table-land of no great elevation, great part of the soil being fertile, and producing cotton, rice, and tobacco.

Coim'bra (anc. *Conembrica*), a city of Portugal, capital of the province of Beira, on the right bank of the Mondego, 110 miles N.N.E. of Lisbon, built on the slope of a hill in the form of an amphitheatre. The streets are steep, narrow, and ill-paved; but there are several fine buildings, including the cathedral and the university—the only one in Portugal—originally established in 1290, and transferred here a second time from Lisbon in 1537. George Buchanan (q. v.) was for some time a professor at C. Being accused of heresy, he was imprisoned in a monastery, where he commenced his Latin metrical version of the Psalms. The library of the university possesses 60,000 volumes. C. has manufactures of earthenware, linen, and woollen. Pop. (1871) 18,147. Since 1816 the university has possessed five faculties—theology, law, medicine, philosophy, mathematics. It has a library of from 40,000 to 50,000 vols., an observatory, a chemical laboratory, and a museum, with an anatomical theatre, and various scientific collections. The number of professors and lecturers is 46, and of students, nearly 900.

Coin, Coining (Fr. *coin*, Lat. *cuneus*, the 'wedge' by which money was stamped). See MINT, MONEY, CURRENCY, NUMISMATICS.

Coin, Coining, Laws Regarding. In 1861 the laws of the United Kingdom relative to the coinage were consolidated and amended. To counterfeit the gold or silver coinage is felony, punishable at the discretion of the court by penal servitude for life or for not less than three years. To diminish or lighten the gold or silver coinage is felony. To attempt knowingly to pass any counterfeit C. is a misdemeanour punishable by imprisonment for a year, with or without hard labour. To deface the coinage by stamping any name or words on a C. is a misdemeanour. C. defaced is not a legal tender. To counterfeit foreign gold or silver C. is felony. Having coining tools is a felony, rendering the possessor liable to penal servitude for life. The Coinage Act of 1870 consolidates and amends the laws relating to the coinage and to the mint. Gold is a legal tender for any amount. Silver is a legal tender for any value not exceeding forty shillings, and bronze C. is so to the value of one shilling. The Act deals with the defacing of light C., and with the coining and purchase of bullion at the Mint. See MINT.

Coir, or Cocoa-Nut Fibre, is a material usefully employed in the manufacture of ropes, cords, mats, &c. It possesses in a high degree all the requisite qualities—strength, firmness, and elasticity. In the Laccadive Islands, cordage and rope-making form a considerable branch of industry, and in many of our prisons and industrial schools the imported fibre is used for making cocoa-nut mats.

Coix. See Job's Tears.

Cojutepeo', a town of San Salvador, Central America, with a pop. of 15,000. A few miles off there is a lake of the same name, which exhibits a remarkable phenomenon. After a gale its waters assume a dark greenish hue; and fish in considerable quantities are cast ashore dead.

Coke (lit. '*cooked*' or '*caked*' coal) is a substance 'which bears the same relation to coal that wood charcoal does to wood.' It is obtained by heating coal to a high temperature in a closed vessel, or its equivalent, and consists essentially of the fixed inorganic matter of the coal with a considerable part of its carbon. It is most commonly prepared in ovens called C.-ovens, which, when filled with coal, are closed up excepting an opening for the exit of gases, and some small holes for admitting air. The coal is ignited at the top, allowed to burn until no further visible smoke is emitted, and then cooled gradually. C. contains from 6 to 12 per cent. of incombustible matter (ash), but *exclusive* of this it is nearly pure carbon. It burns freely, without smoke, and without caking or clinkering (q. v.) upon the fire bars. It is also free from some of the impurities of the coal from which it has been made, and for these and other reasons, it forms in many cases a most useful fuel. It was at one time used exclusively for many purposes (*e.g.*, the smelting of iron), for which it is now found practicable to use the fuel in its natural state as coal. C. can only be made from that class of coals known as 'caking' coals, which tend to soften and clinker by heat, and which it is on that account difficult to use in ordinary furnaces without mixture with some non-caking fuel. In its conversion into C., coal loses from a quarter to nearly a half of its weight, this loss including the greater part of its hydrogen, nitrogen, and oxygen. The cause of the phenomenon of caking, or forming C., is not at present known. It has been connected with the proportion of oxygen in the coal, but although in the average caking coals contain much less oxygen than those which do not cake, yet analyses show that, in many instances, the ultimate composition of specimens of both kinds is almost identical. It is probable that this property of caking (as well as many other properties of coal) depends rather upon the proximate than upon the ultimate constitution of the fuel, and of this we have as yet scarcely any experimental knowledge.

Coke, Sir Edward, an eminent English judge and jurist, was born at Mileham, in Norfolk, February 1, 1552. He was educated at the free grammar-school of Norwich, and at Trinity College, Cambridge, and, after a course of law study at Clifford's Inn and the Inner Temple, was called to the bar in 1578. His professional career was one of brilliant and rapid success. He filled in succession the posts of Recorder of Norwich, Recorder of London, Solicitor-General, Speaker of the House of Commons, and Attorney-General. Although the manner in which he conducted the prosecutions of Essex and Raleigh did not add to his reputation, he gained on the whole a high character as a judge. In 1606 he was appointed Chief Justice of the Common Pleas, as a reward for the way in which he conducted the prosecution of those concerned in the Gunpowder Plot; in 1613 he was made Chief Justice of the King's Bench, and refused to yield a jot of the judicial prerogatives to James I., for which, as well as for persistently opposing the court party in Parliament, he was both disgraced and imprisoned. Under Charles I., he continued an advocate of the popular cause, and in 1628, during the third Parliament of that monarch, took a leading part in the preparation of the celebrated Bill of Rights. He died 3d September 1633. C. has been well described by Mr Green in his *Short History of the English People* as 'a narrow-minded and bitter-tempered man, but of the highest eminence as a lawyer, and with a reverence for the law that overrode his every other instinct.' His works, including his *Reports* and *Institutes*, the first of which is the famous *C. upon Littleton*, are among the most valuable of British law classics.

Col (Fr. a doublet of *cou*, 'neck,' from the Lat. *collum*, of the same signification), applied in Alpine geography to a mountain pass, as *C. du Géant*, *C. Cervin*, *C. Longet*, &c.

Co'la, Koll'a, or Goora Nuts, the seeds of *Cola* (*Stercularia*) *acumenata*, a tree belonging to the natural order *Sterculiaceæ*, inhabiting tropical Africa, and extensively used as a condiment by the natives of the western and central portions of that continent, and by the negroes of the West Indies and Brazil, into which countries it has been introduced. An extensive intertribal trade is carried on in this nut by the Africans. A small piece is chewed before each meal as an appetiser or aid to digestion, and to improve the flavour of any eatable or drinkable. It has an astringent taste. Bitter C. is obtained from Fernando Po, but its source is not yet ascertained, though it is believed to be derived from some species of *Guttiferæ*. There are also several varieties of the true C.-nut, all of which have, however, similar properties—among others, it is said, those of Cinchona Bark (q. v.).

Col'berg. See Kolberg.

Col'bert, the name of a French family which in the 17th c. produced several distinguished men, was descended, according to a popular but now discredited tradition, from a Scottish house established in Champagne as early as the 13th c. The so-called 'tradition' cannot be traced beyond the rise of the great statesman's fortunes, and probably originated in a desire to find for him an ancient and aristocratic origin. Two branches of the C. family in the 17th c. are found pursuing commerce — one at Rheims, the other at Troyes. To the former belonged **Jean Baptiste C.,** Marquis de Seignelay, the illustrious French minister, who was born at Rheims, 29th August 1619, and received a practical training from the Italian bankers of Cardinal Mazarin, who recommended him warmly to Louis XIV. When appointed Comptroller-General of Finances in 1661, he established a chamber of justice, which suppressed great frauds in the collection of the revenue. Minister of Marine in 1668, he gradually acquired authority over the kinds and rate of taxation, the public regulation of commerce, agriculture, and manufactures, in fact, the whole non-military administration of the revenue. On his industry (he worked sixteen hours a day) and his integrity depended much of the glory of the reign of the 'Grand Monarque.' He raised the revenue from 89,000,000 to 105,000,000 francs, and reduced the debt from 52,000,000 to 32,000,000; and yet, fearing the prodigality of his master, he steadily opposed all borrowing by the state. As Sully had favoured agriculture, C. paid special attention to the cloth, silk, and hat trades, &c. His regulations of manufactures, enforced by public inspectors, were no doubt intended as a great act of national technical education, but they hampered trade in the most disastrous manner down to the Revolution. Political ideas led him to prohibit corn exportation, but by the Languedoc Canal, the creation and repair of roads, the diminution of certain feudal burdens, he benefited agriculture and the people generally. He also extended the French marine, Brest, Toulon, Rochefort, &c., dating their importance as naval stations from his rule. In 1663 and 1666 he founded the *Académie des Inscriptions et Belles-Lettres*, the *Académie des Sciences*, and the *Jardin des Plantes*, thus continuing the policy of Richelieu. He had also the happiness of assisting such men as Corneille, Molière, Racine, and Mézerai. Latterly the huge expenses of Louvois' military policy and of the court, and the suspicion the King had of C.'s ambition, oppressed him, and made his position difficult. At last an unjust accusation of jobbery in some fortifications compelled C. to retire, and he shortly afterwards died, 6th September 1683. No man contributed so much to the glory of Louis XIV.'s reign. C.'s brother **Charles** was created Marquis de Croissy; his son, **Jean-Baptiste,** who succeeded him in the Marquisate of Seignelay, had something of his father's greatness; another son, **Jacques Nicolas,** became a prelate of the Church; and in the 18th and even 19th c. the family had still some names of mark. See D'Aubigny's *Vie de C.* in the *Hommes Illustres de France*, and Pierre Clément's *Lettres, Instructions, et Memoires de C.* (Par. 9 vols. 1862 *et seq.*), and his *Histoire de C. et de son Administration* (Par. 2 vols. 1875).

Col'chester, a parliamentary and municipal borough in Essex, on the S. bank of the Colne, 51 miles N.E. of London by the

Great Eastern Railway. From its port and suburb, Hythe, the river is navigable to the sea, 15 miles distant, and corn, malt, and oysters are exported. The baize and silk manufactures have much declined. Among its notable public buildings are the Town-hall, the Corn Exchange, the Hospital, and the Asylum for Idiots. Its 'camp' is the second largest in England. C. returns two members to Parliament. Pop. (1871) 26,343. C. is of great antiquity. It is the Roman *Camelodunum*, or *Colonia*; the *Colne-ceaster* of the English conquerors, a favourite stronghold of the Danes, and a place of note in the times of Elizabeth and of the civil war. Roman remains are abundant in the neighbourhood.

Colchester, Charles Abbot, Lord, born at Abingdon, Berkshire, 14th October 1757, and educated at Westminster School, and Christ's Church, Oxford; entered Parliament in 1795, and soon obtained a high reputation as a legal and administrative reformer. He was mainly instrumental in establishing the Royal Record Commission and the Private Bill Office, and in passing the Act for taking a census of the population. C. from 1802 to 1817 was Speaker of the House of Commons, and on his retirement was raised to the peerage as Baron C., with a pension of £4000 a year. He died 8th May 1829. See *Diary and Correspondence of Lord C.* (Lond. 1861).

Colchicum autumnale.

Col'chicum, the meadow saffron or 'Autumn crocos,' falsely so called, a plant of the natural order *Melanthaceæ*. *C. autumnale* is found wild in many parts of England. The flower expands in the autumn, but the leaves are not fully developed until the ensuing spring. The dried bulbs and seeds are used for the cure or alleviation of gout, though it is only a dubious remedy. They contain a poisonous principle called *Colchicine*, and act upon all secreting organs as a sedative, though rather acrid, and apt to create depression, and in large doses even death. Cattle are not unfrequently injured by eating it. It is believed to have been the basis of the empirical medicine for the gout long famous as *Eau medicinale*, and Dr Royle is of belief that *C. variegatum*, or perhaps *C. bulbocodioides*, furnished the Arabian hermodactyls, at one time considered so potent for soothing pains in the joints.

Col'chis, anciently a province of Asia Minor, bounded on the W. by the Pontus Euxinus or Black Sea, on the N. by the Caucasus, on the E. by Iberia, on the S. by Armenia, and coinciding nearly with the modern Russian province of Imerethia and the district of Mingrelia. C. was from the earliest times celebrated for its trade in linen. As the birthplace of Medea, and the scene of the adventures of the Argonauts in quest of the Golden Fleece, it had a dubious reputation among the ancient poets as a seat of sorceries and enchantments.

Cold Cream, a simple ointment, applied as a cooling emollient to inflamed surfaces. An excellent C. C. may be made by melting one part of white wax in four parts of sweet almond oil, then adding gradually three parts of rose water, and stirring the mixture constantly to render it homogeneous.

Colde'nia, a genus of plants of the natural order *Ehretiaceæ*, consisting of shrubs and trees from India and Ceylon. *C. procumbens* is used in India in a powdered state, mixed with the seeds of the fenugreek (*Trigonella Fœnugræcum*), for the purpose of promoting suppuration.

Coldstream, a town of Berwickshire, on the left bank of the Tweed, 15 miles S.W. of Berwick. Pop. (1871) 1724. It was the favourite ford for the passage of the invading English and Scottish armies during war. Later on, from its proximity to England, it became as 'famous' as Gretna Green for its irregular or clandestine marriages.

Coldstream Guards, after the 1st Foot the oldest corps in the British army, one of the three regiments of Foot Guards included in the Household Brigade, and so named from having been raised at Coldstream in 1660 by General Monk. It was at first named 'Monk's Regiment.'

Cole'brooke, Henry Thomas, a great Orientalist, third son of Sir George C., was born at London, June 15, 1765. After residing in France he was appointed, in 1782, to a writership in India, where he became a judge and President of the Board of Revenue. Following in the track of Sir William Jones, he devoted himself to Sanskrit, and in 1797 published a translation of a digest of Indian laws. He laboriously collected and studied ancient Sanskrit MSS., and contributed to the *Researches* of the Calcutta Asiatic Society learned and suggestive essays on the Hindu religion, the Sanskrit language and poetry, the Vedas, &c. He was appointed President of the Royal Asiatic Society of Great Britain in 1820, and died in London, March 18, 1837. C. was a man of wide comprehension, keen critical insight, and deep research. He was one of the first scholars who revealed the riches of the Sanskrit literature to Europeans, and his edition of the *Amara Cosha* (1808) marks an epoch in Sanskrit-English lexicography. He advanced the study of philology not so much by original speculations as by collecting and elucidating Sanskrit works formerly inaccessible to Europeans, on which succeeding researches have been based. Among C.'s other works are a *Sanskrit Dictionary* and *Remarks on the Husbandry and Commerce of Bengal*, in which he advocated free trade with India. His *Miscellaneous Essays* were published in 2 vols. 1837 (new ed. with *Memoir* by his son, 1873). See notice of the life of C. in the *Journal of the Royal Asiatic Society* (August 1838), and Walckenaer's *Notice Historique* in the *Mémoires* of the French Institute.

Colen'so, The Right Rev. John William, D.D., Bishop of Natal, South Africa, was born January 24, 1814; graduated as second wrangler at Cambridge in 1836; was from 1838 to 1842 assistant-master in Harrow; acted as tutor in St John's College, Cambridge, from 1842 to 1846, and was rector of Forncett, St Mary, Norfolk, until his appointment, in 1854, to the bishopric of Natal. For the first part of his *Pentateuch and Book of Joshua* (1862)—a microscopic investigation of Scripture, displaying extraordinary acuteness, combined with an almost morbid eagerness to discover contradictions in the narrative—C. was deposed from his see by the Bishop of Cape Town, but the deposition being declared illegal by the Privy Council, he was afterwards reinstated in his diocese. On revisiting England in 1874, he was forbidden to preach in their dioceses by the Bishops of London, Oxford, and Lincoln. C.'s theological views have created much discussion in England and a schism among the Anglians of the Cape. It cannot be said with justice that any adequate reply has yet been given to his destructive criticism. His works comprise *Miscellaneous Examples in Algebra* (1848); *Plane Trigonometry* (1851); *Village Sermons* (1853); *Ten Weeks in Natal* (1855); *A Translation of the Epistle to the Romans* (1861); *Natal Sermons* (1866); *A Zulu Grammar and Dictionary; A Zulu Translation of the New Testament; The New Bible Commentary by Bishops and other Clergy of the Anglican Church Critically Examined* (1871); six parts of his *Pentateuch and Book of Joshua* (1862-72), and *Lectures on the Pentateuch and the Moabite Stone* (1873).

Coleop'tera, an order of Holometabolic ('complete metamorphosis') insects, represented by the numerous kinds of Beetles, and so named from the front pair of wings being hard and horny, unfitted for flight, but forming *elytræ* or wing-cases for the protection of the hinder pair. The inner margins of the *elytræ* are generally straight, and form a suture when approximated. The mouth is eminently masticatory, and consists of a *labrum* or upper lip, two *mandibles* or biting jaws, two *maxillæ* or lesser jaws, a *labium* or lower lip, and *palpi* or organs of touch appended to the *maxillæ* and *labium*. The hinder wings fold transversly when at rest. Compound eyes are always present. The antennæ or feelers vary widely in form, and are composed generally of eleven joints. The chest consists of a pro-, meso-, and metathorax—three distinct segments. The tarsus consists usually of not more than five joints, but fewer joints may be developed. The larvæ generally consist of thirteen joints, inclusive of the head. The body is soft, the head in the larvæ being horny. The pupa may be enclosed in a cocoon, but its parts are always to be recognised as they lie within the pupa-case. Many variations in the wings and wing-cases exist, and the body is generally invested by a hard covering of *chitinous* or horny material. The order is classified by the number of joints in the tarsi, by the shape and form of the antennæ, and by other salient features.

Coleorhiz'a (Gr. *koleos*, 'sheath,' *rhiza*, 'root'), the cellular sheath which covers the radicle (and afterwards the fibrillæ) of Dicotyledons, as it pierces the lower part of the embryo. See ROOT.

Coleraine′ (Irish Gael. *Cuil-rathain*, 'the corner of the ferns,' alluding to an incident in the life of St Patrick), a municipal and parliamentary borough and seaport, county of Londonderry, Ireland, on the right bank of the Bann, 4 miles above its mouth. It is a station on the Londonderry and C. Railway which connects it with Belfast and Dublin. The suburbs of Killowen and Waterside, on the opposite side of the river, are joined to C. by a handsome bridge. C. has manufactures of linen, cotton, soap, leather, and paper, and carries on a large trade in grain, pork, butter, whisky, &c. The salmon fishery on the Bann is one of the most valuable in Ireland. Pop. of parliamentary borough (1871) 6588. C. returns one member to Parliament. Although ships of 200 tons can discharge at the quay of C., the real port of the place is Portrush, 5 miles distant, which has steam communication with Glasgow and Liverpool.

Coleridge, the name of an English family distinguished in literature and law.—**Samuel Taylor C.**, 'logician, metaphysician, bard,' but most memorable as bard, was born on October 21, 1772, at Ottery St Mary, in Devonshire. While yet a child he lost his father, who was vicar of the parish. His education began at Christ's Hospital, where Charles Lamb was his contemporary. He there became proficient in Greek, but according to himself, preferred metaphysics and theology to history and poetry. The work of Mr Bowles (q. v.), however, changed his ideas as regards the last of these. In 1791 C. entered Jesus College, Cambridge, where he devoted his mind to classics, but did not graduate. Debt, his academic failure, and a cross in love, led him to enlist in a dragoon regiment, from which unhappy position his friends procured his release in April 1794, after four months of soldiering. Soon afterwards, at Bristol, he engaged with Southey in a visionary scheme to found a *Pantisocracy*, or ideal communistic settlement in America; but scarcity of funds fortunately arrested this at the outset. Here, also, a volume of poems was published, and in the next year (1795) C. married Miss Fricker, whose sister became the wife of Southey on the same day. He now lived at Nether Stowey, in Somersetshire, while Wordsworth resided at All-Foxden, a neighbouring village. Here C. remained for three years, during which some of his greatest works—*The Ancient Mariner, Christabel*, and *Remorse*—were composed. It was at this period that C. preached Unitarianism at Taunton. In 1798 the first edition of the *Lyrical Ballads* by Wordsworth and C. appeared, and in the same year the Wedgewoods gave him the means of visiting Germany. On his return he translated Schiller's *Wallenstein*, which appeared in 1800. C. now resided at Keswick. From 1804 to 1806 he travelled on the Continent, spending the first part of this period in Malta as secretary to the governor. In 1808 he lectured in London on poetry and the fine arts; but from this time till 1816 he was under the mastery of opium. In that year he made a heroic and happily successful effort to break off the habit; and coming then into contact with Mr Gillman, lived in his house at Highgate until he died, after four years confinement to a sick-room, on the 25th of July 1834. During the latter part of his life C. was an orthodox Trinitarian.

C.'s genius was subtle, comprehensive, and eminently original. As a critic, he shows keen insight and exquisite taste. As a philosophic writer, though he embodied no definite scheme and founded no special school, and is at times misty and desultory, he is yet, by his enthusiasm and learning, by the vivifying influence which he exerted over reproductive minds, entitled to be considered, as John Mill said, one of our chief 'seminal' thinkers. His teaching was a strong check to the Benthamism of his day, and his marvellous conversational powers lent him a Socratic influence over many of his youthful contemporaries. Along with De Quincey, he may be regarded as the first interpreter of German thought to Englishmen. His chief prose works are *Statesman's Manual* (1816), *Biographical Sketches* (1817), *Biographia Literaria* (1817), *The Friend* (1818), *Aids to Reflection* (1825), *Constitution of Church and State* (1830). But it is as a poet that his fame is highest and will be most lasting. *The Ancient Mariner* and *Christabel*, in which he introduced the form of lyrical narrative adopted by Byron and Scott, are full of thrilling weirdness and enchanting melody. *Kubla Khan* is a bewitching extravaganza of delicious cadences and dreamy Oriental splendour. His *Ode to France, Love, Youth and Age*, and other shorter pieces, delight us by their tender sentiment, soft fanciful colour, and unsurpassably rich and sweet music. The *Hymn in the Vale of Chamouni* stands apart from his other works. It is marked by sustained and lofty imagination, by solemn and austere religious sentiment. His dramatic attempts are not part of his characteristic work; they neither add to nor lessen his fame. The latest and best edition of C.'s works is that by Pickering (Lond. 4 vols. 1877). See C.'s *Biographia Literaria; Specimens of C.'s Table-Talk;* Cottle's *Early Recollections of S. T. C.;* and Gilman's *Life of S. T. C.*—**Hartley C.**, eldest son of S. T. C., was born in 1796, at Clevedon, near Bristol. His early years gave evidence of great talent, but through his irregular conduct at Oxford University he forfeited the Oriel Scholarship. After some profitless life in London he went to Ambleside, and there remained till his death, 6th January 1849. C.'s sonnets, though admirable, are excelled by his prose works, of which the chief are *Lives of Northern Worthies* and *Life of Massinger*. See *Memoir of Hartley C.* by Derwent C.; also an article in *Macmillan's Magazine*, vol. v. by Lord (formerly Sir J. D.) C.—**The Rev. Derwent C.**, son of S. T. C., was born at Keswick, September 14, 1800. He was educated at Cambridge, served as a tutor in Plymouth, and was from 1841 to 1864 Principal of St Mark's College, Chelsea. He afterwards became rector of Hanwell, Middlesex. He is author of a *Memoir* of his brother, H. C., whose poems and prose remains he edited; of a work on *The Scriptural Character of the English Church*, and of a Life of Winthrop Mackworth Praed. In 1861 he addressed two letters on Education to his cousin the Right Hon. Sir John T. C.—**Henry Nelson C.**, son of S. T. C.'s brother, Colonel C., was born in 1800. He wrote a work entitled *Six Months in the West Indies*, and an *Introduction to the Greek Classic Poets*, but is best known for his *Specimens of the Table-Talk of S. T. C.*, which he published in 1835. He contributed to various periodicals, and died January 26, 1843.—**The Right Hon. Sir John Taylor C.**, nephew of S. T. C., was born at Tiverton, Devon, July 9, 1790. He was educated at Oxford, where he became a fellow of Exeter College, was called to the bar at the Middle Temple in 1819, was appointed sergeant-at-law in 1832, judge of King's Bench in 1835, and privy councillor in 1858. He was made D.C.L. of Oxford in 1852, and was editor of the *Quarterly* after Gifford's death, published an edition of *Blackstone's Commentaries* in 1825, and a *Memoir of Keble* in 1869. He died February 11, 1876.—**Lord C., The Right Hon. John Duke**, son of the above, was born December 3, 1820, educated at Eton and Oxford, and called to the bar at the Middle Temple in 1846. He was made Recorder of Portsmouth in 1858, and a Queen's Counsel in 1861. After contesting Exeter unsuccessfully in 1864, he was elected for that city in 1865; was made Solicitor-General in 1871, and in 1873 was appointed Lord Chief-Justice, and raised to the peerage, with the title of Baron C. of Ottery St Mary's, Devon. He is a man of fine literary as well as legal acquirements, and at one time contributed to various periodicals.

Coleroon′, a river of India, the northern branch of the Cauvery, in the Carnatic, and forming through the greater part of its course of 93 miles the boundary between the districts of Trichinopoly and Tanjore. It falls into the Bay of Bengal 120 miles S.S.W. of Madras. From the constant deepening of the bed of the C., and a corresponding rising of that of the Cauvery, the supply of water in the latter river had become inadequate to the proper irrigation of Tanjore. This was remedied by throwing two weirs, locally called *anakatts*, across the C. in 1836.

Cole′seed. See Rape.

Colet, John, an English scholar and patron of learning, the son of Sir Henry C., a city knight, who had been twice Lord Mayor of London, was born in 1466, studied at Magdalen College, Oxford, and after spending some time in Paris, went to Italy to learn Greek. In 1504 he became Doctor of Divinity, and in 1505 Dean of St Paul's. The death of his father in 1510 gave him the possession of an ample fortune, with part of which he at once began to found St Paul's School. After a generous and enthusiastic career, in which he laboured with equal zeal for the revival of learning and the reformation of religion, he died, 16th September 1519. C. had a thoroughly modern mind. An intense scorn of those mediæval beliefs which constitute the peculiarities of Roman Catholicism animated all his preaching; the picture of Christ drawn by the Evangelists appeared to him the only thing worthy of absolute reverence. It is not surprising that his impatient eloquence alarmed the old-world party, and but for the help of the liberal Archbishop Wareham, he might have suffered persecution as a heretic. Later on, in Henry's reign, C. would certainly not have escaped trouble. Among his published works are a treatise on the sacraments of the Church, and two treatises on the Hierarchies of Dionysius; others exist in MS. at Oxford. See Seebohm's *Oxford Reformers of* 1498, and Green's *Short History of the English People* (1875).

Cole'wort. See BRASSICA.

Col'ibri. See HUMMING-BIRD.

Col'ic (Gr. *kôlikos*, from *kôlon*, 'the large intestine') is a disease the chief symptoms of which are severe griping pains in the belly, especially round the navel, occurring in spasms, and often accompanied by constipation and vomiting. The face has a peculiar anxious expression. Pain may be alleviated by pressure, and hence C. is distinguished from inflammation, in which pressure always aggravates the pain. C. may be due to indigestion, in which case it is generally accompanied by Flatulence (q. v.); to accumulated fæcal matter in the intestines, when relief is obtained by an active purge; or to cold, &c., when opium, chloroform, ether, or belladonna give relief. In all cases poultices or hot fomentations do good. Sometimes C. is caused by working amongst minerals, as copper or lead. Copper C. and lead C. are characterised by the severity of the pain and the length of the spasms; in the former there is a purple line round the gums; in the latter there is a blue line round the gums. In both cases Epsom salts should be given. Lead C. is often called painter's C., because painters are subject to it from working with lead paints.

Colicoden'dron, a tropical American genus of *Capparidaceæ*, all of which have acrid properties. *C. Yeo* of Brazil possesses the acrid principle to such an extent as to be dangerous to horses and mules (Von Martius).

Coligni' or **Coligny'**, the name of a French family, 'seigneurs' of Châtillon-sur-Loing in Burgundy, from whom have come several distinguished men.—**Gaspard de C.**, Marshal of France, was the first who entered the French service after the annexation of Burgundy by Louis XI. He accompanied Charles VIII. on his expedition to Naples, and Louis XII. in his conquest of the Milanese; was created marshal by François I. after the battle of Marignano, and received the governorship of Champagne and Picardy. By his marriage with Louise de Montmorency, daughter of the Constable of France, he greatly increased his influence. C. died 24th August 1522. Of his two sons, one, **Odet de C.** (born 1515, died 1571), became a cardinal at the age of eighteen, but having embraced the doctrines of Calvin, was excommunicated by the Pope. He publicly espoused in his 'red robes' Elisabeth de Hauteville, who was sometimes called, in spite of the ecclesiastical curse, *Madame la Cardinale*. When the civil war broke out, Odet took part in all the strifes with the Guises, but was poisoned by his valet (at whose instigation is not known) after the peace of 1570.—A still more notable person is his younger brother, **Gaspard de C.**, admiral of France, a great soldier, and a leader of the Huguenots, who was born at Châtillon-sur-Loing, 16th February 1517. Entering the army at an early age, he distinguished himself greatly during the reigns of François I. and Henri II. at Cerisales, Carignano, Rentri, and St Quentin, and on other occasions. At first the colleague of Condé, and on his death his successor, in the leadership of the Huguenots, whose doctrines he had embraced from purely conscientious reasons, he fought bravely at the battles of Dreux, Jarnac, and Montcontour, and succeeded in securing an advantageous peace for his party in 1570. After an attempt had been made privately to assassinate him, on the instigation of the Guises, who were jealous of the influence which his powerful mind had acquired over Charles IX., C. perished in the Massacre of St Bartholomew, August 24, 1572. See De la Ponneraye's *Histoire de l'Amiral de C.* (Par. 1830). The family continued to be more or less conspicuous all through the 17th c.

Coli'ma, the capital of a state of the same name in Mexico, with a pop. in 1868 estimated at 31,000. It is in a fertile plain near the volcano of C., which rises 12,003 feet above the level of the sea. Its port, of the same name, 40 miles S.S.W. from the city, has good anchorage, but is little frequented. The *state* of C., one of the Pacific states of Mexico, has an area of 3745 sq. miles and a pop. of 65,827. The coast-line extends 100 miles, and the land, which is in general of low elevation, yields excellent cotton and many tropical products.

Colin. See QUAIL.

Coll, one of the Inner Hebrides, N.W. of Mull, Argyleshire; length about 12¼ miles; greatest breadth 3½ miles; highest summit 326 feet. Pop. (1871) 723, showing a decrease of 56 since 1861. Much of the soil is incapable of cultivation, but some spots are remarkably fertile. The inhabitants neglect the valuable ling fisheries on the coast, leaving them to be prosecuted by fishers from a distance.

Coll'ar-Beam, a piece of timber connecting horizontally opposite rafters, and placed above the level of the feet of the rafter. Also the straining piece of a queen-post truss.

Coll'aring, the neck or cylindrical part of a Doric or Tuscan column.

Collat'eral Secu'rity is, in law, a security besides the main one for payment of a debt or for the discharge of an obligation. Such a security can never be available further than for securing the fulfilment of the principal obligation.

Collateral Success'ion is the succession of the brothers and sisters of the deceased. Formerly in Scotland no representation was allowed in succession to personal (movable) estate; but now the issue of a predeceasing next of kin come in place of their parent in the succession to an intestate, and take the share to which the parent would have been entitled. See BROTHERS, LAW OF SUCCESSION AMONG, SUCCESSION.

Colla'tion, a term of Scotch law. The somewhat analogous one in English law is Hotch-pot (q. v.). C. is a provision of the law of Scotland by which the heritable and movable (real and personal) succession of a deceased person may in certain circumstances be accumulated into one mass, and divided equally among the next of kin. C may take place either between the heir in heritage and the executors, or amongst the younger children. If the heir accept the heritable (real) estate, he has no share in the movable (personal) estate. But he may have his share in both by giving up his exclusive right to, that is collating, the heritage.

Collation to a Benefice is, in England, the act by which a benefice is bestowed. C. comprises presentation and institution.

Coll'e, a town in the province of Siena, Italy, 22 miles S.S.W. of Florence, on the Elsa. It is a bishop's see, has a cathedral and castle, several manufactories, especially paper-mills, and a trade in the corn, wine, oil, and silk produced in the neighbourhood. Pop. 7552.

Collec'tions at Churches. In England C. at C. are at the disposal of the incumbent and churchwardens. Should they disagree as to the distribution, they are to be disposed of as the ordinary shall appoint. (See OFFERTORY.) In Scotland money is still collected at the doors of churches. Formerly one-half of the sum collected by the Established churches was given in support of the poor, the other half was formed into a fund for the temporary relief of sudden distress. Collections at dissenting churches are the property of the congregation. By the present Poor Law Act it is provided that in all parishes in which poors' assessment is levied, the ordinary church collections shall belong to the kirk-sessions, to be applied to no other purposes than those to which they were legally applicable before the date of the Act.

Coll'ects are brief, comprehensive prayers found in all liturgies, and consisting of five parts: invocation, the reason on which the petition is founded, the petition itself, the benefit hoped for, and ascription of praise or mention of the Lord Jesus, or both. They were so called probably because they were originally concluding prayers offered up by the priest alone, in which the previous devotions were all *collected* or summed up, or because in the C. the voices of all the people were collected, as it were, into one, instead of its being said like litanies. See Blunt's *Dict. of Doctr. and Hist. Theology*.

Coll'ege (Lat. *collegium*, a number of persons united by the same office or calling, a corporation or fraternity), in ancient Rome was an association or corporation with a certain constitution, some of them resembling a modern guild, some being of a religious character, as of the pontiffs, the augurs, &c., and others concerned with government and administration. In modern times a C. is a court or council, as of cardinals, bishops, electors, &c.; a society or corporation banded together for a common object, and for mutual help in the preservation of their privileges, as a C. of physicians, surgeons, &c. C. also means a church inferior to a cathedral, which is served by clergy living in common. The commonest meaning of C., however, in England is that of an academic establishment endowed with revenues, and connected with a university, whose students and teachers live together in particular buildings in a monastic way, and the president of which, with the other officers, teachers, and students, forms a corporation independent of the university. In Scotland C. is more nearly synonymous with university. It is so in the case of those of Glasgow and Edinburgh, and although there are two colleges in the University of Aberdeen, the two are simply united under the same government as one to form the university. In France the C. is a high-school of a superior kind, affiliated and subordinate to the university.

College of Arms. See HERALDS' COLLEGE.

College of Justice. This term has in Scotland been applied to the Supreme Civil Court, composed of the Lords of Council and Session, and of the members and officers of court. The court receives the title of C. of J. in the Act of 1537, and the judges of it were in 1540 termed senators. By the Treaty of Union, no person can be appointed a judge of this court who has not served as an advocate or principal clerk of session for five years, or as a Writer to the Signet (q. v.) for ten years. The judge must be at least twenty-five years of age. The admission is made by the judges in virtue of a letter directed to them by the sovereign. There is a form of trial, but the court has no power to reject the presentee. See SESSION, COURT OF.

Colle'giate Churches were parish churches turned into capitular foundations to accommodate the overflow of canons from some of the cathedrals. They are thus inferior to cathedrals in not having a bishop's throne, although a bishop or even an archbishop was sometimes head of the chapter. See Walcott's *Sacred Archæology*.

Coll'ey, or **Collie**, the name given to a Scottish shepherd's dog. The origin of the name is not at all clear. Probably it comes from *colly*, 'grimy, black,' or it may have been called after the name of a person, C., its first breeder. The C. is one of the most sagacious of dogs. For shrewdness it is not excelled by the Newfoundland or the St Bernard. It seems to combine the merits of both. It can take the water and retrieve like the former; it can gallop up precipices and descend into crevices after man or sheep with as sure a step, as keen a scent, as undaunted intrepidity and gentle carefulness for the lost, as the latter. The stories told about the acute and accurate knowledge of a C. dog are very numerous—indeed, they surpass those recorded of the St Bernard. Hogg, the Ettrick Shepherd, says that at one time he had several hundred lambs, which he was taking to the fold. They scampered off over the hills in three separate divisions in different directions, defying all efforts to find them. Night came, and the search had to be given up. The dog remained at his task, and in the morning he was found in a gorge standing watch over the whole of the lambs. The C. is an ornamental as well as a useful dog, and is now much sought after in London as a pet. As much as fifty guineas has been refused for one. The general character of the head of the C. resembles that of a fox, the nose pointed, the eye rather small, but full of intelligence, mingled with sagacious craft, the ears half prick, the tips falling over somewhat, neck long and taper, shoulders and brisket deep, back rather short, coat thick and long, tail long, full feathered, and curling well over the back. The backs of the fore-legs should be feathered, the hind ones bare from the hocks, the hips wide and prominent, and the hocks well separated. The colour varies from bluish-grey and tan to lightish grey, from black and white and fawn to black and tan; the latter is now held in most esteem. An absolute necessity to the shepherd, the C. makes also a capital watchdog. Its size varies from about 18 inches to 2 feet in height.

Coll'ier, Jeremy, a nonjuring divine and polemic, was born 23d September 1650, and studied at Cambridge University; was appointed rector of Ampton in 1679, and chosen lecturer at Gray's Inn in 1685. His life was one long controversy. He was strongly opposed to the Revolution of 1688, writing bitter pamphlets against the Government, and falling foul of Bishop Burnet. For this he was twice imprisoned. The latter portion of his life was occupied with a more useful strife, which he commenced with a pamphlet, entitled *A Short View of the Immorality and Profaneness of the English Stage* (1698). The wits of the day, including Congreve and Farquhar, endeavoured to meet C., but he beat them at their own weapon of satire, and he is generally credited with having aided much in purifying the stage. After a life spent in literary activity, he died, 26th April 1726. Among his other works may be mentioned an *Ecclesiastical History of England*, and a translation of the *Meditations* of Marcus Aurelius, which has been praised by Matthew Arnold.

Collier, John Payne, born in London, 1[illegible]th January 1789, descended from the celebrated Jeremy C., and for a time law and parliamentary reporter on the staff of the *Morning Chronicle*, is known as one of the chief living commentators on Shakspeare and Shakspeare's contemporaries. In 1831 he published a *History of English Dramatic Poetry to the Time of Shakspeare, and Annals of the Stage to the Restoration*. It was followed in 1835 by *New Facts regarding the Life of Shakspeare*. The work, however, which created the greatest sensation was a volume published in 1853, bearing the title *Notes and Emendations to the Text of Shakspeare's Plays, from Early Manuscript Corrections in a Copy of the Folio of 1632, in the Possession of J. P. C.* The publication of this book caused a prolonged, fierce, and somewhat painful controversy, but the bulk of C.'s emendations seem now to be accepted by Shakspearian editors. Among the later noteworthy works of C. are a *Bibliographical Account of Rare Books* (1865), a series of reprints of the productions of early British poets and pamphleteers, and an edition of Shakspeare, completed in 1875.

Colliers and Salters. The workmen at coal-pits and salt-works in Scotland were formerly under servitude. They became bound, independent of agreement, merely by entering the works, to perpetual service there; and in the event of sale or alienation of the ground in which the works were, the right over the workmen passed to the purchaser without express grant. This slavery was abolished by Act of Parliament 15 Geo. III. c. 28; made more effectual by another Act passed in the thirty-ninth year of the reign of Geo. III. See COAL-MINES REGULATION ACTS.

Collimation, Line of, the straight line which passes through the centre of the object-glass of a telescope and the intersection of the wires placed at the focus. The difference between the actual line and the true axis of symmetry of the telescope is termed the *error of C.*

Coll'ine (Gr. *kolla*, 'glue'), a term applied to gelatine, isinglass, and glue.

Coll'ingwood, Cuthbert, Admiral Lord, an English naval commander, was born at Newcastle-upon-Tyne, September 26, 1750. From the early age of eleven, at which he became a midshipman, he served in the navy, his thorough seamanship, coolness, and courage enabling him to rise rapidly in his profession. He distinguished himself in 1794, when Howe beat the French off Brest, and in the battle of Cape St Vincent in 1797. Finally, at the battle of Trafalgar in 1805, he broke the enemy's line, and completed the victory on the death of Nelson, whose devoted friend and admirer he had been throughout life. He was rewarded with a peerage. C. died at sea, March 7, 1810, lamented by the country and his sailors, who called him their 'father.' His *Despatches and Correspondence* were published by his nephew (Lond. 1828).

Coll'ins, Anthony, a noted freethinker, born at Heston, Middlesex, June 21, 1676, and educated at Eton and Cambridge. He produced various shrewd and acute works, and was the friend of Locke and Le Clerc. C., who led an upright and benevolent life, died 13th December 1729. His chief work is a *Discourse on Freethinking*. He also wrote an *Essay concerning the Use of the Human Understanding* (1707), an *Inquiry concerning Liberty and Necessity* (1715), and a book on the *Grounds and Reasons of the Christian Religion* (1724), all of which provoked vehement controversies in their days.

Collins, William, one of the best English poets of last century, was born 25th December 1721, at Chichester, where his father was a hatter. He was educated at Winchester (where, according to Warton, he wrote his *Persian Eclogues* at the age of seventeen), and at Magdalen College, Oxford. On leaving the university he went to London as a literary adventurer, and passed twelve years in toiling and idling, starving and revelling, framing projects which were never realised, publishing poems which were not favourably received, until the death of an uncle raised him above urgent want. But his sufferings had unfitted him for intellectual effort; he became nervous and partially insane, and died 12th June 1759, in his thirty-ninth year. Hazlitt declared that C. was the only one of the minor poets of whom it could not be said that he might not have done the greatest things. With the exception of Blake, he was the most purely poetic spirit of his century. His *Persian Eclogues* (first published in 1742, and again in 1757 under the title of *Oriental Eclogues*) won the praise of Goldsmith, but have not the glow and splendour of the East. His *Odes* (1746) awoke no response in the public, but they have always been favourites with poetic minds. Nothing more delicately imaginative, pensive, and musical, rich in colour and choice in diction, was produced in the 18th c. That on *The Passions* is unsurpassed for bold and vivid personification, and exquisite changes of melody; while the *Ode to Evening* is one of the sweetest, airiest pieces in the language. Every word is faultless, every tone is true. See Moy Thomas's Memoir, prefixed to the Aldine edition of C.'s works (Bell & Daldy, 1858).

Collins, William, R.A., born in London, 18th September 1787, first exhibited at the Royal Academy in 1807, and was elected Associate in 1814, and R.A. in 1820. After the death of his father in 1812 he found himself obliged to paint portraits, though the special branch of art in which, in the earlier part of his life, he took most delight, was landscape, with rustic or homely figures. In 1814, however, he commenced to paint coast scenery, and following this path, arrived at fame and fortune. C. died in London, 17th February 1847. Among his works, which excel in truth of form, chiaroscuro, and colour, probably the best-known are, 'Happy as a King' (1836), 'The Shrimpers—Evening' (1831), and the 'Fisherman's Widow' (1835). See his *Biography* (2 vols. Lond. 1848), written by his son, **William Wilkie C.**, who has attained high distinction as a novelist. He was born in London, January 1824, and intended for a commercial career, but turned aside to literature, commencing with the biography of his father. Among his earlier fictions are *Antonina* (1850) and *Basil* (1852). C. became a fellow-worker with Dickens in *Household Words*, in which appeared *After Dark* (1856) and *The Dead Secret* (1857). An immense accession to C.'s popularity was given by his *Woman in White* (1859-60). Since then he may be considered to hold a leading place among English novelists. Later productions are *The Moonstone* (1868), *Man and Wife* (1870), *The New Magdalen* (1873), and *The Law and the Lady* (1875). Several of these have been dramatised. All C.'s works are remarkable for vivid portraiture, startling incident, and a surprising intricacy of plot, which at once perplexes and captivates the reader.

Collis'ion of Vessels. To prevent collisions of vessels, steering and sailing rules have been laid down by the Merchant and Shipping Amendment (1862) Act. Where loss arises from pure accident, or Act of God (q. v.), as it is termed, the loss falls where it lights; when there has probably been fault, but no one can say who has been chiefly to blame, the loss is divided equally, or in proportion to the respective value of the ships. If the fault be clearly on one side, the owners of the ship in fault are answerable for damage. A steam-vessel is bound to keep out of the way of a sailing-vessel.

Collo'dion (formed from the Gr. *kollaō*, 'I stick') is a solution of a particular kind of *gun-cotton* (see CELLULOSE and GUN-COTTON) in a mixture of alcohol and ether, and is largely employed in photography and surgery. C. was discovered by Maynard, a physician of Boston. The best kind of gun-cotton for C. is prepared by soaking 1 part of cotton-wool in a cooled mixture of 16 parts of nitre, 12 parts of fuming sulphuric acid (Nordhausen vitriol), and 12 parts of ordinary oil of vitriol. The wool should be stirred about in the mixture for five minutes, then washed for a long time in a current of cold water, squeezed, and allowed to dry in the air. To prepare C., 1 part of the gun-cotton is shaken in a bottle with 16 parts of ether; after some time 1-2 parts of absolute alcohol are added, and the mixture agitated till the wool disappears. The C. thus obtained should be filtered. C. is a clear, colourless, and more or less mucilaginous liquid. Its uses depend upon the fact that when spread over a surface and allowed to dry, a tenacious film is left, which adheres closely to the material on which the C. has been spread. Thus a wound or raw surface, if painted with C., becomes covered with an artificial skin, which completely protects it from the air. For surgical purposes *flexible C.* is employed. This consists of a mixture of 6 fluid ounces of C., 120 grains of Canada balsam, and 1 fluid drachm of castor-oil. C. is also employed in making small balloons, and to protect caustic substances, &c., from the air.

Collodionised Paper Process, a photographic process, invented by Mr Corbin, which consists in employing negative paper coated with gelatine as a support for the excited collodionised film, which is preserved by a thin layer of albumen and honey. To render the film sensitive it is immersed in a bath of acetonitrate of silver, after which it is washed and dried. Immersion in a solution of gallic acid to which a few drops of acetonitrate of silver have been added develops the picture.

Coll'ot d'Herbois, Jean Marie, one of the most sanguinary and ignoble characters of the French Revolution, was born at Paris in 1750. He was at first an actor and dramatist, but became prominent at the time of the Revolution, distinguishing himself as one of the most violent of the Jacobins—his sentiments being generally much 'exalted' by liquor, of which he was ludicrously fond. Sent (1793) by the Convention to Lyons after its surrender, he committed the most fearful atrocities, 1600 persons being, at his orders, destroyed by grapeshot or the guillotine. He contributed to the fall of Robespierre, but was nevertheless transported to Cayenne, where he died of fever, 8th January 1796. The *Nouvelle Biographie Générale* gives a long list of C.'s comedies, which once, it seems, had some success, though they are now only remembered by the infamy of their author.

Collu'sion is a deceitful or fraudulent agreement between two or more persons to defraud some one of his right. When proved, it has the effect at common law of making void any transaction in which it occurs. Instances of C. frequently occur in arrangements between bankrupts and their creditors; and as the proof in such cases is often difficult, our bankrupt statutes have created certain legal presumptions of C. in cases of bankruptcy.

Col'man, George, the elder of two dramatists of the name (1733-94), was born at Florence. He was an industrious and successful writer, composing or adapting more than thirty plays, besides writing poems and publishing translations. He was for a time acting manager of Covent Garden Theatre, and subsequently purchased the Haymarket. Of his pieces, the *Jealous Wife* shows perhaps the most ability. His son, commonly known as 'the Younger' (1762-1836), educated at Westminster School, Christ's College, Oxford, and King's College, Aberdeen, was also an indefatigable writer of dramas, receiving large sums for many of them, one or two of which are still occasionally acted. He also managed the Haymarket Theatre, and for a time was Examiner of Plays. His latest work was a memoir of his life, which was published under the title of *Random Records* (Lond. 1830).

Col'mar, or **Kolmar,** formerly the capital of the French department of Haut-Rhin, fell to Germany in 1870, and is now the capital of Ober-Elsass. Pop. (1871) 23,311. It stands on a plain at the confluence of the Lauch and Fecht, about 2 miles from the foot of the Vosges Mountains, and is a station on the Strasburg and Mulhouse Railway. The most remarkable buildings are the cathedral (1363), Hôtel-de-ville, and the college, which contains some pictures by Albert Dürer. It has a public library of 60,000 vols. Its chief manufactures are linens, calicoes, woollens, silks, paper, hosiery, and leather, and it is the entrepôt for cotton, iron, wine, and colonial produce for Switzerland. Under the Franks, C. was a royal court, called *Columbaria*, round which the town grew up. The Emperor Friedrich II. gave it municipal rights in 1226, and it was afterwards a free imperial city. Its fortifications, erected in 1552, were dismantled by Louis XIV. in 1673. The peace of Ryswick

(1697) united it to France, in whose possession it remained till 1870.

Colne, a market-town in Lancashire, 32 miles N.E. of Manchester, on C. Water, a tributary of the Calder, and at the junction of the Midland Railway with the Lancashire and Yorkshire line. Mousselines-de-laine and calicoes are manufactured, and in the vicinity coal, slate, and lime abound. Archbishop Tillotson received the rudiments of his education at the grammar-school of C. Pop. (1871) 7335.

Col'obus, a genus of Old World or Catarhine monkeys, in which alone, of all Catarhina, the thumbs are absent or at most very rudimentary. This genus is allied to *Semnopithecus*, and the *C. Ursinus*, *C. Satanas*, and *C. Guereza* are familiar species. These monkeys exclusively inhabit Africa. See also MONKEY.

Col'ocynth, a medicinal substance consisting of the dried pulp of the bitter cucumber, *Citrullus Colocynthi*, a plant which is a native of the S. of Europe, and bears some resemblance to the common water-melon. C. is a light spongy yellowish-white substance, intensely bitter, and about the size of a small orange. It is imported chiefly from Smyrna, Trieste, France, and Spain. In doses of 2 to 8 grains it acts as a powerful cathartic, producing copious watery stools. C. is apt to cause griping, which, however, may be prevented by combining it with henbane or belladonna. Its active principle is *Colocynthin*, $C_{56}H_{84}O_{23}$.

Cologne', the French form of the German KÖLN (q. v.).

Cologne Yellow, used for lacquering, and generally as an oil or water colour, is a mixture of chromate and sulphate of lead with sulphate of calcium.

Colomba'no, San, a town of N. Italy, province of Milan, in a hilly district 9 miles S. of Lodi. In the vicinity are found felspar, red granite, and limestone. Pop. about 6000.

Colom'bia, United States of, formerly **New Granada**, a federal republic of S. America, is bounded N. by the Caribbean Sea, S. by Ecuador and Brazil, E. by Venezuela, and W. by the Pacific. Area, 455,673 sq. miles; pop. (1871) 2,916,703. It is divided into nine states—Antioquia, Bolivar, Boyaca, Cauca, Cundinamarca, Magdalena, Panama, Santander, Tolima. In the W. it is traversed by the great triple range of the Andes, alternating with lofty plateaux, while in the E. and S.E. it is spread out in magnificent *llanos*, covered with dense forests, and forming the basin of the upper waters of the Orinoco and Rio del Negro. Its great river is the Magdalena, which flows throughout the state from N. to S., receives the Cauca and many smaller tributaries, and enters the Caribbean Sea after a course of 900 miles. There is every variety of climate, from the tropical heat of the coasts to the intense cold of the region of perpetual snow. Of the products, which are rich and various, the chief are tobacco (Ambalema and Palmira), sugar, coffee, mahogany, cinchona bark, ipecacuanha, &c. But its mineral wealth is still more important, consisting of gold, platina, silver, copper, coal, amber, &c. In 1874 the total exports amounted to 9,895,060 dollars. England receives most of the precious metals, and Germany nearly all the tobacco. The value of the imports in 1874 was 11,218,840 dollars. Besides the railway across the isthmus of Panama (q. v.), there is a short line between Sabanilla, on the coast, and Barranquilla, where the navigation of the Magdalena begins. The Magdalena is ascended by regular lines of steam-vessels for some 800 miles. Among the industries, which are all somewhat primitive, the chief are agriculture, cattle-breeding, and mining. Antioquia is the great mining state, and yet has only one mine (Zancudo) supplied with good modern machinery. In all there are (1876) 561 mines, employing 16,000 men, and producing gold and silver to the value of 2,300,000 dollars yearly. The capital is Bogota. The inhabitants of the interior are mostly Indians, while the total number of white men does not greatly exceed one million. The Columbians are Roman Catholics, but no form of religion is protected by law. In spite of the opposition of the Catholic clergy, a state system of education has been established, and in 1874 there were 1845 schools and 83,626 pupils. The press is free, and Government has abolished the penalty of death for crime. Each state of the republic is 'sovereign and independent,' and sends three senators to Congress, and one representative to the Lower House for every 50,000 inhabitants. The army consists merely of some 1000 men.

The country, originally occupied by a semi-civilised tribe, called *Chibchas* or *Muyscas*, was conquered by Ximenes de Quesado (1536–37), and in 1718 was formed into a Spanish viceroyalty, comprising the districts Panama, Bogota, and Quito. In 1819 it became independent of Spain, and was formed into a republic along with Venezuela and Equador. This union was dissolved, however, in 1829–30, and C. was converted into a separate republic in 1833. After several 'revolutions,' the constitution was finally remodelled, and the country received its present name on the 20th September 1861. See Powles, *New Granada, its Internal Resources* (Lond. 1863); Mosquera, *Compendio de Geografia, General Politica, Fisica, y Special dos Statos Unidos de C.* (Lond. 1866).

Colom'bo, a Portuguese corruption of *Kalambu*, itself an Arabic corruption of the Cingalese *Kalan-totta*, the 'Kalany ferry') is the capital of Ceylon, on the S.W. coast of the island, near the mouth of the Kalany-ganga, on a spit of land protected by a fort mounted with 300 cannon. It is the residence of the English governor, the seat of a colonial bishop, and has a pop. (1871) of 100,238, of whom less than 6000 are Europeans, the remainder consisting of a motley mass of Cingalese, Malays, Malabarese, Arabs, Chinese, Parsees, and other Easterns. Among the more notable buildings are the cathedral, and other Christian churches, Protestant and Catholic, a Mohammedan mosque, a military hospital, and an orphanage. The houses, both of the Europeans and natives, are so hidden in clumps of cocoa-palms, and other tropical trees that the town presents the appearance of a forest. C. may be divided into the European or White Town in the neighbourhood of the fort, and the *Pettah* or Black Town, in which most of the magazines and warehouses are situated. The esplanade of Galle-Face forms the public park of the city. C. was formerly the chief station for steamships in Ceylon, but they now mostly resort to the flourishing port of Point-de-Galle. C. possesses a European society of considerable culture. A new museum is nearly completed, which will contain an Oriental and general library, and a museum of natural history and antiquities. Grants have been made for its endowment from the colonial revenues. C. is connected with Kandy, in the centre of the island, by a railway 75 miles long.

Co'lon. See PUNCTUATION.

Colon, a portion of the great intestine. See INTESTINE.

Colonel (Fr. from the Ital. *colonnello*, a dim. of *colonna*, 'a column;' or, according to others, but with less probability, it is Lat. *coronalis*, from *corona*, 'a crown'), in the British army, is the highest officer attached to a regiment. Except in the Engineers and Artillery, the office is a sinecure, bestowed, presumably, as a reward for long service. Besides the regimental rank of C., there is the rank of brevet-C., through which every officer must pass before he becomes a general officer. See BREVET, GENERAL OFFICER.

Colo'nia do Santiss'imo Sacramen'to, a strong seaport of Uruguay (Banda Oriental), on the N. bank of the Plata, opposite Buenos-Ayres. In 1845 the combined English and French fleets retook it from Rosas, then Dictator of Buenos Ayres, to keep the navigation of the upper part of the river free. Pop. about 7000.

Colo'nial Corps were certain regiments forming part of the regular British army, but devoted to the service of the colonies. As the colonies became self-ruling, it came to be considered contrary to imperial interest to keep up forces not available for general imperial purposes. The C. C. have accordingly been disbanded, except the Malta Fencibles and two West Indian regiments.

Col'onies, Laws of England regarding. All persons charged in any colony with an offence committed on the sea, may be dealt with as if the offence had been committed within the jurisdiction of the colonial court, and shall receive the same punishment as would have followed on conviction in England. The term *colony* includes all possessions abroad in which there is a legislature, except the Channel Islands and the Isle of Man. Colonial law is void if contrary to Act of the Imperial Parliament; but mere inconsistency with instructions from the Home Government will not make it void. Since 2d August 1858, all powers previously exercised by the Board of Control and by the East India Company over the territories and revenues of India, have been exercised by the Secretary of State and Council for India. See INDIA, BRITISH.

Colonn'a, an illustrious Roman family, which takes its name from a small village on the Alban Hills in the province of Latium, now belonging to the Rospigliosi-Pallavicini family. It traces its origin to the Counts of Tusculum, who in the 10th and 11th centuries enjoyed the highest estimation at Rome, but it first came forward independently about the close of the 11th c., and from that time till far on in the 16th it played a part surpassed in distinction by no Roman family except its hereditary rival and foe—the Orsini. By numerous fortresses, built all along the Alban and Sabine Hills to the very borders of Naples, it became repeatedly a source of terror, both to the Popes and to the Roman people, while it was perpetually mixing itself up in the bloody feuds of the age. Usually the Colonni figure as the heads of the Ghibelline party, but occasionally they are also found on the side of the Guelphs. The sons of Giovanni C. (who about 1278 was a Roman senator, and in 1288 Marchese of Ancona), **Stefano** and **Agapito**, were the founders of the two still flourishing lines of the C. family, that of *Palestrina* (now represented by the branches of C. di Sciarra, and Barberini-C.), and that of *Paliano*, usually called the line of the Grand Constable, with which is joined the subordinate branch *C.-Stigliano* in Naples. Pope Martin V. (**Oddone C.**), with numerous cardinals, generals, statesmen, scholars, and authors, belong to it, whose names are conspicuous in the ecclesiastical, political, and literary history of Italy. We can only notice here **Vittoria C.**, the most famous poetess of Italy, who was the daughter of Fabrizio C., Grand Constable of Naples, and was born at Marino in 1490. In 1507 she was married to Ferrante d'Avalos, who soon after came to his father's title—Marchese de Pescara—and who died in 1525 of wounds received in the battle of Pavia. Overwhelmed with grief, the young widow sought consolation in solitude, in study, and in religion. She occupied herself with poetical composition, and her verse, which in her early widowhood musically bewailed her lost husband, drew its inspiration in later years from elevated religious feeling. Her poems, the best edition of which was published (with a memoir) at Rome (1840) by Ercole Visconti, are perhaps too faithfully modelled on the style of Petrarch, but evince an exquisite talent and genuine sentiment. Her beauty and talents, which are said to have attracted the affectionate regard of Michael Angelo, are celebrated by Ariosto in the 37th canto of his *Furioso*. It may here be noted that the C. Palace in Rome, at the base of the Quirinal, is world-celebrated for its gallery of art and its magnificent gardens. See Coppi's *Memorie Colonnesi* (Rome, 1855).

Colonna, Capo (anc. *Sunium Promontorium*, Byron's 'Sunium's marbled steep'), a headland of Greece, the most southerly point of Attica, rising almost perpendicularly from the sea to the height of 269 feet. Sixteen columns of white marble, the remains of a temple of Minerva, crown the steep and give it its name.

Colonnade', a series of columns, placed at intervals, and arranged according to the rules of art, and of the particular order to which they belong.

Col'onsay ('the island of Columba'), one of the Inner Hebrides, W. of Jura, between Mull on the N. and Islay on the S. Separated from it by a narrow channel to the S., of not more than 100 yards wide, and dry at low water, is the isle of Oronsay. Together they are 12 miles long, with a breadth of from 1 to 3 miles. Potatoes and barley are grown, and black cattle and sheep of a superior breed are fed on the pastures. Oronsay contains the fine ruins of a priory, founded by the Lord of the Isles. Pop. of both islands in 1871, 456, being a decrease of 142 since 1861.

Col'ony has been applied to a great variety of settlements. The limited space possessed by the states of ancient Greece suggested the Doric colonies of Italy and Sicily, and the Ionic and Æolic colonies of Asia Minor. This was voluntary emigration of persons who proposed to form themselves into a self-supporting society, and who therefore seldom retained any connection (except that of a common religion) with the mother country. Their origin was, however, frequently appealed to for a temporary political purpose, and they were liable to be involved in the wars between the democratic and the aristocratic parties in Greece. The Greek term *apoikia*, or 'departure from home,' is therefore different in meaning from the Latin *colonia*, 'plantation of tenant-farmers,' which was made necessary by the disuse of the agrarian law. The latter were chiefly in the conquered provinces of Italy; they were accompanied by the *augur* and the *agrimensor* (who overthrew the ancient and consecrated the new boundaries): they had duumvirs, quinquennials, and decurions, in imitation of the consuls, censors, and prætors of Rome; these magistrates regulated local affairs, but political sovereignty remained at Rome. The C. was regarded by the better class of plebeians as an exile, as a renunciation of the Roman for a municipal franchise, and the state regarded it as a nursery for soldiers. Fifty such colonies were founded in Central Italy before the second Punic War, and at least twenty more from B.C. 197 to B.C. 177 in Italian Gaul, Campania, Apulia, &c. Some of these colonies were purely military, and had an ensign on their coinage; others were purely civil, *C. togatæ*, and had a plough on their coinage. The Roman C. differed from the *municipium* in this, that the former was entirely governed by Roman, the latter frequently by local law and custom. Modern examples of the military C. are Gibraltar, Aden, Malta, and St Helena. Carthage introduced a different system of colonisation in the commercial factories which she planted round the Mediterranean, and which were imitated in the French and Dutch settlements in the East. The modern policy, however, as in the Spanish colonies of S. America, and in the African and Eastern colonies of Portugal, was to conquer the native race, and keep them down by a strong government, the members of which were taken from the home country. After the Seven Years' War (1763), England gradually took the place of France in Eastern colonisation. The English C., *par excellence*, was, however, a private adventure, as in Raleigh's Virginia, or a movement of conscience, as when the Pilgrim Fathers sailed for New England. The question of the supreme power of the mother country, which had been speculatively raised by Molyneux with regard to the Irish woollen trade, was strikingly illustrated by the failure of the directors of the Indian and African Company to give coherence or permanence to the Darien expedition. That company had, by Act of Parliament, power to make colonies, to defend commerce, and to make reprisals when attacked. Nevertheless, it was found necessary to declare war against Spain, and, of course, the unassisted C. was destroyed. But the political doctrine of trade reciprocity was a stronger link between the colonies and the mother country than even the feeling of allegiance. It was held, even in the time of Adam Smith, that it was important to bind the colonies to buy the manufactures of the mother country, while the latter gave the colonies a preferential market for raw produce. This monopoly was no doubt advantageous to the colonial capitalist, who flourished at the expense of the British consumer. The practice of restraining manufactures in the colonies is curiously counterbalanced by the modern protectionism of colonies, who find it impossible to compete with the free trade of the mother country. Most of the British colonies have rights of parliamentary representation, of debate, and of legislation, of determining the sources of public revenue and expenditure, of enacting laws for the security and control of property, for the repression of crime, &c. They have also right to all the land of the C. not granted to private owners. Theoretically, the acts of a colonial legislature are liable to the revision, and even the rejection, of the Home Colonial Office; this was recently exemplified in the question of marriage with a deceased wife's sister. Appeals from the colonial courts are taken to the Judicial Committee of the Privy Council. The C. is however disabled from such acts of independent sovereignty as the initiative in war, alliances, and diplomacy generally. Colonists are British subjects, and are treated as such by British consuls, although the colonies pay nothing for the consular service. After the doctrine of the complete sovereignty of the mother country had been abandoned, the doctrine of tutelage, advanced by Lord Grey in defending Lord John Russell's colonial policy, was adopted. This led to Kaffir and Maori wars, to the colonial endowments of the Episcopal Church, and the clergy reserve in Canada. Great Britain still expends £3,620,093 per annum on her colonies, including Heligoland, Bermuda, the Falkland Islands, and the Straits Settlement, and the military posts. For the future, it seems probable that the cost of native wars will be thro[illegible] duty of internati[illegible] will remain.

Col'ophon, anciently an Ionian city of Asia, on the river Hales, 8 miles N. of Ephesus, was of little historical note though its trade in resin is mentioned by Pliny. Mimnermus, the elegiac poet, was a native of C., and it claimed to be the birthplace of Homer. The Greek proverb, 'He has put the C., *i.e.*, the finishing stroke, to it,' has probably no reference to the city, though Strabo says it originated in the fact that victory was assured to the party on whose side the famed Colophonian cavalry charged. The C., or inscription at the end of old printed books, contained the printer's name and the date and place of printing.

Coloph'ony. See ROSIN

Colora'do (Span. 'red'), the name of two rivers in the U.S.; one rises in the Rocky Mountains, and, after a course of 1200 miles, flows into the Gulf of California; the other rises in the interior of Texas, and, after a course of 800 miles, flows into the Gulf of Mexico.

Colora'do, one of the United States of N. America, is situated among the Rocky Mountains. It is bounded by Wyoming on the N., Kansas and Nebraska on the E., New Mexico on the S., and Utah on the W., and has an area of 104,500 sq. miles. The chief rivers are the Rio Grande del Norte and the Arkansas. Pike's Peak is 11,497 feet above the sea. The discovery of gold in 1857 led to its settlement. The mineral resources of C. are immense, including not only gold, but silver mines of great value, also gypsum, coal, iron, and salt. In 1870 the yield of minerals amounted to $5,500,000, and real and personal property was valued at $20,243,303. In 1875 the amount of gold and silver taken from the mines amounted to $6,299,817. In the same year there were in operation 735 miles of railway. C. was admitted as a 'state' in 1876. Pop. in 1870: whites, 39,[illegible]; blacks, 456; Chinese, 7; Indians, 7480. Pop. in 1875, about [illegible]. The state capital is Denver; other towns are Golden City, Mountain City, and Central City.

Colora'do Bee'tle (*Doryphorus decemlineatus*), a genus of beetles noted for effecting great destruction in potato-fields, and which has committed great ravages in America. All efforts to check this pest have been unavailing, the plants speedily succumbing to the attack of these insects, which appear frequently in great numbers. See POTATO.

Colorim'eter, an apparatus of great value in the art of dyeing for ascertaining the strength of dye-stuffs. A known weight of the colouring matter to be tested is suitably dissolved, and the colour it produces compared with a standard solution. The colorimetric test is generally applied by the intensity of colour produced by an ascertained depth of the solutions in two different graduated test-tubes.

Colossæ, a city of ancient Phrygia, on the Lycos, now the *Ak-su*, a tributary of the Mæander. Its people were famed for their skill in dyeing wool, but what Strabo means by *Collossean-dyed* is now unknown. C. was one of the early Churches of Asia, and to its members Paul addressed an epistle.

[illegible] See AMPHITHEATRE.

[illegible], a Greek word whose origin is not known, signified a [illegible] than life, but was more frequently applied to those [illegible] large figures which were so famous in Egyptian, [illegible] Roman art. The most celebrated Egyptian C. was [illegible] statue of Memnon, in the plain of Thebes. Among [illegible] of Greece the most celebrated was the bronze statue of [illegible] by Chares of Lindus, which all agree to have been up[illegible] English feet high, and which stood at the entrance of [illegible] harbour of Rhodes, though there is no authority for the statement that it did 'bestride' the harbour mouth. This, like the statue of Memnon, mentioned above, was one of the Seven Wonders of the ancient world. Among the famous colossi of Phidias were the ivory and gold statues of Zeus at Olympia, and of Athene in the Parthenon, and the bronze statue of the latter on the Acropolis, the point of whose spear and the crest of whose helmet were seen by sailors from the point of Sunium. At Rome, the most famous colossi were the statue of Jupiter on the Capitol, the bronze statue of Apollo at the Palatine Library, and the statue of Nero, which gave to the adjoining amphitheatre the name of *Colosseum*.

Colostrum, the first milk of mammalia, distinguished from ordinary milk by its yellowish colour and greater thickness, due to a large proportion of fatty principles, casein, milk-sugar, and solid constituents. See MILK.

Colour, in art, means that combination or modification of tints which is specially suited to produce a particular and desired effect in painting. Among the old masters, the greatest colourists either belonged to the Venetian school, founded by Giorgione at the close of the 15th c., or were the pupils and imitators of the leaders of that school. Titian, Correggio, Paul Veronese, and Rubens are recognised generally as the greatest colourists. The excellence of C. lies, in part at least, in the subtle harmony which is seen to exist between it and the action or suggested meaning of the picture. *Local Colours* are the natural hues of objects arranged in special localities of a picture for the purpose of producing a desired picturesque effect. *Positive Colours* are the natural hues of objects unaffected by any modification, as that of distance, reflected light, or the neighbourhood of colours that weaken or otherwise affect them. *Neutral Colours* are those the natural force of which is modified or broken by the reflected colours of surrounding objects.

Colour, in optics. See CHROMATICS, LIGHT, SPECTRUM ANALYSIS.

Colour, a rhetorical term which has become technical in English law. It was the rule in pleading in Confession and Avoidance (q. v.) to admit some apparent right requiring to be met by the allegation of new matter. This was called giving C. to the plaintiff's claim. The form has been set aside by the Common Law Procedure Act (1852).

Colour-Blindness is a peculiar affection consisting of an inability to distinguish one colour from another. It is often termed *Daltonism*, after the celebrated philosopher Dalton, who was subject to this affection. The most common variety of it is that in which the person cannot distinguish red from green. Poppies among green corn, or ripe fruit on a cherry-tree, have to them the same hue. Others can only distinguish black, white, and grey (which is really a mixture of black and white), and to them nature presents neutral tints only. It is said to be more common in the male than in the female. A harmless defect in most persons, it may be very serious in others, as in pointsmen, railway guards, engine-drivers, or sailors, who have to know the meaning of signals made by coloured lights. The cause of C.-B. is not known. Three theories have been advanced: (1) That it is a defect of the structure of the retina of the eye; (2) that it is a peculiarity in the absorptive power of some of the fluids or transparent media of the eye; and (3) that the defect is in the sensorial centre in the brain. See EYE.

Colour-Printing. See POLYCHROME PRINTING.

Colour-Sergeant is a rank in the army usually given to deserving soldiers. The C.-S. ranks above the ordinary sergeant. The pay is 2s. 5d. per day.

Co'lours, Metals, and **Furs**, are the three tinctures in Heraldry (q. v.). The metals, which are *or*, gold, and *argent*, silver, represent yellow and white, and always take precedence of the C., unless the contrary is specified. The five C. are *azure*, blue; *gules*, red; *sable*, black; *vert*, green; and *purpure*, purple; their abbreviations being az., gu., sa., vert, purp. *Tenne* or *tawny*, an orange colour, and *murrey* or *sanguine*, a dark crimson, are sometimes used, but very seldom now in English heraldry. In French heraldry vert is called *sinople*. C. and metals, when engraved, are represented by a very convenient system of dots and lines: *or*, by dots; *argent*, is left plain; *az.*, is indicated by horizontal lines; *gu.*, by vertical lines; *sa.*, by horizontal and vertical lines, like a small check; *vert*, by diagonal lines from dexter to sinister, or heraldic right to left; and *purp.*, the reverse of the latter. *Tenne* is represented by vertical lines down through those of *purp.*; and *murrey* or *sanguine* by diagonal lines from both dexter and sinister, crossing each other.

Colours, Military, are the standards and other flags carried by a regiment. They are sentimentally regarded as symbolical of the achievements and renown of the regiment, and as forming an important part of 'the pomp and circumstance of glorious war:' accordingly in battle, when defeat has been inevitable, brave soldiers have been often known to wrap their C. round them, and to die in their defence—

> 'One sleeps where southern vines are dressed
> Above the noble slain;
> He wrapt his colours round his breast
> On a blood-red field of Spain.'

The presentation of C. to a regiment by a lady is a graceful ceremony that always evokes a generous and loyal emotion.

Colt, Samuel, inventor of the C. revolver, was born in Hartford, Connecticut, U.S., July 19, 1814, and in early life was successively a sailor and a 'lecturer.' In 1835 he took out a patent for the invention which gave him fame and wealth. In 1837 his revolver was used successfully in the Florida war, and still later in the Mexican war. C. erected large works in Hartford, on the banks of the Connecticut river, reclaiming a great deal of waste land for this purpose. He died January 10, 1862.

Colts'foot. (See TUSSILAGO.) Sweet C. is the American name for *Nardosma*. West Indian C. is *Pothomorpha*.

Colubri'na, one of the chief divisions of the order *Ophidia* (q. v.) or Serpents (q. v.), distinguished by the fact that all its members possess solid teeth in the upper jaw, in addition to the poison-fangs with which that jaw may be provided. The fangs, when present, are immovably fixed in the mouth, and they may be deeply grooved, but never form completely hollowed or 'canaliculated' organs. The head gradually tapers off into the neck, and is not markedly triangular. It is covered by large-sized scales or *scuta*. The C. are divided into the three sections, *Innocua*, or harmless snakes; *Suspecta*; and *Venenosa*, or venomous forms. The *Innocua* possess no fangs or poison-gland, solid teeth existing in both jaws. Of this group the Boas and Pythons (q. v.), and the genus *Coluber*, represented by the common ringed or British snake (*C. natrix*), are good specimens. This latter snake, found in Britain and Europe, inhabits mossy places generally, averages 3 feet in length, and is coloured pale olive, spotted with black above and whitish beneath. The neck is spotted yellow. The *Coluber Elaphis* of S. Europe, the *C. Æsculapii*, or Æsculapian snake of Italy, the *C.*, or *Bascanion constrictor* or black snake of America, are also examples of the same genus. The section *Suspecta* includes snakes with fangs placed far back in the upper jaw, and having solid teeth *in front* of them. These are all Old World snakes (*Homolopsidæ*), &c., and but little is known of their habits. The Colubrine *Venenosa* have fangs in front of the upper jaw, with solid teeth *behind* them. To this group belong the Cobras (q. v.) or *Naja*, the *Hydrophidæ*, or water-snakes of the E. Indies, and many others. As implied by the name *Venenosa*, they are all particularly venomous.

Colu'go. See FLYING LEMUR.

Colum'ba, St, the apostle of the Scottish Highlands, was born at Gartan in Donegal, on the 7th December 521. Fedhlimidh, his father, was of the Cinel Connal, a branch of whom, the Hy Neills, gave several kings to the N. of Ireland. His mother, Eithne (*Aine*), was of the royal race of Leinster. He thus possessed the advantage, especially valuable among a Celtic people, of royal lineage. His uncle was King of Ulster, and he was related to the kings of Dalriada in Argyleshire, his adopted country. He was baptized *Colum*, and was subsequently, from his Christian zeal, called *Colum Cille—i.e.*, 'Colum of the Church.' He began his education at Movile (*Magh-bile*, 'the plain of the large tree'), under the celebrated bishop St Finnian, who ordained him as deacon. After studying some time in Leinster under an aged bard, Gemman, he entered the monasteries of Clonard and of Glasnaoidhein (Glas Nevin) near Dublin, whence he returned to his native N. When twenty-five years of age he founded the Church of Derry in Ulster (*Daire*, 'oak copse,' the foundation of the since famous Londonderry), and about seven years later founded the monastery of Durrow (*Daire-magh*, 'the oak copse of the plain or field'). He planted various other churches from this period to the year 561, when an event occurred which was the great crisis in his life. Various accounts are given of the matter, but the following is the best authenticated:—C. copied a psalter belonging to Finnian without asking the owner's permission. (This transcript afterwards became famous as the *Cathach*, and is said to be still preserved by the O'Donnels as a very valuable relic.) Finnian claimed the copy as his property; C. refused to give it up, and the matter was referred to Diarmat, King of Connaught, who, on the principle that every *CONN* (calf) belongs to its cow (or mother), ruled that every *son-book* (copy) belongs to its book (the original). Far from yielding to this decision, C. raised a number of his clansmen, attacked and routed King Diarmat, slaying several of his followers. For this affray, which was called the battle of Culdrevny, C. is said to have been excommunicated and banished for ever from Ireland by a synod of Irish bishops. This is improbable, as it is certain that he afterwards revisited Ireland, and exerted great political and ecclesiastical influence there. The battle of Culdrevny, however, seems to have induced him to leave Ireland and to enter on his missionary labours. In 563, C., then in his forty-second year, accompanied by twelve attendants or friends, some of them relatives, set sail for the W. of Scotland. Tradition states that he first landed at Salen, in the island of Mull, but finding the water unhealthy, he crossed to the other side of the island, and fixed his abode on Iona (q. v.). This small island has, from his day, been called *I Challum Cille* ('the isle of Colum of the Church'). The name Iona is shown by Dr Reeves to have arisen from the mere carelessness of a transcriber, and has nothing to do either with Hebrew or with the Latin C. Scotland was at this period mainly peopled by the Southern Picts occupying Wigtonshire, &c., the Strathclyde Britons or Cymri, whose capital was Dumbarton, the Northern Picts, who occupied the country N. of Athole along with the Hebrides, and the Scots, who ruled in Argyleshire. Connal, C.'s near relative, reigned in Argyle, and gave him whatever right he himself had over Iona. His people had embraced Christianity in Ireland. St Ninian had ministered among the Southern Picts; St Mungo was at that time labouring in the kingdom of Strathclyde, but the most numerous people of the whole, the Northern Picts, were still heathen. Unfortunately we have scarcely any account of the manner in which C. and his fellow-missionaries laboured among them, but St Adamnan tells of his reaching the dwelling of the Pictish king Brude, near Inverness, and after being for some time refused an interview, at length converting that monarch. He also relates that Brochan, King Brude's chief Druid, had a slave whom C. ordered him to release. He refused, but falling dangerously ill, he besought C.'s intercession for his recovery, which was promised, but on the condition of the slave's release. This was granted, and, along with similar incidents, must have greatly advanced C.'s moral influence. In the *Book of Deer*, written in the 11th or 12th century, we read that he and his pupil Drostan came to *Aberdoboir* (Aberdour) in the district of Buchan, where the Mormaor (high steward) Bede, a Pict, gave him in perpetuity that town, and that the town of Deer (*Deur*, tear) was conferred on him owing to the recovery of the Mormaor's son through the prayers of the Christians. We hear of C. also in Skye, and it is probable that he visited the Orkneys, while some of his successors took up their abode in Iceland. His biographer gives neither a minute nor a consecutive account of his travels, but merely fragmentary details.

We learn that in the year 573 his friend Connal, King of Dalriada, died, and the selection of his successor seems to have been mainly left to the decision of C. He chose Aidan, who proved himself the most talented of all his race. Next year we find him and King Aidan at the celebrated convention of Drumceat in Ireland, where, through his influence, various disputes between Argyle and Ulster were settled, and Argyle was made a free and independent kingdom. At this convention a sentence of death was passed on the bards for their rapacity and scurrility; but C. generously pleaded their cause, and procured a reversal of the decree, consenting, however, to a great reduction in their number. He visited his churches and monasteries in Ireland, and speedily returned to his beloved Iona. Here, at length, in the year 597, he entered into rest, and the closing scenes of his life show that, with all his natural violence of temper, he had learned much of the gentleness and benevolence of his Divine Master. On Saturday the 8th June, with his favourite attendant Diormit, he visited the granary, and blessed the food of his family, as his monks were called. Returning towards his own house, he rested for a time on a stone, when an old white horse, employed in carrying the milk from the byre to the monastery, rested its head on the saint's breast. Diormit was driving it away when C. forbade him, caressed and blessed the animal. On entering his house, he set himself to his favourite work of transcribing the Scriptures, and on completing the 10th verse of Psalm xxxiv., laid down his pen, saying 'Baithen (one of his monks) must do the rest.' He attended vespers in the church, and was the first to return to it at the midnight vigil. He knelt before the altar, and passed peacefully away very early in the morning of the 9th June 597, at the age of seventy-six.

Many interesting questions must be briefly passed over. We read of his conversing with his Pictish cousins, yet needing an interpreter in preaching. This seems to prove that the old Pictish language was a middle dialect between the Gaelic and the Cymric, possessing words common to both, but in several respects differing from either.

His establishment in Iona was simple and primitive, but not so rude as is often supposed. There was a most methodical arrangement of outhouses—or farm-offices, in modern language—among others, a byre, showing the error of the common notion that C. permitted no cows on the island. We also have mention alike of a kitchen and a cook, a baker and a butler; *vide* Dr Reeve's *Adamnan*, pp. 334-368.

As to the Church constitution established at Iona, while it is clear that C. himself was a mere presbyter, yet since Bede affirms that the province, and even the bishops, were subject to the Abbot of Iona, we must conclude that something like apostolic authority was exercised by the great missionary, and descended to his successors, though there is no evidence that any definite 'system' of ecclesiastical government was ever adopted by them. The tradition that C. founded 100 monasteries and 300 churches is an evident exaggeration, but it is certain that he was the means of diffusing Christianity through the N. and W. of Scotland and the Hebrides. He greatly advanced religion in Ireland, and his successors carried the gospel to the N. of England. C. was a man of great energy and determination, but liable to outbursts of violence. He seems to have possessed an athletic frame, and Adamnan describes him as being of 'angelic beauty.' There are few men in Scottish history more deserving of national gratitude. His biography, written by St Adamnan (q. v.), has been issued, with notes and illustrations of the highest value, by Dr Reeves. See also *Historians of Scotland* (Edmonston & Douglas, Edinb. 1875).

Col'umban or **Columba'nus, St**, a native of Ireland, was born in Leinster about the middle of the 6th c. The Christian religion at this period flourished in Ireland as it did in no other country, and Irish missionaries went out far and wide to propagate it. C. was among the most famous of these. After a training at the monastery of Bangor—whose abbot was then Congall, the friend of Columba—C. departed for France in 589 along with twelve companions, the customary number in such cases. Here he established religious houses at Fontaine, Annegray, and Luxeuil in Burgundy. His reproofs, however, offended King Theodoric, and this, together with a dispute as to the celebration of Easter, compelled the Irish monks to leave the country in 610. After travelling through Switzerland, C. founded in 612 the celebrated monastery of Bobbio among the Apennines, on the river Trebbia, where he died three years later, having by his work aided much in advancing Western Christianity. His writings, which are in Latin, comprise twelve sermons, a monastic rule famed for its brevity and simplicity, some poems, and ecclesiastical treatises. M. Guizot has praised his sermons for their eloquence and power. C.'s works are contained in the *Collectanea Sacra* of Flemming (Louv. 1667), and his Life was written by Abbot Jonas, a successor in the abbacy of Bobbio. See also Lanigan's *Ecclesiastical History of Ireland*, vol. ii., Bähr's *Geschichte der Römis. Liter.*, and the Benedictine *Histoire Littéraire de la France*. C.'s name is preserved in the Lombard town of San Colombano.

Columbar'ium (Lat.), a dove-cot. The term was also applied to a sepulchral chamber, fitted up with niches resembling the holes of a pigeon-house, for the reception of funeral urns, called *ollæ*, and formed of baked clay. In these the ashes of the freedmen and slaves of great families were frequently deposited. A very perfect C. was discovered at the Villa Rufini near Rome in 1822.

Colum'bia, or **Or'egon**, originally a vast region of N. America, on the Pacific slope, extending from California to Alaska, It was claimed both by Spain and England, and was for some time a cause of dispute between the U.S. and England. By the treaty of June 12, 1846, the present boundary—49° and the Strait of Fuça—was agreed upon, and the original region is now divided into British C. (a province of Canada), the state of Oregon, and the territory of Washington.

Columbia, British, a province of the Dominion of Canada, is bounded E. by the Rocky Mountains, W. by the Pacific Ocean, S. by Washington Territory, and N. by the rivers Simpson and Peace. It includes Vancouver's Island (q. v.), and has an area of 213,000 sq. miles, and a pop. (1871) of 10,586, exclusive of some 40,000 Indians. The province has a rugged coast-line of some 700 miles, along which are scattered numerous islands, the largest after Vancouver being Queen Charlotte Island, Pitt Island, and Prince Royal Island. The mainland is traversed from N. to S. by two westerly ranges of the Rocky Mountains, and is watered by the Fraser, with its tributary the Thomson, and by the Simpson, the Columbia, and the Skeena. The climate varies greatly, according to the altitude and distance from the sea, but in the most populous parts it is temperate and equable, the temperature ranging from 75° F. in summer to 22° in winter. There are occasional tracts of rich arable land, and the hills and plains everywhere afford excellent bunch-grass pasture. Immense forests of cedar, pine, oak, maple, &c., offer inexhaustible supplies to a rapidly growing timber trade. Sea-otters, black, red, and silver foxes, fur seals, martens, beavers, &c., yield costly furs, while there are also buffaloes, bears, deer, goats, and grouse and other game in abundance. The fish found on the coasts and in the rivers include whales, seals, sturgeon, salmon, cod, halibut, anchovies, &c. The Fraser is specially famed for its salmon and its small oily 'oulachans.' But the importance of the province is mainly owing to its vast mineral resources. The mountains are composed chiefly of granite or mica-schist, with here and there masses of sandstone, limestone, and intruded trap, interbedded with clay-slate containing auriferous quartz. To the N. coal-beds and iron pyrites occur, the latter in great quantities. Gold is found everywhere, and among the other minerals are silver, iron, and copper. In 1871 new gold mines were opened in the district of Ominica and Peace, and in that year the total yield amounted to £300,000. Steam-vessels are now plying on the rivers, and the projected Interoceanic Canadian railway is to have its terminus in Vancouver's Island, after passing through the province. The capital is Victoria, and the other important places are New Westminster, Fort Alexander, and Fort George. B. C. became a member of the Dominion of Canada in 1871. It sends five representatives to the Parliament at Ottawa, and has a local Legislature and Executive Council, and is presided over by a Lieutenant-Governor. In 1870 the revenue of the province amounted to £102,290, the expenditure to £100,523, and the public debt to £322,328.

Columbia College, New York city, was founded in 1754, and is the fifth in regard to age in the U.S. It is controlled by the Episcopalians. C. C. has a law school, and a flourishing 'School of Mines.' President (1875), F. A. P. Barnard, LL.D.

Columbia, District of, is the seat of the Federal Government of the United States. It lies on the left bank of the Potomac, at the head of sloop-navigation, and originally belonged to the state of Maryland. When it was found necessary to establish the general Government in a district free from any local state jurisdiction, Maryland and Virginia gave up for this purpose a piece of land 100 sq. miles The part on the right bank of the Potomac was afterwards given back to Virginia, and the D. of C. is now 60 sq. miles. It is governed directly by the general Government, and is not represented in Congress. The chief cities are Washington and Georgetown. Pop. of district in 1870, 131,700, of whom about one-third were coloured.

Columbia River, or **Oregon** (the latter is the Indian name), the largest river on the W. side of N. America, rises in the Rocky Mountains. It pursues a winding course, and with its large and numerous tributaries drains an extensive region. Latterly it flows almost due W., near the N. boundary of the state of Oregon, and, after a course of 1000 miles, enters the Pacific between Cape Disappointment and Point Adams. It furnishes the only harbour on the Pacific slope between San Francisco and Port Discovery, but although the mouth is 5 miles wide, there is only 4 or 5 fathoms of water at the bar. Navigation is open both to English and Americans, but vessels can only ascend about 100 miles.

The river was discovered by Captain Gray of Boston in 1792, who gave the name of his vessel, C., to it.

Rock-Dove.

Columbidæ, a group of birds usually included among the sub-orders of the Insessores or Perchers, but occasionally considered a separate order of the class *Aves*. The C. are represented by the various groups of doves and pigeons. They perch on trees, a habit which ordinary Rasores do not exhibit. The upper mandible is horny, and arched at its apex, whilst it is also arched at its base, where the nostrils, covered by a cartilaginous plate, are situated. This plate is usually covered by a soft vascular membrane, which may appear in the form of a wart-like process. The wings of the C. are more powerful than those of ordinary Rasores. The hinder toe is as well developed as the three front toes, and is placed on the same level as the latter digits. These birds are all monogamous, and generally pair for life. Their young are born in a naked, helpless state, and thus differ from the young of Rasores. The crop is double, and of large size. The C. inhabit both warm and temperate climates, and from their susceptibility of domestication present innumerable varieties. The rock-dove (*Columbia Livia*) is the progenitor of our domestic breeds. See also CARRIER PIGEON, DOVE, FRUIT PIGEON, GOURA, GROUND PIGEON OR DOVE, PASSENGER PIGEON, &c.

Col'umbine (*Aquilegia*), a genus of plants of the natural order *Ranunculaceæ*. There are various so-called species—many no doubt only varieties of each other—of which the best known is the common C. (*A. vulgaris*), long a favourite garden flower, and at one time esteemed in medicine as a diuretic and aperient. Most of the species of it are natives of the temperate and colder regions of the northern hemisphere.

Columbium, or **Niobium**, a rare metal, discovered in 1801 in *Columbite* from Massachusetts, and since then in a few other minerals. C. is identical with Rose's niobium, and not with tantalum, as supposed by Wollaston.

Columbus (the Latinised form of the Ital. *Colombo*, Span. *Colon*), **Christopher**, born at Genoa in 1436, was the son of a woolcomber, and was sent at an early age to school at Pavia, where he showed a taste for geography, geometry, and astronomy. At the age of fourteen he went to sea, and after having made a number of voyages in the Mediterranean, he made the bolder venture of a voyage to Iceland in 1467. About 1470 he settled in Lisbon, and married Phillipa Palestrello, the daughter of an Italian navigator, who, dying soon afterwards, left to his son-in-law all his charts, maps, journals, instruments, &c. These C. turned to account by constructing globes and maps for sale to support his family. About this time also he joined several successive expeditions to Guinea. At what period he at first conceived the idea of a passage westward to the shores of India it would be difficult to determine. His expeditions, however, to Iceland (where he *may* have read the record or heard the story of the earlier Norse discovery), to Madeira, the Canaries, the Azores, and the Portuguese settlements of Africa, suggested to him the possibility of crossing the Atlantic. His magnanimous spirit rose to the conception of the sea-passage to India, and he proposed his plans for the discovery of this W. passage successively to the states of Genoa, Portugal, Venice, France, England, and Spain. His project was regarded for many years as the hallucination of a visionary; but amid all his disappointments the magnificence of his scheme, and his firm conviction that he was the destined instrument of Heaven to carry the banner of the cross to all the ends of the earth, comforted and fortified his spirit. Years spent in pressing a disregarded suit, however, exhausted his means; and when, in 1480, he was travelling with his little son, Diego, in Andalusia, resolved to turn his back on Spain and appeal to France, he found himself destitute of the bare means of subsistence. Stopping before the convent of La Rabida, he begged for bread and water for his child. This act of paternal solicitude directly opened up the hitherto closed path to success, to the most splendid discovery in the annals of the race, to never-dying fame. Attracted by C.'s distinguished appearance, the superior of the convent entered into conversation with him, discussed his scheme for crossing the Atlantic, and furnished him with means and credentials to the court of Spain. Queen Isabella, after some time spent in hesitation and reflection, declared herself 'ready to assume the undertaking.' The arrangements between C. and the Spanish sovereigns were concluded April 17, 1492. Appointed admiral, viceroy, and governor-general of all such lands as he should discover, C. set sail with three vessels—two of them barques—and 120 men from Saltes, near Palos, on the 3d August 1492, and after a voyage of seventy days (during one-third of which he was detained refitting at the Canaries) he discovered the New World on the 12th October. The land first seen was one of the Bahama Islands, upon which C. landed, and with tears of joy and devout thanksgiving he solemnly planted the cross upon it, and named it San Salvador. He also discovered the islands of Cuba, San Domingo, &c., after which he set sail for Spain, and arrived there 15th March 1493. After this time C. made three successive voyages, discovering the Caribee Islands, Puerto Rico, Jamaica, Trinidad, and the N.E. coasts of S. America. The victim of misrepresentations, and driven by his officers and crews to abandon his legitimate object of discovery for the search for gold, and for the illusory El Dorado, the latter years of C.'s life were wasted, he lost the favour of King Ferdinand, and on 20th May 1506 he died at Valladolid in poverty and neglect. His remains were buried with great pomp at the King's expense, and over his grave a superb monument was raised. He had put his trust in princes, and he had his reward.

A short but interesting biography of C. by his son, Don Fernando Colon, is printed in Barcia's *Historiadores primitivos* (5 vols. Madr. 1749). The diary of C. on his voyage of discovery is to be found in Navarrete's *Viages de los Españoles* (5 vols. Madr. 1825–37), and has been translated into French, with annotations and additions, by Remusat, Balbi, Cuvier, &c., under the title *Relations des quatre Voyages enterpris par C., suivies de divers Lettres et Pièces inédites, &c.* (3 vols. Par. 1828). Recently (Lyon. 1864) Torre has prepared a *Raccolta completa* of C.'s writings. We may also note the biographies of C. by Bossi (Mil. 1818), Irving (4 vols. Lond. 1828), Sanguinetti (Gen. 1846), Reta (Tur. 1846); and the discussion of disputed points in Humboldt's *Cosmos*, and *Examen Critique de l'Histoire de la Géographie, &c.*; and also in Spotorno's *Codice Diplimatico Colombo-Americano* (Gen. 1823).

Columell'a, L., Ju'nius Modera'tus, the most copious and best-informed writer among the Romans on rural affairs, was born at Cadiz, and flourished in the early part of the 1st c. Any knowledge that we possess respecting him is derived from casual notices scattered through his writings. He died, probably at Tarentum, about 42 A.D. C.'s great work, *De Re Rustica*, in twelve books, is a systematic treatise on agriculture. He also wrote *De Arboribus*, in one book. The most complete edition of C. is that of J. G. Schneider (Leips. 1794–97), in the *Scriptores Rei Rusticæ*, containing an account of the various MSS. and of the gradual emendation of the text. Translations of C. exist in English, French, German, and other tongues.

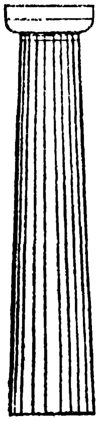
Columellia'ceæ, a small order of Dicotyledonous plants, consisting of *Columella*, a genus of plants from the Andes, comprising two or three species. It is most nearly allied to the *Saxifragaceæ*, among which it may probably in time be allowed to take its place.

Col'umn (Lat. *columna*), a pillar of various materials, either standing alone, or supporting a superincumbent mass of building, or itself merely an architectural decoration. The solitary C., set up in memory of some person or event, is a structure of great antiquity. Jacob set up a pillar on Rachel's grave, and Absalom in his lifetime reared one for himself, because he had no son to keep his name in remembrance. It was not uncommon for the kings of the ancient East to inscribe their deeds on a pillar of stone, the latest discovered and most important of these being the Moabite Stone (q. v.), above 3 feet high, and about 2 feet in breadth as well as in thickness. As famous specimens of the solitary C., Pompey's Pillar, near Alexandria in Egypt, the columns of Trajan and Antonine in Rome, the

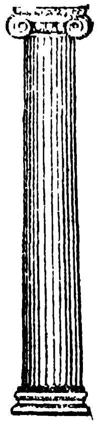
London Monument, the Vendôme C., and that of July in Paris, the Alexander monument in St Petersburg, and, latest and grandest, the C. of Victory erected at Berlin in 1873, may be mentioned.

The C. in architecture which supports a roof or entablature presents a special aspect of the civilisation of every country which has ever found time to enjoy and cultivate the arts of peace. In the architectural monuments of ancient *Egypt*, the C. is always found forming a portico inside the building, has no fixed proportion between the diameter of the shaft and its height, and frequently resembles the trunk of a palm-tree. The shaft of the *Assyrian* C. was tall and slender, and the capital sometimes terminated in two half bulls placed back to back. Rawlinson, in his *Five Great Monarchies*, gives an engraving of two capitals, one of which is very like the Ionic, and the other rather resembles the Corinthian style. The C. of the historical remains of India has a massive shaft surcharged with ornamentation; the capital is sometimes spheroidal, at other times it exhibits a sculpture of the lion, the bull, the elephant, or some fantastic animal. The kind of C., however, to which our attention must mainly be directed, is that which originated in Greece, and which with modifications has been reproduced in all countries to which Greece transmitted its civilisation and its arts. The Greek C. may be described as a pillar of wood, stone, or iron, circular on the plan, and rarely polygonal; either a truncated cone—that is, with the diameter of the shaft diminishing upwards, but having a slight swelling, called the *entasis*, about a third of its height from the base; or cylindrical—that is, with the diameter of the shaft the same from base to capital. It is divided into three principal points, the *base*, *shaft*, and *capital*—respectively its foot, body, and head.

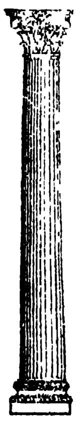
There are three styles or orders of the Greek C.—the *Doric*, the *Ionic*, and the *Corinthian*; and to these the Romans added two other orders—the *Tuscan*, which is only a modification of the Doric, and the *Composite*, which is a combination of the Ionic and the Corinthian. The Doric and the Ionic columns were in use as early as the 30th Olympiad, B.C. 656, while the Corinthian is not known to have existed earlier than the 4th c. B.C.



Doric Column.



Ionic Column.



Corinthian Column.

The *Doric* is said to have been invented by the Dorians; it was frequently employed by them in their temples, and corresponds with the dignified and serious character traditionally assigned to them. It has no base, the foot of the C. resting immediately on the base of the rest of the temple. The shaft is a circular stem on which the entasis is very observable. Only on rare occasions was it monolithic; it was usually composed of drums laid on each other without mortar, but fastened to one another with dowels of cedarwood. Lengthwise this C. was striped with circular indentures, called *whippings* by the Greeks, *flutings* by us, the edges of which form sharp angles. On the shaft rests the chief characteristic of every style—the capital. It consists of three parts—the *neck*, a continuation of the shaft, from which it is separated by one or more indentures, called *amulets*; the neck widens in its upper part, and is generally ornamented with several amulets. Above this is the principal feature of the capital, the *echinus*, a circular ledge projecting forcibly all round. It is the supporting power of the C. under the weight of the beams and roof resting upon it. Above it there is the third part of the capital, the formal-looking beaver, or *abacus*, a square slab with square edges, which receives the chief beam or architrave. The height of the Doric C. is usually only four or five lengths of the diameter at its base.

The *Ionic* C. is more slender than the Doric; this and its more ornamental appearance being supposed to give expression to the lighter and more versatile character of the Ionic people. Its height on the average is equal to eight diameters. The base has the *plinth* as its lowest part, and above it there are two or more bolster-like prominences, each called a *torus*, which are separated from each other by a round groove called the *scotia*. The length of the diameter diminishes less upwards than that of the Doric and between the flutings there are small flat bands called *fillets*, in place of the sharp angles of the massive Doric C. The neck is embellished with ornaments; the echinus or *ovole* is less prominent, and shows the 'egg-and-arrow' carving which gives it the latter name. But the capital is rendered most striking by its *volutes*, which look like the abacus drooping under the weight of the architrave. There are two volutes to the face of the Ionic C., and two to the back. Sometimes, however, the volutes are placed diagonally, especially on the C. at the end of a row. Above them is a small slab, also ornamented, which receives the architrave.

The *Corinthian* C. resembles the Ionic in the proportions and mouldings of the base and shaft, but its capital is very strikingly peculiar to itself. It takes the shape of an open chalice formed by acanthus leaves. There are two rows of leaves, one above the other, eight in each row, the stems of the upper leaves rising from the same level as those of the lower. In the interstices between these masses of leaves are seen stems with smaller chalices at their tops, from which are developed two stalks, each of which droops like a volute under the weight of the abacus. The sides of the Corinthian abacus are concave in plan, being curved out so as to form a sharp point at each corner, which is cut off.

No authentic examples of the *Tuscan* C. have been left for observation; but it has been constructed according to a description given by Vitruvius in his work *De Architectura*. It differs from the Doric in having a base which consists of a plinth and tones; the shaft is not fluted, and the neck or collaring of the capital is separated from the shaft by a small convex moulding, called an *astragal*. Like the Doric, it has, as its chief feature, the echino-abacus capital.

The C. of the *Composite* order differs from that of the Corinthian mainly in the details of its capital, which is of a mixed character, blending the Ionic volutes with the Corinthian foliage. The outline of the leaves of the acanthus is, however, bolder than that of the Corinthian, and instead of two rows of leaves, there are sometimes three, between which volutes appear other flowers also, and the forms of men and animals. The order to which this C. belongs was specially affected by the Romans, the greater number of their large edifices being built in the Composite style. See ORDER, ENTABLATURE.

Column, Military, is a mass of soldiers several ranks in depth. A C. is said to be *open* when the spaces between the ranks composing it permit of their wheeling into line; otherwise it is a *close* or *half-distance* C. In action, authorities are not agreed as to the relative advantages of *line* and C.; English commanders have generally been in favour of the former, the French of the latter.

Col'ure, a semi-obsolete term in astronomy, applied to any great circle of this sphere passing through the equinoxes and solstices.

Colym'bidæ, a family of (*Brevipennatæ*) *Natatores* or Swimming birds, represented by the Grebes (*Podiceps*) and Loons or Divers (*Colymbus*), the latter being the typical forms. They have the three front-toes united by a web, and inhabit the coasts, seeking their food in the sea. In the grebes, the toes are united only at their bases by a membrane, and present broad lobes. The beak in all C. is conical and pointed, and the legs are placed far back on the body.

Col'za Oil is obtained by means of crushing-mills from the seeds of the Colza or summer rape (*Brassica campestris*, var *oleifera*). Other species of *Brassica* yield a similar oil. The plant is largely cultivated in France, and the N. of Europe generally. C. O. is yellow, and the quantity procured averages about one-third the weight of the seed. It is used chiefly for purposes of illumination. *Rape-cake*, the residue after expression of the oil, is useful for manure.

Co'ma (Gr. *kōma*, 'a deep sleep') is a term used in medicine to describe a state of more or less insensibility, from which a patient can with difficulty, if at all, be roused. In severe cases of C. there is on the part of the patient not only obliviousness to all around him, but dilated pupils, strong stertorous breathing, and flaccid hands and legs. C. may be caused by Apoplexy (q. v.), in which case the person cannot be roused at all, and one or both pupils are dilated; by Concussion (q. v.), in which the breathing is easy and the pupils natural, while the patient in general soon awakes to partial consciousness; by opium poisoning, in which case the pupils are contracted, the breathing slow and stertorous, and the patient at first can be partially roused; or by intoxication, in which case there is generally an alcoholic smell in the breath. The treatment depends on the cause.

Coma Boreni'ces ('hair of Berenice'), a small and inconspicuous constellation of the northern hemisphere, situated between the tail of Ursa Major and the head of Virgo.

Comac'chio (the ancient *Comacula*), a fortified town and bishop's see, in the province of Ferrara, Central Italy, between 2 and 3 miles from the Adriatic, in the midst of an unhealthy lagoon, 140 miles in circumference, and famous for its eel culture. Across the narrow belt of mud which separates the lagoon from the Adriatic, canals have been constructed which admit the fry of the eel, mullet, &c., into the lagoon, where they fatten, and in due time are captured and sold. About a million pounds weight are caught annually. The eel-harvest is in autumn, and the men employed in it are lodged in barracks. There are rich saltworks in the neighbourhood. Pop. (of the commune) 8476.

Coman'ches. See INDIANS, AMERICAN.

Comat'ula. See CRINOID.

Comay'agua, the capital of Honduras, a state of Central America, on the river Ullua, near the S. edge of the plateau of C., noted for its beauty, fertility, and fine climate. The town was founded in 1540, became the seat of a bishop in 1561, but was almost destroyed in the civil broils that followed the 'emancipation' of the country from Spanish rule. It is now recovering, but its commerce is still unimportant, though a railway to Puerto Caballos, and to Fonseca Bay, on the Pacific, foreshadows a future prosperity. The only building of mark is the cathedral, and even of it nothing is fine but the outside. Pop. 18,000.

Comb (Old Eng. *camb*, Dutch *kam*, Fris. *kaem*, Low. Sc. *kaim*, Ger. *kamm*), an instrument with a series of teeth for arranging or fastening the hair, as well as for dressing and cleansing wool, flax, &c. Combs, as an article of the toilet, are of great antiquity: the Greeks and Romans used boxwood, ivory, and metal in their construction, but there is no evidence to show that women in early times employed combs to support the hair. Ancient burial-places in England have furnished examples of bone and ivory combs belonging to the Roman and Anglo-Saxon periods. In mediæval inventories of ecclesiastical treasures, combs are frequently mentioned, for it was customary for the priests before celebrating mass to wash their hands and arrange their hair. These ceremonial combs are usually carved or otherwise ornamented. An ivory C. which belonged to St Cuthbert is preserved at Durham, and that of St Loup, of ivory, jewelled, and carved with symbolical animals, is to be seen at Sens. The materials used in C.-making are horn, bone, wood, ivory, tortoise-shell, hardened india-rubber, and metal. Horns, having their tips cut off, are rendered pliant by heat, split up in the direction of the grain, and pressed flat. In the manufacture of side and ordinary dressing-combs, a piece of horn of the required size is stamped out, and from it two combs are made at once by means of the *parting-engine*. This ingenious machine is provided with a tooth-cutter, having a vertical movement, and by means of a cogged wheel, the plate of horn is shifted, as the cutter is rising, through a space equal to the interval between one tooth of the C. and the next. When all the teeth are cut, two complete combs, the teeth of the one fitting exactly into the spaces of the other, are *parted* by a dexterous pull. The teeth are then finished off with wedge-shaped files, called the *graille*, *carlet*, *topper*, &c., and the whole smoothed, buffed, and polished. Tortoise-shell is similarly operated on. Imitation tortoise-shell combs are made by treating the horn with nitric acid, and staining it with a composition of soda ley, quicklime, red-lead, and dragon's blood. Small-toothed combs are cut with a circular saw. Cheap and durable combs are now extensively made from vulcanite, in much the same manner as those from horn.

Combe, Andrew, M.D., an eminent physician, was born in Edinburgh, October 27, 1797. After studying medicine there and in Paris, he commenced to practise in Edinburgh in 1823, was appointed physician-in-ordinary to the King of Belgium (1836), which he was unable to retain on account of his health, and afterwards a physician-in-ordinary to the Queen in Scotland. He died at Edinburgh, 9th August 1847. Three years later his *Life and Correspondence* were published by his brother George. C., who was in every sense a most excellent, amiable, and benevolent man, has enriched medical literature with various valuable works, of which may be mentioned *Management of Infancy, Physiological and Moral* (1840, 9th ed. 1860, revised by his friend Sir James Clark), *Observations on Mental Derangement* (1831), and *The Principles of Physiology applied to the Preservation of Health* (1834, 15th ed. 1860), &c.—**George C.**, brother of the preceding, a phrenologist and philosopher, was born October 21, 1788, at Edinburgh, where he was educated, and became a writer to the signet in 1812. In 1816 he made the acquaintance of Dr Spurzheim, the well-known phrenologist, and ultimately adopted his principles. The fruit of this conversion was seen in his *Essays on Phrenology* (1819), and *Elements of Phrenology* (1824), which became very popular. In 1828 appeared his *Constitution of Man considered in Relation to External Objects*, which caused a considerable amount of hostile criticism, many maintaining that it was opposed to revealed religion, although its leading principle, the harmony of the constitution of man with the surrounding world making it incumbent on him to study the laws of nature, is now a commonplace. The real objection to C.'s philosophy is not what he says, but what he leaves unsaid. In 1833 C. married Cecilia, daughter of the famous Mrs Siddons. In 1837 he retired from the practice of his profession in order to give himself up to scientific and philosophical study, and from his active pen proceeded numerous books, not only on Phrenology, but on Popular Education (1833, 3d ed. 1848), Moral Philosophy (1840, 3d ed. 1846), Criminal Legislation, and Prison Discipline (1854), while he delivered courses of lectures on subjects with which he was familiar, in Great Britain and the United States, and on the Continent. His last work was published in 1857, entitled *The Relations between Science and Religion*. C. died 14th August 1858. His collection of books on phrenology is in the Advocates' Library, Edinburgh. See Gibbon's *Life of G. C.* (2 vols. Lond. 1878).

Com'bermere, Stapleton Stapleton-Cotton, Viscount, an English general, son of Sir Robert Salisbury Cotton, was born 14th November 1773 at Llewenny, in Denbighshire. He entered the army in 1790, distinguished himself in India, especially at the siege of Seringapatam, and in the Peninsular War. In 1810 he received the command of the whole allied cavalry under the Duke of Wellington, and fought in most of the Peninsular battles, being wounded at Salamanca. He was raised to the peerage as Baron C. in 1814. Among the numerous offices he filled subsequently to Waterloo were those of Governor of Barbadoes, Commander of the Forces in the West Indies, Commander-in-Chief in Ireland, and Commander-in-Chief in India, in which last position he captured the famous fortress of Bhurtpore in 1826. In the same year he was made Viscount; in 1852 he succeeded the Duke of Wellington as Constable of the Tower, and in 1855 was made Field-Marshal. C. died February 21, 1865.

Combina'tion (in sociology). This word has lately come into use, legally and politically, and denotes the union of persons having a common commercial interest, with the view of promoting that interest. It is chiefly employed in relation to the proceedings of the working classes for retaining monopolies and advancing the rate of wages. The promotion of these ends is chiefly sought after by means of what are called *trades unions*.

In former times combinations, whether of workmen against their masters or of masters against their workmen, were illegal, and punishable summarily by justices of the peace. This state of law was altered by the statute of 6th Geo. IV. c. 129, by which C. was declared legal so long as unaccompanied by violence and intimidation. Trades unions and combinations, with the laws relating to them, were the subjects of a Royal Commission, which issued its report in 1869. The report gives a complete view of the recent alterations and working of the law regarding the subjects of inquiry. This led to the passing of two other Acts of Parliament in 1871. By these it is provided that the purposes of trades unions shall not be held illegal because they are in restraint of trade, so as to render void or voidable any agreement or trust executed under them. Trades unions may be registered under the first Act, which provides for the tenure and protection of their property. Under both Acts, the provisions of the law against violence and coercion on the part of unionists are repealed and re-enacted, and criminal unions and illegal contracts are defined.

To render C., when not accompanied by intimidation of others, illegal is plainly an infringement of personal liberty. If two or two hundred men—for the principle is the same in both cases—agree not to work for their masters under a certain rate of wages, they have just as much right to do so as their masters have to agree not to sell the produce of their workmen's labour under a certain price; the right in each case being unquestionable. It is equally plain that, when those who combine also try to force others to join them, *they* are infringing on personal liberty. But while the right of C. is thus properly conceded by the law to servants as well as to masters, it may be greatly doubted whether any permanent effect can be produced by it. If the workmen of England cannot or will not work at a rate of wages which will enable their masters to sell their produce abroad cheaper than those abroad can make it for themselves, it is plain that the trade of England must suffer, and thousands be thrown out of employment. These thousands must either return to work at a lower wage, or starve, or go elsewhere. See CONSPIRACY.

Combinations, Laws of (in chemistry). See ATOMIC THEORY.

Combinations (in mathematics). See PERMUTATIONS.

Combreta'ceæ, the Myrobalan order, a natural order of Dicotyledonous plants, natives of the tropics of America, Africa, and Asia, containing about 200 species, remarkable for their astringency. *Quisqualis Indica* of the Moluccas has anthelmintic seeds; *Combretum butyrosum* of S.E. Africa produces a vegetable butter. Myrobalans are produced by various species of *Terminalia*. See BEDDA NUTS.

Combus'tion may be popularly defined as the consumption of a substance with evolution of heat and light, when it is raised to a sufficiently high temperature in air or oxygen. The phenomenon of C. depends upon the union of the combustible body with oxygen, which, like other chemical actions, causes the disengagement of heat, and if sufficiently intense, of light also. Thus when charcoal is raised to a red heat, it continues to glow until it has burnt away, providing that sufficient air is present to support its C. On examining the substances which have been produced, it is found that they are wholly gaseous, and consist either of carbonic oxide (CO) or of carbonic acid (CO_2), according as the supply of air has been limited or excessive. Candles, coal, gas, &c., contain hydrogen in addition to carbon, and when burned produce water (H_2O) as well as the oxides of carbon. The process of respiration is another and very beautiful instance of C. Venous blood, highly charged with effete and useless matters rich in carbon, is pumped by the heart into the lungs, and is there exposed over a large surface to the action of the oxygen of the air. The useless materials of the blood become oxidised to carbonic acid and water, and escape from the body during the act of exhalation, while a new supply of oxygen is taken into the lungs again during inspiration: the heat produced by this oxidation or slow C. is carried off to all parts of the system by the purified (arterial) blood, and serves to maintain the temperature of the body.

The term C. is sometimes used in a more general sense by the chemists to denote other chemical actions than those of oxidation, attended with extrication of heat and light. Thus when copper or antimony in a state of fine division are thrown into chlorine gas, they become redhot and burn away, and in the same manner when a lighted candle is plunged into chlorine it continues to glow.

The theories regarding C. have varied from time to time, and have played an important part in the history of chemistry. Perhaps the most remarkable of these theories is that of *Phlogiston*, first brought forward by Stahl. Stahl believed that all combustible substances contained an inflammable material, which received the name of *Phlogiston*, *terra secunda*, or *terra inflammabilis*, and which was lost when they were consumed. Lead, for instance, when heated in air, smoulders away, and is eventually converted into a yellow powder (litharge). This yellow powder Stahl and his followers believed to be lead deprived of its phlogiston, or *dephlogisticated*. On heating litharge with charcoal, metallic lead is separated and the charcoal disappears. To account for this, it was assumed that the dephlogisticated lead took phlogiston from the charcoal and thus returned to its original state, whilst the charcoal lost its phlogiston and was converted into a gas. This theory was overturned by Lavoisier, who proved conclusively that a substance did not lose anything when burnt, but, on the contrary, gained in weight, and moreover gained in weight by an amount equal to that of the air consumed. The discovery of oxygen by Priestley paved the way for Lavoisier, and enabled him to explain the conversion of lead (Pb) into oxide of lead or litharge (PbO) when heated in air, and the subsequent *reduction* of the litharge by the charcoal, which removes the oxygen and forms with it the gaseous compound carbonic oxide.

Com'edy. See DRAMA.

Come'nius (*Komensky*), **Johann Amos**, an educational reformer, was born at Comna, near Brunn, 28th March 1592. After completing his university studies, he travelled in Holland and England, and thereafter resided at Lissa, in Poland. The most important of his ninety-two works are *Janua Linguarum Reserata* (1631) and *Orbis Sensualium Pictus* (1658). Their object was twofold—to facilitate the acquisition of the power of speaking and writing Latin by weaving numerous Latin words, not exclusively classical, into paragraphs, in which they might be easily learned; and to combine the knowledge of things with that of words, by treating in the lessons of subjects readily intelligible by the pupils, such as animals, trades, sports, and so on. These works were widely popular both in Germany and other countries, and have been frequently translated, imitated, and extended. From his high reputation C. was invited to England, to Sweden, and to Hungary, to aid in organising public instruction. Towards the close of his life he settled at Amsterdam. He died at Naarden, 15th November 1671. A Life of C., with his *Essay on the Education of Youth*, has been published by Mallalieu. See also Von Raumer's *Geschichte der Padagogik* (4 vols. Stutt. 1846-55).

Com'es (Lat. 'companion') was the name given in the later times of the Roman Empire to a state official. Thus we find in the 4th c. an imperial officer in Britain called *Comes littoris Saxonici* ('warden of the Saxon coast'), *i.e.*, of the E. coast of Britain, already exposed to the ravages of Low German pirates. In the Teutonic system the C. was originally one of the *comitatus*, or personal following of a chief, the Old English name for whom was first *Eorl* or *Gesith*, the latter of which means exactly the same thing as C.; but as the power of the kings grew, *Gesith* was dropped for *Thegn* ('servant'), which gradually took the place of the older *Eorl*. The result was that *Eorl* then became distinctively a title of higher rank, and implied greater power and authority. Under the form of Earl (q. v.), it now denotes a particular grade in the peerage, and is held to be the equivalent of Count, for the wife of an Earl is a Countess. See Freeman's *Norman Conquest*, vol. i. c. 3.

Com'ets are celestial bodies, distinguishable from planets and stars by their rapid motions, their usually irregular forms, and the more or less hazy definition of their edges. Before astronomy was established as an exact science, these phenomena were regarded with superstitious dread, and each received the credit of having occasioned any dire calamity which occurred after its appearance, such as famine, pestilence, war, the death of some great person, &c. The only danger, however, which can possibly ensue from the presence of a comet is that arising from a collision with our earth; but as to the consequences of such a chance we cannot, in the present state of our knowledge, more than speculate. In the following sketch we shall first consider the peculiarities and characteristics presented by C. as regards their form and appearance, their orbits and motions; then pass to the enumeration and description of some of the more celebrated historical appearances; and, in conclusion, discuss a few of the results already made out regarding their constitution, together with the various speculations and theories which have been thrown out of late years bearing upon the same question.

The striking feature of C. when seen with the naked eye, and a feature which at once distinguishes them from other celestial bodies, is their hairy-like appendage or *tail*—hence the name, from Lat. *coma*, 'hair.' The rest of the comet, or the *head*, is of a nebulous appearance, consisting of a hazy *envelope*, and a more or less bright *nucleus*. These characteristics are, however, not universal, some C. presenting merely a globular nucleated mass, without any tail, others not even a nucleus. In several instances, more tails than one have been observed, and it has been remarked that these appendages, when present, are generally turned away from the sun. The orbits in which C. move never approach the nearly circular form of those of the planets, but are distinctly elliptical—sometimes so eccentric as to be undistinguishable, for the comparatively brief time the comet is visible to us, from a parabola. There are also authenticated instances of hyperbolic orbits, the C. describing which of course cannot return to the solar system, unless perhaps the course be permanently altered through the perturbing influence of some of the larger planets. Again C. are found to move in planes inclined at all angles to the ecliptic, and to revolve round the sun with a motion as often *retrograde* as *direct*. As a comet approaches the sun, it diminishes in bulk, though to us, whom it also approaches, it may appear to increase. The tail is a later development, and is not present when the comet is first observed by the telescope. It is subject to constant changes and pulsations, sometimes seeming to sweep through space at a speed to which the planetary velocities are scarcely comparable. The head, when viewed through a telescope, not unfrequently presents the appearance of a series of concentric luminous rings, with a bright nucleus in the centre; while at other times the nucleus emits on the side next the sun jets as it were of flame, moving and vibrating as if in a region of conflicting currents.

One of the most interesting C. of modern times is Halley's—interesting especially as being the first whose periodic revolution was recognised, and whose return was boldly predicted by that celebrated astronomer. Noticing the great similarity between the elements of the C. of 1531, 1607, and 1682, Halley fixed the reappearance of the 1682 comet for the year 1759. As the time approached, Clairaut, calculating from the observations of 1682, and taking into account the possibly perturbing influence of Jupiter and Saturn, fixed its perihelion passage for April 13, 1759. The true date was March 12. Messrs Damoiseau and Pontecoulant calculated its next return for November 7, 1835, and the calculation differed from the observed time by less than a week. Its next appearance will be in 1910, and the same comet has been identified with those of 1456 and 1378, the latter of which was observed by the Chinese. It is noticeable that this comet has been diminishing in splendour at each reappearance, and probably after a few more returns it will become invisible to the naked eye. The comet of 1744 is remarkable as having had six tails. The present century has been uncommonly rich in brilliant C., of which we may mention the two great ones of 1811; those of 1819, 1825, and 1847; that of 1843, whose head was only 96,000 miles from the sun's surface at its perihelion passage, and whose tail, not less than a hundred million of miles long, seemed to sweep through two right angles in two hours; the brilliant appearances of 1858 (Donati's) and 1861, both remarkable for the rapid evolutions and dissipations of their envelopes, and the latter further interesting from the now almost settled fact that the earth passed through the extremity of its beautiful fan-shaped tail on the evening of June 30; and, lastly, Coggia's second comet of 1874. This list, however, gives little or no idea of the numerous C. visible by telescopic aid, and far less of the myriads which probably exist, but which have hitherto escaped detection. The most interesting of these telescopic C., possessing as they do short periods, and therefore belonging more to our system than their farther-reaching brethren, are Encke's (period 3·29 years), De Vico's (5·46), Winnecke's (5·51), Brorsen's (5·58), Biela's (6·61), D'Arrest's (6·64), Faye's (7·44). Biela's comet was discovered by that astronomer in 1826, and identified with the C. of 1772 and 1805, in which latter year it was seen by Olbers with the naked eye. In 1846 it was observed to split into two portions, which were still distinct on its next appearance in 1852. In 1859 and 1866, though eagerly looked for, no signs of its existence were detected, and it was regarded by many as a thing of the past. Mr Hind, however, calculated its perihelion passage for October 6, 1872, from Dr Michez's orbit of 1866, and prepared sweeping ephemerides for September and October, with variations of ± 8 days in perihelion passage. It escaped observation, however, till November 30, when Mr Pogson, Madras Observatory, received a startling telegram from Professor Klinkerfues, which ran thus: 'Biela touched earth on 27th; search near Theta Centauri.' After two mornings of vain search, a glimpse of it was obtained. Circumstances were more favourable on December 3, when the comet was seen with a bright nucleus and a faint but distinct tail. It has been doubted, however, whether this comet was really Biela's, and was not rather another and quite a distinct body. Coggia's small comet of 1873 has been identified by Professor Weiss of Vienna with the first of 1818, discovered by Pons at Marseilles, the plane of whose orbit was so nearly parallel to that of Biela's, that by some it was supposed to have been derived from the latter by a splitting analogous to what was observed in 1852. Every year several of these hazy telescopic bodies are discovered, but they possess little interest save to the astronomer.

The first step towards the true comprehension of what C. really are was made by Tycho Brahé, when he demonstrated in 1577 that they were extraneous to our atmosphere. Not much more than a century later, Newton showed them to be subject, like planets, to the law of gravitation; and sometime after the lapse of another century, Arago discovered that part, at least, of cometary light was *polarised by reflection*. This last discovery has been fully borne out by the recent spectrum investigations of Huggins, Donati, Secchi, Vogel, and others. Unfortunately, no comet of any size, with the exception of Coggia's, which was badly situated for observation, has appeared since the introduction of the spectroscope as a useful, and now indispensable, instrument in astronomical research; and, accordingly the spectroscopists have had to content themselves as yet with Brorsen's, Winnecke's, and other telescopic C. These all show one or more bright lines, accompanied by a more or less faint continuous spectrum. It is thus apparent that C. shine partly by reflection, partly by their own light. The characteristic bright lines in Winnecke's comet coincide very closely with the bright lines in the spectrum of carbon taken in olefiant gas; but, in the majority of cases hitherto observed, there is *no* similarity in constitution to any such hydrocarbon. At the present stage of our knowledge, we cannot reason further concerning the composition of the gaseous portion of C.; but this at least is made out, that probably a comet consists of a cloud of solid particles, held together more because their individual orbits are somewhat similar, than because of their own mutual gravitation, and that therefore as it approaches the sun it shrinks in bulk, the orbits of the component meteorites rapidly converging, and the particles themselves coming into frequent collisions, thus generating sufficient heat to volatilise a part of the matter, and giving rise to all the varied changes observable in a comet's head by telescopic aid. This theory is supported by the coincidence, first noticed by Ochiaparelli, which seems to exist between the orbit of the August meteors and that of the second comet of 1862, and the further seemingly similar connection between the November meteors and the comet discovered by Klinkerfues and Pogson, and believed by them to be Biela's. When the meteor-cloud is sufficiently dense, it is visible as a comet; and the extremely eccentric orbits which these bodies describe round the sun, the sometimes great inclinations to the ecliptic, and their frequently retrograde motions, show that, if the nebular hypothesis be granted, C. and meteors did not belong originally to the solar system, but are later importations caught up from surrounding space by the attraction of the sun and planets. All this is an evident inference; but when we come to the consideration of the tail, a new and greater difficulty meets us. It is scarcely possible that this tail can be one and the same material *appendage*, for that matter should be translated with a velocity of more than 30,000 miles per second—the velocity of the extremity of the tail of the comet of 1843 during its perihelion passage—is inconceivable. To meet this difficulty, Sir John Herschel has speculated on the possibility of a '*negative shadow*, a momentary impression made on the luminiferous æther behind the comet.' Professor Tyndall has worked upon this idea, and has explained the momentary impression as due to the decomposition by the concentrated rays of the sun of some chemical compound surrounding the comet—the head acting in some mysterious way as a lens. But if it act as a lens to sunlight, why not to starlight also? Further, whence comes the necessary organic compound? By assumptions of such a nature, any curious phenomenon could be plausibly explained; but no simplicity or better comprehension of the facts is gained. Professor Tait, however, merely discarding the once prevalent idea that C. must have extremely small mass—an idea *taken for granted* upon the ground that *one* comet in 1779 became entangled among Jupiter's satellites, which were not perceptibly perturbed by the encounter—has explained the whole mystery as an optical condition. He likens a comet to a swarm of sea-larks, viewed at such a distance that the birds are not *individually* visible; and in the remarkable changes of form which such a swarm seems to undergo, a consequence of the relative changes of position of the line of sight and the surface in which the birds are situated, he discovers an explanation for all the varied transformations observable in a comet's tail. Thus (see *Cosmical Astronomy, Good Words*, December 1875) 'the gigantic motions of the tail in sweeping round the sun may be merely the running along of the optical condition of visibility among a swarm of separate objects, each of which is moving with a velocity neither extravagantly greater nor extravagantly less than would characterise a planet or other portion of matter at the same distance from the sun.' There is no limit to the size of the component meteorites, but the smaller we suppose the integral fragments to be, the greater must be the average distance between contiguous ones in order to secure transparency to starlight—the less therefore the mass. Upon this hypothesis, the passage of the earth through the *head* of a comet would be fraught with great danger; but the probability of such an occurrence is evidently extremely small, if we assume that C. may approach the sun from any direction. This assumption, however, may require modification, if future research bear out the discovery of M. Houzeau, that of 209 C. considered by him, the major axes show a tendency to arrange themselves parallel to the double heliocentric meridian 102° 20′ and 282° 20′, being only 28° long. from the point towards which the solar system is moving.

Com'frey (*Symphytum*), a genus of plants of the natural order *Boraginaceæ* (q. v.), natives of Europe and the N. of Asia. There are only a few species known. *C. officinale* and *C. tuberosum* are natives of Britain, not uncommon in moist shady places. The former was at one time greatly valued as an application to wounds, and the young blanched shoots are sometimes used as a potherb, or as a substitute for spinach. The root contains a good deal of starch and mucilage; accordingly, when finely scraped 'and laid on calico to the thickness of a crown-piece, it forms an excellent bandage for broken limbs,' &c. (Bentley). A large-sized species—*C. asperrimum* of the Caucasus—may yet become of some value as a fodder plant for pigs and cattle, analysis showing it to be rich in flesh-forming principles: it contains much gum and mucilage and but little sugar. It was introduced into this country in 1811, but is as yet only cultivated as a garden plant.

Comines' or **Comynes, Philippe de, Sieur d'Argenton,** a famous French chronicler, was born near Lille in 1445. In 1464 he entered the service of Charles, Comte de Charolais, afterwards Charles the Rash of Burgundy, but in 1472 he attached himself to Charles's rival, Louis XI., who, within five years, made him one of the richest nobles of France. Louis found in C. an astute and unscrupulous agent of his cruel and perfidious policy. After the death of Louis, Anne of Beaujeu banished C. from the court; but though a decree of Parliament of 24th March 1488 had condemned him to lose a fourth of his estates, and to ten years' banishment, we find him as early as 1493 again engaged in important missions. He was employed both by Charles VIII. and Louis XII., the latter of whom restored his pensions, but withheld his confidence from the minister of Louis XI. He died, 17th October 1509, at his castle of Argenton. C.'s *Mémoires* show him to have been a sagacious, clear-headed statesman; but, though admirably written, they offend modern feeling by the cold-bloodedness with which they detail the most iniquitous and revolting transactions, the sole merit of each of which seems to be its success. The first edition, which is imperfect, was published at Paris in 1523, in folio. The best is that of Mlle. Dupont (3 vols. Par. 1850). C. plays an important part in Scott's *Quentin Durward.*

Comi'so, a town of Sicily, province of Notto, 43 miles W.S.W. of Syracuse, with manufactures of paper. Pop. about 10,000.

Com'itas or **Com'ity of Nations,** a term of international law, signifying the effect given in one country to the laws and institutions of another in questions arising between the natives of both. See INTERNATIONAL LAW.

Comi'tia (Lat. *cum*, 'together;' *eo*, 'I go'), were the great constitutional assemblies of the Roman citizens, duly summoned by a magistrate for the election of magistrates, the enactment of law, the declaration of war, and the trial of citizens on criminal charges. The *Comitium* was the part of the Forum where the C. met in early times, though afterwards their meetings were usually held in the Campus Martius. The C. were of three kinds, *C. Curiata*, *C. Centuriata*, and *C. Tributa*, in which the people voted respectively in curiæ, centuries, and tribes, according to the three modes of their political organisation. Each citizen voted in his own curia, century, or tribe; but each curia, century, and tribe had only one vote on the question submitted, and its vote was determined by the majority of voters within it. Thus, as some centuries, for example, contained a much larger number of voters than others, the decision might not be the opinion of the gross majority of the assembly. The C. Curiata were the most ancient, and were composed entirely of patricians. The C. Centuriata, instituted by Servius Tullius, were truly national assemblies, comprehending all citizens, whether patricians or plebeians, who had property to a certain amount. The C. Tributa were originally confined to the plebeians, and were convened for the first time in the trial of Coriolanus, B.C. 491. The word *C.* often means *elections*, as the C. were yearly convened under the republic to elect magistrates. The C. Calata were assemblies convened by the college of pontiffs, at which the people, sometimes in curiæ, at others in centuries, did not vote, but listened to and witnessed the proceedings, which consisted chiefly of the proclamation of the nones, the consecration of priests and kings, and the making of wills.

Comm'a. See PUNCTUATION.

Comma, in music, a small interval (generally corresponding to a vibration-ratio of 81 : 80) occurring between the true pitches of two notes, which are represented by one only in the organ, pianoforte, and other tempered instruments. See TEMPERAMENT.

Commandant' is an officer of the army in merely temporary command. The designation is more frequently applied in foreign armies than in the British.

Command'er, in the British navy, is an officer next in rank above a lieutenant and under a post-captain. He ranks with a lieutenant-colonel in the army, and is unofficially addressed *Captain.* The full pay of a C. is £1 per day; when in command of a sea-going ship, 3s. 9d. additional. The half-pay of the first hundred commanders on the active list is 10s per day, of the remainder, 8s. 6d. A C. may either serve as second in command, or command independently, according to the rate of the ship.

Commander-in-Chief is the highest appointment in the British army. There is not, however, necessarily an officer of this rank in command of the home army, there having been no C.-in-C. since the death of the Duke of Wellington in 1852. At present the administration of the army is, by the War Office Act of 1870, vested, under the Secretary of State for War, in three officers, one of whom has the title of 'Commanding-in-Chief.' The office is presently held by Field-Marshal the Duke of Cambridge, his department being that of command and discipline. Though in theory all appointments and promotions are made by the crown, on the responsibility of the Secretary of State for War, the officer commanding-in-chief has practically the control of all these, except, perhaps, the very highest. He is responsible for recruiting operations, and for the allocation of the troops. The commander of the forces in India has the title of C.-in-C.

Comm'andite, Société en, is the French equivalent term for what we call a 'sleeping partner.' By the common law of

France, a partner of this kind may, by agreement with his associate, determine the extent of his liability to the public. The justice of the legal principle has to a great extent been recognised by ourselves in the passing of the Limited Liability Act (q. v.). The French term arises from the commercial meaning of the word *commander*, to command. It is applied to the authorising of one person by another to transact business on his account.

Commelyna'ceæ, the Spiderworts, a natural order of Monocotyledonous plants, natives of the E. and W. Indies, Australia, Africa, and N. America. The underground stems of many of these, on account of the starch which they contain, are used for food. In the jointed hairs of the Virginia spiderwort (*Tradescantia Virginica*), a common garden flower, and other species, the singular movement known as *Gyration* (q. v.) can be well examined. *Commelyna cœlestis* is also a well-known cultivated species. Altogether sixteen genera and more than 260 species are described. Some are accounted astringent, and therefore useful as applications to wounds; others are emmenagogue, &c.

Commen'dam. When a beneficed clergyman is promoted to a bishopric, he vacates his benefice by the promotion; but formerly the sovereign could give him the right to retain it. He was then said to hold it *in C.*, that was, ostensibly, until some one else should be provided for it. Future grants in C. were abolished by 6 and 7 Will. IV. c. 77.

Commendator.—In Scotland, in Roman Catholic times, the revenues of a benefice during a vacancy were collected by an officer called a C. He was properly a steward or trustee; but the Pope, who was entitled to grant the higher benefices in *Commendam* (q. v.), abused the power, and gave them to commendators for their lives. This abuse led to the prohibition of all commendams, excepting those granted by bishops for a term not exceeding six months.

Commen'surable, a name applied to two numbers or quantities of the same kind, which are both divisible without remainder by a third number.

Comm'entry, the chief town of a canton in the department Allier, France, in a hilly region on the Œil, 45 miles S.W. of Moulins by railway. It owes its great and sudden prosperity to large coal-mines in the vicinity, and to an extensive iron-work, employing 1200 men. Pop. (1872) 9058.

Comm'erce, Offen'ces against. The commercial code of the country has undergone material alterations in late sessions of Parliament, and many regulations founded on mistaken notions of the public interest, and which interfered with the general principle of commercial freedom, have been repealed. One of the most noteworthy of these reforms is the repeal throughout the United Kingdom of all the Acts against usury. By this repeal the capitalist is as unfettered in the employment of his money as the landlord is in the disposal of his land and the labourer in the disposal of his industry. See FALSE PRETENCES, FRAUDS, SMUGGLING, INTEREST, CHAMBER OF COMMERCE.

Commer'cial Law. See MERCANTILE LAW.

Commina'tion (Lat. *comminatio*, 'a threatening') is the name of a penitential service used in the early Christian Church. It is still read in the Church of England on Ash Wednesday. It purports 'to read the general sentences of God's cursing against impenitent sinners, gathered out of the seven-and-twentieth chapter of Deuteronomy and other places of Scripture.' See Bingham's *Eccles. Antiquities*.

Commissa'riat is the name given to the system by which armies are supplied with the necessaries of life. In the wars of Queen Anne's reign the troops were supplied by contract, a plan which is said to have led to considerable peculation on the part of the famous general who conducted them. In 1793 a commissary-general was appointed, his duty being to superintend the contracts for supplying the army with food. In 1858 and 1859 a new organisation was introduced, the C. being made a department of the War Office. In 1870 it was merged in the 'Control Department,' by which the civil affairs of the army are now administered. The ranks of the C. are commissary, deputy-commissary, assistant-commissary, and sub-assistant commissary.

Comm'issary, in ecclesiastical law, is an officer who acts for the bishop in a remote part of the diocese. In Scotland, following the abolition of papal authority in 1560, the supreme C. court was instituted by Queen Mary in 1563. It had jurisdiction in matrimonial cases, and had a double jurisdiction, one *diocesan* over the three Lothians, the other universal, by which it confirmed the testaments of all who died in foreign countries, or who died in Scotland without a fixed domicile. It also reviewed the judgments of inferior commissaries, of whom there was one in most of the principal towns of Scotland. The powers of the supreme court (abolished in 1836) were gradually transferred to the Court of Session; those of the inferior courts partly passed to the Court of Session and partly to the sheriff courts; but 'even yet,' says Sheriff Dove Wilson, 'the transference of jurisdiction is in form incomplete. In certain actions the sheriff assumes the style and title of C., and uses a seal decorated with the episcopal mitre.' See *The Introduction to Practice of the Sheriff Courts*, by J. Dove Wilson, advocate (Edinb. 1875).

Commis'sion is in law a writing or implied mandate authorising one, or more than one, person to exercise the duties and powers belonging to another or to others. (See AGENT.) There are various legal operations conducted by C., of which the following are the most important:—

Commission of Oyer and Terminer.—This, in English law, is a C. directed to the judges and other gentlemen of the county to which it is issued, directing them to hear and determine in cases of alleged treasons, felonies, and trespasses. It is in virtue of this C. that the judges on circuit dispose of criminal cases. In urgent cases, a special C. of O. and T. is granted. It may be extended to Scotland, provided three Lords of Justiciary be in the C.

Commission of the Peace. See JUSTICES OF THE PEACE.

Commission for taking Proof.—In the Court of Session in Scotland, as well as in the inferior courts, parole proof may be taken under a C. granted by the court. The commissioner is delegated to take the oaths and depositions of witnesses, and to report these to the court. The C. is invariably accompanied by a Diligence (q. v.), which is also a judicial warrant under which the witnesses are cited, and may be compelled to attend the commissioner for examination. The Act 6 and 7 Vict. c. 82, makes it compulsory on witnesses and Havers (q. v.) (*i.e.*, holders of writings) to attend before a commissioner appointed by the Scotch courts; and a C. issuing from an English or Irish court has the same power of execution in Scotland.

Commission, Army, is the crown's warrant constituting a commissioned officer in the army. Formerly, under what was called the *Purchase System* (q. v.), the various ranks were mostly obtainable at a fixed price. But this system was abolished by royal warrant in July 1871. Commissions in the probationary ranks are now given to the successful candidates in competitive examination. The limits of age for candidates for admission to competition to the cavalry and infantry are seventeen and twenty; for students of universities who have passed certain examinations, the limits are seventeen and twenty-one; for B.A. or M.A. graduates, seventeen to twenty-two. To qualify for lieutenant, a sub-lieutenant must serve satisfactorily in a regiment for twelve months, after which he must study at a military college and pass an examination. In the Artillery and Engineers, candidates, selected on examination, are trained at Woolwich Academy. Lieutenancies are given to cadets who have passed an examination on the subjects of instruction. Further examination must be passed before getting a captain's C. in any branch of the service. Promotion is now by 'selection, tempered by seniority,' up to the rank of lieutenant-colonel (see COLONEL, BREVET) in the cavalry and infantry. In the Artillery and Engineers it is by seniority alone. Non-commissioned officers are the sergeants-major, sergeants, trumpeters, drummers, buglers, and in the Life Guards and Horse Guards the corporals. They mess by themselves, and rank between a commissioned officer and a private soldier.

Commiss'ionaire is an attendant attached to Continental hotels, but not forming a part of the establishment. Thus his services are not charged in the bill, and must be arranged for with the C. himself. No one is, of course, obliged to employ him. In some hotels, though not in many, we have found the C. very troublesome and officious, offering to do all kinds of petty services, such as posting letters, &c., for which he expected wholly disproportionate payment. There are, however, many occasions on which the C. is very useful, especially to those who do not speak the language of the country in which they are travelling. Commissionaires can nearly always speak English, and generally French also. For a day's attendance they usually expect about seven francs; for looking after the registering of luggage, taking tickets, &c., in starting on a railway journey, or for meeting one on arrival, and looking after the luggage, &c., five francs is the proper fee of a C.

Commission del Crederé is an Italian expression, used to denote the extra premium charged by an agent or factor for guaranteeing the solvency of a purchaser, and so making himself personally liable for the value of the goods which he has sold for his principal. See AGENT.

Commission Merchant is a merchant who sells goods on account of some one else. The C. M. is paid by a percentage, called *commission*, on the value sold.

Commission of Assembly. See GENERAL ASSEMBLY.

Commis'sioner in Scotch Bankruptcy. Under the Scotch Bankruptcy Act, three commissioners are chosen at the meeting for election of trustee. Their duty is to superintend, to advise, and assist the trustee, and to fix his remuneration. They are not themselves entitled to any remuneration. No one can be a C. who is disqualified to be a trustee. See BANKRUPTCY.

Commissioner of Police, for London and neighbourhood, is appointed under 19 and 20 Vict. c. 2. The C. of P. and the constables are empowered to enforce regulations of the Police Acts respecting houses of public resort, driving vehicles and cattle, nuisances in thoroughfares, &c. They have also power to act on the river Thames, and they may at any time go on board vessels, and take cognisance of the conduct of persons on board.

Commissioners of Justiciary. See JUSTICIARY, COURT OF.

Commissioners of Teinds. See TEIND COURT.

Commissioners of the Jury Court. See JURY TRIAL.

Commit'ment for Trial. When a supposed offender is arrested, the justice before whom he is brought is bound immediately to inquire into the circumstances of the alleged crime, and to take the examination of the prisoner, and the evidence of those who bring him, in writing. If the charge appear groundless, the prisoner must forthwith be discharged; otherwise he must be *committed*, or give Bail (q. v.) for his appearance to answer the accusation at next sessions or assize, and the prosecutor or person injured by the crime charged is bound over to prosecute. In Scotland the information is generally at the instance of the Procurator-Fiscal (q. v.), and C. for T. or discharge is given after the declaration of the accused and the Precognition (q. v.) have been taken before a magistrate. See IMPRISONMENT.

Commitment of a Bill. See PARLIAMENT.

Committ'ee. When an assembly or body of men appoints a few of its members to do special acts, or to make special inquiry, those so appointed form what is called a C. It may, however, consist of only one member; or it may be formed of the whole body making the appointment by its assuming the functions usually discharged by a C. Thus, in Parliament, when the various clauses of a measure which has been passed on second reading—and thus been virtually adopted in its leading principle—come to be considered, a 'C. of the whole House' is formed for doing so. The Speaker leaves the chair, which is taken by the Chairman of Committees. (See PARLIAMENT.) Select committees are also appointed in the House of Commons and in the House of Lords for the consideration of private bills.

Committee of Parliament. See PARLIAMENT.

Commix'tion, a term of Scotch law, indicating the mingling of two or more substances. C. may produce a new subject, as where wine is mixed; or it may not alter the nature of either substance, as where grain is mixed. This distinction is of some legal weight in questions which sometimes arise as to right of property.

Comm'odate, in Scotch law, is a gratuitous loan, the borrower being bound to restore the subject lent in the condition in which he received it. See BORROWING.

Comm'odore. A captain in the navy, when in command, has this title. He hoists a pennant indicative of his rank. Red indicates a C. of the first class, blue a C. of the second. He ranks with a brigadier-general in the army. The pay of a C. of the first class is £3 per day; of a C. of the second class, in addition to pay as a captain, if C.-in-chief, £1 per day; if not, 10s. per day.

Comm'odus, Lucius Aurelius, a Roman emperor, born 161 A.D., the son of M. Aurelius Antoninus, who educated him with unavailing care. On his father's death in March 180, C. concluded an inglorious peace with the Marcomanni, and repaired to the capital to share in its dissipations. His character immediately exhibited itself as one of boundless licentiousness, cruelty, cowardice, meanness, and perfidy; and distinguished virtue, or conspicuous excellence of any kind, soon proved fatal to its possessor. Resigning the government into the hands of a succession of worthless favourites, he rioted in debauchery, and gratified a childish vanity by exhibiting himself as a dancer, a charioteer, a buffoon, and especially as a gladiator. He even claimed divine honours as Hercules. Marcia, a favourite mistress, with Lætus and Eclectus, two officers of rank, learning that they were marked down on the tyrant's tablets for instant death, administered poison to him; but this operating slowly, they introduced Narcissus, a famous athlete, into his chamber, and he was strangled on the night of December 31, 192 A.D.

Comm'on. This is a term of English and Scotch law, but the meaning in the former differs from that in the latter. In England, C. is the privilege of use which one man, or the public, has of the property of another; such as the right to walk over or to fish from the land of another: hence lands over which such rights exist are called *commons*. The 8 and 9 Vict. is an Act whose objects are described to be to facilitate the enclosure and improvement of commons of certain descriptions, and held under certain rights, which obstruct cultivation and the productive employment of labour.

The expediency of this measure has been much questioned. 'We look with the utmost jealousy,' says Mr J. S. Mill, 'upon any further enclosure of commons. In the greater part of this island, exclusive of the mountain and moor district, there is certainly not more land remaining in a state of natural wildness than is desirable. . . . The C. is the peasant's park.'

Under the Act a Board of Commissioners, called the Enclosure Commissioners, is appointed to inquire into the expediency of any proposed enclosure, and to report to Parliament regarding it.

In Scotland, where the legal nomenclature is that of the Roman law, C. rights are called *Servitudes* (q. v.), while a C. or commontry is a piece of ground belonging to several persons, frequently to the inhabitants of a district or village, the right of each usually amounting to nothing more than a servitude. The C. is divisible by an action in the Court of Session, at the instance of any one having an interest. Nice questions, however, sometimes arise as to whether a right be of C. property or of servitude merely.

Common Agent is, in Scotch legal practice, an agent or solicitor before the Court of Session, employed to conduct a case in which several parties have a common interest. The two most important occasions for the appointment of a C. A. are in the process of Ranking and Sale (q. v.), and in the process of augmentation and locality. (See AUGMENTATION.) But a C. A. is also sometimes appointed in a process of Multiplepoinding (q. v.).

Common Debtor.—When the effects of a debtor have been arrested, and several creditors claim a share of them, the debtor is, in Scotch law, called the C. D.

Common Forms.—By this term is meant, in English law, the technical forms of expression used in legal writings. Statutes have been passed to substitute simpler and more generally intelligible expressions for many of these. But the fact that conveyancers were paid for the length of their work, not according to its value or difficulty, has rendered difficult the substitution of intelligible brevity for unintelligible prolixity.

Common Good.—In law this term is used to denote the property of a corporation, over which the magistrates have a right of administration solely for behoof of the corporation.

Common Interest.—This term is used in Scotch law to denote the interest which one person sometimes has in the preservation of that which is otherwise absolutely the property of another. Thus, the proprietor of a house may have a C. I. with the proprietor of a contiguous house in a chimney-can which is the property of the latter, if the falling of the can would injure the property of the former.

Common Property, in Scotch law, is property, whether heritable or movable, belonging to two or more proprietors *pro indiviso.* (See INDIVISIBLE.) The proprietors share the profit or loss according to their respective interests, and the consent of all is required in the management and disposal of the subject. Each joint-owner may sell his right, the purchaser taking his place; and the right may be adjudged (see ADJUDICATION) by the creditors of the C. proprietors, or of any of them.

Common, Tenancy in, or Joint-Tenancy.—This term of English law corresponds to that of C. Property (q. v.) in Scotch law. It denotes the rights of property vested in two or more persons, no division having been made of the property. The owners may agree to a division, or any one of them may under equity compel a division to be made. See COPARCENARY.

Common Bench. See BENCH and COMMON LAW, *Courts of.*

Common Counts, short statements of the cause of an action made in a Declaration (q. v.).

Common House, or **Common Room**, was an apartment in a monastery, presided over by a monk, called the *master.* A fire was constantly kept in it for the benefit of the monks, who were not usually allowed to have one anywhere else.

Common Law. The laws of England, like those of most countries, are largely regulated by customs resulting from experience, and confirmed by judicial decisions. Law so constituted is called C. L. It is to be distinguished from law created by statute (see ACT OF PARLIAMENT, STATUTE), and also from law as created or modified by Equity (q. v.). C. L. is overruled by statute law, and may be set aside or modified by equity, except in matters criminal. These involving public security, no judge can be allowed to administer them otherwise than according to the letter and to established authority. 'Immemorial usage' in C. L. does not refer to a period so remote as to be beyond historical record. The bounds of legal memory are limited by 3 Edward I. to the beginning of the reign of Richard I., from which time an uninterrupted custom acquires legal validity. But as this rule has often been productive of injustice, it has been provided by statute that thirty years' enjoyment shall constitute a right of Common (see COMMON), and that after sixty years the right is absolute. In claims of right of way, the periods are twenty and forty years. (See PRESCRIPTION IN LAW.) The civil and canon laws form branches of the unwritten or C. L. which, under different restrictions, have been adopted in the Ecclesiastical Courts, the Courts of Admiralty, and the Chancellor's Court of the University of Cambridge. Decisions of courts being the best evidence of what the C. L. is, are held in high regard, and are preserved as authentic records in the several courts. In Scotland, the term C. L. is used by many of the writers, and in some of the Acts of the Scotch Parliament, to signify the Roman law. But in Scotland, as in England, the proper meaning is the consuetudinary law, from whatever source derived.

Common Law, Courts of.—The *Court of Queen's Bench* is the Supreme Court of the C. L. in England. It consists of a chief justice and of four *Puisne* judges. It keeps all inferior jurisdictions within bounds of their authority, and may remove the subject of their proceedings so as to be determined by itself. It controls all civil corporations in the kingdom. It takes cognisance of both criminal and civil cases. It is a court of appeal, to which may be removed determinations of the Court of Common Pleas, and of inferior courts of record in England. Indictments removed into this court may be tried either *at bar*, that is, at the bar of the court, during term, or at Nisi Prius (q. v) by a jury of the county out of which the indictment is brought, the court itself being the principal court of criminal jurisdiction in the kingdom. Indictments moved into the Queen's Bench the court may order to be tried at the Central Criminal Court.

The *Court of Common Pleas*, like the other courts of Westminster, has jurisdiction throughout England; but it has no cognisance of crimes, or of matters of a public nature. There is one chief judge and four petty judges. They sit every day during the four terms to hear and determine all matters of law arising in civil causes. These the court takes cognisance of originally as well as on removal from inferior courts.

The *Court of Exchequer* is held before the Chancellor of the Exchequer, the Chief Baron, and four *puisne* Barons. The chief business of the court was formerly to take cognisance of matters connected with the public revenue, though by a fiction of law, common to this court with the Court of Queen's Bench, all personal suits may be prosecuted in the Court of Exchequer. It was at one time a court of equity, but by 5 Vict. c. 5, its jurisdiction in equity was transferred to the Court of Chancery. But it retains all other powers which it previously possessed.

The above constitute the superior courts of common law. They sit at Westminster, and are commonly called *The Courts at Westminster.* They have been consolidated by the Acts of 1873 and 1875. (See COURT OF JUDICATURE, SUPREME, ACTS.) There are also inferior courts of common law, the only important one of which is the County Court (q. v.), to which the corresponding court in Scotland is the Sheriff Court (q. v.). There are the Borough Courts under the presidency of the Recorder (q. v.). See MAYOR'S COURT OF LONDON, STANARIES.

Common-Law Bar.—That portion of the English bar which devotes itself to practice before the Common Law Courts is so termed.

Common Prayer, the Book of, is the liturgy of the Church of England and Ireland. Till the time of the Reformation there was no such book in the vernacular, the only thing of the kind being the Latin liturgy, originally derived from the Gallican (see LITURGY), and revised by the Bishop of Salisbury, 1085. During the reign of Henry VIII., in 1537, Convocation published a book entitled *The Godly and Pious Institution of a Christian Man*, and containing the Lord's Prayer, 'Ave Maria,' Creed, Ten Commandments, Seven Sacraments, &c. Of this a second edition was published in 1540, under the title of *A Necessary Doctrine and Erudition for any Christian Man.* These, however, were more of the nature of a confession of faith than a liturgy; but the same year a commission was appointed to reform the rituals and offices of the Church, and the next year the prayers for processions and litanies were ordered to be translated into English and publicly used. In 1545 the *King's Primer* was published, containing the whole morning and evening prayer very nearly the same as in the present B. of C. P. In 1547, under Edward VI., a committee of divines was appointed, who composed, first, a *liturgy* proper, or order for the Communion (1547), and then public offices for Sundays and holy-days, and for Baptism, Confession, Matrimony, Burial, &c. This liturgy was approved by Convocation, and confirmed by Parliament and the King, 1548. To obviate certain objections, the book was revised under Archbishop Cranmer, when the Sentences, Exhortation, Confession, and Absolution were added at the beginning of the morning and evening services, the Commandments were added at the beginning of the Communion office, and some rites and ceremonies considered idolatrous were removed; and thus revised, it was again confirmed by Parliament, 1551. Interdicted under Mary, it was again introduced, with slight alterations, under Elizabeth. Nothing more was done till after the Hampton Court conference under James I., when some trifling alterations were made, such as the adding of some forms of thanksgiving at the end of the Litany, and an addition to the Catechism regarding the sacraments. After the Restoration, at the instance of the Presbyterians, another revisal was made, the chief alterations then made being that the Epistles and Gospels were taken out of the authorised version of the Bible, and that the office of Baptism for those of riper years and the forms of prayer at sea were added. The B. of C. P. as it now stands was then approved by Convocation, 1661, and confirmed by Parliament next year. See *Annotated Book of Common Prayer* (1875), and *An Introduction to the History of the Successive Revisions of the Book of Common Prayer* (Parker & Co., Lond. 1877).

Commons. The dinner of members in colleges and inns of court is so called. There are separate tables for the Benchers (q. v.), for the barristers, and for the students and other members.

Commons, House of. See PARLIAMENT.

Common Sense, the Philosophy of, was the name given by Dr Thomas Reid to the theory by which he hoped to avoid the sceptical conclusions which Hume had drawn from the idealism of Locke and Berkeley. The scepticism of Hume had indeed no connection with, but was opposed to, the idealism of Berkeley strictly so called, viz., the substantial existence of the ideal world in an all-perceiving mind; but it was undoubtedly founded on what has been called the representative theory of Locke, as extended by Berkeley to the primary qualities of matter. The general statement of Reid was that there are in the mind certain self-evident principles which cannot be proved by any arguments, but which must be accepted as the ultimate grounds of certainty. General acceptance, and the impossibility of explaining them by early training or false reasoning, may confirm this view, but the authority of these principles lies in the simple consciousness of them. They are either *Contingent;* for example, 'those things do really exist that we distinctly perceive by our senses;' the probable uniformity of nature; 'there is a certain regard due to human testimony in matters of fact:' or *Necessary,* consisting of grammatical, logical, mathematical, moral, metaphysical, and æsthetic principles; for example, every proposition is either true or false; whatever begins to exist must have a cause. This procedure of affirming with regard to every unexplained mental fact not merely that it could not be explained, but that it was unscientific to attempt its explanation, had already been adopted by Père Buffier, who declared that, among others, it was the deliverance of C. S. that 'my soul produces motions in my body;' a proposition which is declared to be inconceivable by some modern physiologists. The C.-S. philosophy was largely modified by Dugald Stewart, who introduced the phrase 'Fundamental Laws of Belief,' but it owes its final statement to Sir W. Hamilton. On the leading question of a belief in an external world, he says: 'We are immediately conscious in perception of an ego and a non-ego, known together and known in contrast to each other. This is the fact of the *duality* of consciousness.' This view he calls Natural Realism. All other views, Nihilism, Idealism, Materialism, &c., he declares to proceed on the non-recognition of this ultimate *dualism,* or primitive incomprehensible belief that a material world, solid and extended, exists, and that a perceiving subject also exists. Hamilton's doctrine of C. S. on this question is therefore quite different from the 'irresistible suggestion' of an external world which Reid declared to follow upon sensation. On other points Hamilton accused Reid of having, like Beattie and Oswald, regarded C. S. as an appeal to 'the undeveloped beliefs of the unreflecting many.' C. S. requires strict *universality* and *necessity* as well as *incomprehensibility* or *simplicity* in its principles. Necessity may be the result of a power or of an impotence of the mind. The Cartesian *cogito, ergo sum,* and the intuitions of space and time, are examples of the former; the law of the conditioned as applied to the notions of causality and moral freedom and substance affords examples of the latter.

Common Time, in music, is a rhythm in which strong and weak accents occur alternately, each bar or measure usually taking either the form strong, weak, or the form strong, weak, medium, weak. These primary subdivisions may be indicated indifferently as crotchets, quavers, or minims, the first being by far the most common, and having the time signature $\frac{2}{4}$ and $\frac{4}{4}$ or 𝄵. Each of them may be again subdivided into two or four parts, the relative accentuation of which is the same as that of the primary subdivisions. Rarely these secondary subdivisions are *three* in number (*i.e.*, each crotchet is divided into three quavers, &c.), in which case the rhythm is really changed into what is known as Compound C. T. (q. v.).

Commu'ni Dividen'do Ac'tio, in Roman law, was an action for the division of what was possessed in common by two persons or more. The principles of the Roman law on this subject are adopted in the law of Scotland. See COMMON PROPERTY, COMMON TENANCY, &c.

Commun'ion, or Holy Communion, is one of the names given to the sacrament of the Lord's Supper, doubtless derived from the language of Paul in 1 Cor. x. 16, 17, although he does not call the sacrament by the name of C., but only says what it is or does. C. also meant the fellowship of the Church, expulsion from which, therefore, was called 'excommunication.'

Communion Elements (in law). In Scotland, in a process of Augmentation (q. v.), the court may allow for C. E., payable out of the Teinds (q. v.) of a parish.

Communion Service. See COMMON PRAYER, THE BOOK OF, and LITURGY.

Commu'nis Err'or, a term of Scotch law, denoting the prevalence of an erroneous practice, which practice has been relied on. The Court of Session, in case of C. E., generally pass an Act of Sederunt (q. v.) requiring observance of correct practice for the future, but without decision which might disturb past judicial procedure.

Comm'unism means the negation of private property: it describes a society in which the land and instruments of production would be held as joint property, and used for the common account, industry being regulated by a magistrate, and the produce being publicly divided in equal shares, or according to wants, or on some other principle of distributive justice. Socialism does not involve necessarily the abolition of private property: it merely insists, as in St Simonism and Fourierism, that the land and instruments of production should be the property of the association or of the Government; as was the case in the original Teutonic 'mark' and Indian 'village-community,' and would be partially the case if the state were to appropriate the 'unearned increment' of rent—*i.e.*, the increase of rent due, not to expenditure of capital, but to the fact of inferior soils being forced into cultivation by the pressure of population. Of C., on the other hand, the monasteries and the Moravians give examples on a small scale. In most cases, however, as with the Essenes of Palestine, the American Shakers (except the Inspirationists of Amanda and the Separatists of Zoar), the American Harmonists and Rappists at Economy and Beaver Falls, marriage is entirely given up, the society being recruited from converts or from adopted children. Robert Owen, on the other hand, the Scotch Communist, who founded the abortive experimental communities of Orbiston in Lanarkshire (1823) and Harmony Hall in Hampshire (1843), connected with his C. a scheme of selection and alternation in the family relations, by which the human character (believed by Owen to be wholly the product of education and not of heredity) was to be indefinitely modified into a form which would then be the natural support of C. This idea, found also in the *Republic* of Plato, is not characteristic of C., which, in the economical sense, was advocated by Louis Blanc, Cabet, and Proudhon: these men would not have admitted the 'mobility of the affections,' on which the projects of St Simon, Fourier, and Enfantin were based. It is objected to C. that individuals would be tempted to shirk work. But under the present social system most work, even superintendence, is done for fixed wages or salaries—a state of things which would no doubt be altered by the general adoption of piece-work and the association of workmen in profits. C. would have as many checks against laziness and fraud as the present system. Nor, although marriage has been renounced by some Communists, does there seem much ground for supposing that, if it were retained, the society would unduly multiply. It is difficult to conjecture the force and direction of public opinion on such a matter. But the real difficulties in the way of C. are the distribution of employments and their remuneration. Here the actual inequality of human beings comes strongly out. If the subdivision of labour is to be maintained, the selection of work cannot be a matter of indifference. Then, are wages to be exactly the same for the teacher of science and the hodman, who both honestly do their '*possible*'? This Blanc calls 'the point of honour of industry;' and Cabet, 'fraternity.' No doubt, all the motives to great exertion, except the desire of money and what money commands, would remain, and many false and degrading motives would be starved out; but would humanity not still heap wealth, as well as honours, upon its heroes? The differences of remuneration between a statesman, a physician, and a bricklayer, are no doubt to some extent based on erroneous conceptions of social dignity and on the differences of preliminary outlay; and these would partly disappear under a system which made education gratuitous and universal, and which converted private profession into public service. We have no example of a Communistic society with the fundamental institution of marriage. The American

Shakers are successful economically, but the members become dull and stupid, and are unable properly to train the adopted children. The *ateliers* or national workshops of the French Revolution of 1848, as that of the tailors at Hôtel Clichy, failed from want of management. The bonus-paying concerns of Leclaire (painters), Dupont (printers), Briggs (colliers), have not been very successful. Of 180 associations formed on Blanc's principle, only ten subsisted in 1867. The Communist societies, such as the Travailleurs Egalitaires and the Communistes Revolutionnaires, which had much to do with the French Revolution of 1848, and were represented in the Provisional Government, are now probably swallowed up in the 'International.'

Commun'ity. Voluntary associations have no *persona standi in judicio*, but by special statute it is made lawful to establish societies for raising funds to relieve and maintain members during sickness, and to provide burial. (See BENEFIT FRIENDLY SOCIETIES, BUILDING BENEFIT SOCIETIES.) Joint-stock banks may by statute sue and be sued in the name of their principal officer, on certain conditions prescribed in the statute. See CORPORATION, JOINT-STOCK COMPANY.

Commuta'tion of Small Penalties The Act 28 and 29 Vict. c. 127, provides a scale of equivalent terms of imprisonment for failure to pay penalties between 10s. and £5.

Commutation of Tithes. See TITHES.

Comne'nus, the family name of a dynasty of Byzantine emperors (1057-1204) and of emperors of Trebizond (1204-1461). See BYZANTINE EMPIRE, section headed *The Comnenian Dynasty;* also Christian names of individual rulers—*e.g.*, ALEXIUS COMNENUS, ANNA COMNENA, &c.

Co'mo (anc. *Comum*), a city in the province of the same name, N. Italy, and connected with Milan by railway, is situated at the S.W. extremity of Lake C. (q. v.), in a beautiful valley, encircled by hills and clothed with groves of olive and chestnut. The city itself is ill-built and filthy, but the suburbs contain some magnificent palaces and imposing public buildings. C. is surrounded by double walls, pierced by four gateways, splendid specimens of the military architecture of the middle ages. The Byzantine cathedral (1396) is faced with white marble, and contains some interesting monuments. Iron foundries and marble quarries are in the vicinity; there are manufactures of silks, woollens, hosiery, gloves, and soap; and a considerable trade is carried on with Italy and Switzerland by means of the lake. Pop. (1872) 24,350 C. was the birthplace of the younger Pliny, who enriched it with public works, a library, and other institutions.

The *Lake of C.* (Ital. *Lago di Como*, Lat. *Larius Lacus*) lies at the foot of the Alps, 700 feet above the level of the sea. It is 35 miles long, with a breadth nowhere exceeding 3 miles, but generally considerably less, and a depth of from 40 to 600 feet. The lake is formed by the river Adda, and divided in its southern portion into two great arms by the rocky peninsula of Bellagio. The scenery is singularly beautiful; hence the lake is much visited, and is traversed in all directions by steamers. The younger Pliny, who had several villas on its banks, speaks of it with much affection.

Comodo', an island of the Malayan Archipelago, in the Strait of Sapy, between the islands of Sambawa and Flores. It is 35 miles long, with an average breadth of 16 miles.

Com'orin, Cape, the S extremity of Hindustan, a low sandy point, invisible to the mariner till he is within 10 or 12 miles of it. Eighteen miles behind it is the Peak of C., a picturesque rounded eminence of the Western Ghauts, which serves as a beacon to the passing ship.

Com'orn. See KOMORN.

Com'oro Isles, a group of four large and four small islands of volcanic origin, in the middle of the N. entrance to the Mozambique Channel, between Madagascar and the E. coast of Africa. They were discovered by Houtman in 1598. The names of the larger ones are Angaziya or Great C., Mohilla, Mayotta, and Anjouan or Johanna. They rise to a great elevation, and can be seen at a distance of from 50 to 60 miles. The soil is fertile, and a tropical vegetation is everywhere seen—cocoa and areca palms, fine timber for shipbuilding, yams, bananas, mangos, ananas, citrons, &c. Rice, maize, cotton, indigo, and sugar are cultivated. The inhabitants are a mixed race of Arab and African descent, the majority being Mohammedans. Great C. has an area of 510 sq. miles, and a pop. of 30,000. Mayotta has been a French possession since 1848, and is valuable for the production of sugar. Johanna, the most picturesque and prosperous of the four, is a favourite victualling place for ships.

Com'panies' Clauses Consolidation Act. See RAILWAY ACTS.

Company. See JOINT-STOCK COMPANY, PARTNERSHIP.

Company of a Ship includes all persons engaged in the working and management of the affairs of a ship, officers as well as Crew (q. v.).

Compar'ative Anat'omy. See ANATOMY.

Compar'ison, in grammar, is the name given to the mode of marking the degree in which a quality is attributed to an object. It is customary to say that there are three degrees of C., *positive*, *comparative*, and *superlative*. Exception may be taken to this division on the ground (1) that the 'positive' does not *express* though it may *imply* C., and (2) that the kind of C. which it implies is quite different from that which is expressed by the second degree. Similar objections may be urged against calling the third or highest degree one of C. Admitting that the phrase 'degrees of quality' would be more logical and more simple than 'degrees of C.,' little or no harm can ensue by retaining a nomenclature which is easily interpreted by common sense. In English, German, and some other languages, there are two ways of expressing these degrees—(1) By inflection, which is the prevalent mode in Greek and Latin, as *bright*, *brighter*, *brightest*; (2) By using another word expressive of increase or decrease of the quality, as *conspicuous*, *more* (or *less*) *conspicuous*, *most* (or *least*) *conspicuous*. The former mode is preferred in words of one syllable, or in words of more than one where euphony would not be impaired. As a rule, it is only adjectives of quality that can be compared, and not all even of these Such as express a quality not admitting of degrees—*e.g.*, *round*, *square*, *whole*, &c. – cannot be compared.

For C. in rhetoric, see FIGURES OF SPEECH and SIMILE.

Com'pass, an instrument for indicating the magnetic meridian at any locality. As this meridian lies in a generally N. and S. direction, the C. is of special use in giving bearings of any object from a fixed place, and is of invaluable service to the mariner and traveller as a guide over unknown regions. All such instruments consist essentially of a magnet suspended so as to have as complete freedom of motion in azimuth as possible. The *Mariner's C.* is familiar to all, the only portion visible from above being the large circular card which is attached to the bar magnet, and marked with the so-called *points* of the C. Each quadrant contains eight points, which are named according to the following plan:—Beginning at N. and going towards E., we read N., N. by E., N.N.E., N.E. by N., N.E., N.E. by E., E.N.E., E. by N., E.; and the other quadrants are divided in precisely a similar manner

The magnetic needle is subject to a variation with latitude, owing to the non-coincidence of the magnetic and geographical poles, so that it usually points to the W. or E. of the true N. This deviation is easily corrected; but a much more irregular deviation is produced by the reaction of the ship's iron upon the magnet. Various schemes have been proposed to remedy this, such as fixing the needle at the mast-head, thus reducing the action to a minimum, or by using two parallel magnets. The method employed in the British navy at present is to have the C. at a sufficient elevation above the bulwarks, so as to allow of it having an uninterrupted sweep of the horizon. By setting the vessel in the various directions, the variations of the needle may be obtained and tabulated for future use. Sir W. Thomson has shown that if two masses of soft iron, large in comparison to the size of the needle, be placed at opposite sides of the magnet, the effect of other more distant portions of iron will be very small indeed; and accordingly he has recently constructed a very sensitive C., differing from those ordinarily in use at sea in not having the card fixed to the needle or needles, which are here not more than 1½ inch in length, and which are as nearly dead-beat as they could be wished, and in having two spheroid masses of soft iron fixed close beside the double needle.

Compass'es, instruments for measuring and transferring distances. The *Common C.* consist of two legs, joined together at one end by a pivot-joint, and may be used for describing circles. The *Beam C.* serve the same end, but are more accurate, and better capable of measuring greater distances. The points slide along a straight beam, and are clamped securely at the required distance. *Proportional C.* have two pairs of opposite legs, whose lengths, and therefore the distances between the points of each pair, can be altered to various proportions.

Compass'ionate Allow'ance. Certain annuities to children of deceased British military and naval officers, given by the state, are so called. They are tenable by boys up to eighteen years of age, by girls till twenty-one or marriage. They range from £8 to £20 per annum. A special C. A. was granted in 1855 and 1856 to the widows and children, or, in some cases, to other specified relations, of military officers killed in the Crimean war.

Com'pass Plant (*Silphium laciniatum*), a plant of the western prairies of America, so called because it is said to turn the faces of its leaves uniformly in a N. or S. direction; 'the leaves on the developed stems of the flowering plants taking rather an intermediate position between their normal arrangement on the stem and their peculiar meridional position. The settlers, when lost on the prairies on a dark night, get their bearing by feeling the direction of the leaves' (Brown). The reason of this is, that owing to the Stomata (q. v.) being more equally distributed on both sides of the leaf than is usual in other plants, both sides are equally sensitive to light.

Compear'ance, a term of Scotch law, denoting the appearance made for a defender in an action.

Compearer.—Any one not called in an action in Scotland may *compear* and claim to sist himself on the ground of having an interest in it. If his claim is sustained he is called a C.

Compensa'tion, in physics, a method for eliminating or neutralising unavoidable errors, by introducing others equal but opposite. See PENDULUM and BALANCE-WHEEL for common instances.

Compensation, in law. Where two persons are indebted to each other, their debts, if equal, are held by law to extinguish each other; if unequal, to leave only a balance due. In England the allegation of trespass or wrong done by the plaintiff cannot be pleaded by the defendant in an action as a *set-off* against the claim of damage. The defendant's remedy must be by a cross action. This is greatly the doctrine of Scotch law also.

By a legal anomaly no action used to be maintainable against a person who, by wrongful act or negligence, caused the death of another, while the offender was liable if the sufferer was merely hurt. But this defect has been remedied by Lord Campbell's Act, which provides that any one who has caused the death of another, even under circumstances which make the offence felony, shall be liable in damage at the instance of the executor or administrator of the deceased for behoof of the wife, husband, parent, or child. The action must be begun within twelve months after death.

Com'petent and Omitt'ed, a Scotch legal phrase denoting pleas which might have been maintained in a suit, but which have not been stated. The Court of Session may reduce their own decrees on the emerging of any new fact or writing, unless statement or production has been wilfully omitted to protract litigation.

Competi'tion (which, like its French equivalent *concurrence*, suggests the idea of a struggle for a prize) has been denounced by socialists as a principle of social disorder, and lauded by optimist writers in political economy as the force which overrules private interest for the general good. Practically, however, C. may be best described as the absence of restriction upon individual judgment in industrial affairs. The restriction may be enforced by either law or custom. Thus the usury laws (demolished in this country by Bentham) prohibited the taking of interest beyond a certain rate; the land-custom of India fixed the rent payable for occupancy. In fact, only in modern times has free C. under contract generally superseded the rule of *status* and custom among advanced nations. Another form of C. which was frequently either excluded or hampered by treaty was that between different countries in the same market. Either the privilege of exclusive importation was conceded to a favoured colony or neighbour, or native industry was bolstered up by prohibitory duties on importation. But no more striking change has taken place than with respect to wages, which were formerly regulated either by statute or statutory magistrates, but are now fixed by agreement between capitalists and trade societies, both parties looking to the actual and probable state of trade. Some of these restrictions were no doubt suitable to a stationary society isolated from other societies, but with regard to them all, there is no doubt that they were incompatible with the progressive movement in industry and trade which has marked the last century. Each country devoting itself to the department in which it has either the 'greatest superiority or the least inferiority;' each producer endeavouring by ingenuity or economy to secure a sale by furnishing his commodity at a less cost to society; each capitalist bidding for the labour he requires, and bidding more highly for the more skilled labour: such is the picture presented by perfect C. As Bastiat says, its tendency on the whole is to give every one a larger share of the 'gratuitous utility' of nature, by the advantages which science and invention have attained from nature. But this ideal C. nowhere exists. Manufacturers and traders combine to preserve prices and to sink wages; in particular industries and particular nations enormous vested interests oppose the introduction of new methods; trades unionism endeavours to identify the individual workman with his class. It is therefore equally unjust to ascribe to C. the great achievements of modern industry, and to charge it with the evil results of modern civilisation. The absence of public regulation has assuredly not created the skill, the perseverance, the enterprise which have founded so many trades, nor is it responsible for the prevalence of commercial dishonesty or for the fact that population presses closely on the means of subsistence. On the other hand, the experience of the national *ateliers* of Paris, and the history of the experimental communities founded on socialistic principles, do not suggest that any scheme for public regulation of prices and wages would be at present practicable, or anything but disastrous. It is only where, as in the case of railway and gas companies, &c., a practical monopoly in a district exists, that the state can wisely even specify a *maximum* price or a *maximum* profit. The evils attending on C. can only be removed by the old-fashioned and unpleasantly slow remedy of making people wiser and better than they are.

Compiègne (Lat. *Compendium*), a town in the department of the Oise, France, on the left bank of the Oise, a mile below its junction with the Aisne, and 60 miles N.N.E. of Paris by railway. Pop. (1872) 10,353. Boatbuilding, hosiery, ropemaking, are among the principal industries; and there is a trade in coal, wood, and grain. The chief edifice is the palace, originally built by St Louis, and rebuilt by Louis XIV. Here, on March 27, 1810, Napoleon I. received his bride, Maria Louisa, Archduchess of Austria. It was also a favourite hunting-seat of Napoleon III., and is surrounded by a vast park. Joan of Arc was made prisoner before the walls of C. in 1430.

Com'plement, the amount by which a given magnitude falls short of some fixed magnitude. Thus the arithmetical C. of a number is the difference between it and the next higher power of ten; the C. of an angle or arc is the amount by which it falls short of a right angle or a quadrant; the C. of a common logarithm is found by subtracting it from ten.

Com'pline. See CANONICAL HOURS.

Compo'nee, Compony, or **Gobony**, in heraldry, is a term describing the field of any charge divided into a single row of small squares, alternately a metal and a colour. When there are two such rows, the field is said to be *counter-C.*; when more than two, it is *Checky* (q. v.).

Compos'itæ, Synanther'eæ, or **Aster'aceæ**, the most extensive natural order of Dicotyledonous plants, belonging to the subdivision *Corollifloræ* (or, according to others, to the *Calycifloræ*), herbs or shrubs, universally distributed. In the northern regions these plants are all herbaceous, but in the southern hemisphere they are occasionally shrubby or even arborescent. There are now 9000 species known. They have been usually divided into the following sub-orders:—(1) *Tubulifloræ*, most abundant in hot climates. *Senecio*, Daisy, &c., are good examples. (2) *Labiatifloræ*, almost entirely confined to the extra-tropical regions of S. America. *Mutisia* is an example. (3) *Liguliflora*, most abundant in cold countries. The Chicory (q. v.) and Dandelion (q. v.) are examples. Their properties are variable, though it may be said that the whole order is pervaded by a bitter principle, so that most of them are tonic. Some possess laxative and anthelmintic properties; others, owing to the presence of a volatile oil, are aromatic, carminative, and diaphoretic. Acrid stimulative qualities are possessed by others, while most of the *Liguliflora* abound in a milky juice, which is bitter, and sometimes narcotic. To enumerate all the economic plants of this great and important order would be impossible within our space. Wormwood (q. v.), Chamomile (q. v.), Elecampane (q. v.), Tussilago (q. v.), Arnica, &c., are among the medicinal plants furnished by it. The Artichoke (q. v), salsafy, endive, lettuce, &c., are eaten. The safflower and sawort supply dye-stuffs. The sirrehout (*Tarchonanthus camphoratus*) of the Cape of Good Hope furnishes a close-grained beautiful wood, valued by cabinetmakers.

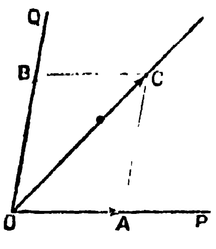
Composite Orders (in architecture). See COLUMN.

Composi'tion. The creditors of an insolvent person are said in law to accept of a C. when they agree to give him a discharge in full, on his paying them a part instead of the whole of the debt he owes them. In England, the creditors of one who is insolvent may, without any proceedings in bankruptcy, resolve to accept a C.; but, to make the resolution binding on the minority, it must be carried by a majority in number and three-fourths in value of the creditors, at two meetings convened in a prescribed manner. In Scotland, no creditor can be compelled to accept a C. until the bankrupt has been examined under sequestration. Acceptance of C. by creditors discharges the bankrupt and reinvests him in his estate. He remains liable for the C. only. All preferences and collusive agreements for concurring in settlement by C. are void, and under the Scotch Act a creditor who has obtained any preference, or accepted any payment for his consent, is liable to the loss of his claim, and to repayment of double the value of the preference or payment which he has accepted. See BANKRUPTCY.

Composition to a Superior is the name given in Scotland to the entry-money paid to the Superior (q. v.) by a Singular Successor (q. v.). The amount of the C. is sometimes fixed, or taxed, as it is called, in the original charter; when it is not so, the superior is entitled to a year's rent of the subject.

Composition, in art, is the arrangement of the figures or objects of a picture, or of the different members of a group in sculpture, or of the lines of a single figure in painting or sculpture, which is found best at once to impart emphasis to the prominent idea of the work, and to supply a fitting environment of harmony and grace.

Composition and Resolution of Velocities and Forces constitute the most important and fundamental principles of dynamical science. Suppose a body to receive an impulse in a northerly direction, which would produce a velocity of 10 miles an hour; and suppose it further to receive a simultaneous and equal impulse in an easterly direction; the question immediately arises, In what direction and with what velocity will the body move? At the end of an hour the body will obviously have proceeded 10 miles N. and 10 miles E.; and therefore it will have travelled in a N.E. direction with a velocity of 10 $\sqrt{2}$ miles an hour. This principle is easily extended to the general case of any two velocities making any direction with each other. Let O A and O B represent in direction and magnitude two velocities, which are communicated simultaneously to a body at O; then it appears by a simple inspection of the figure, and a knowledge of Newton's first law (see MOTION, LAWS OF), that the body will move with a velocity represented in direction and magnitude by O C, the diagonal of the parallelogram whose sides are O A and O B. O C is termed the *resultant* of the two *component* velocities O A and O B. The reverse problem, to *resolve* a given velocity in two given directions, follows as an immediate deduction from this. Thus, to resolve O C along O P and O Q, we have simply to draw through C, C B and C A parallel respectively to O A and O B. Forces are compounded and resolved in precisely the same way, as is at once deducible from Newton's second law, that 'change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts;' and accordingly we may take O A and O B as representing in direction and magnitude the forces which produced these velocities. Hence the resultant force is what would produce the resultant velocity O C, therefore is represented by O C in both direction and magnitude. See VELOCITY.



Compos'itor. See PRINTING.

Com'pos Men'tis. See INSANITY.

Compostell'a, Order of St James of, a Spanish order of knights, founded at Santiago de C., in the N.W. of Spain, and sanctioned by the Pope in 1175. The original founders were thirteen noblemen in conjunction with the canons of St Eloy; and their immediate object was to protect against the Moors the numerous pilgrims who visited C. in honour of the relics of St James the Elder, patron of the city and of Spain, which were believed to be built into the foundations of the cathedral. The affairs of the order were controlled by a council of thirteen, and vows of poverty, obedience, and celibacy were taken by the members; but the order being entitled to retain whatever was won from the Moors, its wealth became enormous; and its power grew so formidable as to excite the fears and jealousy of the crown. The Pope accordingly transferred the grand-mastership of the order permanently to the crown in 1522, which led to a rapid decline of its importance.

Com'posts, a kind of manure consisting of lime, earth, and organic refuse matter gathered into a heap to promote fermentation or decay, the mass being turned over at regular intervals to render it homogeneous before transferring it to the land. C. available for one or more of the cultivated crops may be made with all kinds of farm refuse, as potato-haulms, weeds, leaves, hedge clippings, as well as scourings of ditches, road scrapings, &c., mixed with lime, in the proportion of one load of lime to five loads of refuse. The refuse of manufactures, as wool and flax waste, hair and horn clippings, soap waste, ammoniacal liquor, &c., mixed with earth, constitutes excellent C.

Com'pound An'imals, the name given to animals which are composed of a greater or less number of distinct forms. The included organisms of a compound animal—of which the Tape-worms, *Polyzoa* (q. v.), or Sea-mats, the *Hydroid* zoophytes, and the compound *Tunicates* (q. v.) form good examples—are termed *zooids*, whilst the entire compound form, however numerous its zoöids, is itself named the *individual*. Any *individual* animal in zoology is defined as the result of the *total* development of a *single* egg. Whatever a single egg gives rise to is an individual, and this latter may be *simple*, or consist of one animal, as in higher forms; or be *compound*, as in the examples given. The compound form at first consists of a single *zoöid*, which by a process of *gemmation* or budding gives rise to the compound organism.

Compound Common Time, in music, is a rhythm in which the primary subdivisions of each bar are accented as in Common Time (q. v.). Each of them, however, is indicated (in ordinary musical notation) by a dotted crotchet, minim, or semibreve—generally the former (for which the time signature is $\frac{6}{8}$), and is subdivided into three parts, which have the relative accentuation:

Strong. Weak. Weak.

Each of these secondary subdivisions becomes, according to the notation of the primary, a quaver, crotchet, or minim, and are frequently again subdivided into two parts, upon the first of which the stress falls.

Compound'ing of Fel'ony, or Theft Bote. When one who has been robbed takes back the article stolen on an agreement not to prosecute, he is guilty of C. of F., and is punishable at common law by fine and imprisonment. By 24 and 25 Vict. c. 96, if any one advertise a reward for the return of any property '*lost or stolen*,' and in such advertisement use any words purporting that *no question will be asked* regarding the person producing the missing property, or as to how it came into his possession, he, as well as the printer and publisher of the advertisement, is liable in a penalty of £50, with costs, at the instance of any one suing for the same. By a subsequent Act, no action for the penalty can be raised without concurrence of the Attorney or Solicitor General. Any one taking a reward for helping the owner to recover stolen property, unless he cause the thief to be brought to trial, is guilty of felony.

Compound Interest (in arithmetic). See INTEREST.

Compound Interest, in law, or interest with *Annual Rests*, is never allowed on the sum in the original obligation or agreement; but there is commonly a posterior contract to accumulate interest and make it a principal bearing interest. This is the general rule of law; but in cases of hardship, annual rests may be allowed, and the House of Lords is empowered by statute to allow C. I. on appeal from Scotland, if it shall think fit to do so.

Compound Triple Time is a rhythm bearing the same relation to Triple Time (q. v.) that compound common time (above) bears to common time. Its primary subdivisions are generally noted either as dotted minims or crotchets, for which the time signatures are respectively $\frac{9}{4}$ and $\frac{9}{8}$.

Compressed-Air Bath, an apparatus invented by M. Laburié of Paris in 1832, and since introduced into Ben-Rhydding and other hydropathic establishments, which is efficacious as a cure for asthma, bronchitis, phthisis, &c. The increased pressure of the atmosphere produced by its means seems to invigorate the lungs, compelling them to more rapidly perform their functions of inhalation and exhalation, and thus to purify the blood and restore the body, and especially the breathing organs, to a healthier and more natural condition.

Compressibil'ity, one of the properties of matter, in virtue of which a body is diminished in volume under increased pressure. It is usually accompanied by evolution of heat, and in such cases the application of heat is attended with expansion. All gases are easily compressible, but the name *compressible* gas is restricted to such as have been compressed to the liquid state. Liquids for long resisted all attempts at mechanical compression, and their C. is exceedingly small, being measurable only by the most refined processes. Solids present various degrees of C., but its existence proves either that matter is porous, or that the ultimate particles are capable of compression, the former at any rate being probably true.

Compris'ing, the same as *Apprising* (q. v.).

Com'promise, in English law, is understood to be a mutual promise of parties to submit matters in dispute to arbitration. In Scotland the analogous terms are *Submit* and *Refer*.

Compto'nia, a genus of Deciduous bushy shrubs belonging to the natural order *Myricaceæ*, natives of N. America, and named in honour of Henry Compton, Bishop of London about the year 1714, and the introducer of many exotic plants into England. *C. asplenifolia*, known in the U.S. as the 'sweet fern,' is employed in that country as an astringent and tonic in diarrhœa. In France it is sometimes called *Liquidambar à feuilles de Ceterach*, though it has no connection with the true Liquedambar (*L. Styrocifiua*).

Compul'sion. Acts done or rights granted on C., or under the influence of Force and Fear (q. v.), are reducible. (See REDUCTION.) It is a sufficient defence against a criminal charge that the crime was committed under C.

Computa'tion of Time. See DAY.

Computation of Time, in law. The question of whether or not a particular period of time has legally expired may have a most important effect on the rights of parties. Thus, in Scotland, where the granter of a deed challenged under the law of Deathbed (see DEATHBED, LAW OF) lived for fifty-nine days and three hours after executing the deed, the court held it to be reducible, on the ground that the law requires the granter to have lived for sixty days, without counting the day on which the deed was executed. This decision was affirmed by the House of Lords. Had the granter lived to the morning of the sixtieth day, the legal maxim, *Dies inceptus pro completo habetur*, would have been applicable, and the deed would have been good. There has been a decision in accordance with this principle.

Com'rie, a village and burgh of barony on the Earn, Perthshire, 20 miles W. of Perth, in one of the most beautiful districts of Scotland. Slight earthquake shocks are frequently felt here. An ingenious apparatus has been contrived and stationed in a covered building in the neighbourhood (1875) by which the force and direction of the shock is registered. C. has distilleries and some manufactures of woollens and cottons. Pop. (1871) village, 746; parish, 1911.

Comte, Auguste, the founder of the school of 'Positive Philosophy,' was born at Montpellier, 19th January 1798, of Catholic and royalist parents, and early gained a place in the *École Polytechnique* through his mathematical talent. Expelled from that institution for insubordination, he taught mathematics privately, became secretary to Casimir Périer, and from 1818–24 was associated with St Simon, who no doubt inspired him with the idea of reconstructing social order, expressed in the *Plan des Travaux Nécessaires pour Réorganiser la Société*. In 1824, in an essay in the *Producteur*, C. published his theory of progress from the military offensive *régime* through the military defensive to the industrial pacific; this, he said, depended on the transition from theological conceptions through the abstractions of metaphysics to positive conceptions. Spiritual reorganisation must be based on demonstrated truth, not on faith in the invisible. Next year he made an unhappy marriage, when he had only one pupil, General Lamoricière; and in 1826, before an audience containing Carnot, Humboldt, Poinsot, De Blainville, &c., he began that course of seventy-two lectures on Positive Philosophy, which was interrupted by his insanity. The course was resumed in 1828, and afterwards appeared in six elaborate volumes between 1830 and 1842. During that period he was in easy circumstances, but the character of his doctrines drove him from office and employment, and after receiving aid from M. Grote, Sir W. Molesworth, and other admirers for some time, he gave up working for bread, and lived for the rest of his days on an annual subscription from his disciples. In 1845 began his friendship with Mlle. de Vaux, which seems to have infused a depth and tenderness of moral and æsthetic feeling before unknown to his nature. This appears in his second great work, *Système de Politique Positive*, in four volumes, which appeared between 1851 and 1854, and still more in the *Catéchisme Positiviste* (1852). His latter years were full of religious mysticism, almost asceticism. He died 5th September 1857. The object of the Positive Philosophy has been described 'as the condensation of all knowledge into a homogeneous body of doctrine, capable of supplying a faith and consequently a polity.' The value of C.'s *Hierarchy of the Sciences* has been violently disputed among eminent *savans*, but with the exception of a few disciples (of whom Congreve, Bridges, Beesly, and Harrison are the most prominent in England), all have joined in condemning the artificial and prosaic ceremonialism which he wished to substitute for a religion growing naturally out of human devotional feeling. Thus the *Catechism* includes a Trinity, consisting of (1) Humanity or *Grand Être*; (2) Space, or *Grand Milieu*; and (3) the Solar System, or *Grand Fétiche*. This has been wittily called 'Catholicism *minus* Christianity.' On the other hand, his view of the sciences as abstract and concrete; his treatment of sociological questions as requiring a combination of historical generalisation with deductive reasoning from the truths of psychology; his warnings in the *Politics* against the dangerous notion of an indefinite power of variation in human nature, are entitled to great praise. Minor peculiarities of C.'s system are that he does not recognise psychology as a distinct science, because mental life is merely a counterpart of cerebral function, and introspection of consciousness is untrustworthy; and that he does not discuss the general subject of scientific evidence. Comtism, as a philosophy of knowledge, is widely accepted; as a practical faith, it is absolutely stationary. Littré, the author of the French dictionary, is certainly the most illustrious, perhaps the *only* illustrious name associated with the system. The four English disciples are, however, now engaged upon a translation of their master's large works. See Robinet's *Notice sur l'Œuvre et sur la Vie de C.* (Par. 1860), Littré's *C. et la Philosophie Positive* (Par. 1863), and *Lettres d'Auguste Comte à John Stuart Mill*, 1841–46 (Par. 1877).

Con or **Col** (Ital. 'with'), a word used often in music, as *C. fuoco*, with fire; *C. anima*, with spirit, &c.

Con'can, a maritime territory in the province of Bombay, now subdivided into the districts of Thana, Kolaba, and Rutnagiri.

Concave' and **Convex'**, two relative terms applied to curved surfaces; the former when an intersecting plane lies between the surface and the spectator, the latter when the plane lies on the further side. See Lens, Mirror, Optics.

Conceal'ing Crime. To protect a criminal *after* commission of a crime, is an offence punishable arbitrarily; but where protection is given under an agreement entered into *before* commission, the concealer becomes an Accessory (q. v.). The equivalent term in Scotch law is *art and part.*

Conceal'ment of Preg'nancy. See Birth; Pregnancy, Concealment of.

Concentai'na, a town in the province of Alicante, Spain, 4 miles N.E. of Alcoy, with manufactures of linen and woollen fabrics, of soap, paper, and bricks, of wine, oil, and brandy, and a trade in cattle and grain. Pop. 6100.

Concen'tric circles and spheres are those which are described with the same centre. C. central curves and surfaces of the second order have the same foci. These latter possess many curious mutual properties, which are discussed in Salmon's analytical treatises.

Concep'cion, a city of Chili, on the right bank of the Biobio, near its mouth, with a pop. in 1875 of 18,277. Its port, Talcahuano, on the bay of C., is, after Valparaiso, the best in the republic, exporting largely hides, tallow, wool, and salted beef. In 1870 the imports amounted to £639,062, and the exports, not including produce shipped to other Chilian ports, to £270,160. The *province of* C. has an area of 3589 sq. miles, and a pop. (1875) of 151,365.

Concep'tion, in metaphysics. See Idea.

Conception, Immaculate. See Immaculate Conception.

Conception of Our Lady, an order of nuns founded in Portugal in 1484 by Beatrix de Sylva, sister of the first Count of Poralegro, and confirmed by Pope Innocent VIII. in 1489. At first they followed the rule of the Cistercians, but after the death of Beatrix de Sylva, Cardinal Ximenes imposed on them the rule of St Clara. The order spread into Italy and France. Their habit is a white robe with the figure of the Virgin holding the Child, and a blue mantle.

Con'cert, a name given to any musical performance except that of an opera. The first regular series of concerts seems to have been instituted by 'the Academy of Ancient Music,' an English society, which was formed in 1710, and existed until nearly the close of the last century.

Concerti'na, a musical instrument in which the sounds are produced by the passage of air through reeds, the wind being supplied by bellows which form part of the instrument, and can be extended and compressed by the hands while the fingers are left free to manipulate the keys. The C. has no importance musically.

Concer'to, a musical composition in symphony form, for a solo instrument with orchestral accompaniment. The solo parts in the modern C. are generally for the pianoforte or the violin.

Con'cha, a portion of the external ear. See Ear.

Conchif'era (Gr. 'shell-bearing'), a name given to the class of Lamellibranchiate mollusca. The name, however, is worthless, as other classes of mollusca possess shells. See Lamellibranchiata.

Con'choid of Nicome'des, a curve of the fourth order, invented by that geometrician for the duplication of the cube and the trisection of the angle. It may be traced as follows: From a given point let straight lines be drawn to intersect a given straight line. From the points of intersection lay off along these lines on both sides of the given line distances of constant length h. The points so obtained lie on the C., which must therefore consist of two infinite branches, a superior and inferior, having the given straight line as asymptote. Taking the given point as pole and a as the perpendicular from it upon the given line, the polar equation is

$$(r + h) \cos \theta = a$$

which, transformed into rectangular co-ordinates, becomes

$$h^2x^2 = (a - x)^2(x^2 + y^2)$$

Conchol'ogy (Gr. 'the science of shells') is now obsolete as a separate branch of zoology, since to understand the shell-structure of any animal we must have an idea of the animal itself. The name is mainly characteristic of the *Classificatory* period of zoology, when *Taxonomy* was deemed everything in natural history, and when *Structure* had a subsidiary place. See Mollusca and Shell.

Con'clave (Lat.) is the place in which the cardinals of the Roman Catholic Church meet for the election of a new pope, or the assembly itself. The cardinals, with not more than two attendants (called conclavists) to each, or three to a prince, are *locked* (hence the name) into a large room, which is generally in the palace of the Vatican, till the election is over, having their food passed in through a small opening, and living in small cells within the room. The canon appointing these regulations was passed by the Second Council of Lyon, 1274.

Con'cord. See Consonance.

Concord, a pretty town in Massachusetts, near the Concord river, 18 miles N.W. of Boston. On the 19th of April 1775, the first skirmish of the Revolution took place here, and a monument, on the banks of the river, marks the spot where two English soldiers fell. C. is famous as the residence of Ralph Waldo Emerson; and it has, at different times, been a favourite residence of American *literati*, as Hawthorne, Thoreau, Alcott, and Hoar. Pop. (1870) 2412.

Concord, the capital of the state of New Hampshire, on the right bank of the Merrimac river, 59 miles N.W. of Boston. It was formerly called Rumford, and here Benjamin Thompson, afterwards Count Rumford, resided for a while. The town extends along the river for 2 miles, and contains the state-house and some other handsome public buildings. It has a thriving business in iron, steel, carriages, leather, and woollen goods. Pop. in 1870, 12,241.

Concor'dance is an index of all the words in a book arranged alphabetically, with references to all the passages in which they occur, which may also give the different shades of meaning in which the words are used. A C. was first felt to be useful or necessary for the Scriptures, which were continually made the subject of appeal in learning, teaching, and disputation on religious matters. The first attempts at a C. were made by Antony of Padua (1195–1231), and Hugo de St Chers (died 1262), both being from the Vulgate. The first Hebrew C. was written by R. Nathan (1448); the best is that of Fürst (1840), based on Buxtorf's (1632). The first Greek C. to the New Testament was written by Birck, a Lutheran clergyman (1500–54). The first C. to the English New Testament was made by Thomas Gybson (before 1540), and to the entire Bible by John Marbeck (1550). All were superseded by Cruden's, 1737, which is yet the best.

The best *secular* C. in the English tongue is Mrs Cowden Clarke's *C. to Shakespeare* (Lond. 1845).

Concor'dat is a treaty regarding ecclesiastical affairs between the Pope, as representing the Catholic undivided Church, and a particular temporal sovereign. The matters treated of from time to time have been such as the right to nominate, and the right to confirm, bishops; the right to nominate to benefices while a bishopric is vacant; the right to the income of vacant benefices; and the particular taxes of *annates*, tenths, &c.; appeals to Rome; the authority of councils and of national customs against the Pope individually. The rights or claims of the national Catholic Churches used to be expressed in pragmatic rescripts, as in the French Pragmatic of St Louis (1258); and these national claims were generally modified by concordats, as in that between Leo X. and Francis I. in 1516, the effect of which, however, was postponed by the Ampliative Dispositions. Questions of the treatment of heretics, of the Papal power of excommunication, of the reception of Papal nuncios, and of the *Pase*, *Placito*, *Exequatur*, Letters of *Pasatis*, or *Placitum Regium* (the authority given by a sovereign to the publication in his territory of Papal bulls or briefs), also occurred in concordats. In 1682 the French clergy, founding on the Decrees of Constance, issued their celebrated declaration as to the *Régale*, which was acted on through the 18th c. In 1801 a C. was arranged between the Consul Napoleon and Pius VII., the nomination of bishops being by the first, the institution by the latter. Under the Revolution the institution of the constitutional bishops had been by the Metropolitan. The organic articles of the same year carefully provided for an examination of bulls coming into France. The earliest German C. is the Calixtinum between Emperor Heinrich V. and Calixtus II. in 1122. The writings of Van Espen and the vigour of Joseph II. greatly weakened the power of the Papal nuncios in Germany in the 18th c. The German C. of 18th August 1855 was, of course, destroyed when the N. German Confederation came into existence in 1867. In Spain a C. in 1753 vested all 'patronatos' in the home authorities, the Pope reserving fifty-two benefices, and receiving twenty-two millions *reales* as compensation for *annates* and fees on briefs. The concordats of 16th March 1851, and 25th August 1859, are more favourable to Rome. In fact, Spain has always been at arm's length with the Pope on the Ultramontane question. Philip II. instituted a council, 'Concejo de la Camara,' to protect the constitution of the national Church, and Philip V. appointed a general agent at Rome, through whose *Visto Bueno* communication with the Vatican on certain matters must be made. In 1760 Benedict XIV. finally admitted the right of presentation to exist in Portugal. Carvalho strongly resisted Papal encroachment in the beginning of the 19th c. There is a Portuguese C. of 21st February 1857. The Sardinian and Neapolitan concordats have now lost their interest. The Papal Encyclical, named *Quanta Cura*, published with a syllabus, 8th December 1864, and the bull or costituzione, named *Pastor Æternus*, published 18th July 1870, indicate what sort of C. the Papal power desires to make at the present day. Under the Italian Statute of Guarantees, the Pope is merely a spiritual power. The Austrian C. was practically abolished in 1874.

Con'course, a term of Scotch law.—*Concourse of Actions* means the privilege, not usually allowed, of bringing more than one action on the same ground of right.—*Concourse of the Lord Advocate* means the necessary concurrence of the Lord Advocate in a criminal prosecution, at the instance of a private individual.

Concrete (Lat. *concretum*, 'grown together') is a term in philosophy used to denote the opposite of Abstract (see ABSTRACTION). It means that an object is considered not merely in reference to its pure essence, but as we find it in actual existence, invested with accidental qualities and attributes from which it can be dissociated in thought by an exercise of the reason. There are degrees of concretion as well as of abstraction. Take 'man' as an example of an abstract notion. The idea expressed by the word is stripped bare of everything but the mere attribute of humanity. We begin the process of concretion when we advance to the conception of an 'Aryan,' still further when we reach a 'European,' an 'Englishman,' a 'Londoner,' &c. ; but the proper C. is none of these ; it is the particular individual of whom we think, and in whom the various properties or peculiarities cohere.

Con'crete, a mixture of mortar with coarse materials, such as gravel, flint, peebles, &c. At one time the French term Beton was used where the matrix was *hydraulic* mortar, and C. in other cases, but the latter word has now the more general meaning. The base of the mortar used is in the best C. a hydraulic cement. For inferior C. lime is sometimes used, in which case 'poor' limes are better than 'rich.' The mortar should be made first, and the additional sand, &c., added afterwards, although in England sometimes the whole of the sand required to make both the mortar and the C. is frequently added at once. In the best C. Portland Cement (q. v.) is generally used, in the proportion of 1 part of cement to from 5 to 10 parts of aggregates in ordinary cases. C. is chiefly used for the foundations of buildings and masonry structures in general, and of late years it has found more and more extended application, both in foundations and superstructures in harbours, breakwaters, and other marine works. For these purposes huge blocks of C., weighing in some cases hundreds of tons, have been constructed in suitable moulds on shore, and when hardened conveyed to their destination by floating or travelling cranes. In this way the labour of erection and building below the waterline is very greatly reduced, while the greatest possible stability is attained.

Concre'tion, in medicine, is the formation of a solid substance either in some tissue or in the stomach or bowels. In certain diseases salt of lime is deposited as a solid mass in the lung or the tissue, but the name is generally applied to a solid substance found in the stomach or bowels, formed either by the undigested food matting together so as to cause an obstruction, or by some indigestible substance having been swallowed. Concretions are much more common in ruminating animals than in man. In the latter they sometimes consist of hair, cotton, or other substances. They are often formed in concentric rings arranged round a nucleus, *e.g.*, a gall-stone. Concretions are apt to be originated by the use of certain medicines, as magnesia. When they become very large they require prompt measures on the part of the medical practitioner. See CALCULUS.

Concu'binage. This connection was to some extent recognised by the Roman law ; the offspring being acknowledged by the father, though they had not the civil rights of legitimate children. Under Augustus, C. was only sanctioned between a man and a woman of greatly inferior social position to himself. While the law of the Christian Church sanctions no sexual relationship except by marriage, the civil law of various Christian countries has been and continues to be much more lax, more especially in its application to the marriages of royal families. The law of England reduces to C. every marriage in the royal family of Great Britain which has not been previously approved of by the sovereign, if the prince or princess contracting it is under twenty-five years of age. And if the prince be above twenty-five years of age, the marriage does not hold good if disapproved of by Parliament. See MORGANATIC MARRIAGE.

Concurr'ent Jurisdic'tion. Where jurisdiction may be exercised in the same cause by two courts, or more, they are said to have C. J. The rule, then, is that the court which first exercises its jurisdiction excludes that of the others. In civil cases, the plaintiff may cite a defendant to appear before any competent court or judge.

Concus'sion (Lat. *concussio*, 'a shaking') is a term in medicine used to denote an injury to the nervous system brought on suddenly by external violence. Sometimes there is no lesion of the nervous substance or of any other structure ; at other times there is laceration of the brain or other serious injury. C. is followed by insensibility and loss of all voluntary motion ; the patient lies quite helpless ; the pupils are unaffected by light ; the pulse is feeble, and the breathing slow and scarcely perceptible. There are degrees of C. from the slightest interference with the functions of the nervous system, to that severe case in which the patient dies instantaneously. In the former cases he soon recovers consciousness, but for some time afterwards he suffers from confusion of ideas, often accompanied with noises in the ears. Frequently there is vomiting. The proper treatment consists in keeping the patient perfectly quiet in bed, and in attending carefully to the wants of nature. When there is paralysis of the bladder, the urine must be drawn off by the Catheter (q. v.). During convalescence it is sometimes necessary to modify the reaction by purgatives and by the application of cold lotions to the head ; at other times it is necessary to give brandy and other stimulants, and to apply heat to the body. In all cases the patient must be watched with great care for some days.

Concussion, in law. See FORCE and FEAR.

Concussion Shell. See SHELLS.

Con'dé, a name common to several French towns. Of these, the best known are—(1) C., or **C. sur l'Escaut**, a town and border fortress in the department of Nord, at the confluence of the Haine and Scheldt, 7 miles N.N.E. of Valenciennes, with an arsenal and sluices for the defence of the town. It is a great entrepôt for coal. Pop. (1872) 2818.—(2) **C. sur Noireau**, a town in the department of Calvados, 25 miles S.S.W. of Caen, where the Noireau and Durance meet, with manufactures of cotton, nails, cutlery, and leather, and a trade in flax, thread, horses, cattle, &c. Pop. (1872) 6422. It came to the house of Bourbon in 1487, and gave name to a famous branch of that house.

Con'dé, a famous French family, which takes its name from the town of C. (q. v.), can be traced as far back as the close of the 12th c. In the year 1200 a certain Godfrey obtained part of the barony of C., and was thenceforth known as Godfrey de C. His great-granddaughter, Joanna de C., in 1335, married Jacques de Bourbon, Comte de la Marche. Their second son, Louis de Bourbon, Comte de Vendôme, received as his inheritance the barony of C. His great-grandson, **Louis de Bourbon**, in virtue of his relationship to the royal family, took the title of

Prince of C., and is regarded as the founder of the new house of that name. Louis was born 7th May 1530. He was a son of the Duc de Vendôme, and brother of Antoine, King of Navarre, and first distinguished himself in arms under De Brissac. He defended Metz against the forces of Charles V., assisted in the capture of Calais, and fought on the field of St Quentin. At the conspiracy of Amboise he resolved to head the Reformed party against the Guises, and was only saved from execution by the death of François II. When civil war broke out on the massacre of Vassy, C. led the Huguenot forces from the Loire to Paris, and afterwards to the battle of Dreux (1562), which brought temporary peace. On the renewal of the war at St Denis (1567) he and Coligny were still the recognised leaders. C. fell at Jarnac, 15th December 1569, after maintaining a furious but unequal contest with the Duc d'Anjou's army. Although chivalrously brave, C. had no other quality of a commander; he was of licentious life, although he professed deep attachment to the Reformed Gospel.—**Louis II. de Bourbon, Prince de C.**, known as 'the Great C.,' born 8th September 1621, was great-grandson of the preceding, and son of the feeble prince, whose wife attracted Henri IV., and the nephew of Prince Henri of C., who fought so bravely in the closing scenes of the civil war of the Huguenots. The Duc d'Enghien, as he was called, received a careful education; his mother, Charlotte de Montmorency, then holding a sort of literary court at the Hôtel de C. Marrying a niece of Richelieu, he obtained high command in the army, and just as Louis XIII. died he made his reputation by the brilliant victory of Rocroy (19th May 1643), in which the Spanish army of Fuentes and Albuquerque was completely routed, a result to which C.'s strategic skill, decision of movement, and personal bravery all contributed. He next co-operated with Turenne in the Fribourg (Baden) campaign against Mercy, and repaired the losses of the former at Marienthal by the defeat of the latter at Nordlingen (Bavaria). The capture of Courtray and Dunkirk marked his first campaign in the Netherlands, to which, after an unsuccessful attack on Lerida, in Catalonia, he returned in 1648, and by his crushing defeat of the Archduke Leopold at Lens brought about the Peace of Westphalia. In the Fronde C. supported Mazarin and the queen-mother against the Frondeurs, but falling himself into disgrace, he afterwards attempted to organise a still greater rebellion, in which he was assisted by Nemours, Lorraine, and Le Rochefoucauld, &c., and opposed by his companion Turenne, who was successful at Gien, but defeated at the Faubourg St Antoine. C. was in 1652 declared a traitor; he entered the service of Philip IV. of Spain, and for six years conducted a brilliant war in French Flanders against Turenne, whose victory of Dunes (1658) was followed by the Peace of the Pyrenees, C. being received back into the favour of Louis XIV. The enmity of Louvois and Turenne gave C. the chief command of the French army in Franche Comté (1668) and Holland (1672–74), where he measured his skill without disgrace against that of the Prince of Orange in the bloody field of Senef. His old age was spent at Chantilly, where La Bruyère lived with him, and Boileau and the other literary stars of the period were frequently seen. He died 11th December 1686. Bossuet, who latterly had great influence over him, pronounced a magnificent funeral oration. Very different estimates of C.'s character, his political ambition, and his behaviour to his friends, have been formed. His military genius lay chiefly in daring, persistent assault, and he was therefore not sparing of human life. See Lives by Lord Mahon (Lond. 1840), Lemercier (Tours, 1844; 10th ed. 1869), and Voivreuil (Tours, 1847). There is also an interesting *Essai sur la Vie du Grand C.*, by his *quatrième descendant*, Louis-Joseph de Bourbon, *ci-devant* Prince de C. (1798; 2d ed. Par. 1806). The most recent authority on C. and the Fronde is Fitzpatrick (1874).—**Louis-Joseph de Bourbon, Prince de C.**, born at Chantilly, 9th August 1736, was the son of the Duc de Bourbon, minister of Louis XV. He first distinguished himself at Johannisberg (1762), and other engagements in the Seven Years' War. Army and financial reform and a splendid hospitality occupied his attention till the Revolution, when he emigrated. The corps which C. then formed served in the campaigns of Wurmser, in the Austrian service; in the English service at Ober-Kamlach and Biberach (1796); and in the Russian service at Constance (1799). It was discharged in 1801, and C. came to England, where he remained at Malmesbury till the Restoration. He died 13th May 1818. C. was the grandfather of the Duc d'Enghien, whose official murder so much injured Napoleon's reputation. He was concerned in the Pichegru conspiracy. See *Vie du Prince de C.* (3 vols. Par. 1819–20), by Chambelland, and Muret's *Histoire de l'Armée de C.* (Par. 1844). For the entire family, see Sévelinges' *Mémoires de la Maison de C.* (Par. 1820).

Conden'ser, an apparatus for cooling vapours down to the temperature at which they become liquid. There are various kinds of condensers in constant use, differing considerably in detail; but all work upon the same principle—namely, that of passing the vapour through a tube surrounded by material at the temperature required for the condensation. (See DISTILLATION.) The name C. is also applied to an electrical apparatus, by means of which a charge of low tension distributed over a conductor is concentrated, so that its otherwise insignificant effects are rendered visible to the experimenter. Its action depends upon the theory of electric induction, and may be simply conceived of as follows. Suppose two equal flat discs, A and B, formed of a good conducting material, to be placed close to each other, with only a thin layer of some non-conductor between. Let A be put in connection with the source of electricity, B with the ground. The charge on A induces an opposite charge on B, which reacts upon the charge on A, thus, as it were, disguising a portion of it. Now, the whole charge on B is disguised, but only a portion of the charge on A; that quantity being free with which A would be charged if the C. B were not present. The more nearly equal the induced charge is to the inducing charge, the more effective the C.; and the ratio between the charges is dependent to a great extent upon the specific inductive capacity of the non-conducting separating layer. See DIELECTRIC, ELECTRICITY.

Condensing Steam-Engine. See STEAM-ENGINE.

Condescen'dence is the name given in Scotch law to a judicial pleading. The Summons (q. v.) sets forth the name and designation of the pursuer (plaintiff) and defender, and the conclusions of the action. The statement of the grounds of action are set forth in the C., with a note of pleas in law subjoined. The C. is annexed to the summons, and forms part of it. The Defences (q. v.) must be in the form of answers to the C., with statement of the defender's allegations of fact, if necessary, and a note of his pleas in law. The summons is signed by a Writer to the Signet (q. v.), and the defences by counsel. If the pursuer do not choose to close the Record (q. v.) upon summons and defences, he revises his C., and the defender revises his defences. The record is then adjusted before the Lord Ordinary (see ORDINARY, LORD) in Chambers, and closed.

Condescendence and Claim. See MULTIPLEPOINDING.

Condic'tio Indibiti is a term of Roman law for the reclaiming of money paid under an erroneous belief of its being due. It has been decided by the House of Lords (Wilson *v.* Sinclair, 7th December 1830), that when a person pays money under an error, he has no right to recover unless the error be as to fact. Error as to law is not a valid ground for recovery.

Condill'ac, Étienne Bonnot, Abbé de, a French philosopher, was born at Grenoble in 1715. In the course of a studious life he published *Essai sur l'Origine des Connaissances Humaines* (1746), *Traité des Systèmes* (1749), the *Traité des Sensations* (1754), which was followed by the *Traité des Animaux* (1775), and the *Logique* (1780). His friend, Mademoiselle Ferrand, suggested many of his ideas. He also wrote works on *Grammaire*, *L'Art d'Écrire*, *L'Histoire Ancienne et Moderne*, &c. C. died 3d August 1780. At first a disciple of Locke, describing with special care the function of language in the formation of complex ideas, and in the development of mental faculty, C. afterwards maintained that innate faculties were as much a mistake as the 'innate ideas' which he ridiculed in Descartes, Malebranche, and Leibnitz, and that all knowledge and all mental faculties were derived from sensibility, being in fact only 'sensations which transform themselves differently.' Thus memory, attention, judgment, &c., were merely sensations persisting in a certain way. Similarly all the emotions were transformed desires, and desire was simply the withdrawal of sensation. It followed that the lower animals have not such vivid sensations as man (an exceedingly doubtful matter). C.'s philosophy, partly adopted from Gassendi and Hobbes, and enthusiastically applied by Diderot, De Tracy, and the other *idéologues*, consisted (1) in nominalism, (2) in the confusion of sensation with ideation. His analysis of the faculties, proceeding on this confusion, becomes merely verbal, his language constantly assuming the separate laws of mental growth which his theory denies. While, however, he conceived of the operation of (*e.g.*) memory as a mere mechanical tendency to motion, growing up through repeated motions, he also conceived the soul as a perfectly distinct entity, of whose life nervous motions were only the occasional cause. His theory led him to attach exaggerated importance to language, of both artificial and natural signs, which, if properly arranged, he regarded as being an accurate register of human experience. Reasoning was, therefore, speaking properly. C. is remarkable for the clearness and simplicity of his style, and is perhaps best seen in his criticism of the abstract systems, such as the Leibnitzian monads, the ideas of Descartes, &c. C.'s *Œuvres* were collected and published from autograph MSS. in 23 vols. (Par. 1798), and another edition followed in 32 vols. (1803).

Con'diments are agents used at table to aid the alimentary functions, and to give relish to such articles of food as are difficult of digestion, as fish, veal, vegetables, &c. The simpler C. are salt, butter, sugar, pepper, mustard, vinegar, and pickles. In hot countries, where the digestion is more liable to languish, stronger C. (*e.g.*, betel and curry) are in extensive use.

Condi'tion. In logic, conditions are the antecedents which combine to produce a certain effect, the antecedent which directly brings about the effect being termed the cause. Thus, a spark of fire might be termed the cause of an explosion, though, in reality, it is only the apparent occasion, and the nature of powder a C. necessary to produce the effect. 'The real cause,' says Mill, 'is the whole of the antecedents. Though we may give the name of cause to that one C. which brings about the effect without further delay, this C. has no closer relation to the effect than any of the other conditions has.' See Mill's *Logic*, book iii. chap. v.

Condition. In the real property law of England, it was at one time held that the gift of an estate by the lord to a vassal and the heirs of his body was a gift on C. of his having heirs of his body, and that if he died without having had heirs of his body the estate must revert to the lord. The C., however, was so far fulfilled by the vassal having heirs of his body, that, even though they predeceased him, he might alienate the land. An estate so bestowed may now, by certain legal procedure, be made an absolute gift.

Conditio si sine liberis decesserit.—By Roman law, a gift of estate made when the donor had no children became void on his having children. The principle of this law is recognised in Scotch law in testamentary settlements and in donations *mortis causa.*

Condi'tional Obliga'tion. An obligation depending on a condition has no force until the condition exist, but the granter cannot revoke the ground of hope which he has given. Contracts are null if illegal or impossible conditions are annexed. But such conditions, or frivolous conditions, annexed to a legacy, are merely held *pro non scriptis*, and non-compliance does not affect the right of the legatee.

Conditional Legacy. See CONDITIONAL OBLIGATION, LEGACY.

Conditional Institute, a Scotch legal term. Under destinations of real property, the immediate disponee of the granter is called the *institute.* Those to whom the property is destined, failing the institute, are called *substitutes.* When the destination to the immediate disponee is conditional, he is called a C. I. See DISPONEE-SUBSTITUTE.

Condi'tioned. The philosophy of the C. is the name given by Sir W. Hamilton to a particular application by him of the doctrine of the relativity of human knowledge. 'There is no ground,' he says, 'for inferring a certain fact to be impossible, merely from our inability to conceive its possibility.' This arises, not merely from the limitations of human experience, which, by creating certain powerful associations, exclude others, but because the human mind may be naturally incapable of conceiving many things. Besides the two ordinary meanings of inconceivability, however, viz., impossibility of representing the thing as an image, and impossibility of realising the thing as possible, Hamilton adopted a third, viz., impossibility of explaining, proving, or comprehending under a more general notion. He then states his theory: 'The C. is the mean between the two extremes—two unconditionates, exclusive of each other, neither of which can be conceived as possible, but of which, on the principles of contradiction and excluded middle, one must be admitted as necessary.' This he applies to the antinomies of space, time, free will, &c., maintaining that limited and unlimited space are alike inconceivable, but yet one is necessary. It has been objected to this theory, that it employs the word *inconceivable* in several senses; that the logical dilemma applies not to absolute existence, but to the world of known things, and that no meaning is discovered in the phrase, 'mean-between two extremes' when applied to propositions in which different predicates are affirmed of different subjects. A warmer interest has been imparted to the discussion of this theory since its application by Dean Mansel, in his celebrated *Bampton Lectures on the Limits of Religious Thought*, to the question whether a knowledge of the Absolute and Infinite Being is possible to man. The object of the Bampton Lectures was the important one of displacing all *à priori* criticism of the doctrines of revelation, as these doctrines deal with subjects inaccessible to the moral sense and intellect of man. The scholastic discussion of these abstract notions was therefore taken up by the school of theology who believe that revelation is best defended by showing its adaptation to the wants and aspirations of the human heart. As was inevitable in such a discussion, the term 'Absolute' was used in a great variety of meanings, such as the Perfect, that which is free from relation, that which is self-existent or free from external conditions. The controversy, so far as philosophical, has been admirably summed up in Bolton's *Inquisitio Philosophica.* In illustration of the trifling nature of some portions of the argument, it may be noticed that from the acknowledged principle (which Sir W. Hamilton had successfully established against Cousin's theory of an intuited Infinite) that all consciousness is based upon change and the comparison of relations, it was argued that the Absolute could not even be conscious of itself, since any relation conflicts with the notion of the Absolute, relatives being mutually dependent on each other. In this way it became easy to demonstrate that a Being, defined as transcending human consciousness, was not the subject of human knowledge apart from revelation. It was less easy to explain the manner in which the conditions of human consciousness were set aside by revelation.

Condona'tion in the law of England and of Scotland means *forgiveness.* A plaintiff may condone an offence either by an act implying forgiveness, or by complicity with the wrong-doing of the defendant. C., as accessory or accomplice, bars the suit of the plaintiff. The word is chiefly used in actions of divorce on the ground of adultery.

Con'dor (*Sarcorhamphus gryphus*), an American species of Vulture (q. v.), inhabiting elevated parts of the Andes, and of large size, the average length being between 4 and 5 feet, and the expanse of wings being about 14 feet. The tail is wedge-shaped. The plumage is black; the males have white wings, and their heads are combed and provided with wattles. The beak is curved at its tip. The food consists of carrion, and these birds consume large quantities of food. The King Vulture (*S. papa*), another species of this genus, inhabits Brazil and Guiana. Its plumage is red above and white beneath, with black tail and wings. The Californian vulture (*S. Californianus*) is a third species of the genus to which the C. belongs.

Condor.

Condor'cet, Jean Antoine Nicolas de Caritat, Marquis de, a French philosopher, born at Ribemont, Picardy, 17th September 1743, of a noble family, was educated by the Jesuits of Rheims, and at the College of Navarre, Paris. His talent was chiefly mathematical, and his *Mémoires* on the integral calculus, probabilities, and the higher analysis generally, won the admiration of D'Alembert and Lagrange, the former of whom secured, in 1773, C.'s election as secretary to the *Académie des Sciences*, though Buffon's friend Bailly was a candidate. In this position he wrote many of the finest *éloges* in French literature, notably those of Buffon, D'Alembert, Franklin, Lafontaine, &c. He pled warmly against religious distinctions in scientific societies, asking whether a society containing the Atheist Aristotle, the Catholic Descartes, the Unitarian Newton, the Calvinist Huyghens, the Deist Leibnitz, the Jansenist Pascal, the Mahometan Al Hazen, &c., &c., would not be the best of its kind. Drawn by his friendship for Voltaire and Turgot into social discussions, C. wrote against Necker for free trade in corn and against the feudal taxations. From 1776 to 1791 he held a position resembling the Mastership of the Mint. The lives of Turgot and Voltaire, the slavery abolition question, and religious equality, occupied his attention as well as his official duties. His activity in writing on political questions immediately before and during the first years of the Revolution was great. As member of the Legislative Assembly of 1791 and the Convention of 1792, he prepared reports on the question of peace or war, was influential in taking the custody of registration from the clergy, strongly opposed the capital sentence of the King, and was consulted on all constitutional points of importance. On the expulsion of the Girondins, however, he was denounced by the Committee of Public Safety, and compelled to hide for six months in the house of Mme. Vernet, where he composed his famous *Esquisse des Progrès de l'Esprit Humain*, afterwards printed by order of the Convention. Leaving this shelter, which exposed his friend to the penalty of death, C. escaped from Paris, but was retaken, and died by poison, self-administered, at Bourg la Reine, 28th March 1794. C. had a noble wife, who strengthened him greatly in his separation from the aristocratic party to which he by birth belonged, and in his persecution by the Terrorists, whose constitution of '93 he had opposed. She was the sister of Marshal Grouchy and the sister-in-law of Cabanis. She translated Adam Smith's *Theory of Moral Sentiments* into French. During her husband's concealment she supported herself by painting portraits, the Government having sequestered C.'s property. C. himself was a man of delicate sensibility and warm affections, and undoubtedly one of the greatest intellectual figures in the Revolution. His theory of human progress has been blamed as establishing a rather inconsistent division of history into periods; one being political, another scientific, another religious. His conclusions that equality, or *equal freedom* of nations and classes (as regards trade, wealth, education, government, &c.), will be established, and that human nature is indefinitely perfectible morally, physically, and intellectually, have excited much mistaken ridicule. C. in fact announced the truth that the mental acquisitions of one generation are not dissipated, but transmitted to its successor; he insisted that this might take place with regard to morality as well as intellect; he did *not* suppose that medical science would ever make man immortal. Complete collections of his numerous writings have been made by Garat and Cabanis (22 vols. Par. 1804), and by Condorcet-O'Connor and Arago (12 vols. Par. 1847–49).

Condottie'ri, soldiers of fortune of the 14th c., whose services in warfare were sold to the side that promised most plunder. The quarrels of the petty Italian states gave these mercenaries constant occupation. Among their celebrated chiefs were Francis of Carmagnola, and Sforza, who became Duke of Milan.

Conductiv'ity, thermal or electric, of a given substance, is the amount of heat or electricity which flows through a cube of unit volume in unit time, the difference of the temperature or potentials of the opposite sides being unity. The late Principal Forbes has shown that the thermal C. of pure metals is probably inversely proportional to the temperature from absolute zero, and the same law seems to hold in the case of electric conduction. This law is deducible from theory, upon the hypothesis that heat, during its conduction, arranges itself exactly as it would do if let down from the hotter to the colder part by a perfect engine, *i.e.*, so disposes itself that the least possible amount of work can be got from it during the operation. (See THERMODYNAMICS.) Non-metallic substances are in general bad conductors of heat, and frequently non-conductors of electricity; and these increase in conducting power as their temperatures rise. Liquids are of small conducting power as compared to solids, and the experimental determination of their C. is a matter of considerable difficulty, in the one case owing to the disturbing effects of the thermal convection currents produced, and in the other, if the liquid be a chemical salt or compound, to the electrolytic action and polarisation which generally supervene. The C. of gases is still more difficult of determination, radiation and convection playing by far the most important part. See ELECTRICITY, HEAT.

Conduc'tor, in music, the director of a performance. The C. generally stands in front of the performers, and marks the time for them with a baton, while at the same time he indicates the expression and the entrances of the different parts or instruments. The C. of an orchestra must be distinguished from the *leader*, who is the principal first violin.

Condylu'ra. See STAR-NOSED MOLE.

Condy's Fluid. See MANGANESE.

Cone. See FRUIT.

Cone, the solid formed by drawing lines from every point of a closed plane curve to a given point not in the plane of the curve. If the C. be cut by a plane parallel to the base, the curve of section is similar to the base, and the solid bounded by these parallel planes is called the *frustrum*. The most important C., however, is the *right C.*, which may be generated by the rotation of a right-angled triangle about one of its sides. If it be intersected by a plane perpendicular to the axis of rotation, the curve of intersection is a *circle*; if by a plane inclined at any angle, but cutting both sides of the C., an *ellipse*; if by a plane making with any side an angle equal to the vertical angle of the C., a *parabola*; and if by a plane making any inclination less than this, a *hyperbola*. For the special properties of these conic sections, reference must be made to the several articles.

Coneglia'no, a town of N. Italy, province of Treviso, 28 miles N. of Venice by railway, with several churches, an hospital, and manufactures of silks and woollens. Pop. 6500.

Cone-Shell, a genus of Gasteropodous mollusca, belonging to the family *Conidæ*, in which the shell is inversely conical; the aperture long and narrow, and the outer lip notched near the suture. The *operculum* is minute and of lamellar structure. This family belongs to the *Siphonostomatous* (or 'siphon-mouthed') division of Gasteropoda, and to the order *Prosobranchiata*, in which the gills are placed anteriorly to the heart. These molluscs are common in the Mediterranean and in tropical seas. *Conus imperialis*, *C. admiralis*, *C. nobilis*, *C. textilis*, *C. tessellatus*, &c., are familiar species.

Confarrea'tion, a Roman form of marriage ceremony, deriving its name from the *panis farreus* (bread made of spelt) used on the occasion. The children of parents so married were alone eligible for certain offices of the priesthood.
